CYCLECAR PRICE

Boulevard-Roadster Plaza Model

Four-Cylinder, Water Cooled, 15 Horsepower Motor, Three-Speed Selective Gear Shift, Cone Clutch, Shaft Drive, Cantilever and Quarter Elliptic Springs, Left Side Drive, Wire Wheels, Center Control.

Every Refinement of the Big Car and All the Economy of the Cyclecar Type.

The Salvador Is the Result of 12 Years' Experience With Motor Car Designing and Two Years of the Best American and European Machines.

The Creation of G. B. Mansur, formerly of the De Dion-Bouton Company, Paris, and Built to Meet the American Trade, the

SALVADOR LIGHT MOTOR CAR

Is Unequaled in the Small Car Classes

It Is Sold With An ABSOLUTE GUARANTEE OF MATERIALS and WORKMANSHIP.

AGENCY PROPOSITIONS

Agencies for Some Unassigned Territory Can Be Made. Proposals Must Be Received Immediately, as the 1914 Production Is Limited.

SPECIFICATIONS

MOTOR—4-cylinder, 4-cycle, 15 horsepower, water cooled, L head 70mmx100mm. Cast en bloc.

LUBRICATION—Self-contained, constant level splash and force system, plunger pump operated by camshaft.

COOLING—Water cooled, thermosiphon system.

TRANSMISSION—Unit, with motor, crucible steel gears, double heat treated, oil hardened, running on ball bearings, three speeds forward, one reverse.

CLUTCH—Simple cone clutch, three-spring adjustable type.

FRONT AXLE—Tubular, with drop center, conventional type.

REAR AXLE—Bevel gear drive, patented non-skidding differential.

STEERING GEAR—Worm and sector type, with 15" steering wheel.

FRAME—Pressed steel, channel section.

SPRINGS—Front, $\frac{1}{4}$ elliptic; rear, cantilever.

WHEELS—Wire, 28x3 tires.

WHEELBASE—100" wheelbase, 42" tread.

CONTROL—Left hand drive, center control.

GASOLINE—Gravity feed tank, located under cowl.

BODY—Luxembourg design; boulevard-roadster type, streamline effect; Staggered seats with ample leg room; luxurious upholstery; parcel compartment in the rear.

SPEED—45 miles per hour. Plaza model, 65 miles per hour.

FINISH—Deep purple, black trimmings.

Mr. Motorist

Here's a point you
may have missed

THE greatest power loss with which motorists contend is due to leaky, cheaply built spark plugs—compression leaks through or the charge is only partly ignited.

A cheap plug must be poor; a poor plug always causes power loss, over-heating and costly damage to engine and car.

Bosch Plugs

were designed so that the right plug could be had, so that power losses, over-heating and other ignition troubles could be eliminated and so that the full power always could be obtained.

Bosch Plugs are right and act right. Proof of this fact is in the showing made by Bosch Products in the recent Vanderbilt Cup and Grand Prize Races. Both winners and EVERY car to finish used Bosch Plugs; also the Bosch Magneto.

This was a gruelling test—more heat was present, more oil was used and greater speed was evident than you ever would require—but Bosch Plugs stood it—because they are As Good As Bosch Magnetos. Try a set in your car—the same plugs as used by the racers.

**\$1.00 Each in U. S. from any dealer, or
from Bosch Service Stations or Branches.**

"Locating the Spark Plug" tells you what
you ought to know about plugs—it's free.

TRANSPORTATION EFFICIENCY

Is the Business Man's Big Problem.

The MOTOR TRUCK, the AMERICAN AUTHORITY on Highway Freightage, Is the Only Publication That Specializes Haulage Economies and Deals with Experience and Conditions—Not Theory.

The Investigations for the MOTOR TRUCK Are Made by Trained Experts, Who Analyze Results of Established Services and Present Facts and Figures That Demonstrate Practical Possibilities. Whatever Is of Value Is Told, Not from the Selling Point of View, but for the Education of the Business Man.

These Articles Are the Statements of Men Who Have Worked Out Their Problems with Varying Success. They Reject Ideals and Have to Do with Conditions That Are Common in Business Life. They Demonstrate Practicalities in Every Line of Industry or Commerce.

The Coming Issues of the MOTOR TRUCK Will Be Better Than Ever Before. The Scope of the Magazine Is Broader. It Will Consider Every Phase of Transportation by Highway. The Subjects It Will Deal with Will Include: Systems, Organizations, Records, Equipment, Varying Haulage Requirements, Garaging, Maintenance, Repair and Attention, Operation Economies, Driving Problems, Safety, Traffic Regulation, Street and Terminal Congestion, Freight Handling Facilities, Insurance, Road Building and Highway Uses, Legislation and Legal Aspects, as Well as a Great Diversity of Mechanical Subjects.

The MOTOR TRUCK Is a Business Man's Magazine. It Is a Monthly Compilation of Information That Could Not Be Obtained in Any Other Form. It Deals with Facts That Are of Great Importance, and Can Be Applied to Material Advantage.

Providing Half-Hairbreadth Accuracy

ONE-THOUSANDTH of an inch—one-third to one-half the thickness of a hair—is the standard of accuracy required in the manufacture of Overland crankshafts.

The grinding machines pictured above are the finest and most delicate known to the engineering world. On them the production of an Overland crankshaft bearing is as delicate an operation as watch-making. One-thousandth of an inch above or below the specified size is sufficient to send the whole part to the scrapheap.

Expert workmen, like the one shown in the

upper insert, test every part of the crankshaft, using the most delicate micrometers and measuring instruments available.

The same care is exercised in making every part of the Overland car. The Overland is the utmost in motor car efficiency, construction, progress and real dollars-and-cents value—and it costs from 30% to 50% less than our smaller competitors must ask.

Send for our catalogues and illustrated literature. Please address Dept. 52.

The Best Solution for YOUR Lighting Troubles

Prest-O-Lite

Proved reliable, efficient and economical on hundreds of thousands of automobiles, everywhere.

You don't have to fool along with any unsatisfactory lighting system.

The Result of Experience

Boston, Mass.

Gentlemen—We have for some time past been using electric lighting on our car, but have found it to be so entirely unsatisfactory that we are now having our car equipped with Prest-O-Lite.

We do not know as we can enumerate one specific trouble which has been greater than the others and can only say that the entire system is radically wrong from our standpoint, for effective automobile lighting. We have used Prest-O-Lites in the past and shall use them in the future and therefore we are placing our order for a style "B" Prest-O-Lite complete, with all necessary tubing and connections, to replace the electric lighting system now on our car.

C. L. YORK COMPANY.

E. L. York, Treasurer.

You don't have to pay for continued "service" or waste your time while an "expert" is searching for mysterious troubles.

From all parts of the country come reports of wise motorists who are tearing complicated, delicate and unsatisfactory systems off their cars and substituting Prest-O-Lite.

Gas lighting saves weight, gives greater engine power, never fails suddenly, is free from trouble and repairs, needs practically no attention.

Your gas lights may be lit, dimmed or extinguished, from the seat, by the use of the Prest-O-Liter.

No matter what self-starter is on your car, your headlights should be gas lights. Reliable light is just as essential as fuel.

Use the Coupon

If you want the facts on all lighting systems, showing how you can save time, money and trouble on YOUR car—use the coupon today.

Publisher's Comment.

The Eighth Annual Overhaul and Equipment Number of The Automobile Journal, dealing with the preparation of the car and its equipment, differs materially from previous issues, as will be noted by the accompanying table of contents. Each component of the chassis is treated separately and detailed instructions are given for ascertaining readily the repairs or replacements necessary.

The New Motorist, undertaking for the first time the overhaul of the machine, has been given special consideration and the limitations of the novice are carefully defined. As

ticle dealing with practical repair equipment. Various installations are also discussed.

Equipping the Private Garage is a problem that requires careful consideration to obtain the desired results with a minimum of expense. This subject is treated in detail, and suggestions are made as to storing and maintaining the automobile in an economical manner. The necessary equipment for the small, as well as the large, garage is described and illustrated.

The Special Index is so arranged that instructions for performing any particular work can be found readily. For example: If it be

the chassis components are illustrated and lettered, and instructions given for their inspection, the new owner should be able to estimate readily the work requiring the services of the expert.

The Tools and Supplies required for the overhaul are dealt with comprehensively, and valuable suggestions are given as to the selection and purchase of these members. A number of time and labor saving devices are also described and illustrated in a special ar-

desired to insert new corks in a clutch plate, look under the head of Clutches. Similarly, if one wishes to know how to adjust the contact points of a magneto, the article will be noted indexed under Ignition.

The Classified Buyers' Guide should always be consulted when compiling the list of tools, supplies, equipment, etc. The concerns listed are wholly reliable. When corresponding with advertisers, mention of The Automobile Journal will insure prompt attention.

A VISION

**of your car,
dangerously skidding
on the slippery
pavement ahead——**

You have neglected to put on Weed Chains.

You anxiously view the slippery pavement ahead, and have *a mental picture* of your car "side-swiping" a fellow motorist.

Why nurse anxiety and coax calamity — why take such chances when you know

Weed Anti-Skid Chains

Absolutely Prevent Skidding

If you don't equip your car with Weed Chains, and put them on when the roads are slippery and muddy or covered with snow and ice, you are taking chances on your own life and are a serious menace to every road user.

Weed Chains *do not injure tires* even as much as one little slip or skid—They are slipped on in a minute without a jack—they *never fail* in an emergency. Join the *safety campaign*—exercise caution. *Equip your car with Weed Chains today.*

Price, \$1.00 the Year

WIDESPREAD INTEREST IN GOOD ROADS.

Joint Committee Raised to Codify Existing Laws and Recommend Scientific System of Construction and Maintenance---Brief History of Road Making in This Country and Abroad---Available Funds and Plans for 1914.

AGITATION, which had its inception with the old League of American Wheelmen, and which has been carried on unremittingly by automobile owners and users since the advent of this industry, is expected to result in a systematic revision of existing road laws on the statute books of the various states of the Union during 1914. The work is to be accomplished by a joint committee representing the American Highway Association and the American Bar Association, which already has received the active co-opera-

tion of the United States office of public roads, Department of Agriculture.

Interests decidedly opposed to the construction and maintenance of improved highways, when the subject was first broached and during the early days of the good roads movement as carried on by organized motorists, are now working in harmony with these bodies. There is no longer any disposition to question facts that have been made apparent as a result of the more general adoption of the mechanical transport in high-

Section of the Old National Pike, for Which Congress Made the Initial Appropriation in 1806, and Which Was Taken Over by Individual States in 1850, Government Aid Being Transferred to Railroad Development.

Model of the Appian Way, Constructed Under the Direction of Appianus Claudius in 312 B. C.

way haulage, and other practical demonstrations.

The joint committee is now busily engaged in preparing an index chart of existing road laws, this being based upon a complete literal compilation of such laws in all states, secured by the office of public roads. The first step will be to recommend that all obsolete, useless or unnecessary statutes be repealed, and the investigation already discloses, in several cases, accumulations of laws running back over 100 years that create an almost hopeless confusion.

Recommending Scientific System.

The next step will be to simplify and arrange in logical order those laws which still have merit, and then to suggest certain basic features of good administration, with a view to providing a scientific method of road construction and maintenance for the future. This is the point at which it may be expected that the joint committee will find the most determined resistance when its report is presented to the several state legislatures early in 1915. The effort will be toward the creation of state highway commissions, in charge of highway engineers, and, since a majority of the commonwealths have not as yet adopted this sys-

tem, it readily can be appreciated that the recommendations of the committee will come in the nature of an innovation in many instances.

When and where the first road was built is not known. Herodotus speaks of a great Egyptian road on which 100,000 men were employed for a period of 10 years. This was during the reign of Cheops, about 2500 B. C. According to the historian, this road was built of massive stone blocks 10 feet deep, and lined on both sides with temples, mausoleums, porticoes and statues. The streets of Babylon are said to have been paved in 2000 B. C., and the Euphrates was crossed by a stone bridge about the same time. The Chinese were building bridges as early as 2900 B. C. The ancient Peruvians had a wonderful system of national roads connecting all the principal parts of their empire.

The Appian Way.

However, the first authentic information concerning the systematic construction and mainte-

Model of Tresaugnet Road Construction Begun in 1775 and Continued Under Napoleon's Management.

nance of permanent highways dates from the Roman period, and it is generally understood that the Romans learned the art from the Carthaginians. The first of these great Roman military roads was the Appian Way, begun under the direction of Appianus Claudius in 312 B. C. At that time it was built from Rome to Capua, 142 Italian miles, but it later was extended to Brundisium, a total of 360 miles, and probably was completed by Julius Caesar.

A model of this Appian Way, as prepared by the office of public roads, is reproduced herewith. A indicates the *contignatum pavimentum*, composed of lime and sand, straw, rushes, or reeds, and sometimes laid on sills or boards. B shows the *statumen*, or foundation, composed of two courses of flat stones laid dry or in lime mortar. The depth of this course was 16 to 18 inches. Next, came C, the *rudus*, or rubble, a layer of broken stone mixed with lime in the proportion

Model of the French Roads Laid by the Old Roman Method Under Administration of Colbert in 1666.

of one part of lime to three of stone. Sometimes the material was taken from old buildings, and the course was from six to nine inches deep. Section D represents the nucleus, coarse gravel and lime used hot, bricks, potsherds, or broken tile mixed with lime and covered with a thin layer of lime mortar. E was the pavimentum, or summa crusta, consisting of polygonal blocks joined with the greatest nicety. This course was about six inches deep and about 16 feet wide. F shows the curbs, which were two feet wide and 18 inches high, with mounting blocks, which served as seats for travellers or to aid the riders in mounting. G presents the side roads, the surface of which was composed of gravel flushed with mortar, and the width was from six to eight feet

Roman Road System.

The Roman construction often was varied, although always extremely massive. The general

gravel, and in some cases a mixture of sand and clay or clay and gravel was utilized.

This was the type of road constructed throughout the Roman empire, no less than 29 radiating from the city. Their total length is estimated at 50,000 miles. The Appian Way is said to have been in a good state of repair 800 years after it was built, but with the fall of the Roman empire all this splendid system was allowed to fall into decay, so that today but little more than a trace remains of these splendid achievements.

Early French Roads.

French roads are considered the best examples of modern construction. The present system really was founded by Napoleon, although there was a road system in France—excepting, of course, the Roman period—as early as 1660. Under the ministry of Colbert (1660-9), about 15,000

Section of Concrete Road in Bellefontaine, O., Laid in 1893-4, After Being Subjected to 20 Years of Traffic.

form of construction under Augustus Caesar, when Roman road building appears to have reached its height, was a massive road from 16 to 30 feet wide, from three to four feet thick, and laid in three or four courses. The first course, almost invariably consisted of large, flat field or quarry stones laid on earth, except in swamps, where poles, logs, brush or even boards were used beneath the stone course. The other courses varied considerably with the available material and the period and importance of the road. Small stones with and without mortar, gravel mixed with clay, broken brick, tiles, etc., and even earth were used for the second and third. The surface or wearing course consisted of well cut, irregular, close fitting polygonal blocks on a few of the more important ways, but more often uncut stones; not unlike cobble stone pavements,

miles of stone roads were built, the method of construction being modelled after that of the Romans. In the accompanying illustration, A indicates the earth foundation, which was rolled flat; B, the stone foundation, 18 feet wide and nine or 10 inches deep, composed of flat stones laid by hand in two or more layers; C, the layer of small stones, broken in place by hammers, and D, the finished surface, a course of stones broken by hand into sizes smaller than the underlying material and left to be consolidated by traffic. The total thickness of the road in the centre was from 18 to 20 inches and at the sides from 12 to 14.

Under Tresaguet and Napoleon.

After 1775, Tresaguet introduced the system which was improved by him under the guidance of Napoleon, who evolved a splendid adminis-

trative plan. In the illustration, A shows the earth foundation, with contour parallel to that of the finished surface; B, the stone foundation, composed of flat stones laid on edge, lengthwise across the road and beaten to an even surface, five inches deep; C, small stones laid and beaten by hand hammers, and D, the finishing layer of broken stones about the size of walnuts spread with a shovel. The crown was made six inches, the width 18 feet and the total thickness about 10

any definite attempt to study scientific methods of road construction and maintenance in this country, utilizing specially prepared tar binders, etc.

The first mention of the exaction of tolls is that given by Strabo, on the roads leading from Babylon to Syria, although it was not until 1346 A. D. that this system was generally adopted as a means of raising revenue for highway maintenance and repair. The first toll road in the United States was the Lancaster pike, between Philadelphia and Lancaster, Penn., a distance of 62.5 miles, the construction of which was authorized in 1792.

The more recent agitation for national highways, either constructed entirely at the expense of the federal government as suggested by the National Highways Association, or under some form of federal aid as urged by the American Highway Association, brings to mind the conception of the national road, originally suggested by Albert Gallatin and championed by Henry Clay. By an act of Congress, approved by President Jefferson, March 29, 1806, \$30,000 was appropriated toward the survey and construction of this road from a point on the Potomac river, at or near Cumberland, Md., to the Ohio river, at or near a point opposite the town of Steubenville, O. The government appropriated a total of \$6,824,919.33 for this road, which eventually extended from Cumberland to St. Louis. In 1835 arrangements were completed whereby the various states took over the control of this highway between Cumberland and Wheeling, and by 1850 practically all of it had been taken over in this manner.

There does not appear to have been a period in the history of the United States when the subject of roads has been given the consideration

inches. E shows the curbs, composed of rough, flat stones set on edge, with the upper edge flush with the surface.

American Highway Construction.

After 1830 French roads were constructed of macadam, a method introduced in England and Scotland by a Scotchman, John Loudon MacAdam (1756-1836). Macadam, Telford and other forms of stone roads have been constructed in America for a number of years. It is only since the advent of the automobile that there has been

that is true this year. Previous to Dec. 31, 1911, there had been expended for improved highway construction and maintenance by the several states, according to the figures of the office of public roads, \$106,600,789.07. Quoting this same authority, there was \$43,819,138.67 available for this purpose during 1912, and \$45,024,815.74 in 1913. Complete figures for 1914 are not available at this writing, but the American Highway Association supplies the information contained within the accompanying table. It will be un-

STATE MONEY FOR IMPROVED HIGHWAYS.

	Expended Prior to Dec. 31, 1911	Available in 1912	Available in 1913	Available in 1914

*No report; †estimated. No figures available respecting Arkansas, Florida, Indiana, Montana, Nebraska, South Dakota, Tennessee or Texas.

derstood, in this connection, that a portion of the funds are carried over from year to year, so that it is impossible to determine the exact amount which has been expended by the several states.

These figures are entirely apart from the national movements, reference to some of which already has been made. The United States government appropriated \$500,000 in 1912, which amount has been expended, or provision has been made for its expenditure, in experimental work in various states. Another appropriation of \$25,000,000 is pending before Congress. The office of public roads is at present co-operating with the American Highway Association and various state officials in some of the southern states, looking toward the adoption of a scientific plan for the future.

Concrete Road Work.

The Lincoln Highway Association expects, this year, to complete the raising of a fund of \$10,000,000 for the construction of a concrete highway across the continent from New York City to San Francisco. The plan appears to involve the active co-operation of states, counties and municipalities, some of which already have undertaken the work of constructing large sections of the proposed road.

Concrete roads may still be regarded somewhat in the nature of an innovation, although they have been laid in a number of sections. Probably that which has seen the longest service is that laid in Bellefontaine, O., in 1893 and 1894. About 2000 square yards was built in blocks five feet square with joints at right angles and parallel to the axes of the streets. The bottom four inches was constructed of an unscreened gravel concrete of a 1-6 mixture and the top of 1-1 mixture.

Writing regarding this pavement, under date of Sept. 19, 1913, Clair A. Inskip, city engineer of Bellefontaine, says that there has been but very little wear on these streets in the past 20 years, except along the longitudinal joints, which have worn in ruts and which have been the source of all repair work. He adds that this feature might easily have been avoided by placing the blocks at angles of, say, 45 degrees with the centre line of the streets. An accompanying illustration shows the condition of the pavement at that time. It has been subjected to the heaviest traffic of a city of 10,000 inhabitants.

Little attempt has been made herein to offer more than a suggestion as to the interest that is being taken in the matter of improved highways, and some of the plans now under way looking toward a more careful study of a problem which has presented itself since the earliest days

of the world's history. The automobile industry has every reason to be proud of the important part it has played in this matter. The old national pike of 1806 was abandoned by the United States government because of the growing importance of the railroad as a means for serving commerce. The automobile industry, both with reference to the use of passenger cars and motor trucks, has revived interest in highway transportation, as a means for still further reducing the cost of haulage and travel, and it is beginning to be appreciated that there is a science in road making as well as a science of railroad engineering.

SPECIAL BOSCH PRIZES.

Company Sets Aside \$1300 for Ignition Awards at Forthcoming 500-Mile Race.

In keeping with the practise followed by the Bosch Magneto Company, New York City, for a number of years past, that concern has set aside \$1300 to be paid as special prizes as a result of the forthcoming international sweepstakes 500-mile race on the Indianapolis motor speedway, Memorial Day. Past experience has been such as to indicate to the company that these prizes will be won.

The awards are conditional upon the use of Bosch magnetos and plugs. In case the winning machine uses a magneto of this make the driver will receive \$500, in addition to the regular speedway prize. The driver of the second car to finish will receive \$300 and the driver in third place \$200. If these cars are equipped with Bosch plugs the awards will be \$100 in each instance, in addition to all other prizes won.

ITS BIGGEST YEAR.

Lozier Motor Company Reports That Sales Have Set an Entirely New Record.

As an indication of business conditions throughout the country, it is of interest to note the report of President J. M. Gilbert of the Lozier Motor Company, Detroit, who states that up to April 1 the company had produced and sold more Lozier cars in 1914 than during the first six months of 1913. In addition Mr. Gilbert says:

In February we established the highest record for sales since we began the manufacture of automobiles. March sales exceeded February by a wide margin. Our March sales were actually 142 per cent. ahead of the sales in the corresponding period of a year ago.

FEATURES OF NEW SERIES D HOWARD CAR.

FOR the season of 1914 the Lexington-Howard Company, Connerville, Ind., will market, in addition to a four-cylinder Lexington car,

Series D Howard, a Five-Passenger Touring Car, Completely Equipped and Having Many Refinements Making for Economical Operation.

the series D Howard, a six-cylinder chassis, to which one type of body will be fitted, a five-passenger touring car. The new machine presents many interesting mechanical details, as well as those providing comfort and convenience. The Howard was designed to meet the demand for a high grade, family car, having ample power to meet the requirements of all kinds of service and capable of being maintained at a minimum of expense.

The motor employed is known as the model Six-C Continental, rated at 60 horsepower by the maker, and combined with it is the clutch, gear-set and electric motor starter. A three point suspension is employed, the forward points being extensions of the crankcase casting, while the rear is mounted in a bronze lined bearing lubricated by a grease cup.

The cylinders are cast in blocks of three, have a bore of 4.125 inches and stroke of 5.25, and the output according to the S. A. E. formula is 40.9, but tests have shown that this figure is very conservative. All valves are located on the right and are made of two metals, the stems being of carbon steel and the heads of nickel. The head diameter is 1.3125 inches and that of the stem .40625 inch. The valve mechanism is enclosed, two plates being utilized. Accessibility is a feature of the design.

The crankshaft is a 40 per cent. carbon steel, and the dimensions of the three bearings are as follows: Front, two by 2.8125 inches; centre, two by 3.5; rear, 2.25 by 3.8125.

The crankpins are two inches in diameter. The camshaft diameter is 1.9375 inches and is carried in three bearings of the following dimensions: Front, 2.25 by 2.9375 inches; centre, 2.25 by 1.625; rear, 1.875 by 1.375. All bearing surfaces of the crankshaft, camshaft and connecting rods are composed of nickel babbitt, hand scraped. The connecting rod bearings are adjustable for wear by utilizing varying thicknesses of punched sheet steel shims. The timing gearset is composed of three helical gears, these being employed for the crankshaft, camshaft and magneto drive. The flywheel is 17.25 inches in diameter, secured to the crankshaft by six steel bolts. After assembly the flywheel and camshaft are balanced on a running balance machine.

Pistons Carefully Fitted.

Three diagonally split eccentric rings, .25 inch wide, ground on both sides, are fitted above the chrome nickel steel wristpin, which is of the fixed type and has bearings of 1.21875 by 1.875 inches in the phosphor bronze bushing in the upper ends of the connecting rods. The piston is 5.625 inches and its outside is provided with an oil groove, preventing excess lubricant working into the combustion chamber. The motors are run under belt power to obtain accurately seating rings.

The aluminum alloy crankcase is a two-piece

Chassis of the Series D Howard, Equipped with a Six-Cylinder Motor, Electric Lighting and Motor Starting—Note the Method of Carrying Spare Casings.

construction, the lower section forming the oil reservoir and being easily removable. An efficient type of automatic carburetor is employed

Left Hand Side of Howard Motor, Showing Power Driven Tire Pump, Motor-Generator and the Compact Grouping of Cylinders.

and the fuel supply is by pressure, a small reciprocating air pump being located in the crankcase of the motor. The fuel tank is mounted under the front seat and has a capacity of 18.75 gallons. The supply is registered by a dash indicator.

The ignition system includes a Bosch true high-tension magneto and the Atwater-Kent automatic advance system of battery ignition. A feature of the cooling system is the use of removable covers, permitting access to the water jackets of the motor. The Fedders radiator is attached to the front cross frame member in such manner as to eliminate road shocks and frame stresses.

Efficient Lubrication.

Lubrication is by a combination force feed and splash system and the height of the oil in the crankcase is maintained at a constant level. The lubricant is circulated by a plunger pump directly to the main bearings, overflowing into a series of troughs into which the connecting rods dip, lubricating the pistons, connecting rods, camshaft, timing gears, etc., by splash. The surplus lubricant drains back to the reservoir and before being circulated is strained.

A 14-inch diameter, leather faced cone clutch is used, three inches wide and having a 12-degree taper. One of the qualities of the design emphasized is its light weight at the rim, reducing to a minimum any tendency to spin and making changes of gears easy. The clutch shaft is mounted in annular ball bearings and the throw-out member is also ball bearing. Six small springs, equally spaced, are employed to compen-

sate for wear. Twelve flat steel springs are inserted under the clutch facing, these being in slots milled in the face of the aluminum cone, and it is stated that the combined strength of the 12 springs is slightly less than the six retaining members, obtaining an ideal clutch action. Each leather is ground accurately to size in a special machine. An adjustable clutch brake is also provided. Accessibility of the clutch and its components is a feature of the design.

The gearset is a three forward speed, selective type, designed by the company's engineers, and the gears are of chrome vanadium steel, heat treated, and enclosed in an oil proof aluminum casing. All gears are of ample diameter with .875-inch face and five pitch. They are carried on large shafts with four splines milled from solid, and mounted in oversize imported annular ball bearings. The shaft centres are distanced 4.60 inches.

Special H Slot Used.

Drive is through a Spicer shaft with a universal joint at each end and companion flanges are fitted to each joint to make for rapid disassembly. The gearshift set is mounted directly on the top of the transmission, forming the cover, and the shifting fingers extend directly into the forks. By removing four bolts the construction can be displaced easily. Shifting into the reverse when changing gears is prevented by the use of a specially designed H slot. It is stated that the arrangement is automatic in its action and eliminates thumb latches or similar devices.

The rear axle is a Timken floating design, a one-piece pressed steel housing with the bevel gear and pinion mounted as a unit. The driving dogs are forged integral with the axle shafts, then milled, heat treated and ground. The front

Valve Side of Howard Motor, Utilizing the Moore Multiple Exhaust, Which Increases Efficiency.

axle is also a Timken, of the I beam section type, and all wearing parts are bushed. Timken roller bearings are utilized for the wheel mountings.

Chart Showing Curves from Test of Moore Multiple Exhaust System: Curves 1 and 2 Deplet Results with Regular Equipment; Curve 3, the Moore System—Dotted Curves A and B Deplet Results Obtained with Standard and Multiple Manifold Without Muffler, and C with Carburetor Adjusted to Suit—The Temperature of the Water In Was 150 Degrees Fahrenheit, and 170 Out.

The brakes are ample in size to meet the requirements of all service, the drums having a diameter of 5.5 inches and face of 2.5. The service members are of the contracting type and the emergency, expanding. The wheels are designed by the company and are equipped with 36 by 4.5-inch tires and Firestone quick detachable demountable rims.

The springs receive careful consideration and provide easy riding, as well as durable qualities. The front members are semi-elliptic, 38 inches long and two wide, while the three-quarter elliptic rear members are 52 inches long and two wide. All spring eyes are bronze bushed, reamed to size and fitted with hardened and ground bolts with integral grease cups.

Novel Tire Carrier.

The frame members are of pressed steel made from special material, 4.75 inches deep with three-inch flanges at offset, tapering to 1.5 inches at the rear end. The frame is narrowed in front to provide a short turning radius and has the usual kick-up at the rear. The method of mounting the spare tires is novel and is considered in detail in connection with the description of the Lexington car, made by the same company, elsewhere in this issue.

The steering gear is of the worm and gear type, provided with an adjustable ball thrust bearing on each side of the worm, and other adjustments can be made to compensate for wear. The 18-inch wheel is notched, and the control levers are mounted with friction locks. When

the Atwater-Kent ignition system is being utilized, the spark lever is not employed, but upon switching to the magneto, the lever permits of control of the spark.

The lighting and motor starting system is a special Jesco, a combined unit operating at six volts. Energy of the electric motor is imparted to the crankshaft by a silent chain, and an automatic clutch prevents any injury in the event of a back fire. The wiring system is very simple and the equipment easily cared for.

All controls are convenient to the driver. On the instrument board are mounted the speedometer, air gauge, ammeter, lighting and ignition switches, priming button and instrument lamp. The motor starter is operated by a foot button at the right of the steering column. The accelerator is unique, hemispherical in shape, and permits of changing the position of the foot.

The body design is very attractive and the doors are large, with concealed hinges. Ebonized cap moldings match the ebony finished dash and instrument board. Tool pockets are fitted into the upholstery under the cowl, and nothing but the best curled hair and genuine hand buffed long grain leather is used. The Turkish cushions are very deep and comfortable. The equipment is most complete, including top and cover, windshield, etc. The wheelbase is 130 inches and weight complete 3900 pounds.

Moore Multiple Exhaust System.

The motors used by the Lexington-Howard Company are equipped with the Moore multiple exhaust system, which consists of a manifold di-

Showing the Howard Six-Cylinder Motor with Moore Multiple Exhaust System Being Tested at Wheeler & Schebler Laboratory.

vided in such manner that no two cylinders exhaust into the same compartment at the same time. Two tubes and two mufflers are utilized.

That a motor equipped with this system will develop considerably more power than when fitted with conventional manifolds and mufflers, was demonstrated in tests conducted by Chief Engineer J. C. Moore of the company in the laboratories of Wheeler & Schebler, Indianapolis, Ind. The results of these tests are given in an accompanying chart. They were continued over a period of two weeks, and both four and six-cylinder motors were utilized, it being found that the former showed an increase in efficiency with the Moore system of 10 per cent., while the larger engine gained 22.8 per cent.

It was found that with a standard manifold, tube and muffler, using a 2.25-inch pipe instead of a two, and with a 7.5 by 20-inch muffler instead of a seven by 24, the six-cylinder Lexington-Howard motor attained its maximum at 1400 revolutions a minute when it was developing 44.3 horsepower. With the Moore system 50 horsepower was obtained at the same number of revolutions, but the curve climbed steadily from that point on, until the motor developed 52.2 at 1600 revolutions a minute. The dimensions of the tubes were 1.625 inches, those of the muffler, 5 by 21.

Fuel Economy Obtained.

The carburetion results are interesting. With the motor equipped with a single manifold, tube and muffler, it was found that an 1.25-inch carburetor, No. 6 needle, No. 21 air spring and a .5-inch venturi tube were necessary to obtain the best results. With the Moore system the same size of carburetor was utilized, but maximum efficiency was secured with a No. 8 needle, No. 17 air spring and a .625-inch venturi tube.

Tests were also conducted without mufflers. With the standard single exhaust manifold it was noted that the six-cylinder engine developed its maximum of 54 horsepower at 1600 revolutions a minute. With the Moore manifold exhaust the motor developed 58 horsepower at the same number of revolutions. During all of the tests the barometric readings were approximately the same, the same carburetor and ignition system were used and the water temperatures, in and out, were about equal in all cases. The tests of the six-cylinder motor lasted about a week.

Gain in Horsepower.

Tests with the four-cylinder Lexington-Howard motor showed similar increase over normal conditions. The engine equipped with a single manifold, tube and muffler showed its maximum efficiency at 1600 revolutions a minute and developed 31.3 horsepower. When the Moore multiple exhaust system was substituted, the motor developed 34.3 horsepower at 1500 revolutions a

minute, a gain of 3.2 at a slower motor speed. The motor was also run without mufflers and with the conventional manifold developed 33.8 horsepower at 1600 revolutions, as against 35.2 at 1600 when the Moore exhaust manifold was used. As in the tests with the six-cylinder engine, the barometer readings were approximately the same and similar ignition and carburetor were used. The temperature of the water, in and out, was about equal in all cases.

These tests are interesting to the mechanical expert and those technically familiar with carburetion, in that they show the possibility of obtaining greater efficiency from the motor. The tests also have a bearing upon the subject of back pressure. From a motorist's standpoint these tests indicate the possibility of fuel economy, in that more power is obtained.

ADDS NEW DEPARTMENT.

Pyrene Company Finds It Necessary to Devote Special Attention to Automobiles.

The announcement, which was made public a few months ago, that the leading fire insurance companies had granted a reduction of 15 per cent. in their rates wherever the automobile or motor truck was equipped with an approved fire extinguisher, has resulted in a most gratifying increase in the demand for the product of the Pyrene Company, New York City, for which the Pyrene Company of New England, 176 Federal street, Boston, Mass., is New England representative. It appears upon investigation that the Pyrene extinguisher is the only approved equipment which meets the needs of the automobile user.

In view of this situation the company has found it desirable to establish a special automobile department, which will act in the nature of a general information bureau and counsel on all matters pertaining to automobile fire insurance. Owners of both passenger cars and business wagons are cordially invited to make use of this service, which is furnished without charge. C. Louis Allen, for the past year New York manager of the Service Recorder Company, has been placed in charge as manager.

It is understood that the Hoosier Motor Club of Indianapolis will have a clubhouse in the country this summer. Some very attractive offers have been received by the club recently from organizations and individuals who have desirable quarters that could be used to advantage. It is thought one of these will be accepted.

NEW INSURANCE RATES NOW IN EFFECT.

Automobile Underwriters' Conference Adopts Fire and Theft Schedules for West and South and Makes Changes in Non-Valued Policies for Eastern States.

AT A meeting of the Automobile Underwriters' Conference in New York City, April 10, action was taken, as a result of which cars in the hands of dealers in the states of the West, Southwest and Southeast, may no longer be insured for fire and theft at pleasure car rates, even where the short rate cancellation is provided. The conference also adopted new schedules for the Western and Southeastern departments, the former affecting the states of Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Iowa, Kansas, Nebraska, North Dakota, South Dakota, Wyoming, Colorado and New Mexico, and the latter the states of Virginia North Carolina, South Carolina, Georgia, Florida, Alabama, Mis-

writers' Laboratories of the National Board of Underwriters is carried on the automobile. This provision actually went into effect last fall, following the action taken by the Automobile Insurance Company of Hartford, Conn., which is not a member of the Automobile Underwriters' Conference. Thus far the only one quart capacity pump type extinguisher that has been approved by the board mentioned above is the Pyrene, made by the Pyrene Manufacturing Company, New York City.

The new schedule follows:

WESTERN AUTOMOBILE SCHEDULE.

On gasoline power driven private pleasure motor cars and commercial vehicles, such as trucks, delivery wagons, based on manufacturers' original list prices:

AMOUNT FOR INSURANCE Including Equipment But Not Extra Bodies Subject to "Indemnities and Limits"	Original List Price of Automobile, when New (Not Second Hand), Excluding Cost of Additional Equipment and Extra Bodies												
	6500 and Up	5500 to 6499	4500 to 5499	3500 to 4499	3000 to 3499	2500 to 2999	2000 to 2499	1500 to 1999	1000 to 1499	1100 to 1299	900 to 1099	700 to 899	
	A	B	C	D	E	F	G	H	J	K	L	M	
6500 and up	1½												
5500 to 6499	1½	1½											
4750 to 5499	1½	1½	1½										
4000 to 4749	1½	1½	1½	1½									
3500 to 3999	2	1½	1½	1½	2								
3000 to 3499	2½	2	1½	1½	2	2							
2750 to 2999		2½	2	1½	2	2							
2500 to 2749			2½	2	2½	2	2						
2250 to 2499				2½	2½	2	2						
2000 to 2249					2½	2½	2	2					
1800 to 1999						2½	2½	2	2				
1600 to 1799							2½	2½	2				
1400 to 1599								2½	2½	2			
1200 to 1399									2½	2½	2½		
1000 to 1199										2½	2½	2½	
800 to 999											2½	2½	2½
700 to 799												2½	2½
600 to 699													2½
500 to 599													2½

All cars listed at less than \$700 take a rate of 2½%, irrespective of the amount insured, but the minimum premium for full term policy shall be \$12.50, or with theft and valued policy clauses eliminated, the minimum premium shall be \$10.00.

First Section of Rate Card Applying in New England, Middle Department and Metropolitan District.

Mississippi, Louisiana, Arkansas and Oklahoma. These went into effect April 20.

No action was taken by the conference with reference to changing the rates for New England and the Middle department, including the Metropolitan district, but it did revise rates for the non-valued form of policy. The schedule for the New England and Middle Atlantic States was adopted by this conference about a year ago, and is presented herewith, as well as the changes adopted at the recent meeting.

A noticeable feature of the new schedule is the provision for a reduction of 15 per cent. on the premium if a device approved by the Under-

Limits of amount of insurance include equipment, but not additional bodies. See additional equipment and additional bodies rules below.....

This and Next Year Models—Insure for not to exceed actual cost or less than 50% of original list price.....

Last Year Models—Class A, amount of insurance at option of company; Class B, not more than 70% of original list price; Class C, not more than 60% of original list price.....

Year Before Last Models—Class A, amount of insurance at option of company; Class B, not more than 50% of original list price; Class C, not more than 40% of original list price.....

Minimum premium.....

Three-Year-Old and Older Models—Class A, amount of insurance at option of company; Class B, not more than 30% of original list price; Class C, not more than 20% of original list price.....

Note—Exceptional cases may arise where car is well owned and is in very good physical condition where limits on "three-year-old and older models" are not sufficient. In such case refer to company, with full particulars, when slightly increased amounts may be allowed, but in no case to exceed 40 per cent. of original list price.

Reduction—A reduction of 50c from above rates will be allowed for attachment of "non-valued ex-theft and automatic reinstatement" endorsement by use of clause furnished you for that purpose.

Cars Listing Less Than \$700.

	Rate	Minimum premium
Fire and theft.....	3½%	\$12.50
This and next year—		
Fire only.....	1½%	7.50
Fire and theft.....	3½%	12.50
Last year and older—Fire only.....	3%	10.00

Electric Automobiles.

Rate for full form of fire and theft floater (all models) 1 1/4 %
 Rate for restricted form 1 %

Dealers' Automobiles.

Fire & theft Restricted floater

New gasoline automobiles—
 List price \$3500 or over 2 1/4 %
 List price \$1500 to \$3499 2 1/2 %
 List price less than \$1500 2 3/4 %
 Electric automobiles 2 %
 Steam automobiles 3 %

No risk accepted where boiler and burner are located in rear of dashboard. Second-hand cars, 1 per cent. additional rate must be charged. Pro rata cancellation allowed with a minimum charge of \$1.

SOUTHEASTERN AUTOMOBILE SCHEDULE.

Rates for the full form of policy, gasoline, pleasure and commercial type cars:

	Class		
	A.	B.	C.
Original list price of automobiles when new, excluding cost of additional equipment and extra bodies	\$3500 and over	\$1500 to \$3499	\$1499 and less

This and Next Year Models—Insure for not more than actual cost 2 1/2 % 2 1/2 % 2 1/2 %
 Last Year Models—Insure Class A for not more than 80%, Class B for not more than 60% and Class C for not more than 50% of list price 2 1/2 % 3 % 3 %
 Year Before Last Models—Insure Class A for not more than 70%, Class B for not more than 50% and Class C for not more than 40% of list price 3 % 3 1/4 % 3 1/2 %

Three-Year-Old Models—Insure Class A for not more than 60%, Class B for not more than 30% and Class C for not more than 20% of list price 3 1/4 % 4 % 5 %

Note—Second-hand cars, charge 1/2 per cent. in addition to above rates.

Electric Cars—Models of all years, 2 per cent.; second-hand cars, charge 1/2 per cent. in addition to above rate. Maximum insurable amounts at the option of underwriter.

Taxicabs, Livery and Renting Automobiles—All risks of this kind must be submitted to the home office. If approved, will be written at not less than 1 per cent. in addition to schedule rates, subject to the following indorsement:

"In consideration of \$..... additional premium, permission is hereby granted for the automobile herein insured to be used for carrying passengers for a compensation, provided it is under the personal supervision and guidance of the assured or a chauffeur in his employ while being so used".

Rates for the Restricted Form of Policy.

(The theft and reinstatement features excluded from the full policy by attaching the indorsement provided for that purpose.)

Electric Automobiles, Taxicabs, Livery and Renting Automobiles, Gasoline Pleasure and Commercial Automobiles—A reduction of 1/2 per cent. allowed from the rates for the full form of policy.

Minimum Premium.

For the full form of policy \$12.50
 For the restricted form of policy 10.00

Dealers' Automobiles.

Rates for full form of policy:

New gasoline cars—
 Listing for \$3500 and over 2 1/4 %
 Listing for \$1500 to \$3499 3 %
 Listing for \$1499 and less 3 1/4 %
 New electric automobiles, all models 2 %
 New steam automobiles, all models 3 1/2 %
 (Subject to 1 1/4 % reduction if boiler and burner are located in front of dashboard.)

For second-hand and rented cars charge 1 per cent. in addition to above rates. Pro rata cancellation allowed with a minimum charge of \$1 except on cars list-

ing for \$1499 and less the minimum charge is 50c. Amounts of insurance at option of underwriter.

Rates for the Restricted Form of Policy—A reduction of 1/2 per cent. is allowed from the above dealers' rate for the elimination from the full policy of the theft and reinstatement features. Minimum premiums same as above.

Fire Extinguishing Devices—A reduction of 15 per cent. of the premium is allowed if a device approved by the Underwriters' Laboratories of the National Board of Fire Underwriters is carried on the automobile and an indorsement provided for that purpose is attached to the policy. This reduction, however, is not allowed on additional premiums for the theft full coverage, collision sustained and property damage.

European Privilege—At an additional rate of 1 1/2 per cent. policies may be extended to cover a European trip under the form of indorsements provided for that purpose. If the risk of the transatlantic trip, going and returning, be eliminated, this privilege can be granted without extra charge.

SCHEDULE FOR EASTERN STATES.

The schedule for the eastern states is presented in detail in the accompanying charts, in explanation of which it may be stated that all

CLASS No. 2

AMOUNT FOR INSURANCE Including Equipment But Not Extra Bodies Subject to "Instructions and Limits"	Original List Price of Automobile, when New (Not Second Hand), Excluding Cost of Additional Equipment and Extra Bodies

2000 to 2249	4	3 1/2	3 1/2	3	2 1/2	2 1/2	2 1/2	2 1/2					
1750 to 1999	4	3 1/2	3 1/2	3 1/2	3 1/2	2 1/2	2 1/2	2 1/2	3 1/2				
1400 to 1749	4 1/2	4	3 1/2	3 1/2	3 1/2	3	2 1/2	2 1/2	3 1/2	3 1/2			
1200 to 1399			4 1/2	4	4	3 1/2	3	2 1/2	3 1/2	3 1/2	3 1/2		
1000 to 1199				4 1/2	4 1/2	3 1/2	3 1/2	3	3 1/2	3 1/2	3 1/2	3 1/2	
800 to 999					4 1/2	4	3 1/2	3 1/2	3 1/2	3 1/2	3 1/2	3 1/2	3 1/2
600 to 799						4 1/2	4 1/2	3 1/2	3 1/2	3 1/2	3 1/2	3 1/2	3 1/2
500 to 599							4 1/2	4 1/2	4 1/2	3 1/2	3 1/2	3 1/2	3 1/2
400 to 499								4 1/2	4 1/2	4 1/2	4 1/2	4 1/2	4 1/2

All cars listed at less than \$700 take a rate of 3 1/2 %, irrespective of the amount insured, but the minimum premium for full form of policy shall be \$12.50, or with theft and valued policy clauses eliminated, the minimum premium shall be \$10.00.

Second Section of Rate Card Which Is in Force in the Eastern States.

gasoline automobiles are divided for the purpose of rating into two general classes. Class No. 1 includes columns A, B, C and D, cars of last year, this year and next year models; E, F, G and H, cars of this year and next year, and J, K, L, M and cars listed at less than \$700, cars of this year and next year, in hands of original owners. Class No. 2 includes all automobiles not coming within the definition of class No. 1. The remainder of the schedule follows:

Instructions and Limits.

Amounts to be insured must not be more than actual value and be limited as follows: Columns A, B, C and D, cars of this year and next year models for not less than 50% of original list price. Columns E, F, G and H, cars of this year and next year models for not less than 50% of original list price; cars of last year models for not more than 80% of original list price; cars of year before last models for not more than 60% of original list price; no policy on cars of models earlier than the above shall

be issued for an amount in excess of 40% of original list price. Columns J, K, L and M, cars of this year and next year models for not less than 50% of original list price; cars of last year models for not more than 70% of the original list price; cars of year before last models for not more than 50% of original list price; no policy on cars of models earlier than the above shall be issued for an amount in excess of 40% of original price.

Additional Equipment.

In addition to the amounts fixed by these limits, additional equipment may be insured for not exceeding \$300 on cars in columns A to H inclusive, and \$200 on any other cars by means of the following form of indorsement:

"In consideration of an additional premium of \$....., the sum insured under this policy is increased by \$..... to cover the value of additional equipment not furnished with the car by the manufacturer at its list price; all other terms and conditions remaining unchanged".

Additional premium for this additional amount shall be charged for at the same rate as charged in the body of the policy. The rate on the policy to be computed without reference to this rider.

Electric Automobiles.

Rate for all models $1\frac{1}{2}\%$. A reduction of $\frac{1}{4}$ of 1% for the elimination of theft and valued policy clauses is permitted using the indorsement provided for that purpose. Amount of insurance at discretion of company.

Steam Automobiles.

Cars of this year and next year models, rate not less than 3%. Cars of last year models, rate not less than $3\frac{1}{4}\%$. A reduction of $\frac{1}{4}$ of 1% is permitted if boiler and burner are located in front of dashboard. A reduction of $\frac{1}{4}$ of 1% is permitted for the elimination of theft and valued policy clauses using the indorsement provided for that purpose. Amount of insurance at discretion of company.

Livery and Renting Automobiles.

All applications covering cars used for livery and for renting purposes must be submitted to this office. If approved they will be written subject to the following clause, not less than 1% additional being charged:

"In consideration of \$..... additional premium permission is hereby granted for the automobile herein insured to be used for carrying passengers for a compensation, provided it is under the personal supervision and guidance of the insured or a chauffeur in his employ while being so used".

Additional Bodies.

In determining the original list price of automobiles having more than one body, the sum of the cost of the chassis and the higher priced body shall be taken as the original list price and the amount of insurance for the purpose of arriving at the rate to be charged shall be the amount insured on the chassis and the higher priced body. No change to be made in the classification of the car during the policy period.

In the case of an automobile equipped with an extra body or bodies, a specific amount must be applied to the chassis and equipment and to each body, the same rate being charged on the extra body or bodies as is charged on the automobile. The following clause to be used:

"In consideration of an additional premium of \$....., on and after date this policy shall cover an additional amount of \$....., which shall apply only on extra body used in connection with the automobile insured hereunder, and the insurance on the chassis and original body shall be divided as follows: \$..... on chassis and equipment; \$..... on body".

All other terms and conditions of this policy remaining unchanged.

Dealers' Automobiles.

On new gasoline cars charge $2\frac{1}{4}\%$ in columns A to D; $2\frac{1}{2}\%$ in columns E to H, and $2\frac{3}{4}\%$ for all others. On new electric cars charge 2% for all models.

On new steam cars charge $3\frac{1}{4}\%$ for all models, except where boiler and burner are located in front of dashboard, where a rate of 3% shall apply.

On all second-hand cars 1% additional rate must be charged.

Pro rata cancellation allowed with a minimum charge of \$1, except that the minimum charge on new cars listed at less than \$1500 shall be 50c.

Amounts insured at option of underwriters.

Note—Automobiles in the hands of dealers may be

written under the ordinary form of policy at rates provided for private pleasure cars subject to cancellation on a short rate basis only, except pro rata cancellation may be allowed when a new policy is issued on the same car.

A reduction of $\frac{1}{4}$ of 1% will be allowed for the elimination of theft and valued policy clauses, but in all cases the minimum charge of \$1 and 50c shall apply as above indicated.

Commercial Automobiles.

Shall be written for amounts, and at the scheduled rates, as provided for private pleasure automobiles.

Second-Hand Cars.

Cars in hands of other than the original purchaser of the car when new shall in no case be insured for an amount in excess of the cost of the same to the insured.

REVISED NON-VALUED POLICY RATES.

The revised schedule of rates for non-valued form of policy, excluding theft and reinstatement clauses, applying to New England, the Middle Department and Metropolitan District, in effect April 20, is as follows:

Gasoline Pleasure Cars.

	Per Cent.
Cars of this and next year models—	
Insured for not less than 80% of list price.....	$1\frac{1}{2}$
Cars of last year models—	
Listing \$3500 and over.....	$1\frac{1}{4}$
Listing \$1500 to \$3499, insured for not exceeding 80% of list price.....	$1\frac{1}{4}$
Listing under \$1500, insured for not exceeding 70% of list price.....	2
Cars of year before last models—	
Listing \$3500 and over.....	2
Listing \$1500 to \$3499, insured for not exceeding 60% of list price.....	$2\frac{1}{4}$
Listing under \$1500, insured for not exceeding 50% of list price.....	$2\frac{1}{2}$
Cars of models three years old—	
Listing \$3500 and over.....	3
Listing \$1500 to \$3499, insured for not exceeding 40% of list price.....	3
Listing under \$1500, insured for not exceeding 40% of list price.....	$3\frac{1}{2}$
Four-year-old models and older—	
Minimum rate, insured for not exceeding 40% of list price	$4\frac{1}{2}$

Electric Cars.

All models $1\frac{1}{4}$

Commercial Trucks.

Of not less than one ton capacity—

This and next year models..... $1\frac{1}{4}$
 Cars rented, leased or used for carrying passengers for compensation—charge 1% in addition to above rates.
 Minimum premium, \$5.

At the April meeting of the Automobile Dealers' Association in New York City, the Marmon Company of New York was admitted to membership, this concern being represented on the board by Frank G. Carrie. The Studebaker Company's membership was changed to the Phelps Motor Car Corporation, represented by George Phelps, and the Carl H. Page Company to the Chalmers Motor Company of New York. George H. Stowe. S. S. Toback replaced A. M. Day, resigned, as representative for the A. Eliott Ranney Company, and George H. Smith replaced John Clark for the Peerless Motor Car Company of New York.

GENERAL NEWS OF THE INDUSTRY.

Crude Oil Prices and Their Effect upon the Cost of Gasoline and Motor Lubricants--- Well Known Concerns Planning to Materially Increase Their Capital.

WHAT effect, if any, the reduction in the market price of various grades of crude petroleum will have on the cost of gasoline and motor oils, is a subject which will interest automobile owners and users. Since the middle of the month there has been a decline of from five to 30 cents a barrel on practically all grades. Kansas and Oklahoma crudes made the first reductions, dropping from \$1.05 to 80 cents, in stages of five cents each. Later, these recovered five cents, and at this writing were selling at 85. Pennsylvania crude, which was selling at \$2.50 a barrel previous to April 17, dropped 10 cents that day, and has suffered two additional drops of 10 cents each since that time, now being quoted at \$2.20.

The reason for the reduction in Kansas and Oklahoma crudes is given as the increased production from newly located wells. One authority states that between 1000 and 1200 wells a month have been driven in those two states during the past year, previous to March 1. This rate is now beginning to fall off, and it is anticipated that it will be between 600 and 700 wells a month after May 1. However, a report from Gainesville, Tex., states that new oil fields have been discovered at Dexter, northeast of that city, and that citizens have formed a stock company and completed arrangements for sinking a large number of wells.

As is well known, the price of gasoline in 50-gallon lots or more has been reduced in the East from 17 to 15 cents a gallon. This was accomplished by two reductions of one cent each. In St. Louis there have been five reductions, bringing the price of the Indiana Standard Oil Company's product down to 13 cents. Competition is said to be very keen in that district and price changes were found to be necessary in order to hold the business.

TO INCREASE ITS CAPITAL.

Stockholders of Vacuum Oil Company to Consider Addition of \$10,000,000.

Stockholders of the Vacuum Oil Company, Rochester, N. Y., may have opportunity to subscribe for \$10,000,000 additional stock during the current year, officials of that concern having a

plan for increasing the capital from \$15,000,000 to \$25,000,000. It is stated that the new issue would greatly assist in the expansion of the business and bring the capital to a figure more nearly representing the net assets.

The capital was increased from \$2,500,000 to \$15,000,000 in February, 1912. The company owns oil plants in Rochester and Olean, N. Y., and Bayonne, N. J., and has spent large sums in extending its refining and marketing facilities in Russia, Austria-Hungary, Germany and Australia. The greater part of last year's earnings is said to have been turned back into the property, although two semi-annual dividends of \$3 were paid, and another of the same amount has been declared, payable in May. The balance sheet, as of Dec. 31, 1912 and 1913, shows the following:

Assets.		
	1913	1912
Real estate, machines.....	\$3,501,109	\$3,138,907
Manufacturing, merchandise, material and stock in process	7,008,885	4,967,604
Cash and debts receivable.....	12,544,054	12,469,420
Stocks in other companies.....	11,430,136	11,422,126
Total.....	\$34,484,184	\$31,998,057
Liabilities.		
Capital stock	\$15,000,000	\$15,000,000
Insurance reserve	100,840
Accounts payable, floating in- debtedness	2,232,295	2,322,781
Surplus	17,151,049	14,675,276
Total.....	\$34,484,184	\$31,998,057

KELLY-SPRINGFIELD TIRE PLAN.

Special Meeting of Stockholders to Consider New Preferred Issues.

A special meeting of the stockholders of the Kelly-Springfield Tire Company, New York City, has been called for May 4, at the offices of the company, 15 Exchange place, Jersey City, N. J., to consider the plan proposed by the directors for retiring the four per cent. income debenture bonds of the company, by issuing therefor, par value, of six per cent. cumulative preferred stock, on the basis of one share of said stock of the par value of \$100 for each \$100 face value of said income debenture bonds.

The plan further contemplates the funding of the 78.5 per cent. of dividends accumulated upon the present issue of six per cent. preferred stock, by the issuance of seven per cent. cumulative

preferred stock, each share of said seven per cent. cumulative preferred stock, if authorized, to be convertible into one share of common stock, at the option of the holder thereof, at any time within 10 years after July 1, 1914.

The plan involves increasing the authorized capital stock from \$5,149,500 to \$10,299,000, divided as follows: Common stock, \$5,029,900; six per cent. cumulative preferred, \$4,239,200; seven per cent. cumulative preferred \$1,029,900.

BECOMES ADVERTISING MANAGER.

Joseph M. Kraus Will Take Charge of Publicity Campaign for Partin-Palmer Cars.

C. C. Darnall, general manager of the Partin Manufacturing Company, Chicago, Ill., announces the

appointment of Joseph M. Kraus, formerly of New York City, as a d e r t i s i n g manager. He will take immediate charge of the extensive publicity c a m p a i g n which the company is arranging for Partin-Palmer cars for the 1915 season.

Joseph M. Kraus, Advertising Manager, Partin Manufacturing Company.

P a r t i n - P a l m e r cars were introduced about a year ago, and the success which has attended their initial appearance has been such as to warrant the company in making more extensive plans for the future. Mr. Kraus has had a very broad advertising experience, having sold space, written copy and made a thorough study of the proposition from all aspects.

NET PROFIT OF \$1,115,000.

Balance Sheet of Indiana Refining Company Shows Splendid Year's Business.

The annual report of the Indian Refining Company (of Maine), which concern handles

the sale of Havoline oil, and subsidiary companies, for the year ending Dec. 31, 1913, shows net earnings, after deducting all charges, of \$1,115,601. The company set aside a general reserve of \$610,465, equivalent to the year's first mortgage bonds sinking fund payments, against exhaustion of oil deposits and other contingencies. The balance sheet follows:

Assets.	
Properties, pipe lines, storage tanks, real estate, selling stations, investments, etc..	\$5,812,970
Inventories	830,369
Advances to salesmen and others.....	20,673
Accounts receivable	976,860
Bills receivable	13,943
Foreign accounts	78,660
Cash	675,332
Accounts in process of adjustment.....	450,000
Insurance fund assets.....	19,399

PAINESVILLE CITIZENS AROUSED.

Offer for Removal of Vulcan Car Plant Results in Holding Mass Meeting.

Citizens of Painesville, O., held a mass meeting April 15, for the purpose of discussing the possibility of securing additional local capital, in order that there shall be no question as to the permanent establishment of the plant of the Vulcan Manufacturing Company, maker of Vulcan passenger cars, in that city. It had previously come to the attention of the people that offers had been made from other cities, looking toward a removal of the factory.

The Vulcan Manufacturing Company entered the automobile field last year, and the presentation of its line has been followed by a large number of orders. The Vulcan cars were first placed in the market in January, since which time there has been an average of 200 employees on the pay roll. As is true of all growing concerns, additional capital is necessary in order that the company may keep abreast of its orders, and this is the point which is interesting Painesville men at present.

TO SELL HERRESHOFF PLANT.**Referee in Bankruptcy Grants Trustee's Petition for Sale on May 1.**

Acting on a petition from the Detroit Trust Company, trustee in bankruptcy, requesting permission to sell all the assets of the Herreshoff Motor Company, Detroit, Lee E. Joslyn, United States referee in bankruptcy, has issued an order making the date of sale 10 in the morning of May 1, confirmation to be made May 5. The trustee states that the Herreshoff company will be sold free of all incumbrances. The following schedule has been filed:

Liabilities.	
Taxes due	\$3,999.88
Wages	337.73
Secured claims	52,862.20
Unsecured claims	85,620.03
Total.....	\$142,819.84
Assets.	
Real estate	\$150,000.00
Cash on hand	959.92
Bills, promissory notes and securities.....	150.00
Stock in trade	81,297.81
Books, prints, pictures.....	39,128.42
Carriages and other vehicles.....	4,000.00
Machine tools, etc.....	16,155.78
Patents, copyrights and trade mark.....	2,500.00
Debts due on open accounts.....	27,611.81
Deposits of money in bank and elsewhere....	23.54
Total.....	\$321,827.28

It is stated that the Peninsular State Bank of Detroit holds a real estate mortgage of \$25,000. It is understood that the referee in bankruptcy is planning to dispose of the land and buildings on easy terms, and that the purchaser can do so on contract.

TO MANUFACTURE BENZOL.**United States Steel Corporation Makes Appropriation for This Purpose.**

The United States Steel Corporation, Pittsburgh, Penn., has made an appropriation of \$400,000 for a large extension to the by-product coking plant at Farrell, Penn., which is to be utilized for the production of benzol. This is believed to be the first attempt made by an American concern for the production of this substitute for gasoline as automobile fuel.

Benzol has been employed with success by a number of foreign automobile users, both as a distinctive fuel and in combination with various proportions of gasoline and kerosene. The Carnegie Steel Company has been experimenting for some time at the Farrell plant, and it is reported that it has been found that about two per cent.

of the coal tar can be converted into benzol. Work will be started on the new buildings in the near future.

FORM \$3,000,000 COMPANY.**New York Men Organize Concern to Exploit Entz Electric Transmission.**

A certificate of incorporation has been filed by the Entz Motor Car Corporation at Albany, N. Y., the capital stock being \$3,000,000. The incorporators named are W. B. Harding, Adolph Widder and A. C. Johnson, but it is understood that among the other men who are identified with the venture are R. M. Owen, R. R. Owen, Roy Rainey and Robert H. Montgomery. It also is stated that Carl H. Page, formerly at the head of the Carl H. Page Company, New York City, also is interested.

The new concern will undertake the active exploitation of the Entz electric transmission, which is said to have been invented by Justus B. Entz some eight years ago, although formal announcement of the production was not made until a few months ago. For some time R. M. Owen and his brother, R. R. Owen, are said to have been engaged in experimentation with the transmission in a laboratory at 136 West 52nd street, New York City.

The transmission was developed by Mr. Entz while employed by the Electric Vehicle Company at Hartford, Conn., later the Columbia Motor Car Company. It is stated that a few cars were equipped with the device at that time, and that, upon the failure of the original company, the patents passed into the hands of R. M. Owen, who was until recently head of R. M. Owen & Co., general distributor for Reo cars.

MAY LOCATE IN LYONS.**Representative of Wahl Automobile Company Confers with Local Business Men.**

A dispatch from Lyons, N. Y., states that a representative of the Wahl Automobile Company, Detroit, who also is interested in the Hazard Motor Company, Rochester, N. Y., recently held a conference with the Lyons Business Men's Association, looking toward the possible location of the Wahl plant in that city. The report also states that the plan involves a consolidation of the Hazard and Wahl companies.

The proposition is understood to depend upon the inclination of Lyons citizens to subscribe for

\$20,000 worth of stock. The high cost of real estate in Rochester is given as the reason for the change on the part of the Hazard company, and the present labor situation in Detroit is held to have influenced the Wahl company in its desire to locate in a smaller city.

HANDLES CANADIAN SALES.

Hoover Holton of Empire Sales Force Receives Well Merited Promotion.

Announcement is made by the Empire Automobile Company, Indianapolis, Ind., that Hoover Holton, for a long time prominent in the sales work of that company, has been appointed Canadian sales manager. He will devote his entire energy to the further development of Empire

sales and distribution in Canada, operating from the offices of the Empire Automobile Sales Company, with headquarters at London, Ont.

Mr. Holton is well known throughout the industry and trade. He joined the Empire company as sales manager when the concern was organized in 1911. Later he

Hoover Holton, Canadian Sales Manager, Empire Automobile Company.

resigned to become connected with another Indiana company, but shortly thereafter returned to the Empire, engaging in sales development work in the South and East. In this field he was particularly successful in opening new territory, and his most recent appointment comes in the nature of a well earned promotion.

TO OPEN BOTH PLANTS.

Nyberg and DeTamble Factories in Anderson, Ind., Soon to Resume Production.

According to information from Anderson, Ind., it is expected that both the Nyberg and

DeTamble plants in that city, which have been inactive for some time, will be reopened for the production of motor vehicles in the near future. It is understood that the manufacture of trucks will be undertaken at the Nyberg plant and passenger cars in the DeTamble factory.

A short time ago it was announced that a Chicago man had purchased the assets of the Nyberg Automobile Works and that this factory would be operated in conjunction with the plant of the old Streator Motor Car Company in Streator, Ill. It is not stated, in the information from Anderson, whether or not the latest developments are in connection with that plan.

WILL PRODUCE TRUCKS.

James J. Dauch Organizes Company to Take Over Assets of Sandusky Concern.

With an authorized capital of \$1,000,000, the Dauch Manufacturing Company has been incorporated in Sandusky, O., by James J. Dauch and his associates. It is stated that this company will take over the assets of the Sandusky Auto Parts & Motor Truck Company, which were purchased recently by Mr. Dauch.

It is understood that the plans of the new concern include the production of motor trucks, but whether these will follow the details of designs and construction of the Sandusky product is not stated. The factory will be placed under the management of George A. Schwerer, formerly connected with the Ohio Motor Company.

WOULD FORM NEW COMPANY.

Charles I. Kirkham Says Demand for Small Motors Is Growing Very Rapidly.

Charles I. Kirkham, who founded the Kirkham Motor Works at Bath, N. Y., has placed a proposition before the Business Men's Association in Corning, N. Y., looking toward the organization of a new company for the manufacture of small four-cylinder motors. He declares the demand for this type of engine has increased very materially of late, and he expects it will grow very rapidly because of the popular interest in the light automobile.

Mr. Kirkham's plan calls for a capital of \$100,000, \$40,000 preferred and \$60,000 common. He desires, as his share, \$35,000 of the common stock, and states that he has a tentative contract for 3000 four-cylinder motors for one concern. The Corning business men will give the matter further consideration.

DE PALMA TO DRIVE ABROAD.**Vanderbilt Cup Winner Will Pilot Vauxhall in French Grand Prix.**

Ralph De Palma, the well known racing driver, who won the Vanderbilt Cup race at Santa Monica, Cal., Feb. 21, announces that he will drive a Vauxhall car in the French Grand Prix, which will be run July 4. He is to participate in other important road races on the Continent this year, and previous to the Grand Prix, will take part in a meet at the Brooklands track, Weybridge, England.

MILLER TIRE RECORD.**Maker Calls Attention to the Fact That These Still Hold World's Road Mark.**

In view of the near approach of the 1914 international sweepstake race for 500 miles on the Indianapolis speedway, it is of interest to learn that no less than eight drivers in that event are now negotiating for the use of Miller tires, made by the Miller Rubber Company, Akron, O. And at the same time the maker calls attention to the fact that these tires still hold the world's road racing record at a speed of 78.5 miles an hour, a mark set by Teddy Tetzlaff in a Fiat car at Santa Monica, Cal., two years ago, in May, 1912.

Because of the important part played by tires in the recent Vanderbilt Cup and Grand Prize races over the Santa Monica course, it is anticipated that there will be lively competition among the various tire makers for representation in the forthcoming event on the Indianapolis speedway.

SAFETY FIRST SOCIETY.**New Organization in the Metropolis Seeks to Protect from Danger.**

The Safety First Society of Greater New York is a new organization which has for its object the lessening of the number of accidents on the streets and railways of that city. The secretary is Frederick H. Elliott, well known throughout the industry through his connection with motoring bodies of both local and national importance.

Committees have been appointed to take charge of various phases of the work, which include the interesting of school children in the movement of "Safety First". Cards will be distributed in the schools, each of which will be organized into districts, and children will be taught carefulness in crossing the streets. Older boys will guide younger children at crossings, etc. Illuminated globes at subway entrances will serve to call attention to the movement at night.

TO A MIRROR FINISH.**Studebaker Fenders Must Reflect Face of Workman in Order to Pass Test.**

Without being in the least vain over his personal appearance, there is a veteran foreman in the works of the Studebaker Corporation, Detroit, who admits to looking at the reflection of his own face several hundred times a day. His name is Thomas Humphreys, and he is the man

Plan View of Seven-Passenger Studebaker Six-Cylinder Chassis.

who is held responsible for the mirror finish of the black enamel on the fenders, hoods and other pressed steel parts of Studebaker cars.

The parts come completed and polished from another section of the plant, where they have been pressed to shape from the cold sheet steel. Humphreys and his men give them the luster. The enamelling is accomplished by three baths, each of which is followed by a baking process, so that the enamel virtually becomes a part of the surface. The work is held to have been completed, only when Humphreys can tell, by looking at the surface of a fender, whether or not he needs a shave.

An accompanying illustration shows a plan view of a seven-passenger Studebaker six-cylinder machine, and, aside from the mirror finish, it presents the seating arrangement. The two auxiliary seats, when not in use, fold out of the way against the back of the front seat.

DETAILS OF THE LEXINGTON MODEL H.

THE Lexington-Howard Company, Connersville, Ind., is producing two chassis, a four and a six, these being designated as the Lexington H and series D Howard. The Lexington four, the mechanical details of which are presented herein, is fitted with a two-passenger roadster and a five-passenger touring body. There are many refinements as well as conveniences noticeable in the new design and the equipment leaves nothing to be desired.

The cylinders, which are cast en bloc, with cored inlet passages, have a bore of four inches and stroke of five, and the S. A. E. rating of 25.6 horsepower is stated to be very conservative. The valves are interchangeable, located on the right, of ample diameter, and all operating

One of the features of the motor is the use of the Moore multiple exhaust system, which provides practically a separate passage for the first and second cylinders, also the last two. The Atwater Kent ignition system with automatic advance is utilized and in addition a limited amount of advance and retard, controlled by a small lever situated on the top of the steering wheel, is provided. This feature is designed to supplement the automatic, but not to interfere with its action, as it permits the driver to throttle the motor down to very low speeds when idling. The control lever also makes possible starting the automatic advance from any position selected on the wheel.

The clutch is a multiple disc of the dry plate type and is held to have easy engaging qualities. The gear-set is of the selective design, providing three forward speeds and a reverse. The gears are of nickel steel, carried on ample sized shafts mounted on large annular ball bearings. The gear case is flanged and bolted direct to the flywheel housing. The gear shifting lever is mounted on the top of the gearset case and the cover is not only large, but is easily removed.

Shaft drive is employed, two universal joints being utilized, and these are thoroughly enclosed and packed in grease. Each joint is fitted with a companion flange, allowing easy re-

Lexington Model H Roadster, an Attractive Design with a Complete Equipment, Including Electric Lighting and Motor Starting.

mechanism is enclosed. The crankshaft is of the three-bearing type, of 40-point carbon steel. The connecting rods are of the I beam section type with die cast bearings at the large end, and are clamped to the wristpin. The pistons are of close grain gray iron, accurately machined and ground to size, and the four eccentric rings are ground on three sides.

Lubrication is by the constant level splash system, a plunger pump operated by an eccentric on the camshaft maintaining the proper level, and a conveniently located gauge indicates the supply at all times. The camshaft and pump shaft are actuated by helical gears operating in a bath of lubricant. Cooling is by a large centrifugal pump, assisted by an adjustable fan, and the radiator is a large honeycomb design. Carburetion is by a late model Schebler.

removal of the shaft without disturbing other parts. The shaft material is nickel steel.

The rear axle is of the full floating type with drive shafts of 3.5 per cent. nickel steel with flanges bolted to the wheel hubs. Annular ball bearings are employed. Two sets of internal enclosed brakes are provided, the service being actuated by pedal and the emergency by the conventional lever. Both are ample in width and diameter. The torque rod is triangular in shape, constructed of seamless steel tubing electrically welded to drop forgings at either end. It is swivelled to the rear axle and carried in heavy cushion springs, these being mounted in a carrier swivelled to a bracket on a cross member of the frame.

Semi-elliptic springs are employed in front and three-quarter elliptic at the rear. Both sets

are long and very flexible and the rear members are underslung, providing a low centre of gravity. All spring eyes are bushed with bronze, fit-

is suspended on the main frame under the front toeboard, an accessible position.

Both the five-passenger touring and two-passenger roadster bodies are attractive designs. The lines are graceful, and among the features is the use of large doors, permitting easy entrance and exit. All hinges are concealed and the cap moldings match the highly finished dash and instrument board. Nothing but the very best curled hair and genuine hand buffed long grain leather are used in the upholstery, which is very deep. The finish is in keeping with the design. The equipment is most complete and includes a mo-

Chassis of Lexington Model H, a Well Designed Construction Having Unit Power Plant, Underslung Rear Springs and to Which Are Fitted Two Types of Bodies.

ted with hardened and ground bolts, and have integral grease cups.

The front axle is a solid drop forging of the I beam section type, has large spindles fitted with large annular ball bearings, and the tierod is placed in front of the axle. The frame is of pressed steel, very deep, and has extra wide flanges. It is narrowed at the front to provide a short turning radius and has the usual pickup at the rear. The wheelbase is 114 inches. The driver is placed at the left.

The tire holders are attached to arms constructed of a part of the frame. Provision is made for carrying one or two shoes without the use of straps, the casings being clamped into position much in the same manner as the rim is supported on the wheel, the tire tool being employed for this work. This method not only makes for a rigid mounting, but eliminates possibility of chafing. Demountable rims are standard equipment.

The electric lighting and motor starting system is a unit, a motor-generator which is driven by means of an enclosed silent chain. The energy of the motor starter is applied to the crankshaft of the engine by pressing a button conveniently located and, upon the engine starting, releasing the button automatically opens the circuit, causing the unit to operate as a generator charging the battery. The output of the dynamo is automatically regulated and is held to be ample for all requirements. The battery

hair top, ventilating type of windshield, tools, etc.

TAKES OVER STEARNS BRANCH.

Ruess and Dingley Will Handle This Line in Los Angeles District.

Another well known motor car manufacturer that has followed the example set by the makers of the Peerless and KisselKar in abandoning factory branches, is the F. B. Stearns Company, Cleveland, O. A deal has been consummated by William P. Ruess, who takes over the branch at Los Angeles, Cal. He assumes complete control of Stearns sales in Los Angeles and surrounding territory.

Bert Dingley, a well known racing driver, who has driven Pope-Hartford cars in many important road races and long distance events, is associated with Mr. Ruess, who also has competed in motoring contests on the Pacific Coast.

Showing Right and Left Sides of Lexington Four-Cylinder Motor, a Compact Design.

NEW ACCESSORIES FOR THE MOTORIST.

LEE PUNCTURE PROOF TIRE.

Construction Includes Hardened Steel Discs Which Overlap.

The Lee Tire & Rubber Company, Conshohocken, Penn., is manufacturing the Lee puncture proof tire, so

called because it is stated to be impervious to nails, etc., which ordinarily penetrate the tread and fabric of conventional types of shoes. An accompanying illustration shows the construction of the Lee puncture proof tire and it will be noted that a large number of metal discs are imbedded under the tread within the tire.

The discs are of hardened laminated steel, and while they overlap, they do not touch. It is stated that they reinforce the tire body, and at the same time protect it and the inner tube from articles that would puncture, also from the effects of water or moisture. It is added that the resiliency of the shoe is not affected and that it will not heat. A cash refund is included in the selling agreement. The Goodby-Rankin Company, Providence, R. I., is Rhode Island distributor.

JOHNSON SHOCK ABSORBER.

Principle Involves Use of Two Concentric Coiled Springs.

The Johnson shock absorber is manufactured by the Triple Action Spring Company, 55 East 28th street, Chicago, and is made in four different sizes, the smallest being suitable for Ford machines and the largest for five-ton commercial vehicles.

The principle involves the use of two concentric coiled springs, one being utilized to compensate for the lighter shocks and the other to care for the heavier ones. The main spring is ample in diameter, and being of heavy stock has ample capacity for absorbing considerable shocks. The maker calls attention to his design, stating that it has an advantage over other types in this respect.

The main spring is a double coil, with the upper ends bent into the form of loops, providing a simple construction and one making for easy attachment of the shock absorber to the upper spring shackle bolt of the machine. A central adjusting bolt provides for an adjustment of 1000 pounds.

A weather proof casing is fitted over the springs and it serves as a spacer, as well as contributes to the neatness of the design.

NO-SHAMMY FUNNEL.

Permits Fuel to Flow as Freely as with an Ordinary Funnel.

The No-Shammy funnel is manufactured by the No-Shammy Products Company, Cleveland, O., and is marketed by Chas. E. Miller, 97-103 Reade street, New York City. One of the qualities of the design is that the gasoline will flow as readily as through an ordinary funnel not equipped with a screen or filtering means. With the No-Shammy the fuel passes through quickly, while all water and foreign elements are trapped.

The principle of operation is the

difference between the specific gravity of gasoline and water. When the fuel is poured into the funnel, any water and heavy sediment in it immediately settles to the bottom of the funnel, while the gasoline floats off through a gauze member. The particles of dirt held in suspension are prevented by the gauze from passing over.

It is pointed out that water can rise to the top of the funnel, as the film of gasoline over the gauze prevents it passing through. This is secured by scientific determination of the angles of the walls, position and mesh of the gauze, etc. The No-Shammy funnel is not only inexpensive, but is sturdily constructed and guaranteed. It is made in three sizes, for garage, owner and for motorcycle.

Particular attention is called to the Classified Buyers' Guide, found elsewhere in this issue. Listed therein will be noted names and addresses of concerns manufacturing tools, supplies and material useful in the overhaul of the motor car, as well as its equipment. In writing always mention The Automobile Journal.

READYHOT TORCH.

Utilizes Gas or Acetylene and Is Adapted for Brazing.

The Nemo Chemical & Specialty Manufacturing Company, 510 Rector building, Chicago, is marketing a

very practical and useful article both for the public and private garage. It is termed the Readyhot brazing and soldering torch, and one of the qualities of the design is that it can be employed for brazing and soldering.

The supply of fuel for obtaining the desired temperature may be secured from the regular gas supply or from a Prest-O-Lite tank, suitable connections being provided. The Readyhot torch is always ready for service, and it is stated that there is no delay in obtaining the necessary heat, and that a steady temperature is maintained. It can, however, be adjusted for any desired heat. The alternating inspirator is so graduated that practically any metal can be heated to a melting point in a short time. Owing to the unique construction the torch can be utilized in places not accessible with ordinary soldering equipments.

BAER ALARM SIGNAL.

Shows Plate Bearing Words "Look Out" and Is Operated by Button.

The Baer alarm signal is marketed by the Baer Manufacturing Company, Philadelphia, and is an ingenious warning device which differs from those of conventional design. It is operated by the current of a storage battery or similar source of supply, and when the circuit is closed a plate bearing the words "Look Out", rises from its normal position in a case. The movement of the signal is accompanied by a loud "click".

With the Baer design provision is made to indicate the proper working of the signal, a miniature tell-tale located next to the press button showing when the device operates properly. The button fitting is constructed for convenient attachment on the steering wheel.

FARNSWORTH GENERATOR.

Makes Possible Use of Heavy Fuels and Distillates.

The Farnsworth gas generator, marketed by the Distillate Motor Equipment Company, San Francisco,

Cal., makes possible, it is claimed, the operation of a motor car with kerosene, distillate and other low grade fuels. The exhaust gas is utilized for raising the temperature of the fuel, and the generator shown in the accompanying illustration is attached to the carburetor in such manner that the exhaust taken from the exhaust manifold is passed around the chamber of the device. The generator itself is cylindrical in form.

It is stated that tests made with the device resulted in a great saving of gasoline, and that considerably more energy was developed by the motor. Similarly, it is claimed that the mileage a gallon was increased, it being 12.6 miles without the generator and 15.3 with the apparatus installed on a standard make of pleasure car.

PERFECTION STARTER.

Mechanical Design for Model T Ford Cars Operated by Pedal.

The Perfection Auto Starter Company, 1561 Broadway, Denver, Col., is marketing a mechanical starter for the model T Ford car termed the Perfection. The maker states that any mechanic can attach it to the machine in one hour or less and that complete instructions are given if owners desire to install the device.

The starter is actuated by the pressure of the foot, much in the same manner as depressing the conventional clutch pedal. This lever or pedal member is located at the left of the regular clutch member and is connected by suitable linkage to a pulley member located just below the left hand lower corner of the radiator.

From the pulley leads a chain which actuates the starter ratchet. The last named member is fitted to the extension of the crankshaft and it does not interfere with cranking

of the motor in the usual manner, as provision is made for an emergency brake handle which is included in the equipment. In the illustration the casing protecting the mechanism from foreign elements is shown displaced. Included with each Perfection starter is a device for making possible priming the carburetor from the seat. One of the qualities of the starter emphasized is that it may be fitted without displacing the radiator.

KNOFF RECORDER.

Registers Mileage Distance, Stops, Etc., on Removable Tape.

The Knopf Bros. Manufacturing Company, Inc., 2071 Seventh avenue, New York City, has brought out a new type of mileage recording instrument, the operating mechanism of which is contained within a case which is attached to the wheel by several screws entering the spokes or hub flanges. The screw heads, however, are inside the case, which is provided with a lock.

The mechanism is suspended inside by ball bearings with a weight to maintain it in its proper position.

The odometer is operated by a cam located inside the case, which strikes a roller once during each revolution of the road wheel, actuating an arm which moves a ratchet wheel one notch. The odometer registers to 10,000 miles and repeats, but it cannot be set back without completely disassembling.

A cylinder in the upper end of the odometer rotates once for each mile travelled by the car, causing an arm to oscillate with a slow, continuous motion, once for each mile. The arm carries at its upper end a stylus, which produces a record on a tape as it is drawn out from a little round box at the top of the instrument.

At the right of the weight is a clock which will run for 36 hours on one winding. It is geared to a large drum surrounding the central wall of the instrument, upon which the tape is wound at such speed that the stylus comes opposite the hour marks at the proper time. The tape is sensitized so that the pressure of the metallic stylus traces a line upon it, and it is graduated into three-minute periods, two inches being allowed for each hour. The recorder registers starting, stopping and operation of the vehicle, as well as the rate of speed, and they are outlined on tape.

S. & M. GAS LIGHTER.

Controls and Lights Acetylene Headlights from the Seat.

The S. & M. gas lighter appliance is marketed by the S. & M. Manufacturing Company, Salem, O., and is an

electrical device which enables the operator of a car to control his gas lights from the seat. The gas is turned on at the dash, a diaphragm regulator preventing it from being turned on too high by controlling the pressure from the tank. This insures the proper sized flame at all times.

Ignition of the gas is effected by an electrical circuit which starts at the rear spark plug and runs to one terminal of the controlling valve switch. From the other terminal a wire is led to the right hand burner, which is wired across to the other headlight and grounded. Special burners are necessary with the system and are included with each equipment. The outfit is moderately priced.

MORGAN PRIMING CUP.

May Be Utilized When Motor Is Hot and Has Novel Valve.

The Morgan Manufacturing Company, Newport, R. I., is marketing a practical form of priming cup which presents several interesting features, among which is that it may be operated when the motor is hot without burning the hands. As will be noted by the accompanying illustration, the head or operating member is composed of a non-conducting heat material.

The base is made of steel, threaded at its lower end as usual to fit the cylinder, while the upper is tapped out to receive the cup portion. The base is provided with a bevel shaped seat into which fits a ball shaped valve which is free to revolve. By inserting the cup portion into the base the ball shaped gas tight valve finds its own centre. The ball valve is fitted with a slot so that it can be ground with a screw driver when necessary. Priming opening is large.

CLEANING AND REPAIRING RADIATORS.

THE cooling system of a car, especially that of a machine that has seen considerable service, will require attention, and this applies particularly to radiators in which an anti-freezing solution has been employed.

Inspect Tubing for Loose Fabric.

Continued use of these solutions during the cold weather to prevent freezing of the cooling fluid, leaves deposits in the radiator, water jackets and piping which are likely to impair the efficiency of the system in mild or warm weather.

Some motorists content themselves with running off the solution, refilling with clean water and running the motor for a few minutes, then draining off the fluid and again filling the radiator. If an alcohol solution has been utilized during the cold weather, and the motor operated long enough with the mixture replaced by water, it may be possible to displace all deposits by this method, but the water should be changed until it is free from discolorations.

The better method, and an inexpensive one, is to prepare a solution of common washing soda and water, dissolving as much of the soda as possible. It is better to employ fairly hot water and before pouring the mixture into the radiator, run the motor until the anti-freezing mixture is warm, then open all petcocks. The motor should be operated with the soda solution, the period of running depending upon the age of the car. If it be an old model it is advisable to drive the car for some distance with the soda solution before removing it.

After draining off the mixture, refill with warm water if possible, as using cold water in an old radiator when hot causes a sudden contraction of the metal and may result in injury. The water should be changed until it shows no discoloration. The radiator makers advise using rain or distilled water, as the average water is too hard, containing elements that manifest themselves by a brick like deposit. If rain water cannot be obtained it is a good practise to

change the water in the cooling system at least once a week. This is particularly applicable to cars which have a tendency to overheat on warm days.

If the machine is to be overhauled and the work includes the power plant, it is best to clean out the circulating system before removing the radiator. It will also afford an opportunity to note if any leaks exist in the cooler. If any be discovered it should be sent to an expert on radiators for repairs. The writer is of the opinion that the ordinary tinsmith is not capable of repairing certain types of radiators, and that one cannot be too careful in selecting the person making the repair. It is not advisable for the owner to undertake the work, as soldering radiators is an entirely different proposition from ordinary work.

There are several radiator cements marketed which are not only inexpensive and easily used, but efficient. The writer can vouch for these, having used them on several different makes of radiators with success. Among these is *Se-ment-ol*, manufactured by the Northwestern Chemical Company, Marietta, O., and it can be found at any supply house.

While directions accompany each can of *Se-ment-ol*, a description of its use will be of value to those who contemplate using it for the first time. If an anti-freezing solution has been used, it should be removed, and the radiator flushed out with water. Refill with clean water, start and operate the engine until the water is warm. With the motor running, pour *Se-ment-ol*, a little at a time, into the radiator until entirely dissolved. Ordinarily, operating the motor about

Outlet and Inlet Water Manifolds and Connections May Need New Gaskets.

15 minutes will suffice, but if the cooler leaks badly it may require a longer period.

It will be noted that the fluid emerging from the openings is red and that at first it will run freely, but in a short time it will gradually lessen, finally ceasing. This is due to the chemical action taking place when exposed to the air, layers of cement hardening around the leak until it finally closes. One of the qualities of Se-ment-ol is that it is a cleansing compound, and the company states that it will displace corrosions, deposits, etc. It should not be left in the radiator, but removed after the leaks are cemented, and the cooler should be refilled with clean water.

Another radiator cement is Rad-Fix, manufactured by the Radiator Fix Company, 121 Massachusetts avenue, Boston. This is a filtered solution which is stated will pass through the screen of the filler cap and, mingling with the water, form a preparation that cements any

Indicating Components of the Cooling System That Should Be Inspected.

leaks. It is held to be very efficient in cleansing the cooling system, in that it will cut rust, etc. The repair made by Rad-Fix is stated to be permanent and the preparation is guaranteed to be harmless.

The International Metal Polish Company, Indianapolis, Ind., markets a radiator compound known as the Blue Ribbon radiator cement, which is guaranteed to repair an ordinary leak in a few minutes. It is placed in the water and circulated throughout the system, stopping leaks through the composition hardening when exposed to the air.

All rubber piping employed in the cooling system will require careful inspection, especially if glycerine was used in the anti-freezing mixture. Glycerine attacks rubber and it may be found necessary to replace the connections between the radiator and intake and outlet mani-

folds. These pipes should be inspected on old machines, for after considerable service the plies of fabric and rubber separate, restricting the passage of water. Frequently overheating is due to this cause.

In replacing faulty connections with new it is better to use a clamp than wire, and there are several practical types marketed.

If the motor is dismantled, new water gaskets will be necessary, unless one is very careful in displacing the old members. The latter should be put to one side, as they will be useful as patterns for the new gaskets. The thickness of the old members will serve as a sample and if it is factory material it is best to employ the same grade. Accompanying illustrations show the various components of the motor with which gaskets are necessary to prevent leakage of the cooling fluid, the parts being indicated by arrows. In replacing bolts and nuts retaining these components they should be first cleaned and the threads coated with a mixture of graphite and oil. This will prevent rust and sticking of the parts.

The stuffing boxes of the water pump may require attention and these should be packed according to the directions of the maker. Some recommend the use of candle wicking saturated with grease in which is mixed powdered graphite, and in packing the box do not set up the adjusting nut too tightly, else wear of the pump shaft will result. It is best to make a second adjustment than to cut the shaft.

Before replacing the fan belt it is a good plan to test the bearings of the fan and of the pulleys. The majority of the fans are provided with ball bearings, the adjustment of which is an easy matter. All grease cups or lubrication members ought to be cleaned, after which new lubricant should be used.

Adjust Fan Belt and Examine the Pulleys.

The Water Pump Stuffing Boxes May Require Packing.

BALANCING INTERNAL COMBUSTION ENGINES.

Second Installment of F. W. Lanchester's Paper Deals with Elimination of Torque Reaction and with the Balancing of Four-Cylinder Motors.

IN THE first installment of F. W. Lanchester's paper on Engine Balancing, read before the Institution of Mechanical Engineers, London,

England, the defects of balance to which a single-cylinder engine may be subjected, and torque vibrations, were discussed. The second installment presented herein deals with the elimination of torque reaction and with the balancing of four-cylinder engines.

Balancing Illustrated by Model.

It has already been pointed out that one of the advantages of the multi-cylinder engine is the reduction of the irregularity of the recoil torque; the greater the number of cylinders, the more nearly the driving effort is constant, and counterpart to that, the more nearly the recoil torque is constant, but in order to obtain the best results from the multiplicity of cylinders, it is self-evident that the distribution of the impulses should be made as nearly uniform as possible. This point has been touched on in considering the two-cylinder engine.

The author some 10 or 12 years ago devised a simple means of illustrating in four-stroke cycle engines the relations between impulse frequency, the fundamental piston frequency, and the octave piston frequency, in order to illustrate in a diagrammatic manner the virtues and failings, from the point of view of vibration, of engines of different cylinder number and type. This device is represented in Figs. 4 to 6. Three drums are provided, of which the diameters are in the relation of the respective frequencies in question, namely, in the ratio of 1 to 2 and 4, and strings threaded with a number of beads to correspond with the number of cylinders are provided. The drums will be referred to as the cycle drum, the main drum and the octave drum. Taking, firstly, as an illustration, Fig. 4 A, a string threaded with four beads representing a four-cylinder engine, in order that the impulses should be equally spaced, the beads are arranged at equal distances, that is to say, quadrants on the periphery of the cycle drum. If, now, the string is passed round the main drum, it will take two turns and the beads will be found two on one side and two on the other, diametrically opposite; this demonstrates that the main vibration is balanced by two cylinders being always opposed to the other two. Now let the string be passed round the octave drum; it will be found that in the four turns the beads all come on one side of the drum, thus denoting what we already know quite well, that in the four-cylinder engine the secondary or octave vibration is totally unbalanced, the four cylinders acting synchronously. Let us now take the case of the six-cylinder engine. On spacing this equally on the cycle drum at the corners of an imaginary hexagon, we find that on the main drum the beads take their place in pairs on the corners of an imaginary

equilateral triangle, and on the octave drum the beads are again found to be in pairs at the corners of an equilateral triangle, showing that the six-cylinder engine is balanced for both fundamental and octave vibration. Let us now try a smaller number of cylinders. We will take the two-cylinder engine in which the impulses are equally divided, and we now find that when the string is placed on the main drum two beads come together, and similarly on the octave drum, showing that both fundamental and octave piston vibrations are unbalanced. If we now so distribute the beads that the fundamental vibration is balanced, by arranging these opposite on the main drum, on passing the string round the cycle drum we see that the two beads are 90° apart, and that the impulses are not properly spaced; on testing the string on the octave drum we find again that want of balance exists. If we take the special two-cylinder engine with opposed cylinders, we require to remember that as the cylinders are opposite the reciprocation balance will be in order when the beads come together, and not when they are on opposite sides; to remind us of this the author has arranged a black and white bead on the string representing this type of engine. Here, arranging the impulses as equally spaced, that is, separated at equal distances on the cycle drum, we find, on placing these on the main drum, the black and white beads come together, and similarly on the octave drum the black and white beads come together, showing the engine to be balanced in both cases.

It is quite true that the present method does not tell us anything we did not previously know, or at least that we could not ascertain in other ways, but it appears to the author none the worse on that account. It is, in effect, a pictorial analogue, and as such is of service.

Recall Balancing—Reverse Rotation.

The fundamental character of rotational recoil has already been demonstrated, and also the fact that no combination of pistons and connecting rods, however elaborate, can affect the recoil kick of a given engine. In the ordinary multi-cylinder engine it has been shown that the trouble is mitigated by substituting a number of distributed torque applications of small magnitude for the intermittent and heavier torque of the equivalent single-cylinder engine. There is a method, however, by which the torque recoil may be eliminated. The author believes the method in question to have been first described in his patent application in 1895; it consists in the employment of two flywheels having opposite rotation. Where two flywheels of equal moment of inertia are arranged or geared together to rotate in opposite directions, the storage of energy does not involve a change of angular momentum of the system; thus if, for example, starting from rest, two equal flywheels be given equal velocities of rotation, the one clockwise and the other counter-clockwise, as in Fig. 7,

a storage of energy has taken place just as effectively as if the two flywheels had been running in the same direction, but the angular momentum of the one is positive and that of the other negative, and the total angular momentum is zero, just as it stood when the fly-

wheels were at rest; hence no torque has been applied to the system from without, and the engine possessing two such flywheels can function without any rotational recoil kick being transmitted by its holding-down bolts. The same result can be demonstrated by a careful analysis and resolution of the connecting rod, piston and crankshaft forces, but the author considers the fundamental method of dealing with the problem here adopted to be preferable. It is easy to make a slip in resolving forces and moments in a complicated mass of link work, and it is an altogether wrong way of tackling the problem.

The method of reverse rotation also provides the solution to another problem connected with balancing; thus, an unbalanced reciprocation can be, in effect, balanced by two rotating weights. Referring to Fig. 8, if two spindles, 1 and 1', be arranged to rotate in opposite directions and carry respectively balance weights 2 and 2', whose centres of gravity in rotation take up the positions respectively a, a', b, b', c, c', d, d', e, e', f, f', it will be seen that the combined centre of gravity of the balance weights follows a straight line path with strictly harmonic motion, the combined centres of gravity being represented by the letters A, B, C, D, E, F, as the spindles revolve.

The principles discussed in the two preceding paragraphs are conveniently illustrated by the old Lanchester type of engine, which may be said to date from patents Nos. 15,045 of 1895 and 13,960 of 1896, and which were manufactured over a period of years extending from 1896 to 1903. Referring to Fig. 11, two parallel single-throw crankshafts were provided and fitted with flywheels of equal moments of inertia, geared together by helical gearing. Two opposed cylinders were arranged symmetrically on opposite sides of the plane con-

drive a car. At each impulse there will be a variation in the flywheel velocity; this, in an ordinary engine, would produce a recoil on the frame, but in the present engine, owing to the reverse rotation, this does not take place. It produces, however, an increased acceleration on the vehicle, that is to say, every time the flywheels are accelerated by the expansion of the gases, the vehicle has to follow suit, and so, owing to the inertia of the vehicle, the transmitted torque, that is to say, the torque between the engine flywheel and transmission mechanism, is a variable torque, and this in turn reacts on the engine and its mounting.

Fig. 7

We have here an extremely interesting property of the engine with reverse rotation, the torque carried by its mounting is precisely the torque impressed by the driven mechanism; in other words, if the work done is intermittent, the torque on the engine mounting is intermittent to a like degree, whereas if the driven torque is constant, the engine mounting is not subject to fluctuation.

It is an interesting point in connection with the motor with reverse rotation that the same means taken to eliminate rotational recoil or kick also eliminate the torque variations and torque vibrations which have been shown to be due to piston inertia.

It is, in the author's opinion, very important to be clear on the distinction between the transmission of vibration to the engine mounting as due to variations in the work done and the transmission of vibration as due to the working cycle of the engine itself. Thus, it may be laid down that in cases where the work done is of an intermittent and vibratory nature, the employment of a motor with reverse rotation may result in transmitting vibrations to the engine mounting to a detrimental degree, and such an engine is therefore bad, whereas in an ordinarily constructed engine with a single flywheel all such vibrations and torque variations are intercepted by the flywheel and are not felt by the engine mounting; it will, therefore, be seen that, broadly speaking, where questions of vibration have to be dealt with, the conditions have to be studied individually, and what may be right in one case may be equally wrong in another.

The manufacture of the Lanchester engine, made in accordance with the patents aforesaid, and described in the foregoing sections, has been discontinued for many years; in spite of this there are, however, several hundreds still on the road. More recently an engine having the same main feature, that is to say, the two crankshafts with oppositely rotating flywheels, has been put on the market under the name of the "Valveless". Fig. 10; this engine, made under patents of Mr. R. Lucas, works on the two-stroke cycle. This a matter quite apart from its balancing devices, which are in their essence identical with those described above. In the Lucas

engine, the crankshafts are acted on by two cylinders side by side with axes parallel; the design is inferior to the Lanchester type in so far that the secondary or octave vibration is not balanced; it is superior from the point of view of simplicity and ease of manufacture, two of the factors which eventually led to the abandonment of the author's earlier type.

The four-cylinder engine, which may be taken broad-

Fig. 6A

Fig. 6B

taining the crank axes, and the connecting rod system consisted of a symmetrical parallelogram of, functionally speaking, four rods, actually six rods being employed. Both crankshafts were fitted with balance weights whose function was not only to balance the rotating portions of the cranks themselves, but also to balance, on the principle already discussed, the reciprocating parts of the engine.

By an inspection of Fig. 9, it will be seen that the distribution of pistons and connecting rods at all times formed a symmetrical figure about a point A half way between the centres of the two crank pins, and so the whole motion of the reciprocating parts could be treated as a mass concentrated at the point in question with strictly harmonic motion; it could, therefore, be balanced with mathematical accuracy by oppositely rotating weights on the crankshafts. The engine was not troubled with any rocking moment, owing to the fact that the whole of its reciprocating parts had "looking glass" symmetry about the transverse vertical plane. The rotational recoil impulse was balanced completely by the reversely rotating flywheels of equal moment of inertia; the fact that these lie in two different planes is of no importance. Though the distribution of the impulses does not take place at equal angular intervals, this is without effect on the balance of the engine owing to the absence of rotational recoil—since there is no unbalanced kick it is of no consequence when the kick takes place. From a scientific point of view, probably this engine is the only completely balanced type of reciprocating engine that has ever been built.

In connection with this engine, it is of interest to call attention to a kind of vibration that may be felt, or at least may make itself appreciable, apart from any vibration of the engine proper. Let us take an engine of the type under discussion, and admitting that it is perfectly free from vibration, let us put it to work to

Fig. 8

Fig. 9

ly as the popular type of engine of today, has been dealt with to some extent earlier in the paper, but on account of commercial importance of this particular type, it is necessary to devote to it more than passing attention. We have seen that the main defective balance is due to the synchronizing of the octave components of the motion of all four pistons, that is to say, the displacements of the pistons as due to connecting rod angularity all take place in the same sense, so that the forces in a four-cylinder engine tending to set up octave period vibration are four times as great as would be the case in a single-cylinder engine of equal bore and stroke. In Fig. 11 we have represented diagrammatically the movement of the gudgeon pin, corresponding positions of which are given at the "in" and "out" centres and at 90° thereto. If the connecting rods were of infinite length, all four pistons would reach mid-stroke position at the same instant, and at all other points pistons Nos. 1 and 4 would by their motion accurately compensate for Nos. 2 and 3. In an engine with a rod length of about two and a quarter times the stroke (Fig. 11), there is a considerable departure from this in the position of the pistons when they should be at mid-stroke. Thus, when the crank pin is at 90° from the in-centre, all four pistons are somewhat below their mid-stroke position; in the case of an ordinary 20 or 25 horsepower engine (R. A. C. rating) the error of position amounts to about a quarter of an inch. Let us express the length of the connecting rod in terms of the crank throw = unity, and take the ratio as 4.5; then, in Fig. 13, if a be the position error of the gudgeon pin at mid-stroke, as due to connecting rod angularity, we know that a is approximately equal to the crank throw squared divided by twice the connecting rod length, or, in the present case, one divided by nine. But the quantity a is the total amplitude of the octave vibration of the piston, hence the octave amplitude is 1/18th of the stroke. Now, since the force is proportional to the square of the periodic speed, the maximum disturbing force due to the octave

Fig. 10

components of the piston motion will be 4/18ths of that due to the main component of each piston; multiplying this again by four to represent the whole engine, we have the unbalanced force due to the octave component in a four-cylinder engine nearly as great (in the relation of 16 to 18)* as the main unbalanced piston force of a single-cylinder engine of equal bore and stroke. This comparison is given graphic-

*If the rod/throw ratio had been taken = 4 we should have had equality.

ally in Fig. 12, which represents the unbalanced forces in a four-cylinder engine in comparison with the unbalanced forces in a single-cylinder engine of equal bore and stroke, assuming the base chambers of both engines to be bolted rigidly to the foundations.

As an illustration, we may take the case of an engine of about 20 R. A. C. rating, stroke = 130 mm, running at 2000 revolutions per minute with a total reciprocating mass of 12 pounds; the maximum value of the unbalanced alternating vibratory forces under the conditions stated is approximately 800 pounds.

In addition to its defect in the matter of the secondary vibration as above, the four-cylinder engine is affected by another of the forms of want of balance to which the single-cylinder engine is liable, that is to say, the torque alterations due to piston inertia. In the four-cylinder engine the whole of the pistons are at rest at the same instant of time, and the whole have their maximum velocity at approximately the same point. Thus, as in the one-cylinder engine, there is a continual give and take of energy between the flywheel and the pistons, which results in an intermittent torque about the crankshaft axis just as has been described earlier. The magnitude of this torque in the four-cylinder engine is that of the sum of its combined elements, that is to say, it is four times as great as in the case of a single-cylinder engine of equal stroke and piston weight. The four-cylinder engine also (as in the single-cylinder) has a torque alternation due to the work done in compression and restored in expansion. This torque variation may be treated as part of the functional torque variation due to the total cycle of operations, and from this point of view the torque variations due to the compression and explosion pressures cannot be separated.

We have already seen that torques due to pressure and those due to piston inertia are actually superposed, and since in the four-cylinder engine there is a compression in one cylinder or another on every stroke of the engine, they are of

Fig. 11

the same frequency, and there are conditions of running under which these variations in some degree cancel out.

Let us suppose that powerful springs are fitted, tending to bring the pistons to their mid-stroke position; then it is evident that there is some particular running speed of the engine which corresponds to the period of the springs and piston masses, and at this critical speed no torque variation will be required. The particular speed in question is that at which the kinetic energy of the piston in its mid-stroke position is just equal to the energy stored in its spring when fully compressed, so that at every point in the stroke the total of the energy in the springs and the kinetic energy in the pistons will be constant. At this speed, since the energy of the system does not fluctuate, there will be no give-and-take of energy between the pistons and the flywheel, and so the torque fluctuations that otherwise are necessary will not occur.

Now, in fact, there is no such spring system as that indicated, but if we consider the combined effect of the four indicator diagrams, assuming the engine to run against compression only it will be seen, by referring to Fig. 13, that the combined indicator diagrams would be such as to simulate with a fair degree of approximation a straight line spring diagram, and so in an actual engine the form of vibration now under consideration will be far less apparent when running on compression than when closely throttled down, and so the spring effect of the compression is destroyed.

We have so far dealt exclusively with engines in which

the cylinder axes are in the same plane, but there are other types of engine in which the cylinders are arranged radially round a crankshaft at different points of the circumference. In some cases, as in the 80-100 horsepower Anzani, or the R. E. P. engine, the distribution of the cylinders is symmetrical, their axes being spaced at equal angles round the crank axis; in other cases only a portion of the circumference is utilized; or again in other cases, as in the ordinary V type of engine, the arrangement resembles more the "twinning" of two multi-cylinder engines whose cylinder axis planes are arranged at an angle. The latter type is best considered from the point of view of balance as two distinct engines, and the unbalanced components of the two superposed to give the resultant.

In the case of the eight-cylinder V engine (two fours), the octave disturbance can only be balanced if the angle between the cylinder planes be made 180° . Such an arrangement is considered bad owing to the fact that the working strokes cannot be properly distributed, the explosion always taking place in pairs of cylinders simultaneously. The usual arrangement for the eight-cylinder engine is for the two fours to be set at an angle of 90° , so that four impulses take place per revolution at 90° interval. In such an arrangement the octave vibration is not balanced, the resultant vibration being represented by the horizontal diagonal of a square in which the component vibrations of the two sets of cylinders are represented by two of the inclined sides, Fig. 14.

Upon investigation it will be seen that the vibration

Fig 12

can be corrected by the anti-vibrator, the disposition of the rotating balance weights being that corresponding to a four-cylinder engine in a horizontal position.

In the case of a "double six" built on the V system, the angle between the cylinder axes should be either 60° or 180° ; by this means the impulses, six per revolution, can be distributed evenly at 60° intervals; the balance of such an engine requires no comment, inasmuch as each component engine is in itself balanced in respect of its fundamental and its octave vibration, and is not subject to inertia torque variation.

METROPOLITAN S. A. E. MEETS.

William M. Power Reads Paper on "General Trend of American Motor Design".

At the regular monthly meeting of the Metropolitan section of the Society of Automobile Engineers held at the American Automobile Club of America, New York City, William M. Power

read a paper on the "General Trend of American Motor Design". There was also a brief discussion on the proposed associate and student plan of membership, an advocate pointing out that there are thousands of young men in and around New York City who are either taking engineering courses or have just graduated from engineering schools, who would gladly affiliate themselves to a committee. The next meeting will be held April 30, when Finley R. Porter, formerly engineer of the Mercer Automobile Company, will read a paper on the "Influence of Racing on Motor Car Design". This will be illustrated by moving pictures of the Grand Prix and other races.

QUART RIDE POPULAR.

Studebaker Dealer Utilizes an Auxiliary Tank to Demonstrate Mileage Claims.

Prospective purchasers are very much interested in the mileage possible with a gallon of fuel in these days of the high cost of gasoline. The Chester N. Weaver Company, Studebaker dealers in San Francisco, Cal., have adopted a plan which is termed the "one-quart ride". An auxiliary tank, having a capacity of one quart, is fitted to the car and the prospect is asked to fill it from his own quart measure. The ride then takes place over a measured course.

Tire Valve—B. M. L., Des Moines, Ia.

Why is it that air leaks out of an inner tube through the valve even when it is screwed down as tightly as possible? Why is it hard to inflate one tire and easy with another?

Generally, the cause of leakage is due to dust or other foreign substances on the valve seat. Sectional views of the construction are shown at Fig. 1 and a little study will make clear the point involved. The illustration at the left shows the valve seated; that at the right its position when

Fig. 1—Sectional Views of Tire Valve.

the plunger is depressed and air is consequently escaping. The arrows indicate the passage of the air. It will be seen that the valve is off its seat. Normally it is held closed by the tension of the spring which, with the guide, moves freely on the valve stem. As previously explained, if foreign elements prevent the valve from seating, air will escape as indicated by the arrows. The leak may be minute or slow.

The cause of hard inflation is due to the resistance set up by the spring member. If the tension is above normal, more pressure will be required to overcome this resistance and to push the valve down off its seat. The resistance increases as the tube becomes inflated and the pressure of the pump must be greater than that set up by the air in the tube to open the valve.

Many motorists make the error of screwing down too snugly the threaded member of the valve, destroying the rubber packing which is employed to prevent the escape of air. The threaded member should be adjusted lightly, and if it be loosened when inflating a tire, it will be found that the shoe can be pumped up easily. After inflation the threaded member should be adjusted and tested for leakage.

Wiring Dry Cells—N. B. H., St. Louis, Mo.

In your last issue mention was made of wiring dry cells in series and in multiple series. What is the difference and which is the better way?

The article in question dealt in a general manner with installing dry cells when placing the machine in commission after it had been stored for the winter. By wiring cells in series is meant connecting the terminal of the carbon post to that of the zinc as indicated at Fig. 2, A. This leaves two free terminals, a positive and a negative.

This method of wiring is utilized to obtain voltage. As six volts are generally necessary to operate ignition systems, and as the voltage of a cell is slightly over one volt, the wiring of six cells in series obtains the desired result. Wiring in series increases the voltage, but not the amperage. Assuming the amperage of each cell to be 20, wiring six or more in series does not increase it. It will remain 20.

If, however, the cells are wired in multiple series as shown at B, the amperage will be increased. The method consists of wiring two or more groups of batteries in series as at A and so arranging the groups that the free carbon terminals will be at one end and the zinc members at the other. The two or more positives are connected together, as are the negatives. This is plainly shown at B.

The voltage of the cells shown at B will be that of four cells wired in series, and, assuming that the voltage of each battery is 1.5, the total voltage will be $4 \times 1.5 = 6$. The amperage is increased. Figuring on the basis of 20 amperes to each cell, and that there are three groups, the total amperage obtained by the multiple series wiring is 60. For each group of four cells in series added the amperage will be increased by 20. Thus with six groups in multiple series the amperage would be 120.

The advantages of wiring in multiple series are many. A manufacturer of dry cells conducted a series of experiments, using various groups

with a motor, and operating the latter continuously until it began to miss. Five cells in series gave 20 hours' service, or 400 estimated miles. By utilizing two sets of five cells in multiple series, 70 hours of service were obtained, or 30 more than would have resulted by using two sets of five in series.

Motor Starter Trouble—T. B. Brown, Gainesville, Ga.

I have a 1914 Cadillac. When I put it up the other night it was all right, but the next morning the motor starter would not turn over the engine one little inch. Used the starting handle and the motor started. Ran the car about an hour, then tried the starter and it worked all right. It has been operating satisfactorily ever since. I would like to know where the trouble was, as it is the fourth time the trouble has occurred. I have been taking your book for some time and would not be without it, as I get some mighty good doings out of it.

The trouble referred to was probably due to the storage battery being in an undercharged condition. A battery discharged below a specific gravity of 1.150 will not crank the engine, and the gravity must be brought up by charging. The fact that the starter operated satisfactorily after the engine was run for some time would indicate that the cells were in a discharged condition. When a battery is in a properly charged condition the electrolyte should read from 1.275 to 1.300. The electrolyte is tested by a hydrometer syringe. Elsewhere in this issue will be found an article on storage batteries which will explain in detail the points involved.

If one is not familiar with the starting and lighting system, it is better to consult the expert at the service station when trouble is experienced.

Overland Steering Gear—L. M. Coleman, Hyman, S. C.

I have a model 59 Overland, the steering gear of which has lots of play, especially in the wheel. Please give me instructions for tightening it.

To properly adjust the steering gear of the model 59 Overland car it is advisable to jack both front wheels off the ground so that the linkage may be moved easily.

First, loosen the two clamping bolts at the base of steering gear, which clamp it in a rigid position. By turning the notched adjusting nut at the top of the steering gear housing, and at the bottom of the outside tube, to the right, all end motion is eliminated.

Next, turn the steering wheel around as far as it will go and adjust the worm gear by turning the adjusting collar next to the steering ball arm. The worm gear shaft is within an eccentric bushing, and, by turning this collar, all lost motion is taken up between the gear teeth. It is important that this adjustment should be made on the extreme, as all steering gears wear more in

the centre on account of being used most in the straight ahead position when driving.

If lost motion exists after making the above adjustment, and there is considerable play in the centre, it will be necessary to remove the ball arm from the worm gear shaft and turn the steering wheel 1.5 times around. This will present a new surface, of which there are four, to the worm. There are practically three adjustments to the steering gears utilized with the Overland cars, and if properly lubricated the wear will be very slight.

Magnetos—Le Moyne Thomas, Richwood, O.

Please inform me as to the exact position of the armature or core in the common horseshoe type of magneto when the greatest current is generated, and where the safety spark gap is located in the new Bosch and Splitdorf magnetos and how to adjust it. How should you go ahead to remove the condenser from a magneto without injuring it?

The current generated by a magneto of the permanent magnet type is at its maximum when the greatest number of lines of force is cut, or

Fig. 2—Wiring Dry Cells: A, in Series to Obtain Voltage; B, Multiple Series to Obtain Amperage.

approximately after the armature has attained one-eighth revolution, or 45 degrees of travel.

With the new types of Bosch and Splitdorf magnetos the safety spark gap is enclosed and will require no attention, as it is adjusted properly at the factory.

Relative to the condenser: The writer would not attempt to remove it and it should not be tampered with. It is enclosed and if it be suspected of being the cause of ignition trouble, the magneto should be sent to the factory or the nearest service station. In the Classified Buyers' Guide will be found the lists of service stations maintained by the magneto manufacturers.

Unless one is an expert on magnetos he should not attempt to disassemble an instrument. Complete instructions as to what may be done by the owner are given elsewhere and, as pointed out, the directions of the maker should be followed to the very letter. The majority of magneto troubles are held by the manufacturer to have been caused by tampering.

OVERHAULING THE BRAKE ASSEMBLY.

AS THE safety of the occupants of the motor car depends upon the efficiency of the brakes, the inspection and restoration of worn

Showing Components of External and Internal Types of Brakes.

linings, linkage, etc., cannot be too carefully performed. It is decidedly better to slight other repairs than to economize on these members, as good brakes afford excellent insurance against accidents.

Aside from a knowledge of the steps necessary in relining the bands, the work of placing the brakes in first class condition does not require any great skill, as the linkage and mechanism are not complicated and a little study will enable one to become familiar with the design, as well as any faults that may have developed after considerable service.

With very few exceptions the brakes are fitted to the rear wheels of the machine, although the use of the propeller shaft brake is noted in one or two modern high grade cars. It is the practise to employ two sets with the sliding gear transmission; service members, generally operated by a pedal, and emergency, actuated by a hand lever, although some makers eliminate the lever, utilizing the clutch pedal to actuate the service members. With this form a partial depression of the clutch pedal disengages the clutch, and a further movement applies the brakes.

Brakes may be divided into two general classes, the external contracting and the internal expanding. The principle of the former is the use of a band faced with a friction material, which, when contracted by suitable mechanism, grips the drum of the wheel. The other design consists of a band within the drum, which is expanded by means of a cam. Both types are actuated by levers connected with the operating means by linkage.

Conventional designs of internal expanding and external contracting brakes are shown in an accompanying illustration with their components lettered. It will be noted that the external brake encircles the brake drum, and is made in two sections; that is, is split. It is pivotally mounted, as shown at A, while diametrically opposite the halves are linked by a lever. As shown in the drawing, this lever is in its normal position and the lining is not in contact with the drum. Upon the lever being moved outward, the ends of the band are drawn together, resulting in the friction material gripping the drum. The expanding brake, usually utilized for the emergency, is actuated by a lever which when moved forward spreads the halves of the band.

To inspect the internal types, the wheel will have to be removed and it is best to jack up the rear axle, making sure that the forward wheels are chocked, so that there will be no danger of the axle slipping off the jacks. If the equipment does not include two jacks, raise one wheel and block up the axle, taking care not to have any weight come upon the strut rods, or springs.

First remove all old lubricant. Many times the failure of the brakes to grip properly is due to grease working out from the differential onto the linings. If this be the case, it will be well to displace the axles and fit new washers, as new friction material will not improve conditions.

After thoroughly cleaning the bands, etc., test the retaining spring of the internal brake. It may be that it has lost its elasticity, causing the friction material to drag. Either fit a new spring or

Clean and Lubricate Equalizers and Linkage of Brake System.

shorten the old member. Examine the springs and supporting clips which maintain a space between the friction material and the surface of the

drum. All moving parts, such as the lever connections, spring saddles, adjusting nuts and bolts, should be thoroughly cleaned, as more or

The Radius Rods Require Careful Attention.

less mud collects on these members. If any are badly worn, replace with new, lubricating all working parts.

If the brake linings are worn to the rivets, new fac-

ings will be necessary. The friction material comes in different widths and thicknesses. Before purchasing, ascertain the proper size to use and measure the drums. If one is careful in this work, or consults the agent of the car, no trouble will be experienced.

To reline the brakes the bands will have to be displaced. Clamp them in a vise and by using a sharp, cold chisel the heads of the rivets can be cut off easily, after which the remaining part of the rivets can be driven out with a punch. Place the new lining around the band, and cut to approximately the correct length. Next clamp one end of the lining to the band, taking care that it is parallel with it, drill the holes and countersink them. The novice generally makes the mistake of not countersinking the holes deep enough. In performing this work make sure that the head of the rivet is well below the surface of the lining. The rivet is then driven home and the small end peined over. This operation is repeated until all the rivets are in place. The lining should be drawn tightly over the band and be free from wrinkles.

Before replacing the wheels, clean and inspect the equalizers and all linkage, also lubricate all parts subject to friction. Test the brake pedal spring to note if it works freely. An excellent lubricant for all brake linkage is grease mixed with powdered graphite.

After assembling the brake mechanism, it generally will be found that trouble is experienced in replacing the wheels, owing to the ad-

justments that have been made to compensate for wear of the old lining. It is a good plan to release all linkage until the wheels are replaced, then readjust. After the work is completed the brakes should be tested to note if they grip evenly, and this may be determined by a gradual application and turning each wheel. During the first trip or so with the car, place the hand on the drums and note if they heat. If so, it denotes dragging, which should be corrected. Newly lined brakes will require a little attention for the time being, such as minor adjustments.

Coming next to the rear axle: There is not much that the owner can do except to clean out the old lubricant from the differential, wash with gasoline and refill with fresh lubricant. The differential should be examined for play and, if any exists, adjusted according to the instructions of the maker. End thrust may be present in the drive shaft, causing the pinion gear to mesh too deeply with the large gear.

Radius and torque rods are important and should be inspected carefully, as too much lost motion will result in undesirable stresses upon the driving mechanism. Remove the boots from the universal joints, clean and examine these members very carefully. It is possible that these may be badly worn and if they cannot be re-bushed it is best to purchase the parts needed. Repack with new lubricant and fit new boots if necessary.

Strut rods should receive attention, for if they be loose or too tight, they are likely to break

Part Sectional View of Conventional Type of Rear Axle and Components That Should Not Be Overlooked in the Overhaul.

when traversing uneven roads. In adjusting, set them up snugly. Go over all riveted components and note if any are missing or loose.

APPLYING BUSINESS METHODS.

The purchaser of an automobile, or a watch, may be pardoned for attempting to secure all he can for his money, but there is no real reason why one transaction should be conducted on a different basis than the other. It may have been necessary, once, to convince the prospective purchaser that a watch would keep time. That day has passed. The general public has become convinced that the watch is a practical invention.

The man who desires a watch, today, selects one which best meets his needs, pays the price which is asked and takes possession of his property. Accompanying the watch is a certain guarantee as to workmanship and material, but this is taken for granted and there is no attempt to influence the salesman to undertake additional obligations.

The automobile industry has passed the experimental stage, insofar as it has been amply demonstrated that cars will run and serve a useful purpose. The owner and prospective owner have had every opportunity to inform themselves as to the respective merits of machines selling at various prices. They know what to ex-

pect of a given product. They know also that the manufacturer guarantees his product within certain limits.

Instead of being content, however, with the purchase of a car, as would prove true with respect to the watch, the average man seeks something in addition. Automobile dealers who have given the subject thoughtful consideration have arrived at the decision that it is this something additional which may mean their success or failure. The demand and the granting of the demand are relics of the past—a result of conditions for which dealers and purchasers alike are responsible.

The time has come when those engaged in the production and sale of automobiles—passenger cars in particular—must adopt methods which are regarded as essential in other lines of business endeavor. The period may be termed one of readjustment, but by whatever name it is called, the prospective purchaser is the one who will reap the largest benefit by the change. Manufacturers who have adopted strictly business methods, and who insist that their dealers shall follow their example, are those who are giving their patrons the most for their money. Automobiles should be bought—and sold—on the same basis as any other piece of merchandise.

TARIFF AND IMPORTS.

While it may still be too early to determine just what effect the new tariff is to have upon the importation of automobiles, eventually, it is of interest to note that the number and value of cars brought into this country has been decreasing steadily since the law went into effect in October. In February, the last month for which the government figures are available, the value had dwindled to \$20,575 as compared with \$82,119, for the same month a year ago.

The number of cars imported during October, 1912, was 78, compared with 29 for the same month in 1913. Since this was the first month of operation under the new law, it seemed desirable to await further developments before making comment. In November the figures were 87 and 37 for the two years; in December, 87 and 38; in January, 71 and 12, and in February, 33 and nine. Evidently, the tariff is to have some effect upon the importation of cars.

IGNITION CARE AND ATTENTION.

Directions Enabling the Motorist to Clean, Adjust, Time and Lubricate the Magneto—Suggestions for Inspecting Systems Utilizing Batteries, Coils and Timers.

(By C. P. Shattuck.)

AS THE efficiency of the motor depends largely upon the ignition, the system should be given a thorough inspection in the overhaul of the car, and all components of the magneto, distributor, commutator, coil, switch, etc., cleaned and adjusted. Failure of the motor to develop its maximum power, difficult starting and a decrease in the number of miles formerly obtained to a gallon of fuel, are generally due to the ignition system requiring a minor adjustment. When it is considered that the mixture within the cylinders must be as completely burned as possible to obtain the maximum energy of the explosion, and that the spark must occur at a predetermined instant, the importance

cleaning the power plant, cover the magneto and be careful not to spill the cleansing fluid over the wires, etc. It will not be necessary to displace the instrument to inspect the parts that may require adjusting or cleaning, but if it must be removed for any reason, make a diagram of the wiring plan, and note the direction of rotation of the distributor and the original factory setting. If these facts are given in the instruction book, a sketch will not be necessary.

A simple method of insuring correct replacement of all leads and connections is to tag each wire and terminal. If not sure of the firing order of the motor, displace the distributor cover of the magneto and crank the motor until the distributor brush rests on the segment with which the cable leading to the No. 1 cylinder is connected. By tracing the wires from the other segments to the plugs, and observing the direction of rotation of the brush, the firing order will be noted easily. Fig. 9 illustrates the point involved, and it will be seen that the distributor rotates clockwise. It should be borne in mind that in all magneto setting, timing, etc., the distributor rotates in an opposite direction to that of the armature shaft.

Fig. 1—Showing Components of Magneto That May Be Cleaned and Adjusted by the Motorist.

of placing the ignition system in an efficient condition will be appreciated.

Dealing first with the magneto: There is no reason why the motorist cannot clean and adjust the instrument, for the work does not involve a technical knowledge of its components or their operation. It requires very little attention, and if the motorist will lubricate according to the instructions of the maker, clean and keep the contact points adjusted, no trouble will be experienced. On the other hand, tampering with the instrument will result in loss of service of the car while the magneto is being repaired at the factory, and considerable expense.

By observing a few simple precautions when overhauling the motor, the owner-repairman can eliminate the expense of the magneto expert. In

The first step in cleaning the instrument is

to remove all foreign deposits from its exterior, using a cloth moistened with gasoline. Next examine the Oldham or other form of coupling connecting the driving

Fig. 2—Showing Platinum Contact Points of Magneto Which Interrupt the Primary Current.

Fig. 3—In Cleaning Contact Points Use a Very Fine File.

Fig. 4—To Adjust Contact Points, Loosen Locking Nut of Long Platinum Screw and Use Wrench as Shown.

shaft with the armature shaft. It is possible that the coupling may be badly worn and if so it is best to replace with a new one. The practise today is to employ flexible and adjustable couplings which may be obtained from magneto manufacturers and supply houses.

To displace the distributor cover or housing, it may be necessary to remove screws or disengage the holding springs, depending upon the make of instrument, and a little study will determine the method of retention. To clean the distributor, moisten a soft camel's hair brush with gasoline and wipe out any carbon or foreign elements that may be present. Do not attempt to improve the tension of the distributor brush spring, as it was properly adjusted at the factory. Lay the distributor cover to one side and take off the interrupter housing, or dust cover, as it is termed by some makers.

This is located under the distributor and is generally retained by a spring lever which can be slipped to one side. With the Bosch magneto, such as shown at Figs. 4, 5 and 6, the cover snaps out and into place. The Eisemann and Splitdorf instruments, shown at Figs. 1 and 3, as do some types of the Bosch, employ a spring lever.

Having displaced the cover, clean the interrupter mechanism with the brush moistened with gasoline and be very thorough in the work. The next step is to inspect the platinum contact

Fig. 5—To Decrease Gap at Contact Points Turn Adjusting Nut to the Left.

points indicated by the pointer at Fig. 2, and if the armature shaft is turned until the fibre block rests, as shown in the drawing, the points will be separated. In explanation it may be stated that this block causes the points to break, and as many times in each revolution of the shaft as there are cams in the housing.

If the points are pitted or burned, clean and true them with a fine jeweller's file, holding the file as shown at Fig. 3, a method that will insure even surfaces. It is possible that the thickness of the file will be such as to make necessary increasing the gap temporarily. To do this, employ the wrench accompanying the magneto and loosen the locking nut, as shown at Fig. 4, turning it to the left. With this nut loose, place the wrench on the nut on the long contact screw as shown at Fig. 5, and turn the screw in the same direction as the locking nut was rotated. This will increase the gap between the points. In filing, be careful not to remove too much of the platinum—just enough to clean the points—and

Fig. 6—Showing Method of Adjusting Points of Battery Breaker Mechanism and How Gauge Is Utilized to Obtain Correct Gap.

the fibre block should not rest on a cam during the work.

After truing the points, readjust them. Turn the armature shaft until the fibre block rests on a cam and, with the points fully separated, insert the gauge as shown at Fig. 6, which illustrates testing the gap of the battery breaker contact points. The gauge should fit snugly, yet fairly freely. If the space is too large—which it will be if the points have been filed—use the wrench as shown at Fig. 5, but turn it to the left to decrease the space. After obtaining the correct gap, set up the locking nut tight. Next rotate the armature shaft and note if the points meet and break properly. This hint will be of value if magneto trouble is experienced on the road, and it should be remembered that with those types utilizing the one breaker mechanism to interrupt both the battery and magneto current, fail-

ure of the parts to operate properly means that a spark cannot reach the plugs.

Too much emphasis cannot be laid upon the instructions of the maker as to lubrication. Each part requiring lubricant is marked "Oil", and do not assume that if a little oil is useful a large quantity will be better. Magnetos have been spoiled by too much lubrication. The interrupter and distributor should be oiled only when so specified by the maker, and as a general rule breaker mechanisms utilizing fibre in their construction must not be lubricated, as oil swells the fibre.

If the magneto has been removed from the motor and it is necessary to retime it, it is best to obtain the timing from the factory or agent of the car. Some car makers provide for considerable lead, and others a slight advance, according to the engine and make of magneto. The best setting is determined by the manufacturer and it is rarely that the original setting can be

Fig. 7—Distributors and Timers Should Be Cleaned, Lost Motion Eliminated, and Lubricated.

improved. Timing may be accomplished by utilizing the piston or crank circle. When the former is employed the method of procedure is to bring the piston up to nearly dead centre or fully complete the compression stroke, according to the timing plan. Then connect the armature shaft with the driving member, when the contact points are just beginning to separate. Of course the distributor arm should be on the No. 1 segment. When the magneto is provided with a timing window its setting is greatly simplified.

It is a good plan to go over the magneto and note if any of the screws securing the magnets to the pole shoes are loose. If so, tighten them. The high and low-tension wires, especially the former, should be inspected for broken or chafed places, and if the cable is old replace with new. Solder all new terminals utilized and make sure that all of the strands of copper wire are soldered in place, as one of these members may cause a puzzling short circuit. Particular attention

should be paid to the ground wire, that lead connecting the circuit breaker box with the switch. If the wire be old, replace with a new one, as,

should the strands come in contact with any metal, a short circuit would result, making starting and stopping of the motor difficult, according to the type of magneto employed.

Commutators and distributors are employed on some cars, using a battery or a generator as a source of current supply. These should be well cleaned with gasoline and their components carefully inspected for lost motion and wear. If the contact blocks, roller and fibre ring of the timer are badly worn, they can be trued up in a lathe, but if the bearings are not adjustable it will be cheaper and more satisfactory to fit a new one. The same remarks may be applied to the distributor. If found to be in good condition after cleaning, lubricate with a good grade of light oil. Timers should be washed out with gasoline from time to time and oiled, as more or less foreign elements collect, setting up a resistance to the passage of the primary current and imposing an unnecessary drain upon the batteries.

Coils employed with the battery system will require attention. The platinum contact points of the vibrator and adjusting screws will require cleaning and adjusting and it is possible that some of the connections will need replacing with new, as well as tightening the old members. Test the dry cells and if any fail to register at least 10 amperes, throw them out and purchase new ones. In installing new batteries pack them in snugly in the container. In inspecting and adjusting the ignition system, do not hurry the work, as time gained by haste may be lost in tracing troubles on the road.

Relative to storage batteries utilized for ignition purposes: If they have been stored for the winter or not used for some time, it is best to take them to a capable battery man and have them given a long, slow charge. They may need slight repairs.

WITH THE MOTORING INTERESTS ABROAD.

Ulster Volunteer Force Attracts Decided Attention by Its Use of Automobiles in Mobilization Work--New Low Priced Swedish Car--Foreign Notes.

AMERICANS will undoubtedly be interested in learning that the automobile has played an important part in the action of the Ulster Volunteer Force in resisting the proposed Home Rule bill for Ireland. The success of the plans carried out under the direction of Sir Edward Carson, insofar as this applies particularly to the use of motor vehicles, has been such as to occasion no little favorable comment on the part of British motoring prints, and it is strongly hinted that regular army officials may do well to consider the advisability of adopting similar tactics.

The basis of the organization of the Ulster force is locality. It was created by the members of the Unionist clubs, which sprang up all over Ulster. Commanders of companies were appointed, the companies were divided into squads, and each squad chose its own leader. The squads were composed of volunteers living close together—neighbors, in fact—so that when mobilization is ordered the battalion commander tells his company commanders, who notify the squad leaders, who, in turn, go around to their neighbors. In this manner the entire company and battalion are mobilized in the shortest possible time.

At the same time that this system was being formulated, motor car owners all over Ulster were also being organized by a similar system. At first, volunteer automobile owners were called upon only to assist in the distribution of imported arms and ammunition, and it was almost entirely through their efforts that the contraband materials found their way to the different units of the volunteer body. In the meantime, the dispatch riding corps, composed of volunteer motorcyclists, was organized.

Each district now has its motor car company, divided into sections with a section commander, who is relied upon to turn out with his section of four or five automobiles and act under a company commander responsible for 40 or 50 cars. Practise mobilizations have been held until it is now possible to assemble rapidly at a given place, pick up from 100 to 200 volunteers and transport them to some distant locality where field manoeuvres are carried out, and return them to the original place of assembly. While this much of the plan has received publicity, additional information is not available, although

it has been made to appear, at least, that these motor car companies are able to concentrate members of the volunteer force at any particular spot with a celerity far beyond that of cavalry.

Of course it will be admitted that the mobilization of a volunteer army in times of peace is quite a different matter from transporting an army under actual warfare, but it is suggested that it would be possible to convey forces long distances at the speed of from 25 to 35 miles an hour, by automobile, without the delays attendant upon the use of railroads.

In arranging the plans in Ulster, each commander undertakes to convey a certain number of men, which is generally a little below the total capacity of the cars on his list. This is expected to leave a margin for accident, or for intentional damage to cars by the enemy's forces.

SUNBEAM SECURES RECORDS.

Chassagne Lowers Burman's Speedway Marks for Half Mile, Mile and Two Miles.

Robert Burman still holds the world's straight away free-for-all records for the half mile, mile and two miles, but the speedway marks for these distances were exceeded by Chassagne in a 12-cylinder Sunbeam car on the Brooklands track, Weybridge, England, March 25. The time made by Chassagne is not recognized as a world's record abroad, since it was not registered as the mean time out and back, as required under the new rules. For that reason it is probable that Burman will still hold the speedway marks for the half mile and mile, secured by him in the Blitzen Benz at Indianapolis, May 29, 1911, and Bragg will retain the two-mile mark set by him with a Fiat at Los Angeles, April 13, 1910.

Chassagne's time for the half mile was 15.17, as compared with Burman's 16.8. His time for the mile was 29.82, while Burman's was 35.35. The two miles were covered at Brooklands in 1:00.31, while Bragg drove his Fiat the same distance in 1:15.96.

The six-cylinder Sunbeam was constructed by its English maker for the purpose of striving for the world's straightaway records held by

Burman. It was expected that the test would be held somewhere on the Continent this month, and this plan may yet be followed. Chassagne is entered as a Sunbeam driver at the forthcoming 500-mile race at Indianapolis, Memorial Day.

WILLYS UTILITY ABROAD.

Flying Squadron of Police Finds American Built Chassis Meets Every Need.

It is seldom indeed that British municipalities depart from what appears to be an unwritten law with respect to goods made in Great Britain. It is therefore somewhat surprising to learn that the police department in Leeds, England, has been using a specially equipped Willys Utility chassis, made by the Willys-Overland Company, Toledo, O., and with such success that English newspapers felt constrained to state that the men assigned to this vehicle were particularly efficient in the discharge of their duties.

The 16 policemen shown in an accompanying illustration composed a "flying squadron", assigned to special duty in Leeds during the recent industrial strike in that city and vicinity. For three weeks they were on duty night and day, ready for instant transportation to any quarter in which trouble might occur. Of course the machine was subjected to the same requirements, and it was almost constantly employed in rushing the officers from one part of the city to another. The success which attended this initial use of an American machine for such work is expected to result in increased business for this type of vehicle.

SWEDEN FIGHTS "INVASION".

Company Organized to Produce Low Priced Car in Competition with America.

It has been stated in these columns that the low priced American car was decidedly popular in Sweden and Norway, and it is not surprising, perhaps, to learn that a company has been organized in the former country to produce machines which shall compete directly with this

class of vehicles. The new car is to be rated at 20 horsepower and it is announced that it will sell for less than \$800.

The factory will be located at Norrköping, and it is stated that the company has strong financial backing. The technical manager is the well known Belgian expert, Vivinus. It is added that the first models will be ready for the market in the autumn.

NEWS NOTES FROM ABROAD.

Of the 34 cars that left Paris on the Tour de France reliability trials last month only 13 returned. A combination of heavy roads and many storms did much to discourage the contestants. At the conclusion of the tour a 67-mile road race was held over the Sarthe circuit at Le Mans, this being won by the Pierron. The cars which finished the trials were: Buick (two), Barre (two),

Willys Utility Chassis Utilized by Flying Squadron of Police During Recent Strike Riots in Leeds, England.

Aquila Italiana (two), Pierron, Gregoire, Buggati, Georges Roy, Phenix, Zedell and Hispano Sulza.

The list of entrants for the French Grand Prix was increased by two names before the final closing date, at double fee, March 31, so that the total is now 41 instead of 39. The late entries were made by a Caesar and a Nazzaro. The race will be held July 4.

Twenty-four cars have been entered for the 1914 Tourist Trophy race over the Isle of Man circuit, June 10-11, as follows: Minerva, three; Humber, three; Straker-Squire, two; Sunbeam, three; Star, two; Vauxhall, three; Martini, one; Adler, three; D. F. P., one; S. A. V. A., one; Crossley, one, and an unnamed machine entered by A. Rawlinson.

The Irish Automobile Club is planning a reliability trial for light cars, weighing not more than 1500 pounds, which will be held in the vicinity of Dublin during the last week in May.

The Imperial Automobile Club of Austria, working in conjunction with the automobile clubs in Styria, Tyrol, Carinthia and Trieste, has decided upon the route for this year's Alpine tour, which starts from Vienna, July 11, and will occupy eight days with night stops and daily mileage as follows: Klagenfurt, 234; Trieste, 229; Toblach, 240; Meran, 231; Innsbruck, 113; Villach, 228; Salzburg, 241; Vienna, 239. The total mileage is 1755.

INTERESTING MILEAGE RECORD.

Cadillac Car Has Covered 200,000 Miles in Five Years, Averaging 109 Miles a Day.

According to the report of the City Messenger Service of Binghamton, N. Y., a Cadillac car, made by the Cadillac Motor Car Company, Detroit, owned by that concern, has covered 200,000 miles during the past five years. This means that the machine has been driven an average of 40,000 miles a year, or 109 miles a day. The record is one which must be considered as extraordinary in every respect.

The City Messenger Service utilizes the car for parcel delivery, and at times it serves the purpose of a taxicab. Four different drivers are now engaged in operating it under varying shifts. It is stated that 25 inexperienced men have been taught how to operate it, and in spite of this the

Century race, for cars under 450 cubic inches, at approximately 100 miles, will be held July 3, and a purse of \$1500 is to be divided into four prizes. The Golden-Potlatch trophy, for cars under 600 cubic inches, will be run July 4 over a distance of approximately 200 miles. On the same date will be run the Montamarathon Trophy event, a free-for-all contest at 250 miles. Prizes aggregating \$3500 will be offered in the Golden-Potlatch race and \$5500 in the Montamarathon Trophy event.

COLE CAR AND PHYSICS.

High School Students also Learning How Automobiles Are Put Together.

As stated in these columns recently, high schools and colleges throughout the country have been making use of the automobile in teaching the subject of physics. An accompanying illustration shows Assistant Chief Engineer M. B. Covert of the Cole Motor Car Company, Indianapolis, Ind., giving instruction to a class of high school pupils in that city.

The students in many schools are using a Cole chassis with which to impress practical points upon their memory, and engineers from the Cole factory are lending assistance by personal instructions and in answering communications from students. President J. J. Cole

also is furthering the movement, by supplying teachers with copies of the Cole Technical Bulletin.

By this method the student not only gains a knowledge of the basic principles of physics, by an application of the automobile to the study, but he obtains inside information regarding the automobile. He is shown how the car is made, what each part has to do, and their relation to each other. It is suggested that as a result many of the high school pupils are given a better opportunity of knowing an automobile than is afforded the average motor car owner.

About 120 automobiles, representing 25 standard manufacturers, paraded the streets of New Haven recently to mark the opening of Automobile Week, the first of its kind ever held in the New England States.

Teaching Physics with Aid of a Cole Chassis in Indianapolis High School.

working parts, with few exceptions, are said to be those which were fitted originally at the factory.

TACOMA ENTRY BLANKS ISSUED.

Three Long Distance Events Scheduled for Two-Mile Track in July.

Entry blanks for the initial meet on the new speedway at Tacoma, Wash., July 3 and 4, have been issued and show that there will be distributed among the successful drivers at the Montamara Festo races, \$10,500 in prize money. Work on the new two-mile course is progressing rapidly, and it is expected that it will be ready for practise May 1. The course has an asphalt surface and is from 30 to 60 feet wide.

Three events will be run. The Inter-City

CARE OF LEAD STORAGE BATTERIES.

AS THE satisfactory operation of the electric motor starter depends wholly upon the storage battery, it is important that the owner follow carefully the instructions accompanying each equipment. That section of the instruction book dealing with the care and attention of the cells should be read very carefully and the suggestions as to testing the electrolyte with a hydrometer syringe complied with. Failure to do this is likely to result in the motor starter refusing to crank the engine, and the lighting system may also be affected.

The first step for the new owner is to purchase a hydrometer syringe, two types of which are shown in an accompanying illustration. Another view shows an enlarged section of the reading scale, which is floating in the electrolyte. The latter is taken from each cell by compressing the rubber bulb. The reading on the graduated stem of the hydrometer at the point where it emerges from the solution is the specific gravity of the electrolyte. After testing the fluid is returned to the cell.

Enlarged Section of hydrometer showing float reading of 1.280 which shows that the battery is fully charged.

If the cells are in good condition the gravity will test about the same or within 25 points of each other. Gravity below 1.200 indicates that the battery is less than half charged and it should be used sparingly until the gravity is restored to at least 1.250. When it is below 1.150 it indicates a completely discharged condition and should be given a full charge. The gravity should be between 1.275 and 1.300 when the cells are fully charged. It should be borne in mind that acid should never be added to bring up the gravity. This is accomplished by charging.

One of the most important factors to be considered is that of maintaining the solution above the plates and to the height stated by the maker. This is indicated by an arrow in an accompanying illustration. Never add ordinary water. Use distilled, which is inexpensive and obtained from any service station. In connection with the addition of water: It should be done after readings of the electrolyte have been taken, as a reliable gravity test cannot be made until the water has become well mixed with the solution by charging the cells or running the car.

If for any reason the cells require an extra

charge it may be accomplished by running the engine idle or by removing the battery from the car and taking it to an expert. There are times

Two Types of Hydrometer Syringe Utilized for Testing Electrolyte of Storage Batteries.

when the condition of the cells is such that a long, slow charge at a low rate is necessary and this work is best performed by a capable battery man. A battery that fails to hold the charge can generally be placed in a serviceable condition by a long, slow charge, but the owner must not expect that it can be done over night. The battery should be left with the service station until the expert in charge is satisfied that it is in an efficient condition. It is more economical to hire a battery while the work is being done than to spoil a good battery by insisting that the charging be hurriedly performed.

The battery and its compartment should be kept clean and dry, and the terminals and connections coated with vaseline. If solution has been spilled, wipe up with waste saturated with ammonia to neutralize the effect of the acid.

Showing Construction of Storage Battery—The Arrow Indicates Proper Level of Electrolyte.

IN THE COMMERCIAL VEHICLE FIELD.

Two New Water-Cooled Models Supplement Air-Cooled Line Produced by Chase Motor Truck Company--Details of New Signal Delivery Wagon from Detroit.

ANOTHER company which has hitherto been known throughout the industry as a producer of commercial vehicles utilizing an air-cooled motor and which has added models equipped with water-cooled engines is the Chase Motor Truck Company, Syracuse, N. Y. The light delivery wagons will be continued with the three-cylinder, two-cycle, air-cooled motors, but to this line have been added two water-cooled models, one with rated capacity of 3000 pounds and the other of three tons. The larger machine is illustrated herewith.

The motor used in each instance—reference now being had to the two new chassis models—

and reverse. The latter is assembled with the jackshaft, suspension being at three points to avoid the stresses of chassis frame distortion. Service brakes are expanding and the emergency members contracting on rear wheel drums. Springs are semi-elliptic, those at the rear being underslung. The front axle is an I section and the rear, rectangular. Wheels are 36 inches in diameter, carrying four-inch solid tires in front and three-inch dual members in the rear.

This chassis is produced in two lengths, 146 and 160 inches, although the former is standard, the latter being made only upon special order. The standard loading space is 109.5 inches length

and 48.5 inches width. The driver is located at the left and the control levers in the centre.

The three-ton chassis, that which is illustrated, has a motor with bore of 4.5 inches and stroke of 5.5, the cylinders being cast in pairs. The S. A. E. rating is 32.2, but the maker claims 40 horsepower under normal service conditions. The ignition system is the same as with the other, and the motor may be governed to

Model O Three-Ton Chase Truck, Equipped with Water-Cooled Motor and Worm Driven Rear Axle.

is a Continental four-cylinder, L head type. The smaller machine has an engine with bore of 4.125 inches and stroke of 5.125, the cylinders being cast en bloc. This motor has an S. A. E. rating of 27.2 horsepower, but is claimed by the maker to develop 30 practically under any condition of normal operation. Ignition is by a Bosch DU4 magneto with automatic spark advance. The engine is governed to a maximum speed of 1250 revolutions a minute, this being set and sealed at the factory so that it may not be changed without the knowledge of the owner.

The clutch is a multiple disc, and the selective transmission affords three forward speeds

any predetermined speed, by a sealed governor, in the same manner.

The clutch is a dry plate, and this and the four-speed selective transmission are assembled as a unit with the motor. Direct drive is on the third speed. From the gearbox the drive is through a propeller shaft, in which there are two universal joints, to a Selden rear axle, equipped with a worm and gear wheel of the David Brown type. This axle is designed to carry 80 per cent. of the load and is maintained to possess an ample margin of safety.

The frame is a channel section of pressed steel, having a width of 6.5 inches, depth of 5.5

New 1500-Pound Signal Delivery Wagon with Standard Express Body Equipment.

inches and thickness of .25 inch. This is well braced and has three cross members. The spring suspension and the braking system are the same as with the smaller vehicle. Wheels are 36 inches in diameter and carry four-inch tires, single in front and dual in the rear.

The wheelbase of this model is standard at 148 inches, but can be supplied at 165 inches. The standard chassis length is 218.5 inches, with loading space of 122.5 inches length and width of 52 inches. The driver is located at the left with central control lever.

SIGNAL DELIVERY WAGON.

Details of New Chassis of 1500 Pounds Capacity Recently Announced in Detroit.

Announcement is made by the Signal Motor Truck Company, Detroit, of a new 1500-pound delivery wagon chassis, which is held to be designed to meet the needs of those who desire equipment of this character. The machine is assembled by a factory organization that is regarded as highly efficient, and in the completed chassis are to be found the product of concerns well known throughout the industry in the manufacture of high grade components.

The motor is a Continental, four-cylinder, water-cooled, L head type, with bore of 3.75 inches and stroke of 5.25, the cylinders

being cast en bloc. This has a rating of 22.5 horsepower under the S. A. E. formula, but the maker claims it will develop more than 30 under brake test. Ignition is by Eise-mann high-tension magneto, with fixed spark.

The clutch is a Hartford cone, and the selective trans-

mission is a Covert design, affording three forward speeds and reverse. The jackshaft is a Russell product. Drive to the rear axle is by chain. The front and rear axles are Timken construction, the former being an I section and the latter, rectangular. The frame is a pressed alloy steel channel section, and is mounted on special springs, made by the Detroit Steel Products Company and designed for truck service, which are fitted with a patented lubricating device. The service brake operates on the jackshaft, and the emergency, on rotating carriers on the rear axle.

Wheels are 34 inches in diameter forward and 36 inches rear. The forward tires are three inches in cross section, and those in the rear 3.125. The wheelbase is 115 inches and the tread 56 in front and 60 in the rear. With standard bodies the loading space is 96 inches length, 48 width, and the platform is 32 inches from the ground. The driver is located at the left, with central control.

M. E. McKenney of Milwaukee, Wis., has become assistant sales manager for the Federal Motor Truck Company, Detroit.

Plan View of Signal Wagon, a New Detroit Product Utilizing Standard Components.

HANDLING NITROGLYCERINE.

Five Adams Trucks Utilized by Oklahoma Concern in Hauling This Explosive.

One of the reasons assigned for the recent reductions in the price of gasoline was that several new oil wells had been opened in the Oklahoma district. The oil fields in that state cover a large area, much of which is represented by country that has been developed but little, and prospecting has been carried on at some distance from the towns and cities.

The drilling of wells necessitates hauling materials, etc., from the source of supply, and, in addition, as it often becomes desirable to use nitroglycerine in the wells to start the flow of oil,

Adams 3000-Pound Wagon Used for Distribution of Nitroglycerine in the Oil Fields of Oklahoma, Fitted with Special Equipment.

considerable quantities of this high explosive are carried about from place to place where work is in progress. To utilize horses for this service is costly, and dangerous when explosives are handled. For this reason those who distribute the nitroglycerine have adopted motor trucks, as being more thoroughly under the control of the driver, to say nothing of the longer mileage capacity.

The American Glycerin Company, with headquarters at Battersville, Okla., now has in use five Adams 3000-pound wagons, made by the Adams Bros. Company, Findlay, O., which have been built expressly for this work. The machines have 42-inch wheels, giving large clearance for use over rough roads, and where there are no

roads in the generally accepted use of the term. The driving chains are enclosed to prevent wear and avert danger. In other respects the chassis do not differ materially from standard.

The bodies are of the express type, but are fitted with special boxes having covers that may be locked. These are divided into compartments, each of which takes a single can. The rated capacity of the boxes is 720 quarts.

BUYING TRUCKS IN FLEETS.

Seven Concerns Purchase 21 White Machines, 17 Being with Dumping Bodies.

Strong evidence of the superiority of motor trucks in the hauling of supplies and materials in the building trade and in the handling of coal is found in the recent purchase of 21 White trucks, made by the White Company, Cleveland, O., by seven concerns in that city and three in New York City. This report follows closely that of nine similar machines sold to the Brooklyn Alcatraz Asphalt Company, Brooklyn, N. Y. Of the 21 mentioned above, 17 were fitted with the new power dumping mechanism, which is held to hoist and dump a load in 30 seconds.

The Cleveland purchasers were: Brooks-Norton Motor Sales Company, which bought four five-ton machines to haul brick for the Farr Brick Company; Zettelmeyer Coal Company, one dumping truck; C. C. Parsons, two five-ton machines to haul material for the Euclid Brick & Supply Company; Cuyahoga Builders' Supply Company, one five-ton model; Cleveland Motor Truck Company, four five-ton dumpers for use for the Cleveland Macadam Company; Andrew Dall & Son, general contractor, five-ton platform dumping truck, and Lakewood Lumber Company, three-ton truck. In New York: Scranton & Lehigh Coal Company, four five-ton models; William Farrell & Son, two; Bacon Coal Co., one.

RESTORING THE TRANSMISSION ELEMENTS.

THE overhaul of the sliding gear transmission is a task the motorist should not undertake unless familiar with the work. With

either the selective or progressive types, a gear is moved on a shaft and made to engage with a corresponding member on another to obtain the various gear ratios.

A common source of trouble lies in the

Clutch and Transmission Removed from Chassis.

edges of the teeth becoming burred over, which makes it difficult to properly shift the members. Another cause is wear at the bearings, which changes the centre distance between the gears and so alters the pitch circle that they will not slide by each other. If the teeth are burred the rough edges may be restored to smoothness by grinding, but if the gears are badly worn because of worn bearings, it may be necessary to replace them with new. This will require the services of the expert and it is best to consult him when in doubt.

The cover to the gearcase should be displaced and as much as possible of the old lubricant removed before attempting to flush the case with gasoline or kerosene. By using an old brush the lubricant can generally be dissolved by the gasoline, and, after it is in a fluid state, remove the drain plug under the gearcase. Replace the plug and repeat the operation of cleaning until all lubricant and foreign elements are eliminated. If properly cleaned the inspection of the gears, bearings, shifting rods and forks will be simplified. One cannot be too careful in cleaning all corners and crevices of the gearcase, as minute particles of metal sheared off the edges of the gears may be present.

The gears should be tested to determine that they are firmly attached to the shafts with which

they rotate, and that the bolts, keys or pins by which they are fastened are securely in place. Looseness of these members not only causes noisy operation, but may result in shearing off the parts due to the constant hammering action.

The shifting yokes and collars will require attention, and, if any play exists, the defective parts should be replaced, which should fit with the minimum of lost motion. The locking device, commonly employed to prevent motion of the members when not in use, should be examined and tested to see if it performs its function properly.

Relative to bearings: Those of the ball type will require careful examination and cleaning. Metallic particles between the balls or races will cause a rapid destruction of the parts and one cannot be too careful in the work, or in the selection of the lubricant employed.

Many amateur workmen make the error of passing bearings as being satisfactory when there is a little play, but it should be borne in mind that lost motion contributes to trouble in time. All collars and levers on the shifting members should fit properly and have no back lash or play, as they are intended to engage with a limited sliding movement.

The different gears should be engaged and, with the gearcase and gearset clean, it will be an easy matter to determine if the gears mesh properly. A partial engagement with the lever in its locked position will not be satisfactory, as only a portion of the teeth of the gear will take the driving stresses. Means are generally provided for adjusting the forks and rod members. Renew felt washers if this is found necessary.

Selective Type of Transmission and Control Levers—Inspect Bearings, Shifting Forks and Rods for Lost Motion and Examine Gears.

CAUSES OF FAULTY CLUTCH ACTION.

IN OVERHAULING a car, even if the clutch has not given trouble, it will be well to carefully examine the components to detect wear that may cause trouble at some time, and which can best be prevented by proper restoration.

Fig. 1—Cone Clutch.

Dealing first with the cone clutch: The parts most subject to wear are the leather facing and at the bearing surface of the male member where it revolves on the shaft. The leather may have become hard, or charred because slipping has caused the facing to heat. The spring that holds the parts in engagement may have become weakened, and the cone hub so worn that its bearing surface will cause the clutch to drag, making the changing of gears difficult and noisy.

Types of cone clutches are presented at Figs. 1 and 4, the latter design being lettered for identification. Both clutches are adjusted by nuts, screwing in of which increases the tension of the springs. Care must be taken not to turn one nut more than another.

If the clutch be suspected of dragging it may be tested by removing the floor boards and, with the motor operating, depressing the clutch pedal fully. If the clutch continues to spin, note if its lower section is in contact with the flywheel. This will indicate worn bearings, which will require the attention of the expert. Sometimes the clutch design is such that spinning cannot be avoided without a clutch stop, and if one has not been provided to overcome the trouble, it is possible for the owner to fit one. It should be so adjusted that it retards the rotation of the clutch, but does not wholly stop it.

If treatment of the leather with neatsfoot oil, kerosene, fuller's earth, etc., does not remedy the trouble, and it is necessary to fit a new facing, the diagram at Fig. 3 will be of service in laying out the lining, provided the old member cannot be utilized. Take a large sheet of paper and lay out the clutch to exact size, being sure that the faces are at the proper angle. Draw a line through the centre of the hub and parallel with it, this being represented by the line A-B. Continue the angle of the cone by straight lines meeting at a point on the centre line. Then, using

this point as a centre and the distance from B to C and B to D as radii, describe the circles E G and F H. The distance from E to G must equal the largest circumference of the cone, so that the ends will butt together; or it may be advisable to make the strip a little longer than necessary and allow for fitting. The pattern thus obtained may be used to cut the new leather.

Before riveting in place the leather should be made as pliable as possible with oil, and if properly fitted there will be no danger of the leather becoming too loose or so closely engaged about the cone that it will tear from its fastenings. In fitting, clamp it to the cone, drill the holes and make sure that they are well counter-sunk. Rivet one end and then pull the leather tightly around the cone to the next point of fastening, the facing being stretched by a clamp; the holes drilled and the rivets applied, this operation being repeated from one point of attachment on the outer circumference of the cone to the next one.

After the facing is applied, the cone should be trued in a lathe by taking a light cut off the surface, or the high spots may be rubbed off by hand with sandpaper, a piece of glass or a coarse file. The best material for cone facing is good oak bark tanned sole leather or belting.

The multiple disc type of clutch is popular with modern car makers and these may be divided into two general types, those operating in lubricant and dry. The first named generally comprises plates of steel and other metals, such as

Fig. 2—Form of Clutch Utilizing Cork Inserts to Minimise Harsh Engagement.

steel to bronze, etc. While the modern design rarely gives trouble if properly lubricated and adjusted, earlier forms may annoy the driver by

slipping, generally due to distortion of the plates, or weakening of the spring maintaining contact between them. Too harsh engagement is caused

Fig. 3—Pattern for Laying Out New Lining for Cone Clutch Employing Leather as Friction Material.

by absence of lubricant, presence of carbon or roughness of the surfaces. Spinning, primarily the cause of difficult meshing of the change speed gears, is often due to seizing between the plates, gummed lubricant, etc.

In the opinion of the writer the disassembly of the multiple disc type of clutch and its repair are best left to the expert unless one is thoroughly familiar with the work. The construction is too expensive to replace in the event of damage by incompetent workmen.

Practically every maker gives complete instructions for the care of the multiple disc clutch and states specifically the best grade of lubricant to employ. If the clutch has not been operating satisfactorily, remove the old lubricant and fill the case with kerosene. Next disengage and engage the clutch several times, and spin the motor with the gearshift lever in neutral. This will work the kerosene in between the plates, cleansing them. Remove the fluid and refill with fresh lubricant. It is possible that slight adjustments will be necessary, and if these fail to cure slipping or harsh engagement, it is best to consult a repairman who is familiar with the clutch utilized.

At Fig. 2 is shown a type of dry plate clutch employing cork inserts in the middle member. These are utilized to eliminate harsh engagement, as well as to increase the power transmitting qualities without increasing the dimensions of the construction. These cork inserts if worn flush with the surface of the plate, or, in other words, if they fail to make contact with the driving and driven plates, should be replaced

with new material free from cracks, etc.

The surface or face of the corks should extend but slightly beyond that of the face of the plate, and with some types of clutches .0025 inch is the maximum. It should be remembered in fitting the inserts that they are utilized only to provide easy engagement and that the drive is taken by the plates, not the corks. If the inserts are too thick, it may be difficult to adjust the toggles so that the clutch will hold, and trouble will be experienced in fully disengaging the clutch. With the majority of designs the corks may be fitted without dismantling the clutch.

In adjusting clutches of this type, the adjusting screw bolts should be turned the same number of rotations to insure an even pressure of the plate transmitting the drive to the clutch shaft.

Faulty clutch action may be due to a number of conditions existing outside of the clutch, such as wear at various points of the operating mechanism and defective adjustment of the linkage. As the type of control varies with every car it is not possible to give other than general instructions for adjustment. Many cases of failure of the clutch to release have been traced to poor adjustment of the interlocking levers and rods; for instance, a worn shifting collar often hinders disengagement, as the clutch pedal may be fully depressed without materially reducing the pressure of the spring that maintains the parts in contact.

Small pins are sometimes worn to half their diameter, and the holes which they are designed to fit are worn oval, considerable play being evident. If this exists at several points it may amount to considerable and the lost motion will not only cause rattle, but make it impossible to

Fig. 4—Components of Conventional Type of Leather Faced Cone Clutch and Operating Linkage.

properly disengage the clutch.

Before attempting to make any adjustments to the linkage, its operation should be studied.

ADJUSTING AND TIMING THE VALVES.

THE amount of work necessary to place the valves and their mechanism in condition will depend upon the age of the car and the time

Components Utilized in Adjusting Valve Lift.

that has elapsed since the last overhaul. The valves of the practically new machine may not require other than grinding and a checking up of the timing. For this work some form of valve lifter and abrasive will be necessary. The use of a valve grinding tool or a screw driver is optional. A number of the former are marketed, as are valve lifters, and in selecting the tool it is well to consider its adaptability to the motor. Valve grinding compound can be purchased or made. The writer obtains excellent results with the finest grade of carborundum mixed with oil, but as it is a rapid cutting abrasive it is best to employ plenty of oil with it, if not familiar with its use.

The first step is to take out the valve plugs, and if these be rusted in it may be necessary to heat the members, as when displacing frozen nuts. This can be avoided in the future by graphiting the threads of the plugs. Before attempting to remove the valves the valve springs must be compressed and the pin or key retaining the washer or collar taken out. Generally, the valve lifter holds the valve on its seat while the spring is being compressed. In performing this work make sure that the valve is seated. Unless the valves are numbered it is best not to remove more than one at a time when cleaning and grinding.

Examine both the stem and the head of the valve for wear or defects. The cylinder seat should be perfectly smooth and free from grooves or deposits and the bevel seat of the valve head should be in the same condition. After scraping off the carbon deposits it may be noted that the seats, especially the exhaust members, are pitted. Before grinding, examine the valve

stem, as it may have a shoulder, caused by an uneven pressure of the spring forcing it against the valve stem guide. Warped or bent stems should be straightened.

Before grinding, be sure that the valve tappet is at its lowest position so the valve will seat. Smear the seat of the valve head with the abrasive, insert in the cylinder, and with the screw driver or valve tool, impart a reciprocating movement to the valve. Exert only a light pressure and from time to time lift the valve to prevent the abrasive from scoring the seat. Take out the valve, wipe it and its seat clean and inspect it. The grinding process should be continued until the seat is perfect. It may be that the valves and their seats will need reseating and this will require a special tool and experience. Grinding valves necessitates care and the results obtained should be passed upon by an expert if the work is performed by the novice.

A common cause of missing at low motor speeds is weak valve springs or air leaking past the valve stems and their guides. This trouble is rarely experienced in new motors, being more prevalent in old types. If the guides are bushed, new bushings can be fitted; if not, a stuffing box, such as shown in an accompanying illustration, may be made. It is constructed of brass tubing, threaded as indicated at B and screwed onto the guide, which will also have to be provided with

Section of Cylinder Cut Away to Illustrate Valve Mechanism Assembly.

threads. A bevel seat is cut in the guide to retain a strand or more of graphited candle wicking which fills the space between the stem and

the guide. Another plan is shown at C. It consists of making a leather washer and cutting the hole for the valve stem slightly smaller than the

Preventing Leakage Around Valve Tappets: A and B, Stuffing Box of Brass Tubing; C Utilizing Leather Washer.

diameter of the stem. The washer is held in place by the valve spring.

Before assembling the valve mechanism, the valves and the cylinder seats must be washed thoroughly with gasoline to prevent any of the abrasive being carried into the combustion chamber. Some pack the port with waste, but this is not necessary if care be exercised in the washing.

Coming next to the valve operating mechanism: If the tappets are removable without displacing the crankcase and camshaft, it is a good plan to inspect them for wear. New motors will not require this attention. If roller types of pushrods are employed, clean and examine the pins retaining the rollers, as they may be so worn as to create lost motion and cause a late opening of the valves, besides noisy operation. New pins are not expensive and any machine shop should be able to make the necessary repairs.

The tappet or pushrod bushings may be so badly worn that considerable lubricant is forced out by the crankcase compression. While this defect is not serious, considerable oil is lost, to say nothing of the lubricant attracting road dust. With some types of motors it will be necessary to remove the camshaft to take out the bushings and fit new ones. Care must be taken in driving them out, as it is an easy matter to break the crankcase.

As the general practise is to fit adjustable tappets, it is a simple matter to check up or correct any error in the timing of the valves. Before attempting the work examine the top of the hardened nut, as this member may be hollowed out where it comes in contact with the end of the valve stem. If such be the case, it should be ground smooth and true.

The practise of adjusting the clearance between the valve stem and the tappet by a business card, etc., is not recommended if accurate timing is desired. When it is considered that the efficiency of the motor depends upon the proper opening, lift and closing of the valves, it will be seen that the work of adjusting the tappets is not best performed by guess work.

It is the exception rather than the rule, that the flywheel of the motor is not marked with the opening and closing points, also the dead centres. These markings also serve to facilitate the setting of the magneto or other ignition system. The points described are indicated by figures and letters. For example: I O 1-4, denotes the opening points of the intake valve of the first or fourth cylinder and I C 1-4, their closing points. Similarly E O and E C denote the opening and closing points respectively of the exhaust members.

The method of utilization of these points is simple. Rotate the flywheel in its normal direction until the mark I O 1-4 comes opposite the arrow or other point on the upper crankcase or cylinder. With the marks registering, the inlet of the first or fourth cylinder should begin to lift. If not, the adjusting nut of the tappet is loosened and the nut member lengthened until the valve stem begins to raise. Lock the nut and rotate the flywheel a half turn until the next valve in the firing sequence lifts. After resetting each, check the openings and closing points a second time to make sure the timing is correct.

A feature of the automobile show held in Lexington, Ky., recently, were the daily runs of the Lexington fire department's motor appa-

Illustrating Use of Flywheel Markings in Timing Opening and Closing Points of the Valves.

ratus, which were held between the hours of 3 and 4 in the afternoon, with demonstrations of the working of the new aerial ladder truck.

WITH THE CYCLECAR MANUFACTURERS.

New Jersey Club Plans First Competitive Events for Memorial Day---O-We-Go and Hawkins Among America's New Models---Initial Machine from Canada.

MEMORIAL Day promises to witness the initial appearance of the American cyclecar in competitive events. Numerous sociability runs are set for that date by various cyclecar clubs throughout the country, but to the Cyclecar Club of New Jersey belongs the honor of announcing the first race meet. This will be held at Dr. Charles G. Percival's farm in Teaneck, at the conclusion of the cross country run from Newark. Dr. Percival is president of the club.

Practically all of the cyclecar clubs and some 38 manufacturers of cyclecars have protested against the control of contests in this field by the American Automobile Association, the sentiment being entirely in favor of leaving such matters to the Cyclecar Manufacturers' National

Latest Model of Woods Mobilette, in Jackson Park, Chicago.

Association. The president of the latter body, W. H. McIntyre, of the Imp Cyclecar Company, Auburn, Ind., has presented a trophy to the Cyclecar Club of New Jersey, which will be awarded to the member winning the greatest number of points in the following six events: Speed-up race, standing start; slow race, low gear; starting race, with motors cold; reverse gear race, 45 yards up-grade; hill climb, 1000 yards, grade of 7:1, and a pint-of-fuel race over a measured course.

Cyclecars also will be prominent among the visiting machines at the international sweepstake 500-mile race on the Indianapolis motor speedway, Memorial Day. Members of the Chicago and Detroit clubs will journey overland to South

Bend, Ind., forming a joint tour from that point into Indianapolis, where they will be the guests of the Hoosier Cyclecar Club.

LATEST WOODS MOBILETTE.

Constructional Details of Second Model Designed by Francis A. Woods.

After experimenting for some 18 months with the original model of the Woods Mobilette, the designer, Francis A. Woods, has made several changes in the construction of the machine bearing his name, chief among these being the substitution of a four-cylinder motor for the two-cylinder unit at first employed. This model No. 2 is being produced at present at 1509 Michigan boulevard, Chicago, by the Woods Mobilette Company. An accompanying illustration shows one of the vehicles in Jackson park, in that city.

Despite its four-cylinder motor, the machine is still a true cyclecar, within the definition of the Cyclecar Manufacturers' National Association. It seats its two passengers tandem, and has wheel-base of 98 inches and tread of 30—the smallest tread of any American cyclecar. The motor has bore of 2.68 inches and stroke of 2.93. Cooling is by air.

The transmission is incorporated with the rear axle. The latter is of the full floating type with full bevel gear differential. The gearset is of the planetary type, affording two forward speeds and reverse. The shifting lever is in the centre of the car, and the selective type quadrant is used. The multiple disc clutch is located in the transmission case. The drive shaft runs in a straight line from the rear axle to the crankshaft, where one universal joint is employed. Springs are semi-elliptic in front and cantilever in the rear. Wheels are of wire, carrying 28 by 2.5-inch tires.

O-WE-GO FROM OWEGO.

Prominent Men Identified with Former Hatfield Truck Manager in This Venture.

Designed under the direction of Charles P. Hatfield, Jr., formerly general manager of the Hatfield Auto Truck Company, Elmira, N. Y.,

O-We-Go Closely Follows Standard Streamline Design for Tandem Machines.

the O-We-Go has made its appearance, and will be manufactured at Owego, N. Y. The concern is styled the O-We-Go Car Company, capitalized for \$150,000, with offices and headquarters at 286 Fifth avenue, New York City. The machine is a tandem seater, with wheelbase of 104 inches, tread of 36, clearance of nine and weight of 600 pounds.

The president of the company is George Ramsey, a prominent New York bank director, also associated with the Riker-Hegeman Drug Company. The vice president is W. I. Payne, who is connected with a number of important New York concerns, including the Standard Oil Company. George R. Ramsey is treasurer and Mr. Hatfield secretary and general manager.

The motor is a two-cylinder, air-cooled V type, rated at 10-12 horsepower. The dimensions are not given. Ignition is by the Atwater Kent Unisparker system, and the carburetor is a float feed type. Lubrication is by force feed.

The friction transmission is of special design, and affords five forward speeds and reverse. The friction plate is supported on a frame entirely separate from the motor, and thrust is taken by means of an extra large ball bearing. The friction wheel runs on a shaft at right angles to the flywheel, and is faced with fibre filler, said to have been molded under a pressure of 50 tons to the inch.

Drive to the rear wheels is by double 1.125-inch V belts. Springs are cantilever, front and rear. The wheels are of extra heavy wire, fitted with 28 by 2.5-inch tires. Brakes are expanding in rear wheel drums. Steering is by 15-inch hand wheel with worm and gear. Control is by spark, throttle and speed shift lever on the steering column and foot accelerator.

Aside from the passenger body, which is of steel and streamline in design, the chassis also is fitted with a light delivery

van with open box or full panel with top. The equipment consists of electric lights, windshield, horn and tools.

It is stated that Mr. Hatfield has been testing the initial machine over all kinds of roads and under all weather conditions in New York State during the past three months, and is thoroughly convinced of its practicability. In

fact, it is maintained that there has been no occasion for changing any of the details of construction, and future models will follow the original drawings.

DETAILS OF THE ZIP.

A Cyclecar That Has Already Gained a Reputation for Long Distance Touring.

One of the makers which, according to the best information available, is ready to ship cars in quantities, is the Zip Cyclecar Company, Davenport, Ia. Zip machines have been undergoing severe road tests throughout the winter, and several long distance trips have been taken. The maker is convinced that its practicability has been thoroughly demonstrated, and that the present design will not need change.

The Zip is a true cyclecar, with side-by-side seating, the driver being located at the left. Special attention is directed to the amount of space between the dash and the back of the seat, 52 inches, which is held to give ample leg room. The wheelbase is 92 inches and the tread 40.

The motor is a two-cylinder, air-cooled V type, with bore of 3.375 inches and stroke of 3.9. Ignition is by Atwater Kent Unisparker, and carburetion by a Schebler. Lubrication is by combined force feed and splash, automatically controlled under all speeds by a four-speed oiler.

The transmission is of the friction type, af-

The Zip, a Well Known Product, Seats Its Passengers Side by Side.

foring any number of speeds forward and reverse. The friction disc is 12 inches in diameter, of special gray iron and mounted on New Departure ball bearings. The friction wheel, or spur wheel as it is termed, is of the same diameter and is provided with a hard fibre filler face 1.25 inches depth. This is mounted on a steel shaft, also utilizing New Departure bearings. The pulley wheels on the end of the jackshaft are adjustable to different gear ratios, ranging from 3:1 to 6:1, and drive to the rear wheels is by 1.125-inch duck wall, non-stretchable belt.

Springs are full elliptic, front and rear. Expanding brakes operate on inside drums on the rear wheels, and the bands are six inches diameter with 1.125-inch face. Both axles are I beam section drop forgings, equipped with grease cups at all bearing points. Wheels are of wire, carrying 28 by 2.5-inch tires. The equipment includes a six-volt, 40 ampere-hour battery, spe-

The Hawkins Has Made Its Initial Appearance from Factory in Xenia O.

cial electric headlights and tail lamps, electric horn under the hood, etc.

FIRST CANADIAN CYCLECAR.

The Wel Doer Makes Its Initial Appearance from Factory in Berlin, Ont.

While it has been stated from time to time that a number of cyclecar concerns were soon to make their appearance in Canada, the first actually to make announcement of a completed vehicle is the Welker-Doerr Company, Berlin, Ont. The machine is a true cyclecar, termed the Wel Doer, and seats its two passengers side by side, with the driver at the right. The wheelbase is 100 inches, the tread 36 inches and the weight 500 pounds.

The motor is a two-cylinder, air-cooled unit, rated at 9-13 horsepower. Ignition is by Berling dual magneto. Transmission is by friction, with final drive by belt. The frame is of reinforced white ash, suspended on quarter-elliptic springs.

Wheels are of wire, fitted with 28 by three-inch tires. The body is of metal, streamline in design, and the equipment includes a single Prest-O-Lite headlight, oil tail lamp, etc. It is stated that a top and windshield also will be fitted, although these do not appear on the original model.

NO STOCK FOR SALE.

Hawkins Cyclecar Company of Xenia, O., Makes Its Initial Announcement.

After undergoing road tests during the past year, the Hawkins cyclecar is being announced by the Hawkins Cyclecar Company, Xenia, O. The concern is capitalized for \$50,000, and it is expressly stated in the announcement that there is no stock for sale. The officers are: President, Hon. George Little; vice president, John W. Prugh; secretary, A. V. Perrill; treasurer, C. H.

Little; engineer and general manager, P. E. Hawkins.

The machine is a true cyclecar, with two passengers seated tandem. The wheelbase is 100 inches and the tread 36. The weight is not stated. The motor is a two-cylinder De Luxe, rated at 9-13 horsepower. Ignition is by Atwater Kent Unisparker, and the carburetor is a Schebler.

Drive is by chain from the motor to the planetary transmission, affording two speeds forward and reverse, mounted on Hyatt roller bearings. Final drive is by 1.125-inch V belts. Springs are cantilever, front and rear. Wheels are of wire, carrying 28 by 2.75-inch tires. Control is by spark and throttle lever on the steering wheel. Standard equipment includes head and tail lights, with Prest-O-Lite tank.

It is expected that demonstrating cars will be placed in the hands of dealers at once.

The motorists of the Chicago Athletic Association and the Chicago Automobile Club, will hold their seventh reliability run June 12-13. The route will be to Peoria and return, and it is planned to cover a distance of 165 miles each day. In the six previous dual tours the C. A. A. men have won five.

Detroit's total production for motor vehicles of all classes for February was 36,890, of which 35,900 were passenger cars.

CLEANING AND LUBRICATING SPRINGS.

THE average motorist, in undertaking the overhaul of the car, generally slightes the springs, especially the cleaning process, and is

They will permit of carrying the spring to the work bench and noting if play exists in the shackles, due to insufficient lubrication or a badly worn bolt.

To disassemble a spring, clamp it in the vise, and unscrew nut of the bolt passing through the centre of the leaves. Open the vise gradually, until the leaves assume their normal shape. They can then be handled easily, and all rust should be removed with emery cloth or an abrasive. After cleaning, prepare a mixture of oil and powdered graphite, smearing the preparation liberally over the bearing surfaces of the leaves. The surplus material is then removed and a little powdered graphite sprinkled on the surfaces during the assembly, which is performed by the aid of the vise. Make sure that the nut of the retaining bolt is set up snugly.

If the shackle bolts are badly worn, it will be necessary to fit new members, and if the shackles are bushed, new bushings will be required, as a new bolt may not eliminate the lost motion. If the parts are in good condition, displace the bolts and make sure that the passages conveying the grease to the bearing surfaces are free. If new bolts are required, it is a good plan to purchase those having a grease cup attached and with grease ways, as they are not expensive.

Irrespective of whether the springs are disassembled or not, all spring clips, shackles, hangers, etc., should be gone over carefully and loose components tightened. Many times the breaking of a leaf is due to a loose clip, and it will generally be noted that the rupture occurs between the clips. Spring pads need inspection.

Conventional Type of Rear Springs and Components Requiring Attention in the Overhaul.

usually content with refilling the grease cups with lubricant. The spring suspension of the machine is deserving of the same careful attention as other components of the chassis, for not only is the comfort of the passengers involved, but there is the possibility of a spring breaking when it is least expected. With some cars the drive is taken through the springs, which makes it necessary that the worn components be replaced if it is not possible to eliminate the lost motion by ordinary methods.

The writer advocates the entire disassembly of the springs when they have not been cleaned and lubricated for some time. This work, however, may be performed by the motorist without removing them from the car, as there are several types of spring spreaders on the market which permit of separating the leaves sufficiently to clean and lubricate. The method is optional with the motorist.

To displace the springs the chassis will have to be so jacked up that all weight is supported by the frame. The method of removing the springs will vary according to their design, and if three-quarter elliptic for example, it will be a simple matter, as they are retained by spring clips.

Springs Should Be Cleaned and Graphited and All Clips, Nuts and Bolts Tightened.

CLEANING AND ADJUSTING BEARINGS.

THE motorist should have at least a working knowledge of how to clean and adjust ball and roller bearings, for these members will require periodic attention. It should be remembered that the cost of either type is such as not to warrant their neglect.

Fig. 1—Type of Roller Bearing.

bearing a maximum freedom of .001 inch. In connection with this, in single radial bearings an axial freedom or end play of the inner race relative to the outer is allowed, this varying with the size of the bearing between the extremes of .0005 to .005 inch for new bearings. If there is an excessive amount of radial or axial motion, it is invariably caused by the admittance of some abrasive between the parts. The amount of wear will depend upon the cutting power of the abrasive and the length of time the foreign matter is between the surfaces.

Many bearing troubles have been traced to the presence of dirt and metallic particles, and often rust is created by the application of water to the parts in which the bearings are mounted. Rust is particularly destructive to ball bearings and its results are noted by pits or depressions. They may also be caused by the presence of acid in the lubricant.

Bearings should not be washed in dirty gasoline. A simple solution of common washing soda and hot water is easily made by using about a handful of soda to a pailful of boiling water. The bearings should be dipped in the fluid to remove all dirt, then immersed in clean kerosene and thoroughly washed. It will take but a few minutes to accomplish both operations, after which the bearings should be inspected.

Many anti-friction bearings are damaged in the removal or application. A common cause of

failure is noted when they are driven in place by blows from an ordinary machinist's hammer applied directly to the bearing face or through the medium of a steel drift or blunt cold chisel. Ball bearings should never be driven in place or removed by the use of steel or hard metal tools because the race members may be permanently sprung or deformed by the treatment.

A wheel puller having two arms and a cross beam should be used when removing a bearing cone. An attachment to permit it to remove a bearing of the unit type, such as a double-row annular, without exerting any pressure on the balls or outer race is depicted at Fig. 2. This consists of a split casting adapted to be clamped loosely around the shaft back of the bearing inner race, and any pressure exerted to remove the bearing is applied directly against the member which is a force fit on the shaft. When any form of hub or bearing puller fails to start the member to which it is applied by direct pull, its action may be accelerated after the screw has been tightened sufficiently to place the parts under a certain initial tension by a few sharp, well directed hammer blows on the beam or main body of the device.

In all cases, where possible, the pressure applied to remove a bearing or part should be exerted directly against the portion that is a tight fit on the shaft or in the housing. In most cases it is the inner member of the bearing that is a force or press fit on the shaft; the outer member is usually a push fit in the housing and may be removed easily.

If it is necessary to force the bearing off with a series of blows, always use a brass or hard babbitt metal bar or drift, or even a piece of hard maple, hemlock or oak. Do not direct all of the

Fig. 2—Construction for Removing Single or Double-Row Annular Bearings Without Exerting Stresses on the Balls.

blows at one point on the bearing as this tends to cramp it and will make it harder to drive off. Distribute them evenly around the entire circumference, always having successive blows at points diametrically opposite. When driving bearings in place, it is always best to use some form of soft metal yoke member or a tubular section piece as indicated at Fig. 4. With either the hammer blows should be distributed evenly.

In adjusting the cup and cone type of bearing, care should be taken not to have it too snug or too loose. The condition of the bearing may be ascertained by jacking up the wheel, then grasping the wheel rim at opposite points and shaking the wheel. Any looseness in the bearings can be detected by lost motion between the wheel hub and spindle, but play in the spindle or its bolt should not be confounded with that in the bearings.

In taking up lost motion considerable judgment must be

Fig. 3—Shimming Ball Bearings.

exercised in screwing up on the adjusting member, not to get this too tight and impose an injurious end pressure on the balls. An excess pressure that will stress the bearing parts dangerously will not make much difference in wheel resistance when turned by hand, although, when the car weight must be sustained at high speeds or when going around corners, the resistance will be increased materially and bearing endurance reduced in proportion. A safe rule to follow is to take up the wear by screwing in the adjustment nut so that the shake or looseness will be eliminated, yet permit the wheel to spin a few revolutions when given an initial impulse. Many motorists make the mistake of adjusting bearings of the take-up type too loosely. This is not desirable any more than the fitting of parts too loosely together. Always lock the adjustment nut securely.

Some bearings are shim adjusted, a number of thin washers of sheet brass being interposed between the bearing cup and retainer as shown at Fig. 3. When taking down an assembly of this nature always keep the shims from any bear-

Fig. 4—Showing How the Blows of a Hammer May Be Distributed Evenly with Tubular Tool.

ing together and tagged for future identification to insure that the adjustment made at the factory will be maintained in the reassembly. If the bearings are loose for any reason, add thin shims about .005 inch thick to the others until there is no apparent lost motion and yet no binding between bearing parts.

A good lubricant for bearings is slush made of pure vaseline and lighter mineral oil, this being heated to make its viscosity less and enable it to penetrate to all parts of the bearing. When the bearings have been dipped in this and allowed to remain long enough to permit the oil to reach all parts, they are taken out and allowed to cool, and the surplus lubricant wiped off the outside. Such a mixture will stay in place and will not run out like lighter oils.

The same care and attention should be given roller bearings and the suggestions for adjusting the ball types may be utilized. Care must be taken, however, not to set the rollers up too snugly. With either ball or roller types, if a ball or roller is worn, it is best to renew all.

Fig. 5—Components of Ball Bearings Used in Adjusting, and Parts Requiring Care in the Work.

OVERHAULING STEERING GEAR AND LINKAGE.

TOO much emphasis cannot be laid upon the importance of thoroughly overhauling the steering gear and its linkage and the work of restoring or adjusting worn parts must be carefully performed. The steering gear mechanism is subjected to continuous operation when in service and no expense should be spared to place it in the very best possible condition.

Play in the Drag Link Is Not Desirable.

While a slight amount of play in the wheel is permissible, undue lost motion is undesirable and should be eliminated, for it not only makes for difficult steering, but prevents perfect control of the machine in crowded traffic and on uneven thoroughfares. When deep sand is encountered or rutty roads traversed, the gear and its linkage are subjected to abnormal stresses.

Before attributing lost motion to the gears, note if the wheel is secure on the steering column. It is possible that a worn key may be responsible for some of the looseness. Inspect the method of retaining the spider to the wheel rim and tighten any screws or bolts utilized. Next note if the bracket or bearing in which the column or shaft rotates has undue play. Where the shaft turns within a tube make sure that its supports are not loose. It is a good plan to lubricate the bearings of the control rods when these members are contained within the tubing.

Having made sure that there is no undue stiffness in the operation of these members and that they are well lubricated, test the hand wheel and note the amount of play. This play or back lash is generally caused by wear of the gears or the bearings. Lost motion should not be confounded with wear of the linkage and, to properly test for back lash, hold the ball arm securely and try the wheel. It is possible that the lost motion may be due to the linkage and not caused by worn gears.

Adjusting means are generally provided, making it possible to change the gear relations

and bring the parts into closer engagement. A steering gear of the worm and gear type is shown in an accompanying illustration with the components utilized in making adjustments lettered. It will be noted that a notched nut is provided and that it is locked by a dowel screw. To tighten up the bearing or to eliminate end thrust of the column, remove the dowel screw and turn the notched nut to the right. In making the adjustment, as well as with all others, jack up both front wheels clear of the floor, as this will prevent stresses to the steering gear and linkage, which might otherwise ensue with the wheels on the ground.

If it be found that backlash of the gears is present, it may be reduced by turning the bushing where the ball arm shaft enters the gearcase. As rotating this bushing lowers or raises the steering post, the bearing supporting the end of the shaft should be loosened from the frame sufficiently to allow replacing or removing shims between the bearing and the frame, also to prevent cramping of the shaft in the bearing.

When adjustment of the bushing fails to correct lost motion, the ball arm shaft will have to be removed and turned through an angle of 180 degrees, which will bring an unworn section of the gear into mesh with the worm. Before attempting this work the ball arm should be removed, which operation is accomplished by loosening a nut and bolt, and disconnecting the drag-link. Before replacing the arm it will be necessary to file a notch through the upper corner of the squared section of the shaft, diametrically opposite to the original notch, so as to permit the bolt, which retains the assembly, to be replaced.

The larger illustration shows the steering gear assembly utilized on a well known make of

Depleting Components of the Front Axle in Which Lost Motion Should Be Eliminated.

car, which is of the worm and gear type. To eliminate play the wheels should first be jacked up, then the clamping bolts A and B should be

loosened. Next, turn the slotted adjusting nut to the right until play is eliminated. Turn the wheel around as far as it will go and adjust the worm

End Thrust of the Steering Column Is Eliminated by Means of the Notched Nut.

gear by turning the eccentric bushing on the ball arm shaft. This adjustment should be made with the wheel in the extreme right and left positions, as the wear occurs in the centre.

If the bushing has been adjusted several times and the play remains, it will be necessary to displace the ball arm by first removing the clamping bolt C. The steering wheel is then turned 1.5 times around to present one of the surfaces, of which there are four. The adjustment is made as previously described. It will be noted that the method is similar to that employed with the first named gear. The gears should be packed in a suitable grease and all nuts and bolts tightened securely.

The next step in the inspection of the steering mechanism is the draglink. Generally the end attached to the ball arm shaft is adjustable. Remove the cotter pin and screw out the adjusting plug, clean the parts and repack with grease. Lost motion is eliminated by screwing in the plug, and be sure to replace the cotter pin. The connection at the steering arm should be treated in a similar manner, and if boots are utilized they should be cleaned and repacked with grease.

Coming next to the front axle: Chock the wheels between the steering knuckle and the axle to prevent wear of the spindle bolt being confused with lost motion in the tierod. The tierod bolts may be respon-

sible for lost motion, and the yokes generally are provided with removable bushings. If considerable wear exists it will be better to fit new bolts as well. If the members are in good condition, displace, clean and refill the grease or oil cups, making sure that none of the passages are clogged.

Under the head of steering mechanism should be included the spindle bolts, those members retaining the knuckles. Displace and examine these members if only for cleaning. By removing the chocks previously referred to and rocking the wheel, it can be determined whether or not new bolts will be needed. The knuckles are usually fitted with bushings, and new members, as well as bolts, are not expensive.

Before lowering the wheels to the floor, test the action of the steering gear very thoroughly. It should move freely, and if not, the adjustments should be gone over to note the cause of binding. It frequently happens that a gear that operates easily when the wheels are jacked up, will be stiff when the wheels are carrying a load. Do not hurry the work on the steering mechanism or its linkage. Be thorough in every detail, and after the trial trip go over all nuts and bolts, to make sure they are snug. The careful, experienced motorist gives the mechanism frequent attention.

The Long Island Motor Parkway was opened for the season April 4. The road runs from Queens to Lake Ronkonkoma, a distance of 45 miles, and the particular feature is that it is without speed traps or dust. All grade crossings have been eliminated for the first 30 miles, this involving the bridging of three railroad branches and two trolley lines.

The Automobile Club of Utica, N. Y., plans, among other improvements, to place about 200 road signs in vicinity of that city this summer.

Conventional Type of Steering Gear with the Parts Utilised in Adjusting Lettered.

MOTOR COMPONENTS REQUIRING ATTENTION.

WHEN dismantling of the motor is necessary to make replacements and adjustments, a knowledge of the procedure will be essential. As-

To Remove Rings Insert Thin Strips of Metal as Shown.

suming that new bushings are required for the wristpins, new rings are to be fitted and bearings are to be taken up: The first step is to drain the water from the circulating system, shut off the supply

of fuel to the carburetor and disconnect the main pipe. Next remove the unions of the oil pipes leading to the dash indicator, if they be used, and, if a coil be employed in the ignition system, disconnect the leads, tagging them if not familiar with the wiring plan. Make sure that the exhaust manifold is free from the exhaust pipe, and all other components, such as the bolts retaining the power plant, for example. A little study of the method of suspension will simplify the work. If the motor is to be removed from the frame, a falls and tackle will be needed, or several persons may lift it out and onto the motor stand.

Remove the following components in the order named: Spark plugs, valve plugs, valve springs, valves, intake manifold and carburetor, exhaust manifold, oiler (if exterior member), fan belt, lower half of crankcase, inlet and outlet water pipes and cylinders. This order may be varied slightly, however, according to the design of the motor.

To remove the cylinders, loosen the nuts, and if the cylinders are cast en bloc, two or more persons may be necessary. If single or in pairs, one person can displace them by standing on the frame and lifting upward. This work should be done carefully to prevent injury to the pistons and rings. Place the cylinders to one side for cleaning, marking them if not numbered, and disconnect the connecting rods at their large ends. Note their position so as to insure correct replacement and number the rods with a prick punch if not marked. As the subject of worn bearings, including wristpin bushings, etc., is treated elsewhere, it will not be discussed herein.

Clean the pistons and rings thoroughly before inspecting these members. As the rings are fragile and broken easily, care must be taken in removing them from the piston. By using three old hacksaw blades or thin strips of metal, inserting these as shown in an accompanying illustration, the ring can be slipped off the piston easily. Start with the top ring in removing and put on the bottom ring first in replacing. Clean all carbon from the piston, rings and their seats and note if the edges bearing against the cylinder walls are bright. Discolored spots indicate that the gas is escaping, and that the walls of the cylinder are not true or the rings do not fit properly. Relative to fitting new rings: The work will require the services of an expert, and as the pistons are out of the cylinders it will be a simple matter to take them to the repairman for his opinion.

In an accompanying illustration is shown the Leak-Proof piston ring, made by the McQuay-Norris Manufacturing Company, St. Louis, Mo. This ring is specially adapted to motors with which compression troubles, as well as leakage, are experienced, and, being a two-piece construction with no open joints, gas cannot escape. The company supplies very complete details as to fitting, etc. The writer knows of many instances where the use of the Leak-Proof ring has cured ring troubles, as well as greatly improved the efficiency of the motor.

In replacing the old rings on a piston, lubricate them and their seats and make sure that the openings do not register. If three rings are employed, space the openings equidistant. Pinned types will not require this precaution.

Assuming that the connecting rod bearings and wristpins have been scraped in or adjusted

Showing Assembly of Connecting Rod, Piston, Rings and Wristpin, also These Members Separately.

for lost motion: Before replacing the cylinders it will be well to note if the axis of the bearing is exactly in line with the wristpin. The centre line of the wristpin bushing will frequently be found to be inclined toward the centre line of the crankshaft, owing to the fact that the connecting rod is slightly out of alignment. It is not always easy to detect the defect before assembling and to facilitate matters the device shown in an accompanying illustration will be of service.

The method indicated at A consists of clamping the rod to a round metal bar supported on a surface plate and using a steel try square as shown. That at B illustrates another manner, it being assumed that the upper surface of the crankcase is planed true. Any variation should be corrected by the bearings, for if the piston is not in alignment with the bearing, undue wear of the walls of the cylinder will result.

Motor with Cylinders Removed, to Indicate Places Subject to Carbon Deposits.

In replacing the cylinder on the pistons, the connecting rod should be placed in a vertical position. The work will require two persons, at least, one to steady the pistons and compress the top ring, while the cylinder is lowered. Care must be taken not to attempt to force the cylinder over the rings, for if they be fully compressed and the cylinder held vertically, it will be an easy matter.

The work is simplified when a piston ring clamp is employed. These may be purchased or made. To make a clamp, employ a flexible strip of metal slightly larger than the circumference of the ring. Form the strip into a circle and bend the ends so that they can be gripped by a pair of pliers. By slipping the clamp over the ring and compressing it by the pliers, the ring will be seated, enabling the cylinder to be fitted. It is

best to have one person operate the pliers while another slips cylinder on the piston.

Leak-Proof Piston Ring Designed to Improve Compression.

In reassembling the exterior components of the power plant special pains should be taken to insure that the exhaust and intake manifolds and pipes are proof against leakage. If gaskets are utilized do not use the old members unless in perfect condition, as new ones are inexpensive. It should be borne in mind that any leakage of air in the intake assembly between the carburetor and the cylinders will result in the motor missing at low speeds, as well as upset all attempts to adjust the carburetor for low and high speeds.

Where parts are subject to heat the gaskets must be of a non-burning material. There are a number of excellent makes marketed and these may be obtained in the desired sizes at any supply house. The copper-asbestos gaskets made by the Victor Manufacturing & Gasket Company, Chicago, are carried by the supply houses, and come in assorted sizes and for all kinds of work.

If gaskets are employed between the cylinders and upper crankcase, new ones can be made of heavy wrapping paper. These can be cut out by placing the material over the open end of the cylinder and tapping the edges lightly with a ball peen hammer.

With some types of motors felt gaskets are employed between the halves of the crankcase, and unless equipped with a gasket cutting tool it is best to purchase one from the factory or nearest service station, although they can be obtained from concerns making a specialty of felt gaskets.

Lakewood, N. J., is to have an automobile race track and plans are now being completed for its construction. About \$20,000 has been raised.

Method of Verifying Alignment of Bearings with Wristpin, Etc.

CLEANING THE LUBRICATION SYSTEM.

TO MINIMIZE the friction of the working parts of the power plant manufacturers of lubricating oils have spent vast sums in experi-

Illustrating Components of Constant Circulation Lubrication System.

mentation to obtain a lubricant that will fulfill the peculiar requirements of the internal combustion engine. Assuming that the motorist employs nothing but the best grade of oil, efficiency will not be obtained unless it is clean and supplied in the proper quantity to the working parts.

It should be borne in mind that after the lubricant has been in service for some time its efficiency will be impaired because of the foreign elements collected in the operation of the motor. While the majority of lubricating systems include a screen for filtering the oil, it is important that the old lubricant be drained from the crankcase or reservoir and the last named thoroughly washed with kerosene. It will be surprising how dirty the lubricant will become after continued service. This cleaning of the crankcase or reservoir and refilling with fresh, clean oil, should be performed frequently and in accordance with the instructions of the maker.

Lubrication systems may be divided into two general classes, splash and pressure, and these combined. The principle of the splash system is one in which the connecting rods dip into an oil reservoir, splashing the lubricant to the working parts of the motor, and the system may include means for feeding the lubricant to the crankcase. The pressure or constant circulating principle involves the delivery of the lubricant from the reservoir through piping to the main bearings, wristpins, etc., from which the excess oil gravitates back to the reservoir, whence it is again taken up by the pump and again circulated. The splash-pressure system is a combination of the two above described.

Owing to the different locations of the strainers, pumps and gauges, other than general directions for their care will not be given. Generally, the instruction book gives a diagram of the lubricating system and states the method of displacing the screen and adjusting the pump. The filter will need removing and washing in gasoline and all components of the pump mechanism should be inspected for undue wear.

If the motor has been in service for some time it is advisable to clean all oil pipes by running gasoline through them. Similarly, the devices indicating the supply of lubricant in the reservoir should be tested to note if they register properly. An accompanying illustration shows the mechanism actuated by a float, also a sectional view of a plunger pump and the parts employed in adjusting it.

If the power plant has been thoroughly overhauled and the bearings taken up, it will be necessary to increase the supply of lubricant over normal until the bearings have worn in. To do this a knowledge of the pump mechanism will be essential. The plunger type of pump is adjusted by increasing the stroke of the plunger, permitting it to draw in and force a larger amount of oil to the working parts. The mechanical oiler is used on old cars and is adjusted in a similar manner.

In the Classified Buyers' Guide will be found the names of makers of high grade motor lubricants and any of these will forward information

Lubrication Systems: A, Arrangement of Mechanism Indicating Supply in Reservoir; B, Components of Plunger Pump and Parts Utilized in Adjustment.

as to the best grade of oil to employ with the motor. Price should never be considered in motor lubricants, as a cheap oil is dear at any price.

REACHES FOURTH EDITION.**Popular Demand for Interesting Book Published by Empire Automobile Company.**

The Transcontinental Empire book, which describes in pictures and story the 4000-mile Indiana-Pacific tour of last July, has just gone into its fourth edition, and, according to the publisher, the Empire Automobile Company, Indianapolis, Ind., "the peak load" of the demand does not yet appear to have been reached. If the popularity of the book does not wane, its circulation will soon reach the proportion of the "best sellers", when editions ran into hundreds of thousands.

While much space is devoted therein to the performance of the Empire car, the main feature is a description of the Indiana-Pacific tour as a whole. The more difficult and interesting regions are quite graphically described and illustrated; the various types of country encountered are portrayed, and the motoring conditions are set forth in a manner that gives the reader glimpses of the wonders and pleasures, as well as the hazards and hardships met with on transcontinental journeys.

One of the interesting facts brought out by the demand for the book is that there are large numbers of motorists who are planning transcontinental tours for this summer and in 1915. Scores of those who have written the Empire company have told of their plans and, in many cases, they have asked for additional information and advice. Harlow Hyde, of the company, who made the trip, took the pictures and wrote the book, has been much surprised to learn of the widespread interest in such travelling. The book is mailed free upon application to the company.

DEMISE OF J. ELWOOD LEE.**Well Known Tire Manufacturer Is a Victim of Heart Failure.**

Word has been received of the death of J. Elwood Lee, inventor of the Lee tire and president

of the Lee Tire & Rubber Company, Conshohocken, Penn. Death was attributed to heart failure. In 1905 Mr. Lee went into the motor car tire business and founded the Lee Tire & Rubber Company. He was also vice president of Johnson & Johnson, Philadelphia and New Brunswick, N. J., producer of surgical instruments. Mr. Lee is survived by his widow and three children.

PENNANTS SHOW DESTINATION.**Pittsburg Department Store Adopts Novel Method with Its Fleet of White Trucks.**

In order that the public may know the wide radius within which goods are delivered by the 40 White trucks, made by the White Company, Cleveland, O., and operated by the Kaufmann & Baer Company, Pittsburg, Penn., the firm has

Fleet of White Trucks Operated by the Kaufmann & Baer Company, a Pittsburg Department Store.

adopted the use of pennants. These show the destination of each vehicle, somewhat after the manner in which signs on street cars indicate the districts served.

The Kaufmann & Baer Company has one of the newest department stores in that city, and the plan was inaugurated to direct attention to the service which might be expected. All of the trucks are uniform in design and the bodies, which are unusually attractive in appearance, have actual reproductions of the new store building on each panel. Two pennants are attached to staffs at the front of each truck.

The following concerns have been elected to membership in the Motor & Accessory Manufacturers: T. P. Howell & Co., Newark, N. J.; the Perfection Spring Company, Cleveland, and the Pittsburg Steel Products Company, Pittsburg, Penn.

CARBURETORS AND THE FUEL SYSTEM.

EVERY motorist who drives his own machine should have at least a working knowledge of the carburetor fitted to his motor so as to be

Fig. 1—Sectional View of Stromberg Carburetor.

able to clean and adjust it during the overhaul and throughout the driving season. Carburetors are not so complicated as some imagine and a little study of the design utilized should enable one to adjust the instrument so as to obtain an efficient as well as an economical mixture. Views of standard makes are presented herein with their components lettered, which will prove of service in making adjustments or cleaning.

Rayfield.

The adjustment of Rayfield carburetors is simple. At Fig. 2 is illustrated an exterior view of the water jacketed type with the components utilized in adjusting clearly lettered. The low speed is set first by turning the low speed screw to the left until the arm member above it and slightly to the right just breaks contact with the cam above that. Next turn the slow speed screw 1.5 turns to the right, open the throttle about one-quarter, prime the carburetor and start the motor. Close the throttle until the motor runs slowly without stopping, then turn the low speed screw to the left, cutting down the fuel, and do this one notch at a time until the engine idles smoothly. The desired speed may be obtained by the adjustment of the screw in the top arm to the left, using a screw driver.

Open the throttle slowly until wide open. If the motor backfires, turn the high speed adjusting screw to the right, a half turn at a time, until each cylinder fires evenly. Should the motor not backfire, turn the high speed screw to the left until it does, then to the right until it runs smoothly. This insures economy of fuel and efficiency as well.

One is apt in setting the Rayfield, for the first time, to obtain too lean a mixture, which makes it sensitive to climatic changes. The low speed should not be touched in setting the high, but should the motor backfire with the throttle about one-quarter open, the automatic air valve adjustment should be turned to the right, a turn or two, increasing the tension of the spring and decreasing the amount of air slightly. For very high altitudes the maker recommends setting the air valve so that it seats a trifle lighter and cutting down slightly on the low and high speed fuel adjustments. It should be remembered that the automatic air valve must be seated when the motor is idling. It is further suggested that starting is made easier when the throttle is about one-quarter open. The float chamber is drained by removing the plug member.

Stromberg.

The Stromberg carburetors are produced in a number of types, having single and dual jets. They are not difficult to set, as there are but two adjustments, a low

and a high speed, these components being shown at N and LN in the sectional view at Fig. 1. As the adjustment of other types is similar a description of the design illustrated will serve all practical purposes.

Since it is possible that climatic changes may compel a slight alteration of the original setting, it is well to have a knowledge of the work involved. The low and high speeds are adjusted separately. The proper low speed mixture is obtained by turning the nut N up or down until the low speed spring SL seats the valve AV lightly. By this is meant that the tension is sufficient to retain the valve on its seat. It is important that the high speed spring should have about .06125 inch play. By rotating the nut LN up or down, and by turning it one notch at a time, the desired, even idle, operation of the motor is secured. This is obtained with the spark retarded and the throttle but slightly open. After the motor has become warm, retard the throttle and note if it runs as slowly as desired. If not, move out the screw acting as a stop for the lever. To increase the speed move in the screw.

To adjust the high speed, advance the spark and open the throttle, and if the motor backfires or shows an indication of a weak mixture, turn up the nut LN a notch at a time. If too rich, rotate the nut in the opposite direction. It is important that the high speed spring have at least .03125 inch play when the motor is idling. The season adjustment is shown at SA and this should be open in warm weather.

The height of the float and proper size of the nozzle is determined at the factory and should not require any attention. If it becomes necessary to displace the nozzle it is accessible by taking off the nut P, after which the nozzle PN can be removed with a screw driver. The float chamber may be drained by opening the petcock DC. Should this fail to remove obstructions in the fuel line above the inlet pipe, take off the nut C and clean the filter.

Too much air is usually denoted by the motor being hard to start; by its speeding up upon closing the air valve; by the engine being slow to respond when opening the throttle, and by back firing. A lack of fuel presents similar symptoms. Too much fuel and not enough air is known by the motor speeding up when the air valve is opened slightly; by missing when the car is being operated slowly on the level, and by failing to pick up when the clutch is disengaged. The last named condition indicates a very rich mixture.

Schebler.

Schebler carburetors are made in several types, these including models F, L, O and R. Models O, L and R are shown at Figs. 3, 4 and 6 respectively, with their components lettered. Models F and L have single jets, although provision is made for adjustment of the high, intermediate and low speeds, and both are fitted with the lift type of needle, this member providing more fuel and proportionately to the speed of the motor.

To set the model L the low speed needle valve, Fig. 6, is screwed in until it seats firmly. Next, unscrew it

Fig. 2—Rayfield Carburetor, with Components Utilized in Adjusting and Cleaning Lettered.

about a turn and a half, and prime or flood the carburetor. Open the throttle slightly less than two-thirds way and, with the spark retarded, start the motor. Change position of low speed needle until the engine

Fig. 3—Model O Schebler Carburetor, a Two-Jet Construction.

runs smoothly. If it operates too fast, move out the adjusting screw, which restricts the opening of the butterfly valve. If the motor stalls, move the screw in.

The low speed member must not be disturbed in making the adjustment of the intermediate and high speeds. These are obtained by moving the arms or pointers on the dials, of which there are two. The intermediate speed is adjusted first and has three numbers, 1, 2, 3. Move the arm or pointer about half-way from the figure 1 toward the figure 3. Next advance the spark and open the throttle so that the roller moving with the track like member beneath the dials is in line with the intermediate speed dial. It is important that the auxiliary air valve seat lightly.

If the motor backfires with the spark and throttle in this position, increase the amount of fuel by moving the arm towards the figure 3, or if the mixture be too rich, back toward the figure 1. A little experimentation will secure the proper position. Noting the color and odor of the exhaust also will be of value.

The high speed is secured by utilizing the other pointer and dial, and with the throttle wide open. The maker of the Schebler recommends cutting down the supply of fuel until the motor shows signs of back firing, then increasing the amount until the engine runs smoothly and evenly. Turn the low speed member a notch at a time and note the results. In adjusting the arms, do not move these more than half-way at a time between the graduated divisions or marks. Slight variations may be necessary in setting the speeds as, frequently, apparent proper operation with the motor idle will not obtain the desired results under load.

Model F.

The model F is similar to L, differing in that but one dial is provided. The low speed is set in the same manner, but with the intermediate the spark is advanced about one-quarter and with the throttle one-third open. In this position cutting down the fuel by screwing in the needle or slow speed member should not result in speeding up the motor. This indicates that the point of the needle is too large. The engine should run smoothly, and will, if the needle is of the proper size. As previously pointed out, the proper needle is inserted at the factory and the above suggestion is made for the benefit of those who fit new carburetors.

The adjustment for the high speed is secured by advancing the spark one-quarter and with the throttle open to its maximum. The arm or pointer should stand at the figure 1 on the dial. If the motor backfires it indicates that more fuel is required, and this is obtained by moving the arm toward the figure 3. If the back-firing continues and with the arm at 2, increase the tension of the spring of the auxiliary air valve: that is, cut down the air supply.

Model O.

The model O is supplied with two jets, these being shown at Fig. 3 by the letters I and E respectively. In adjusting this type the auxiliary air valve is seated

lightly and the needle members I and E screwed in until seated firmly. Do not use pressure. Next turn the valve E to the left about three turns, open the throttle about one-third and start the engine.

After the motor is warm, turn the valve E to the right until it operates smoothly and slowly with the throttle nearly closed. Open the throttle slowly until about one-third open and if the motor backfires screw in the adjusting screw until it runs evenly. Next open the throttle wide, and if the motor backfires at speed, turn the needle member I to the left until the missing ceases. The second jet is not utilized until the car attains a speed of from 18 to 25 miles an hour, or a motor speed of from 700 to 1000 revolutions a minute. The needle or jet I is not difficult to adjust and when set for high speeds exposes from one to four threads of the knurl.

To clean the Schebler models described the nut retaining the bowl or float chamber is removed, although sediment in the spraying nozzles can sometimes be displaced by cranking with the primary air passages closed. This exerts considerable suction, which will invariably remove small particles.

Model R.

Two adjustments are provided in the model R Schebler, the latest design, which is shown at Fig. 4. Turning the air cap A to the right augments the supply of fuel; in the opposite direction, decreases the amount or makes for a leaner mixture, in that the needle valve is lowered. The high speed is regulated by the tension of the auxiliary air spring. The low speed needle is indicated by the letter E. The adjustment is obtained by means of a Bowden cable W from the steering column of the car, the wire being connected to the bell crank lever B, which raises or lowers the needle as desired. The lever on the steering column is so attached that when in a central position the mixture is correct for low speed. The operating position is when the boss of the lever is against the stop. The lever should then register with the words "Lean" or "Air". This permits of the driver altering the position of the needle valve to meet atmospheric changes, and to enrich the mixture for starting when the motor is cold.

The carburetor shown at Fig. 5 is utilized in a popular make of machine and has but one adjustment, that of the needle valve, which is operated from the seat. As the components are lettered, a little study of the construction will enable one to make any needed adjustments or cleaning.

Cleaning the Fuel System.

The writer advocates the cleaning of the fuel system in the spring overhaul, and especially if the car has been inoperative for a considerable period. All fuel should be drawn from the sup-

Fig. 4—Model R Schebler, Having Two Adjustments.

ply tank and it will be useful for cleaning purposes. The tanks ought to be thoroughly cleaned, and if the machine has seen considerable service,

all supply pipes should be disconnected and examined for chafed or worn places.

The gravity system is easily inspected by ex-

Fig. 5—The Design Employed with a Popular Make of Machine.

amining the petcocks, filters and unions. If the fuel container is located under the seats, note if it be firmly retained. It may be that some of the retaining screws or bolts are loose. Leads from the tank to the carburetor or indicating devices should be secured to prevent play or vibration.

The pressure feed system should be gone over after disassembly and tested for leakage. Utilize the hand pump to obtain a few pounds pressure and test all joints and connections with soap suds. This method is more satisfactory than oil as minute leaks are detected more readily. The adjustment of the pressure regulator and pump should be performed according to the type employed. Where the pressure is obtained from the exhaust, the ball check valves should be removed and cleaned, as more or less soot may be present, making it necessary to utilize the hand pump when the machine is being operated slowly.

Too much emphasis cannot be laid upon the importance of straining all fuel when the supply is replenished by the owner or at a garage. It is better to take a little more time to see that the gasoline is filtered properly than to be delayed on the road by cleaning a carburetor. It should be borne in mind that the spray nozzles have very fine apertures and are easily clogged by foreign elements.

HANDLES HARDMAN TIRES.

Locates Distributor for Southern and Western New England in Hartford, Conn.

The Hardman Tire & Rubber Company, Belleville, N. J., announces that the distribution

of Hardman tires in southern and western New England will be handled by the Hardman Tire Agency, which has opened a fully equipped store at 177 Allyn street, Hartford, Conn. Walter Gallup, formerly of Hyde Park, Mass., who has been in the employ of the company at the factory, is general manager, and already reports a generous demand for these tires.

The Hardman tire is made by the single cure wrapped tread process, which, because the tire is built and cured simultaneously, in one operation, is held to cause the component parts to adhere more uniformly. It is maintained that the different layers are not likely to separate, and that the result is a much longer life.

Particular attention is drawn to the Hardman Sure Grip tread, which consists of a series of indentations on either side of parallel bars along the tread, so arranged as to provide an especially effective tendency to prevent spinning on slippery surfaces. This is held to present additional qualities, in that the extra heavy traction tread makes for greatly increased mileage.

Entry blanks calling for cars to be used in conveying the orphans to and from the playgrounds on their 10th annual outing, to be held June 4, have made their appearance along Automobile Row, in New York City. The following donations have been received: Stutz Motor Car Company, two touring cars; Poertner Motor Car Company, three touring cars; Henry Caldwell, one touring car; H. M. Hanks, Springfield, cash contribution; S. A. Miles, \$25; E. Lascaris, \$10, and the Locomobile Company of America, \$25. Those wishing to contribute to this cause may

Fig. 6—The Model L Schebler, Having Three Fuel Adjustments.

send their donations to the association's secretary, A. L. Prindle, 7 East 42nd street, New York City.

CHESTER DEMOUNTABLE RIM.

Designed for Ford Cars and Requires No Alteration of Wheel.

Many owners of Ford cars desiring to equip their machines with demountable rims have decided that the expense involved in altering the wheels, purchasing new casings, etc., does not warrant the outlay. Many times an owner does not care to lose the services of the car while the work of altering the wheels is being performed. The problem of equipping the Ford automobile with demountable rims, and without altering the wheels, has been solved by the Chester Demountable Rim Company, Fall River, Mass., manufacturer of the Chester rim, shown in an accompanying illustration.

The construction differs from conventional practise, in that no cutting down of the spokes or building up the felloes, drilling, fitting new bands, etc., are necessary. Another quality of the design is that there are no bolts to work loose on the felloe and that only five nuts are utilized. Rings, levers, etc., are also eliminated.

A feature of the Chester rim that will appeal to owners is the statement made by the maker that the equipment can be attached in about 20 minutes. The regular clincher rim is not disturbed, as the retaining construction shown at D is easily fitted to the old rim as indicated at C. The new rim A has spot welded edges and is slipped over the old member as illustrated at B. The rim and its casing is secured by a simple clamp and locking nut, there being five of these members. Their removal and replacement is accomplished by a double socket wrench.

Another quality of the Chester rim is that the same size shoes, 32 by three inches, are used all around. This oversize makes for easier riding qualities and tire economy, and the company is prepared to supply some interesting figures on tire mileage obtained with its equipment.

NOT GOING TO LYONS.

Hazard Motor Company States There Is No Foundation in the Report.

Elsewhere in this issue will be found the substance of a dispatch from Lyons, N. Y., in which

it was suggested that the Hazard Motor Manufacturing Company of Rochester, N. Y., was interested in a plan looking toward its removal to the former city. Since that section of the magazine was printed, The Automobile Journal has been advised by the Hazard company that the report is not in accordance with the facts. This is taken to mean that this company does not contemplate removal from its present location.

INFORMATION ON LUBRICATION.

Manufacturer of Non-Fluid Oil Publishing Interesting Booklet for Owners.

"Where can I find a book that will give me the information I need regarding the lubrication of my car?" is a question often asked by the car owner, especially the new owner. Having learned by experience that there is a large demand for enlightenment on this important subject, the N. Y. & N. J. Lubricant Company, 165 Broadway,

Chester Demountable Rim for Ford Cars: A, Rim with Spot Welded Edges; B, Rim Being Demounted; C, Attachments in Position to Receive Rim; D, Members, Which Hold Rim to Wheel; E, Rim Locked in Place.

New York City, maker of Non-Fluid oil and Motorol, has recently issued a revised edition of its booklet, "Lubrication of the Motor Car".

In this booklet the problems of motor car lubrication are thoroughly covered, and the text matter is profusely illustrated with drawings of the different parts of the car. Among other things are some hints as to the proper lubricants to use, and some simple tests for distinguishing the difference between the various grades. A particularly valuable feature is a complete lubricating chart inserted in the centre, designed to show at a glance every part requiring lubricant. Accompanying this chart, and listed in tabular form, are the names of the different parts arranged to show the intervals at which lubricant should be applied.

A copy of this valuable booklet will be mailed free upon application to the company, if the writer mentions The Automobile Journal.

PREPARING THE TIRE EQUIPMENT.

THE experienced motorist does not neglect inspecting the tires and rims, and the removal of these members is among the first steps of the overhaul. It insures that the tire equipment will be given the attention necessary and provides ample time to make any repairs needed or have the work done by the expert. While it would appear that the removal of four apparently good shoes from the rims involves useless labor, it should be borne in

Wizard Vulcanizer.

mind that the interior of a casing cannot be judged by its exterior. Many times a shoe that appears perfect from the outside will be found to have loose fabric. Then again punctures may have allowed moisture to penetrate to the inner fabric, laying the foundation for a blow-out.

The type of rim employed will determine how best to remove the tire, and with some designs the casing may be displaced more easily when the rim is on the wheel. If it be found that the shoe is what is termed frozen, considerable care will be necessary to prevent injury in its removal.

Clean the shoes and examine their interior for loose or broken fabric. Discolored interiors indicate, as a rule, that water has found its way through a puncture and that deterioration of the fabric has begun. The section should be backed up by cementing fabric, or the casing should be taken to the tire expert. If in doubt as to an old shoe have the tire man pass upon it.

Inspect the exterior very carefully for cuts and if any exist probe these to make sure that dirt or other foreign elements are not present, for if allowed to remain they will work through to the tread, causing it to separate from the fabric. Sand blisters, so-called because of their bulging appearance, are the result of neglecting cuts. Before attempting to vulcanize, all dirt must be removed and the rubber thoroughly cleaned.

All rims, clincher, quick detachable and de-

mountable, should be gone over carefully and any rough places smoothed up. Remove all rust and other foreign elements by the use of sand-paper or emery cloth and make sure that a clean, smooth surface is obtained.

Wipe the rims clean, then coat them with a rust resisting material. The tire makers recommend painting, etc., but the writer has obtained the best results with graphite. Use the powdered material and enough light oil to form a thick paste. Smear the mixture over rims, and, when they are of the quick detachable or demountable type, make sure that the locking and clamping rings, bolts, nuts, etc., are well graphited, as well as all crevices filled.

Next take a piece of waste or cloth and remove the surplus material. By rubbing, a fine polish may be imparted. Before replacing the tire, sprinkle a little powdered graphite on the rims and their locking mechanism. It will be surprising how easy it will be to remove a shoe and to fit a new one when the rims have been treated in this manner. The moisture resisting qualities are well known.

For the benefit of the new owner who has not utilized the demountable rim, the section view of a well known make will be of value in the work. The components are lettered and a little study should enable one to disassemble and reassemble the parts correctly.

The inner tubes will require careful attention. If, in displacing the shoes, it is found that a tube is frozen to the casing, do not use force, but employ gasoline. Inflate the spare tubes, if not new ones, to make sure that a punctured tube has not been placed by mistake with those supposed to

Components of a Standard Make of Quick Detachable, Quick Demountable Rim.

be in good condition. Test the valves and replace all damaged or faulty members with new.

After repairing the tubes, place the spares in a tube bag and sprinkle the interior of the latter with soapstone. An accompanying illustration shows the progressive steps in properly folding a tube, and before folding it will be necessary to remove the valve stem to eliminate the air. A method of removing the air is shown at B. In securing the folds, strips of cloth or sections of an old tube can be utilized, as indicated at F.

Van Steam Vulcanizer.

The marketing of practical and inexpensive vulcanizing outfits enables the motorist to undertake successfully tire and tube repairs. These vulcanizers operate automatically and require little if any experience, and the instructions of the maker are easily followed.

The National Motor Supply Company, Cleveland, O., maker of vulcanizing equipments, is marketing the Wizard, shown in an accompanying illustration. It is of the automatic steam type, has a hollow body partly filled with water and sealed at the factory. A fire box filled with asbestos packing is cast in the bottom of the vulcanizer, and upon pouring a predetermined amount of gasoline or alcohol in the receptacle the fuel is absorbed by the packing. When the fluid is ignited, it burns with a blue flame and no smoke, a series of draft holes being open in the firing chamber. As the temperature is automatically controlled, the vulcanizer requires no attention after lighting, and it is stated that perfect vulcanization can be obtained in five minutes.

The Wizard has a vulcanizing face six inches long and three wide. It is curved to conform to a casing against which it is clamped by an adjustable chain held by special retainers. When tubes are to be repaired a plate is employed. The Wizard permits of repairing shoes without removing them from the wheel. The equipment is very complete, including rubber, cement shears, instructions, etc., packed in a neat wood box.

The Vanderpool Company, Springfield, O., manufactures vulcanizers for the owner, garage and repair shop. One of its portable types is shown in an accompanying illustration, and the Van, as it is called, utilizes steam for obtaining the proper vulcanizing temperature. As will be noted by the illustration, the equipment can be employed to repair a casing without removing

it from the wheel. It is also adapted for vulcanizing inner tubes. The same high grade material and workmanship is incorporated in the Van as is noticeable of the other equipment produced by this company.

No consideration has been given to the inflation of tires, but the subject may be dismissed by calling attention to the importance of following the instructions of the maker. If new casings are to be purchased and carried for spares, they should be protected from the elements by a tire cover. In strapping or locking the extra members to the tire irons or supports, make sure that there is no play, as a new shoe can be ruined in a very short time by chafing.

HAS TWO COURSES.

Boston Auto School Offers Special Instruction for Those Who Desire It.

Particular attention is being drawn to the personal instruction afforded by the two courses offered by the Boston Auto School, 222 Columbus avenue, Boston, in a neat little folder issued recently. One of these is termed a driving course, in which instruction is given in the heavy traffic of Boston's city streets, as well as in the country and with the late car models. Individual attention is given to all students, and the driving is supplemented by a series of evening lectures by experts in their respective fields.

The shop course is held to be exceedingly practical. The school is maintained by Bonney & Greig, which also operates a repair shop, where cars are brought by the owners for attention and overhaul. The students work on these cars, under the guidance of expert repair men, thereby securing a practical knowledge of various machines and repairs. In addition, the company operates a service department for Rayfield carburetors and another for overhauling and adjusting magnetos. Instruction in these branches is supplied free to all shop students.

Showing the Progressive Steps in Folding a Spare Tube.

ELIMINATING WASTE IN COLE PLANT.

SPECIAL and improved machinery and devices to eliminate waste make for economy in the production of motor cars, and many of the

Fig. No. 1

machines are the design of efficient workmen. As they are not patented their operation is not known by the general public. To reduce the overhead expense is a problem that has been given serious consideration by the Cole Motor Car Company, Indianapolis, Ind., and while Factory Manager J. F. Richman has constructed a number of time and labor saving devices, he has received valuable assistance from the employees, there being a box in his office where the workmen can deposit their suggestions for improving manufacturing. Mr. Richman is never too busy to go thoroughly into an idea entertained by one of his workmen.

Four unique labor and money saving devices are utilized at the Cole plant, these comprising the combination pneumatic body hoist and travelling crane, Fig. 1, the grease cup filler, Fig. 2, the linoleum cutting machine, Fig. 3, and the press, Fig. 4. These are said to be exclusive features in the Cole plant.

Heretofore, from eight to nine men were required to place a seven-passenger body on the chassis in order to mount it safely, and the finish of the body was more or less marred by the operation. The hoist and crane performs this work and only one workman is necessary. Four steel cables with hooks at their lower ends are attached to the body. The hook is made from round steel, shaped like a letter J, and upon its lower portion is a circular steel weight, free to slide, which overhangs the short portion of the hook so that when the weight is dropped down it is impossible for the hook to come out of the top iron to which it is attached. This insures safety when the cables are slack. The operator stands to one

side and by moving a small lever the body is lifted, afterwards pushed forward, the crane permitting the work to be done by a single person. When the body is over the chassis, it is dropped easily and safely by utilizing an air control lever.

Another interesting machine is that employed for filling the grease cups, and four a minute can be supplied by one person. The construction is ingenious and comprises a supply cylinder and two sets of petcocks. The cylinder is shown at the left in the illustration, is made in two pieces, and the upper removable section resembles a bayonet. The grease is placed inside of the longer piece and it is forced by pressure, the air being admitted at the top of the cylinder. The lubricant is forced through the two rows of petcocks into the attached grease cups. The petcocks are utilized to measure the grease, and in the illustration the operator is shown opening the No. 2 petcock in order to fill the cup from the left hand end, supplying the others in order. It is stated that the workman is so proficient in the use of the device that he can tell when a cup is filled by the first bit of material that begins to ooze through the treads at the bottom. The single operator replaces a number of boys formerly utilized in filling the cups by hand, which method not only made for waste, but did not insure the elimination of dirt, or a proper supply.

The fitting of the running boards with linoleum requires considerable skill to prevent the material warping, and if the work is not performed carefully it will detract from the appearance of the car. The Cole practise is to secure this without tacking or the use of metal angle

Fig. No. 2

strips. To prevent warping of the boards, they are made in three pieces, tongued and grooved together, then impregnated with creosote to render the material impervious to water. As a precaution the boards are mounted on four channels with steel step hangers to prevent bending. Then the boards are covered with linoleum, which is secured with a water proof glue. During the setting process the boards are placed in a big press to insure a uniform appearance, as well as perfect adhesion of the material.

The linoleum comes in rolls six feet long, weighing 350 pounds. Because of the weight and bulk it is difficult to handle and with the old method there was considerable waste in the cutting of the material, difficulty being experienced in measuring correctly. With the device shown

**J. F. Richman, Production Manager
at the Cole Factory.**

at Fig. 3 efficient and economical cutting is assured. Three pulleys are provided, by means of which the roll is lifted into a position well above the floor, protecting it from the injurious effects of moisture and dirt. The loose end of the roll is brought through a pair of lead covered feed rolls at the top of the cutting boards. One of these members is clearly seen just above the linoleum in the illustration. The rolls are operated by a crank at the right, and the material moves down over a cutting board, where it is accurately measured, and vertical cuts made perfectly true. As a result waste has been eliminated, the material is kept clean and when secured to the running boards by the press machine, results in a uniform job, as well as one making for neatness and durability.

Owing to ill health, Manning J. Smith, treasurer of the L. H. Gilmer Company, Philadelphia, Penn., maker of Gilmer endless belts, has been forced to give up his duties, temporarily.

G. Walker Gilmer, Jr., who was formerly connected with the company, will act as sales manager during his absence. John S. Krauss has been elected secretary and factory manager.

The Western Automobile Association, promoter of the Vanderbilt Cup and Grand Prix races at Santa Monica, Cal., has made good its promise to distribute extra prize money for the races if the receipts warranted. Checks have been issued for \$5000 among those in the money in the Vanderbilt Cup and a like sum among the placed drivers in the Grand Prix.

The first use of a cyclecar for the delivery of mail has been made by Earl Stacey of Encanto, Cal., near San Diego, who has taken delivery of an Imp, made by the Imp Cyclecar Company, Auburn, Ind., with which to cover his four-mile route in that section.

FIG. NO. 4

EQUIPPING THE NEW PRIVATE GARAGE.

Describing Tools and Supplies Needed in the Overhaul and Maintenance of the Car---Devices Economizing in Time and Labor.

HOUSING and maintaining the motor car are problems requiring careful consideration, especially if the owner desires to save the expense incurred by keeping the machine at a public garage and relying upon the expert when minor adjustments or repairs are needed. Numerous instances are noted wherein

Victor Assorted Gaskets.

motorists have reduced the cost of upkeep to the minimum by the home garage, a practise that is gaining many adherents each season through the marketing of moderately priced, portable garages.

There are several factors to be considered in planning the equipment of the garage. If one is mechanically inclined and is capable of undertaking repairs, and intends to wash and polish the car, the equipment must be more complete than if the machine is simply stored. Some owners attend to minor repairs, wash and polish, and have the more difficult work undertaken by the expert, while others utilize the garage for protecting it from the weather only.

The last named method makes for economy solely, eliminating storage expense, although when the building is on the premises, an additional advantage gained is convenience. A careful study of the subject reveals the fact that the motorist who is capable of accomplishing his own repairs, and utilizes good judgment in purchasing his equipment, can considerably reduce the cost a mile of service for his machine.

A practical working equipment does not necessarily involve a large expenditure of money. Many motorists have, by purchasing tools, supplies, etc., as needed, accumulated a most complete installation, one enabling successful handling of ordinary repairs. When such an equipment is supplemented by the numerous labor and time saving devices now marketed, and, for example, a lathe and a drill press, the outside expense is limited to stock and material.

The age and condition of a car are factors to be taken into consideration when stocking the home garage, for it is obvious that one that has seen much service will require more attention than a modern machine in which the faults of the earlier model have been corrected. The ability of the owner is another factor. Some motorists can complete extensive repairs with an ordinary equipment, while others will require special tools and devices. As it would not be practical for the writer to outline any specific equipment, owing to the varying individual requirements and conditions, the subject will be treated generally, and in selecting material, etc., the owner should bear in mind that a small high grade equipment is to be preferred to a large assortment of inferior articles. This applies particularly to the tools.

Dealing first with the tool equipment: It should include a socket wrench set and, as a complete outfit costs but little more than a small one and generally includes a number of tools

Bay State Autokit, a Practical Wrench Set Eliminating Many Ordinary Tools.

Mossberg Wrench Set.

torists can complete extensive repairs with an ordinary equipment, while others will require special tools and devices. As it would not be practical for the writer to outline any specific equipment, owing to the varying individual requirements and conditions, the subject will be treated generally, and in selecting material, etc., the owner should bear in mind that a small high grade equipment is to be preferred to a large assortment of inferior articles. This applies particularly to the tools.

Dealing first with the tool equipment: It should include a socket wrench set and, as a complete outfit costs but little more than a small one and generally includes a number of tools

Crane Wheel Puller.

which would otherwise be purchased separately, the extra expense is warranted. Such an equipment, as manufactured by the Frank Mossberg Company, Attleboro, Mass., is shown in an accompanying illustration, and includes in addition to the sockets, open end, offset, ratchet and double

end wrenches, also a pipe wrench, screw driver bits, cotter pin extractor, etc. Not only does such an outfit replace a large number of ordinary tools, but parts not easily accessible with conventional wrenches may be reached with the special members.

The Bay State Autokit, made in several sizes by George A. Cutter, Taunton, Mass., is another practical, complete and inexpensive socket set

Coes All-Metal Monkey Wrench, a Design Making for Efficiency and Durability.

wrench. Open end and S wrenches are handy and a complete set can be obtained by purchasing single members as needed. A good monkey wrench is most important. The expert repairman utilizes the all-metal member, the Coes, made by the Coes Wrench Company, Worcester, Mass. These come in different sizes and their durability makes for economy. The Stillson wrench is another useful member.

A hacksaw, preferably the adjustable type,

with coarse and fine blades, is a necessary tool, as are pliers. The last named should comprise at least two, ordinary members and a pair having good, strong cutting jaws. Cape, diamond and round nose, and ordinary chisels are not expensive, nor are centre punches and drifts. Poor files are dear at any price and one cannot be too careful in purchasing these. A good machinist's hammer, or two of these, will suffice for all ordinary work, but for driving out threaded parts, etc., a lead, copper or rawhide hammer is required. These, supplemented with one or more

An Auto Tray or Creeper is Handy When the Garage is Not Equipped with a Pit.

substantial screw drivers, a vise having at least a 3.5-inch opening, a breast drill and a fair assortment of drills, steel rule, calipers and clamps, will enable one to complete ordinary repair work.

The work bench can be made or purchased. The marketed type will save time and has many conveniences. A practical motor stand may be constructed from ordinary piping or wood, but those marketed permit of turning over the motor without removing it from the stand.

During the last year or so a large number of time and labor saving electrically operated tools have made their appearance on the market. These include drills, valve grinders, grinders, polishers, etc., and lighten the work wonderfully. Several concerns make a specialty of manufacturing machinery operated by an electric motor and, as electricity is invariably utilized for lighting the garage, it can be employed to operate the lathe, drill press, etc. A drop light with bulb protected by a cage, should be included in the lighting plan. They make for safety.

Practical Tire Gauge, Dover Funnel, Dover Waste Can, Carbon Scraper, Quick Acting Vise and Baby Torch.

TOOLS, MACHINERY, SMALL PARTS AND SUPPLIES.

Supplies, such as cotter pins, lock washers, cap screws, hex nuts, taper pins, tape, wire, soldering iron and torch, waste, graphite, valve grinding compound, shellac, prussian blue, etc., can be obtained as needed.

Dover Gasoline Funnel.

The valve lifter is not an expensive tool and choice is given of a wide variety of designs. Carbon scrapers permit of displacing foreign elements without removing the cylinders with some types of motors, and if the bearings require refitting bearing scrapers will be necessary. When the motor is to be taken out of the chassis, a falls and tackle or chain hoist will be required, and the device will be useful in removing and replacing the body.

In the overhaul of the rear axle and examination of brakes, if the wheel cannot be removed easily a wheel puller will be required. A practical design is the Crane, made by the Crane Puller Company, Arlington, Mass. As will be noted by

Dover Saval Funnel and Soap Economizer.

removing flywheels, gears and similar parts.

Formerly, gaskets were cut by hand, and while with some motors this practise is neces-

sary, ready made members can now be obtained at a slight cost. The Victor Manufacturing & Gasket Company, Troy and 21st streets, Chicago, maker of copper asbestos gaskets, now produces them in assorted sizes packed in neat boxes, including an assortment of the most popular and universally used members. If an owner desires to make gaskets of special material or size, a gasket cutter that will cut ovals or circles may be secured at a moderate cost.

If the garage is not equipped with a pit, a tray with castors permits of moving in and out beneath the chassis and also prevents the clothes coming in contact with the floor. Some types come equipped with head rests and the majority are not expensive. The above list may be supplemented by a number of useful tools and devices, but those mentioned will suffice for a thorough overhaul of the car, relying upon the machinist for work requiring machinery or accuracy.

Dover Fuel Measure.

The equipment essential for the proper upkeep of the machine—that is, for its operation—will include lubricants, fuel, polish, soap, waste and chamois. Assuming that the owner is to wash and polish his own car, considerable time and labor will be saved by the installation of an overhead washer. Several designs are shown in accompanying illustrations and they permit of moving around the machine easily, as well as eliminate waste of water. Some designs include lighting means, a cluster of lamps being mounted on the washer. If the washing is done by means of an ordinary hose, a light stand will be useful.

Types of Bearing Scrapers, Creeper, Adjustable Hacksaw Frame, Tire Jack and Overhead Washers.

WASHING EQUIPMENT, TURNTABLES AND FUNNELS.

The maintenance of the car will require what may be termed standard equipment, such as fuel and oil funnels, etc. These are not expensive, but only serviceable members should be purchased.

During the overhaul, considerable oily and greasy waste will accumulate and it should not be left on the floor or work bench, as it is susceptible to spontaneous combustion. The only safe receptacle is a metal can, as it is a positive safeguard against fires. The design shown is made by the Dover Stamping & Manufacturing Company, Cambridge, Mass., and is equipped with a self-closing spring cover, a construction insuring that the container is always kept closed.

Perfect Overhead Washer.

material. They are sturdily constructed.

A good fuel funnel or measure is an absolute necessity and irrespective of the type purchased it should be fitted with a practical strainer, one that will prevent water or foreign elements reaching the gasoline tank. There is a wide variety offered and several designs are shown in the accompanying illustrations. The Dover company markets all types and its No. 55 garage funnel is a practical construction in that it has ample capacity and means for straining the fuel. The strainer is cone shaped, providing a larger surface, and the screen is 100 mesh brass wire. It is removable, as is the spout, and chamois can be used if desired.

The Dover Simplex is another design and is made in two and five-gallon capacities. It is a

pouring measure, has a funnel attachment on one side and a large special lip for fast pouring on the other. A bail and a handle make for convenience.

Chas. E. Miller, 97-103 Reade street, New York City, markets the No-Shammy funnel shown in an accompanying illustration. This design permits of fast pouring and separates water from the fuel by a novel construction.

Pitless Auto Turntable.

A good oil measure makes for economy and cleanliness, also saves time and labor. While the ordinary members may be utilized, the Dover Saval permits the motorist to control the flow of the lubricant, thereby preventing waste, as well as the oil spilling over the motor, etc. The Saval has a brass ball valve in the spout and is controlled by a plunger member convenient to the handle. The design permits of pouring oil in cramped positions and where it would be impossible to withdraw the funnel quick enough to

Universal Turntable, Product of Canton Foundry & Machine Company.

prevent overflow. It is made in one, two and four-quart capacities and of heavy stock, copper plated. These designs make for convenience.

Bay State Sticket Wrench, Brunner Compressor, Electric Valve Grinder, Canton Crane and Morgan Garage Jack.

FUEL AND OIL STORAGE SYSTEMS, PUMPS, COM-

Economy can be effected in the grease and oil gun equipment by purchasing a combination unit, although some motorists prefer two or more for handling light and heavy lubricants. The combination unit when equipped with a variety of tips provides a practical gun, and one of this type is the B Line, manufactured by the Randall-Faichney Company, Boston. The Cox Brass Manufacturing Company, Albany, N. Y., also markets a variety of grease and oil guns to meet all requirements of motor car lubrication.

Texas Oil Tank.

The storage of the cylinder oil is a problem that should receive careful consideration. The practise of utilizing a five-gallon can and leaving the measure or funnel beside it on the garage floor is indulged in by many owners. In the first place purchasing lubricant in small quantities does not make for economy, and exposing the measures to dust and dirt means that a rapid cutting abrasive is introduced into the lubrication system and motor, creating wear of the working parts. The can on the floor method also means waste, as frequently the lubricant is spilled in filling the measure.

Texas Fuel Pump.

An oil cabinet or tank eliminates these undesirable factors and choice is given of a large number of designs. That shown in an accom-

panying illustration is the product of the Texas Company, 146 Summer street, Boston, and its advantages are obvious. This concern produces a variety of storage systems to meet individual requirements. Chas. E. Miller also markets an oil tank which comes supplied with three measures and one funnel. The advantages of these designs are that they permit of handling oil in large quantities, filling the measure without waste, and prevent foreign elements mingling with the lubricant.

When the fuel is purchased in quantity, one or more barrel lots, economy will not be effected unless the container prevents waste by evaporation or in handling the fluid.

Scaife Fuel Storage System.

The problem of storing and handling gasoline has been given serious consideration by the manufacturers of such equipment and today it is possible to obtain a practical, moderately priced outfit, one that can be locked to prevent use by others than those intended.

There is another factor to be considered in storing gasoline and that is the effect the method will have upon the insurance. Today it must conform with the regulations of the National Board of Fire Underwriters. The underground

B Line Grease Gun, Turntable, Temco Drill and Grinder, Emery Wheel, No-Shammy Funnel, Turntable and Tri-bloc Hoist.

PRESSORS AND GENERAL ELECTRICAL EQUIPMENT.

tank is the safest and most practical installation, as by it the supply can be renewed by the tank wagon without unlocking the garage. The pipe line generally leads into the garage, where it is equipped with a pump for drawing the fuel. There is a wide variety of pumps, some being plain members, while others provide registering and measuring means and locking devices. Some makers include a coil of hose and faucet, enabling the fuel tank of the car to be filled direct, and eliminating the use of a measure and a funnel. With all, provision is made for filtering the fuel, insuring clean gasoline.

Pyrene.

As previously stated, the fuel storage equipment can be obtained with tanks of varying capacities and prices. Two designs are shown herewith, one made by William B. Scaife & Sons Company, Pittsburg, Penn., and the other by the Texas Company of Boston. Both are the underground system and are made in different capacities.

In connection with the home garage should be mentioned the fire extinguisher. One or more of these members should be included in the equipment. With a fire extinguisher it is possible to put out incipient fires that might develop into serious affairs. Among the types marketed is the well known Pyrene, made by the Pyrene Manufacturing Company, 1358 Broadway, New York City, and for which the Pyrene Company of New England, 176 Federal street, Boston, is New England distributor. The tank holds a combination of purely organic materials, containing neither acid, alkali, salts or moisture. Operation is by a double acting pump, throwing a continuous stream to a distance of 30 feet. The fire is surrounded by a non-poisonous gas blanket,

which cuts off the air supply, without which combustion cannot take place.

The Northwestern Chemical Company, Marietta, O., markets a dry powder fire extinguisher, termed Fire-Fly, which comes in tubes and is held to be very efficient. Both makes mentioned are designed for service on the machine, as well as the garage.

The electrically operated garage pump eliminates labor and saves time in inflating tires when the car is not equipped with a power driven pump.

A compact and moderately priced design is the Tri-Phoon, made by the Green & Swett Company, 737 Boylston street, Boston. As will be noted by an accompanying illustration the

Tri-Phoon Garage Pump.

equipment is most convenient and complete.

No attempt has been made to completely list garage equipment, but to present a practical installation which can be supplemented from time to time as needed. The motorist equipping the new home garage, as well as those adding to their equipment, will find many valuable suggestions in the Classified Buyers' Guide, found elsewhere in this issue. All concerns listed will forward data and prices upon application.

J-M Fyro Fire Extinguisher, Water Nozzle, Inspection Lamp, Battery Hydrometer, Washing Brush and Torch.

NEW AND PRACTICAL TOOLS, MACHINERY, EQUIP-

The Dover Stamping & Manufacturing Company, Cambridge, Mass., produces oil and fuel funnels, measures, waste cans, soap pails, bulb cases, drip pans, dust pans, oilers, etc., and a variety of other useful and practical equipment for the garage and the maintenance of the car. These are described and illustrated in the new catalogue issued by the company, which will be of valuable assistance in equipping the new private garage.

The Rub-On Manufacturing Company, 89 Brayton street, Buffalo, N. Y., markets a number of preparations for the motor car, these including restoratives for the top, upholstery, etc.; enamel for the metal parts, top dye and a compound for stopping leaks in the radiator. The company also manufactures the Auto Turn Jack, a very practical device for the garage, in that it practically performs the same work as a turntable. In addition it can be used as a jack. Complete details of the Auto Turn Jack and the line produced by the company will be supplied free upon request.

The Cox Brass Manufacturing Company, Albany, N. Y., in addition to its welding and decarbonizing outfit, markets the Coxajusto shock absorbers, which are not only adjustable to any load, but to any car. Adjustment is obtained by turning a cap at the base of the absorber, it regulating the tension of a helical spring. The company produces a special set for the model T Ford car.

The Perkins Campbell Company, 626 Broadway, Cincinnati, O., is manufacturing an attractive line of specialties for Ford cars, these including the Latigo fan belt, steering gear boots, crank holder, hood strap, license holder, etc. The concern makes a specialty of water proof seat covers, producing these for standard makes of machines, and is prepared to supply them at short notice. The covers, which include top members, are of double, water proof, high grade cloth, made over special patterns, and an accurate fit and high grade material are guaranteed.

The D. Henry Bonner Company, Cambridge, Mass., maker of the Tremo horn, has brought out a special size for the model T Ford car. One of the qualities of the signal is the elimination of the usual coupling, as the attaching means is incorporated with the horn itself, a shank clamping over the exhaust pipe. It is locked by a bolt and nut. The Tremo provides a clear, musical, penetrating sound, and one of its features is that it is as efficient at low motor speeds as at high. It is operated by the exhaust gases and these are not impeded in their flow. The equipment includes the usual linkage, etc., and is moderately priced.

The Alsten & Goulding Company, Worcester, Mass., is making a special offer that will interest motorists in need of tire and tube repairs. The concern will give a discount of 10 per cent. from standard prices up to May 15, and will pay all freight and express charges on out-of-town orders. The company is unusually well equipped to handle all kinds of vulcanizing work and makes a specialty of sectional repairs. The Alsten & Goulding Company is distributor in western and central Massachusetts, New Hampshire and Vermont for all standard lines of motor car accessories.

The Milwaukee Auto Specialty Company, 128 Second street, Milwaukee, Wis., is manufacturing the Centerfire spark plug, which is designed to overcome motor troubles, as well as to operate under abnormal conditions, such as too much oil, etc. The design is such that the gap is protected from oil and carbon deposits. The Centerfire is made in any length and point, and is guaranteed.

The Automatic Appliance Company, 172 Columbus avenue, Boston, has perfected a mechanical motor starter for the model T Ford car, which not only enables the operator to start the motor from the seat, but does not interfere with the use of the regular starting crank. Qualities of the device are an automatic release and an automatic spark retard, preventing injury to the mechanism when starting the engine. One of the features of the Boston starter is that it may be installed easily and without interfering or changing the appearance of the machine, as the equipment, with the exception of the operating handle, is fitted under the hood. The handle is conveniently placed for the driver. It is stated that the leverage obtained is powerful and that a child may turn the motor over easily. Further details and prices are given in a circular which will be mailed free upon request.

The Walte Auto Supply Company, 81 Exchange place, Providence, R. I., is one of the largest exclusive supply and jobbing houses in New England. Its location provides excellent shipping facilities for quick service, and the company carries an unusually large stock, including everything from a cotter pin to a complete garage equipment. The latest catalogue, issued recently, is unusually large and lists in detail the complete line of accessories, supplies and equipment carried by this concern. These include Rayfield carburetors, Mea magnetos, Batavia tires, Success dry cells, garage compressors, Success spark plugs, etc. The new lines carried by this concern include the Halliday Ford shock absorber, Leak-Proof piston rings, Raybestos brake lining, G. B. valve tools, Barrett jacks, Keystone greases, etc. The company makes a specialty of guaranteed service and uses every effort to insure satisfaction in all respects.

Colgate & Co., 199 Fulton street, New York City, is marketing Colgate's Moto-Gloss soap, which is the result of 107 years of soap making and which is stated to be very efficient in removing dirt without injuring the lustre of the varnish. A trial size can will be sent free, also a sample of the Mechanics' soap paste for the hands. Moto-Gloss comes in five, 10 and 25-pound pails, also in half barrels. In writing address department 22.

The Bi-Motor Equipment Company, 180 Massachusetts avenue, Boston, the only exclusively wholesale accessory and supply house in New England, and distributor for the Splitdorf magneto, Rayfield carburetor, Apple Electric Company, and a number of other well known lines, is issuing a new catalogue for dealers only. The book comprises 234 pages, one of the largest ever issued, and it will be mailed to the trade upon application. This company was organized some six years ago and recently remodelled its building to care for its rapidly increasing business. It maintains a large number of men on the road and prompt attention is given to filling orders and making shipments.

F. Shirley Boyd, 903 Boylston street, New England distributor for R. I. V. bearings, the J. H. S. shock absorbers and bumpers, Multibestos, etc., is making a special offer to motorists on the J. H. S. shock absorbers, a trial of 30 days being allowed at the expense of the company. These absorbers are accompanied by a very liberal factory guarantee for one year.

The Motor Parts Company, 185-187 Columbus avenue, Boston, distributor for the Bosch magneto, Zenith carburetor, Leak-Proof piston ring, Kemco fan type generator, Mohawk tires, etc., with branches at Philadelphia and Springfield, Mass., has extended its excellent service by the appointment of distributors in the leading cities of New England, the names and addresses of which are given elsewhere in this issue. Each of the concerns mentioned has a well equipped laboratory for the adjustment and repair of Bosch magnetos, and carries a supply of parts. The other lines of the Motor Parts Company can also be obtained at these houses. Quality, efficiency and service is the motto of the company.

The Platt & Washburn Refining Company, 7 Broadway, New York City, is marketing Veedol, an automobile lubricant, made from the best Pennsylvania crude petroleum, and the result of 30 years' experience with every kind of lubricating oil. The company states it has tested the product, not only by every method known to science, but in actual service under the severest conditions in every standard type of car.

MENT AND SUPPLIES OF INTEREST TO THE MOTORIST.

Chas. E. Miller, 97-103 Reade street, New York City, is issuing a most comprehensive catalogue in which are described and illustrated parts, materials, supplies, accessories, tools, machinery, etc. The books contain hundreds of pages of practical and useful data concerning the overhaul and equipment of a machine, and a postal will bring a free copy. The house of Chas. E. Miller was established in 1896 and it now has branches in the leading cities of the country. Mr. Miller is entirely familiar with the requirements of motorists and the trade.

The Auto Parts Company, Providence, R. I., maker of the well known line of Apco accessories for Ford cars, has brought out a large number of new specialties for this machine, all of which are fully described and illustrated in the new catalogue issued by this concern. The company manufactures a number of parts for the Ford car, such as rings, valves, etc., and all of these are moderately priced, as well as high grade. One of the new accessories is a brake rod support, a very practical device. The catalogue will be mailed free upon request.

The Nicholson File Company, Providence, R. I., an old and established concern, has brought out a file especially adapted for trueing up the points of coils, magnetos, etc. One of the qualities of the tool is that it eliminates waste of the platinum, and another feature is its compact size, making for convenience when smoothing points. The company issues a booklet on files which contains valuable, as well as instructive, data.

The Morgan Manufacturing Company, Newport, R. I., has brought out a new metal polish termed MorganBrite. It comes in popular size containers, and is held to be decidedly efficient in removing tarnish from metal, as well as imparting a high and lasting lustre. The company makes a number of useful and practical specialties, these including the Morgan rolling wedge spring leaf opener, the utility tool, priming cups, carbon scrapers, garage jack, gas lighter, hose clamps, valve lifter, etc. Descriptive matter will be mailed free upon request.

The Bowling Green Sales Company, 82 Flatbush avenue, Brooklyn, N. Y., is marketing Ball carbon remover, which differs from the usual preparations of this kind in that there are no waits, as the tablets do their work while the motor is operating in service. One of the qualities of Ball carbon remover is that it provides lubrication while the carbon deposits are being displaced. The tablets are inexpensive and come in a screw cap box.

The Auto Protector Company, 58 Tyler street, Springfield, Mass., is manufacturing the Clear Ahead lamp bracket, which is made in a special size for the Ford car and a standard design. The device turns the headlights in the same direction as the steering wheel, enabling the driver to make curves with the same degree of safety at night as in the daytime. The device is not only moderately priced, but requires no alterations of the machine to install it.

The Monarch Manufacturing Company, 213 North Main street, Dayton, O., specializes in welding and decarbonizing equipments, which permit of removing carbon deposits from the motor without disassembling the engine, as well as making repairs of broken parts. The company issues descriptive matter explaining fully the advantages and operation of its outfits and will mail it free upon request.

The Headlight Support Company, 1212 Dime Bank building, Detroit, is manufacturing Turning Headlights for the model T Ford car, and one of the qualities of the design is that they may be quickly and easily attached. As the name implies, the device actuates the headlights so that they automatically follow the slightest movement of the steering wheel, thereby throwing the light where it is most needed. When rounding a curve the rays are so projected that the inner portion, as well as the cen-

tre, of the road, is illuminated, making for safety. The company also markets Gasolock, a device for locking the fuel system.

The Frank Mossberg Company, Attleboro, Mass., produces a wide variety of tools useful in the overhaul and maintenance of the motor car. The concern specializes in socket wrench sets, the feature of which is the Mossberg ratchet wrench. These sets are produced in varying sizes to meet requirements, and among them is the special for the Ford car, which contains sockets adapted to reach every nut, bolt, etc., of the machine. The company produces a number of special tools for the Ford car and its catalogue of nearly 200 pages describes and illustrates these.

The Harding Specialties Company, 755 Boylston street, Boston, maker of the Boston tail light detector, a dash device for warning the driver when the tail light becomes extinguished, has brought out a new and practical tool for the garage. It is the Little Giant magnetic lift, which comprises a powerful magnet, a searchlight and a flexible cable. With it tools, nuts, parts, etc., can be removed from places not accessible by the hands. The Little Giant is inexpensive and will save considerable time and labor in recovering parts as above described.

The Frank Miller Company, 351 West 26th street, New York City, is marketing a water proof dressing for leather tops, cushions, seats, upholstery, straps, etc., which is not only inexpensive, but is held to make an old top, or other similar equipment, look like new. The preparation restores the life of the material, and is especially adapted to tops that have become hardened and lustreless. The company also markets a mohair top dressing which is compounded for pantosote and similar materials. It imparts a new velvety finish without hardening the surface.

The Sebastian Lathe Company, 125 Culvert street, Cincinnati, O., specializes in high grade engine lathes, tools and attachments for the same, and produces a number especially adapted for automobile work. The designs are modern and practical in every particular, and the best of material and workmanship is incorporated. The catalogue issued by the company will be mailed free upon request, and contains complete descriptions, as well as illustrations.

The Prest-O-Lite Company, Inc., 226 Speedway avenue, Indianapolis, Ind., maker of the well known Prest-O-Lite gas tanks, is issuing some interesting data on lighting the automobile, which will be mailed free. The company is manufacturing a system for lighting, controlling and extinguishing the lights from the seat, which will appeal to owners whose machines are equipped with acetylene.

The Valentine Company, 456 Fourth avenue, New York City, one of the oldest and best known manufacturers of varnish, is issuing an interesting booklet on "The Care of the Car". It tells how to keep the car new, and as the expense of painting and varnishing a machine is an important factor in its upkeep, the information imparted should be read by every motorist. The booklet will be mailed free upon request.

The Salvador Motor Company, 126 Massachusetts avenue, Boston, Mass., has an interesting proposition for dealers in unassigned territory, respecting its Salvador cyclecar, the dimensions of which place it in the light car division. The machine is said to have been designed by G. B. Mansur, formerly with the De Dion-Bouton Company, Paris, and to incorporate a number of foreign features which have been adapted to meet the requirements of American road conditions. It is pointed out that it is necessary to make application early, as the output for the present year is rapidly being allotted.

NEWS OF THE MANUFACTURER AND DEALER.

The following concerns have been incorporated recently to manufacture or deal in motor vehicles, accessories, etc.:

Van Curve Light Company, Green Island, N. Y.; \$10,000; W. H. Rabbett, T. E. Vanderwerken, R. Caldwell, R. T. Fleming.

Milwaukee Cyclecar Company, Milwaukee, Wis.; \$25,000; to manufacture cyclecars; Charles J. Elgel, Stanley Elgel, Samuel P. Carroll.

Wisconsin Cyclecar Company, Milwaukee, Wis.; \$25,000; to deal in cyclecars; W. B. Christie, W. H. Schwab, W. Fernekes.

Fisk & Dunham Rubber Company, Trenton, N. J.; \$50,000; to manufacture rubber goods; C. F. Fisk, R. C. Dunham, A. A. Taylor.

Conklin-Spindler Auto Company, Chicago, Ill.; \$2000; to deal in automobiles, etc.; Alva L. Spindler, Maurice Kohn, Charles E. Conklin.

Clark Auto Company, Minneapolis, Minn.; \$25,000; to operate a garage and deal in automobiles; Frank C. Clark, Clem Bofferding, John A. Cronholm.

Union Sales Association, Terre Haute, Ind.; \$5000; to deal in machinery, automobiles, etc.; J. R. Finkelstein, G. C. Buntin, H. D. Hughes.

Israel & Stanke Auto Renting Company, New York City; \$3000; Norman Israel, Blanche Israel, Robert A. Stanke.

Tire Supply Association, Minneapolis, Minn.; \$50,000; to deal in tires and automobile accessories; M. J. Rosenstein, L. S. Rosenstein, A. W. Juster, Lewis Rosenthal.

Motor Car Service Station, Rochester, N. Y.; \$1000; to deal in motor car accessories, etc.; William D. Elliott, Joseph K. Elliott, William R. Gilman.

Yale Motor Car Company, Minneapolis, Minn.; \$20,000; to deal in motor cars and conduct a general garage and repair business; N. F. Oslin, R. L. Oslin, Hawkin Oslin, G. A. Nelson.

Cleveland Coil & Manufacturing Company, Cleveland, O.; \$10,000; to manufacture dynamo and motor coils; H. L. Carleton, Owen N. Wilcox, Charles A. Norris, George W. Bach, George A. Shively.

Motor Finance Company, Ltd., Montreal, Can.; \$50,000; to manufacture motor vehicles, engines, etc.; Adolphe Kornbloom, Edwin N. Todd, Edwin A. Mumford and others.

Engel Crude Oil Engine Company, New York City; \$15,000; Henry Engel, Winifred L. Smith, John M. Mumford.

Hoboken & North Hudson Auto 'Bus Transportation Company, Hoboken, N. J.; \$125,000; to conduct a general motor transfer, express and transportation business; W. O'Neill, W. A. Kavanagh, E. F. Martin.

Empire Axle Company, Dunkirk, N. Y.; \$20,000; to manufacture automobile axles, accessories, etc.; Otto F. Hakes, Zella R. Hakes, E. DeHaven.

Back Bay Auto Supply Company, Boston, Mass.; \$2500; William E. Soule, Irving F. Carpenter.

Cooper Manufacturing Company, Ware, Mass.; \$10,000; to manufacture automobile appliances; Julian J. Cooper, Kathryn M. Cooper, Clarence E. Tupper.

Motor Cleaning Company, Rochester, N. Y.; \$50,000; to conduct an automobile business; H. D. Carlton, G. D. Forsythe, M. F. Clark.

The Motor Tire Reconstruction Company, Jersey City, N. J.; \$250,000; to manufacture rubber tires, etc.; C. N. King, G. H. Russell, W. L. Steck.

City Garage of Hartford, Hartford, Conn.; \$10,000; to conduct a garage; R. Elmer Curtiss, John W. Morrison, George W. Dean.

Bord's Garage, New York City; \$10,000; to conduct a garage; John H. Bord.

Northwest Motor Company, Seattle, Wash.; \$25,000; G. H. Tilton.

Erle-Penn Auto Company, Pittsburg, Penn.; \$25,000; John Z. Miller, S. Farmer, R. J. Farmer.

Six-in-One Electric Battery Company, Detroit, Mich.; \$20,000; Lamott W. Little, B. A. Bullock, Seth J. Wicker.

Borden Motor 'Bus Company, Chicago, Ill.; \$2500; Edward N. Dancona, A. J. Pfau, Edwin B. Mayer.

Combustion Engineering Company, New York City; \$100,000; to manufacture heating devices; R. C. Peabody, C. E. Carnard.

National Tire Company, Trenton, N. J.; to manufac-

ture automobile tires; Arthur R. Calvin, Albert Numbers, E. L. Iring.

Acorn Insulated Wire Company, Brooklyn, N. Y.; \$100,000; to manufacture insulated wire; J. Quittner, J. T. McMahon, W. V. Donovan.

Beeson Non-Skid Tire Band Company, Ltd., Ford, Ont.; \$40,000; to manufacture automobile accessories; B. J. Beeson and others.

Continental Starter Company, Detroit, Mich.; \$20,000; to manufacture compressed air starters; Henry J. Guthard, Nelson A. Bloom, Herbert Thomas.

Globe Rubber Tire Company, Jersey City, N. J.; \$25,000; to manufacture automobile tires; Harry J. Joyce, Joseph P. Hall.

Lincoln Tire & Rubber Company, New York City; \$5000; to deal in automobile tires, etc.; Olaf K. Pacht, David Gross, Jacob Cohen.

Eastern Garage Keeper's Protective Association, New York City; \$5000; Chester S. Walz, Thomas C. Walz, John A. Samborn.

Modern Wheel Company, New Orleans, La.; \$35,000; to manufacture wheels for automobiles; T. Semmes, S. P. Walmsley, Arsene Perillat, Clarence O. Sherill, George Blardone.

The Noble Air Pump Company, Cleveland, O.; \$25,000; to manufacture air pumps of all kinds; Elmer E. Derr, George I. Langman, Thomas S. Dunlap, J. C. Noble, C. H. Truscott.

GARAGE AND DEALER.

Benjamin J. Massell, Atlanta, Ga., will erect an automobile salesroom, three stories high, with mezzanine floor, 21 by 100 feet. It will cost \$10,000.

The Vestal Motor Company, Pittsburg, Penn., will erect a new building on Moorewood avenue.

The R. W. Munser & Sons Company, Minneapolis, Minn., distributor of the Hupmobile cars, will erect a new four-story building at 907 Hennepin avenue at a cost of \$45,000, to be used for automobiles and trucks.

Raoul Garcia, Key West, Fla., has sold a half interest in the Island City garage to W. R. Asche. The firm name has been changed to Garcia & Asche.

The Anderson Automobile Company, Anderson, Ind., has changed its name to the Automobile Sales Company. The company handles the Cole cars.

Abraham Cooper, Syracuse, N. Y., contemplates the erection of a modern garage at 815 South State street, to cost \$17,000.

The South Bend Automobile & Garage Company, South Bend, Ind., has dissolved.

The Portage Motor Car Company, Portage, Wis., has placed Leslie Helms in charge of the repair department at its garage.

The Trade Circular Addressing Company, Chicago, can supply the trade with complete lists of garages, Ford dealers, truck owners and supply houses throughout the country.

James Brophy, Bisbee, Ariz., has purchased the agency heretofore conducted by the Overland Automobile Company, and will build a new garage. Work on the building has started.

The Commercial Garage, New York City, will erect a new modern warehouse on Thompson street at a cost of \$70,000.

The Halsey Automobile Company, St. Louis, Mo., is erecting a large building at 26th and Locust streets.

Nicholas Rommelfanger, Boston, Mass., has established a used electric car department at his service station on Newbury street. He is making a specialty of rebuilding used cars and equipping them with new batteries.

D. L. Love, Atlantic City, N. J., has purchased the Old Postoffice garage on New York avenue and extensive improvements will be made.

Charles W. Harris, Nevada, Ia., has purchased the business of the Nevada Auto Company.

The Sanford Street Garage, Springfield, Mass., has taken over the business of the Morse-Readio Company. The company handles the Velle cars.

The Sutter Garage, Marysville, Cal., has been sold to M. P. Powell of San Francisco.

Eugene Bond, Bonner Springs, Kan., has purchased the garage formerly owned by J. E. Stotts.

Casey & Tutin, Sacramento, Cal., has dissolved partnership. J. S. Casey has taken over the business and changed the firm's name to the Cole Motor Company. The concern is located at 1906 M street.

J. E. Hodge, Pomona, Cal., has purchased the Iowa garage at 105 South Gordon street and will operate same.

Leon Cuyler, Millville, N. J., has taken over the garage on West Main street, formerly occupied by Carl Rockhill.

The Barnes, Ziegelm & Mable Company, Fond du Lac, Wis., conducts an exchange for second hand cars of all makes. The company also does repairing and carries a full line of accessories.

J. J. Henry Mueller, Jr., Newark, N. J., has leased the garage at 340 Central avenue and will conduct an up-to-date automobile business. He handles the Havers car.

Gillette & Cramer, Towanda, Penn., has taken over the new garage on Main street and will operate a repair shop in connection with its automobile showroom.

WITH THE MANUFACTURER.

The Motor Materials Company, New York City, has put on the market a new starting device for Ford cars.

The Miller Rubber Company, Akron, O., has opened a new branch at 429 North Meridian street, in that city, in charge of Messrs. Broering and Ruske, both of whom have had long experience in this field. An accompanying illustration presents the interior of the salesroom. A service station will be maintained as well.

The Emil Grossman Manufacturing Company, Inc., Brooklyn, N. Y., has at the request of the management of the Indianapolis motor speedway, repeated the offer of cash prizes to entrants in the 500-mile race, May 30, as follows: First prize, \$500; second prize, \$250; third prize, \$100. These prizes will be paid providing the drivers finishing in the order named use Red Head spark plugs exclusively in the race.

The Ford Motor Company, Detroit, has secured permission to erect a plant at Pittsburg flush with the street line on Baum boulevard and along Morewood avenue. The building will be 11 stories high and will cost about \$1,000,000. It will be used for an assembly plant. Work has already commenced.

The Clark Engine & Boiler Company, Kalamazoo, Mich., is building a 10-12 horsepower, four-cylinder, water-cooled motor for cyclecars.

The General Motors Truck Company, Pontiac, Mich., has just completed some additions to its equipment. The company has installed a 100,000-gallon reservoir as an added protection against fire. A number of new cement floors have also been put in the factory. The factory force has been largely increased within the past 60 days.

The Liggett Spring & Axle Company, Cleveland, O., has moved its plant to Monongahela, Penn., where the executive offices are now located. J. H. Newhart, who is the treasurer, will also assume the duties of general manager.

The Volute Spring Shock Absorber Company, Mount Vernon, N. Y., is the name of a new concern organized to manufacture a new type of spring absorbing device for motor cars. Among those who are interested in the project are Edward M. Benford, Mark D. Stiles and John G. Rock.

The Dort-Wiley One Lady Top Company, Detroit, held its annual meeting recently and the following officers were elected: President and treasurer, H. W. Wiley; vice president and general manager, Emmis J. Beattie; secretary, Walter Stowers; superintendent of construction, Walter Dort.

The Security Auto Locks Auto Company, New York City, has placed on the market a new device to prevent the theft of automobiles.

The J. F. Cram Automobile Company, Geneva, N. Y., will manufacture motor fire apparatus.

The Splittorf Electrical Company, Newark, N. J., has opened new branches and service stations recently as

follows: Cincinnati, 811 Race street; Dallas, Tex., 462 South Ervay street; Dayton, O., and Toronto, Ont., 469 Yonge street. H. J. Hinley, manager of the long established Detroit, also supervises the branches in Cincinnati and Dayton. E. A. Kelly, Chicago sales manager, has placed E. C. McKinney in charge of the Dallas office, while he is preparing to open a branch in Minneapolis. Minn. O. J. Rohde, who looks after the company's interests in New York, Newark, Philadelphia and Atlanta, also supervises the Toronto branch. In addition, C. O. Dail, for several years associated with the sale of Swinehart tires, has been placed in charge of sales for the western territory with headquarters in Chicago. He takes the place made vacant by Fred Connell, who is now manager of the Apple Electric Company, Dayton, O., recently acquired by the Splittorf concern.

The Packard Motor Car Company of Paris, Paris, France, the foreign branch of the Packard Motor Car Company, Detroit, has established a branch office, service station and rental depot in London, England, at 7 Lower Belgrave street, close to Buckingham Palace road. It will carry a complete supply of parts and provide the same technical attention that characterizes this company's other branch houses.

The Bosch Magneto Company, New York City, has recently added to its already long list the following supply stations: Motor Supply & Tire Company, Akron, O.; Albany Garage Company, Albany, N. Y.; Augusta Garage, Augusta, Me.; Bangor Motor Company, Bangor, Me.; Bath Auto & Gas Engine Company, Bath, Me.; Motor Supply & Tire Company, Cleveland, O.; Troy Automobile Exchange,

Interior of the New Branch Salesroom Recently Opened in Akron, O., by the Miller Rubber Company.

Cohoes, N. Y.; Motor Supply & Tire Company, Columbus, O.; Warren Garage, Elkhart, Ind.; Pearce Street Garage, Gloucester, Mass.; Blair Motor Company, Logan, Utah; Court Motor Car Company, Marietta, O.; George W. Roberts Electric Works, Marysville, Cal.; Minot Auto Company, Minot, N. D.; J. P. Gayle Supply Company, Newport News, Va.; Port Washington Garage, Port Washington, N. Y.; Provo Machine & Foundry Company, Provo, Utah; St. Albans Foundry Garage, St. Albans, Vt.; Jenson Bros. Auto Company, Santa Cruz, Cal.; Gavin-Williams Company, San Diego, Cal.; Troy Automobile Exchange, Troy, N. Y.; Utica Cycle Company, Utica, N. Y.; Morgan & Williams Company, Warren, O.; Brass City Auto Company, Waterbury, Conn.

The Utility Motors Corporation, Chicago, has secured a new factory location at Plymouth, Ind., and the machinery is being removed thereto. The company manufactures automobile engines.

The Motz Tire & Rubber Company, Akron, O., recently established three new distributing stations in the Central West. The Electric Garage, Fort Wayne, Ind., and the South Bend Rubber Company, South Bend, Ind., were added to the company's representation in Indiana. Glet Bros. is now distributor of Motz tires in the territory adjacent to Springfield, Ill.

MERCER USING A TENT.

Demand for Product Makes This Necessary to Relieve Congested Conditions.

As a result of the rapidly increasing demand for Mercer cars, particularly since a machine of this make won the Grand Prize at Santa Monica, Cal., in February, the Mercer Automobile Company, Trenton, N. J., has been forced to adopt somewhat unusual means for relieving congested factory conditions, pending the erection of permanent additions to the plant. It may be stated, in this connection, that several large additions were completed only a few months ago, but these appear to have been outgrown.

In order that work might be permitted to progress without interruption, the company recently purchased a large tent, measuring 90 by 150 feet, from the Robbins circus, which has been wintering in Trenton, and this has been erected within the factory grounds. The tent will be utilized for some of the final operations of chassis assembly.

OPEN NEW COLE PLANT.

Dealers and Owners Invited to Visit the Factory During Memorial Day Race.

The new factory of the Cole Motor Car Company, Indianapolis, Ind., was formally dedicated April 15. This building is held to be one of the most up-to-date and complete manufacturing plants in the United States, and the company is justly proud of it.

In order that all Cole dealers and their friends, and owners of Cole cars, may have abundant opportunity to inspect the new plant, the company has extended an invitation to all such to visit the factory during the week of the international sweepstakes 500-mile race on the Indianapolis motor speedway, Memorial Day.

SPLITDORF ON ANDES TRIP.

Martin's Buick Was Equipped with This Make of Magneto on Historical Journey.

Additional information relative to the recent transcontinental journey of Johnson Martin in a Buick car, from Buenos Aires to Santiago, South America, being the first automobile to cross the Andes, shows that the magneto utilized on this trip was a Splitdorf, made by the Splitdorf Electrical Company, Newark, N. J. The news is contained in the following cablegram from Mr.

Blatchley, in charge of the Splitdorf factory branch in Buenos Aires:

The Buick car with Splitdorf magneto made the trip from Buenos Aires to Mendoza through mud, sand and water without trouble and without changing a spark plug in 94 hours. Good result. We have since received word that they have successfully crossed the Andes, arriving safely at Santiago. Highest altitude reached was 13,000 feet. Everything snow above 11,000 feet. Terribly cold. Crossing Continental Divide never before accomplished.

It may interest you to know what we have done with the EV magnetos. One, we installed on the special Indian racer which we have here; the Indian which has it on anything on wheels in South America. Since we put on the Splitdorf the machine runs better than ever and we are getting quite a lot of business through it. We are winning races continually with this machine; never lose.

COMING EVENTS.

May.

- May 5—S. A. E. electrical equipment division meeting, New York City.
- May 9—Hill Climb, Atlanta, Ga.
- May 12—S. A. E. ball bearing division meeting, New York City.
- May 14—S. A. E. motor testing division meeting, New York City.
- May 20-June 7—International automobile and agricultural show, Warsaw, Poland.
- May 25-26—Targa Florio race, Italy.
- May 30—500-mile race, Indianapolis, Ind.
- May 30—Track meet, New York City.
- May 30—Track races, Providence, R. I.

June.

- June 1—Coupe Florio race, Palermo, Italy.
- June 6-7—Track meet, St. Louis, Mo.
- June 10-11—Isle of Man road race.
- June 17-18—Hill climb, Uniontown, Penn.
- June 23-26—S. A. E. midsummer meeting, Cape May, N. J.
- June 24-26—Meeting National Gas Engine Association, Chicago, Ill.
- June 27—Race meet, Brooklands track, Weybridge, England.
- June 30—Track races, Sioux City, Ia.

July.

- July 1-3—Non-stop run, Chicago-Boston, for Glidden trophy.
- July 3-4—Mid-summer meeting, American Automobile Association, Bretton Woods, N. H.
- July 3-4—Road races, Tacoma, Wash.
- July 4—Track races, Providence, R. I.
- July 4—300-mile race, Sioux City, Ia.
- July 4—Grand Prix, Lyons, France.
- July 17-18—Speedway meet, Seattle, Wash.
- July 25-26—Grand Prix, Belgium.

August.

- Aug. 21-22—Road races, Elgin, Ill.
- Aug. 27—Race meet, Brooklands track, Weybridge, England.

September.

- Sept. 5—Track races, Milwaukee, Wis.
- Sept. 7—Track races, Providence, R. I.
- Sept. 9—Speedway races, Pomona, Cal.
- Sept. 9—Road races, Corona, Cal.
- Sept. 9—Grand Prix, Italy.
- Sept. 14—Track meet, Milwaukee, Wis.
- Sept. 26—Race meet, Brooklands track, Weybridge, England.
- Sept. 26-Oct. 6—Show, Berlin, Germany.

October.

- Oct. 1—Kerosene motor competition, Paris, France.
- Oct. 2-3—Track meet, Oklahoma City, Okla.
- Oct. 2-3—Track meet, Trenton, N. J.
- Oct. 16-26—Automobile Salon, Paris.
- Oct. 17-24—Show, Pittsburg, Penn.
- Oct. 19-26—American road congress, Atlanta, Ga.

November.

- Nov. 6-16—Olympia show, London.
- Nov. 8-11—Track meet, Shreveport, La.

AMES EQUALIZING SPRINGS.

Manufacturer Is Co-Operating with Dealers in Providing for Increased Business.

According to the Clarence N. Peacock Company, 1790 Broadway, New York City, and 5986 Center avenue, Pittsburg, Penn., dealers handling Ames equalizing springs report largely increased sales as the result of revised prices. Another feature which has facilitated business is a specification order blank arranged to be filled out with the width, length, curvature and full information as to the spring suspension of the car to which the shock absorbing equipment is to be fitted. This information enables the maker to forward spacing blocks and longer clips for attachment, exactly right for the model to be equipped.

The Ames equalizing spring is designed to gradually check recoil, just as the chassis spring cushions the down thrust. It is stated that spring makers in various sections of the country are indorsing and taking agencies for the equipment, and that several manufacturers of well known cars have made exhaustive tests, signifying their intention of adopting the Ames as a standard fitting. In the latter case the equalizing spring is being built by the vehicle spring maker, under arrangement with the licensees, and delivered assembled with its springs.

Among the new agencies may be mentioned the Babcock Automobile Spring Company, 187 Oneida street, Milwaukee, Wis., and the Josiah Fowler Company, Ltd., one of the best known spring companies in Canada, which has the exclusive Canadian rights, with headquarters at St. John, N. B.

HOLTZER-CABOT GENERATOR.

New JS Magneto Is of the Permanent Field Type and Has High Output at 6.5 Volts.

Believing that there is a demand for a moderately priced, high grade generator, one adapted to the used automobile, the Holtzer-Cabot Electric Company, Brookline, Mass., has, after considerable experimentation, brought out what is known as the JS type magneto. It is of the permanent field type, is very compact, and one of its qualities is its output, which is stated to be 5.5 amperes continuously at 6.5 volts—remarkably high for the size of the generator. This efficiency is held to be due to the peculiar form and arrangement of the magnets.

The maker does not claim that the generator is universally applicable to motor car lighting,

but that it will be decidedly satisfactory under the following conditions: For the large car, the owner of which prefers gas headlights, but desires electric side, tail and interior lighting, electric horn and battery ignition for starting; for the complete lighting of cars that are driven chiefly during the day time or where the use of headlights is restricted; for the complete lighting of small automobiles, and for earlier types of large cars without magnetos.

The magneto is equipped with a governor pulley, which prevents excessive armature speeds, and when a storage battery is employed with the system it is connected to the dynamo through a special reverse current cut-out and an ammeter. The last named need not be of an expensive type, as it is utilized to indicate any slipping of the belt, by means of which the generator may be driven, this form being recommended. When the headlights are operated directly from the dynamo the cut-out and ammeter are not necessary, but a form of idler is utilized to release

Holtzer-Cabot JS Type Magneto for Electric Lighting and Battery Charging.

the tension of the belt, as during operation of the car in the day time.

One of the qualities of the cut-out is that it serves as a junction block for the magneto, battery and lighting circuits. The reverse current device permits the battery to take up the ignition and lighting when the motor is slowed down or stopped for any reason, and to allow the charging of the cells when the dynamo attains a predetermined speed. This action is entirely automatic. A six-volt battery may be used with the system, of from 40 to 120 ampere-hour capacity. The new generator is constructed with the same high grade material and workmanship for which the product of this concern is noted, and will appeal to owners desiring a moderate priced lighting equipment.

REVIEW OF 1914 LEGISLATIVE SEASON.

PERHAPS it is not too much to suggest that the recent decisions of the supreme courts in Michigan and Ohio had a decidedly wholesome effect upon the legislatures which have been in session this past few months. Of course, public opinion has helped. Of the 183 bills introduced in the 10 states in which sessions were held this year, but 27 reached the governors, and but 23 were signed. Eight of the legislatures already have adjourned, and it is expected that the other two, Massachusetts and Rhode Island, will adjourn shortly.

Registration Bills.

No drastic or very objectionable measure has been enacted in any state, unless it may be the new registration law in Mississippi. It will be remembered that the supreme court in that state declared the bill passed by a former legislature unconstitutional. The present law is termed a "privilege" tax, and it fixes the rates at which motor vehicles are permitted to use the roads as follows: Motorcycles, \$2.40; electric vehicles, \$4.80; commercial vehicles up to 4400 pounds capacity, \$8.40, and exceeding this capacity, \$16.80; all other motor vehicles, 36 cents a horsepower. The law is somewhat in the nature of an innovation, in that, besides fixing the above rates, it also provides for the registration of motor vehicles, a flat rate of \$2 being required for this purpose, payment of which entitles the owner to a number tag.

Ohio and Kentucky also have new registration laws. The Ohio legislature was called together in extraordinary session for the purpose of enacting a law to take the place of that passed last year and declared unconstitutional by the supreme court. The new rates are practically the same as those in force previous to 1913, and are as follows: Motorcycles, \$2; electric vehicles, \$3; all others, \$5; dealers' licenses, \$20. Chauffeurs must be examined and pay \$1 for registration.

There were 14 bills introduced in Kentucky, some of which were decidedly displeasing to motorists. Only one was passed. This is the new registration law, providing fees as follows: Motorcycles, \$5; cars of 25 horsepower and less, \$6; 25-50, \$11; more than 50, \$20.

Universal Lighting.

Three states enacted universal lighting bills. Of these, Massachusetts already had a law requiring lights on all vehicles, except where street lights were maintained at a distance of 500 feet apart. This exception has now been removed.

Rhode Island also has passed a bill following this latter plan. The new law in New York is patterned more largely after the older Massachusetts statute.

Massachusetts ranked first in number of bills introduced. Of the 48, but four have been enacted as yet. One of these is the light bill mentioned above, another prohibits the use of muffler cut-outs, a third grants additional privileges to non-resident motorists, and the fourth relates to garages in Boston.

Thirty-three bills were introduced in New York, of which three were sent to the governor. Besides the light bill the most important was that placing motorcycles under the provisions of the automobile law, but this was vetoed. The third bill was an act making it a misdemeanor to violate the traffic rules in New York City.

Maryland Speed Limits.

In Maryland, the only important new law regulates the speed of motor vehicles, prohibiting speed exceeding 35 miles an hour. It also limits trucks weighing four to eight tons, with load, to 15 miles an hour, and those weighing eight to 12 tons and traction engines to six miles. It limits widths to 90 inches, gross weight to 14 tons and weight an inch to tire width to 800 pounds.

The administration measure to exempt motor vehicles from personal property tax and increase the registration fees in New Jersey was defeated. The only bill of general interest passed in that state authorizes park boards to limit the speed of motor vehicles and even to exclude them from park drives. A bill authorizing the commissioner of motor vehicles to increase the number of special inspectors to 30 and to appoint men from other state departments upon request, passed both houses, but was not approved.

Local Licenses Permitted.

With the exception of one bill, those enacted in Virginia are local in character. This prohibits driving a truck, tractor or traction engine, fitted with cleats or lugs that will cause injury to the road, over any turnpike that has been treated with bitumen or other binder. One of the others permits local authorities in Accomac, King William and Spottsylvania counties to levy special license taxes to provide funds for construction and maintenance of roads in these mountainous regions. Another prohibits speeding of motor cars between Big Stone Gap and Appalachia in Wise county.

The only bills enacted in South Carolina were

local measures permitting special automobile license in Beaufort and Oconee counties to increase the road fund.

According to the American Automobile Association, which has kept a careful record of the legislative work of the season, the record of bills up to the middle of April was as follows:

	Bills Introduced		Passed	Signed	Vetoed
	Senate	House			
Kentucky	5	9	1	1	..
Maryland	6	16	3	3	..
Massachusetts...	6	42	4	4	..
Mississippi	3	4	2	2	..
New Jersey	9	15	4	3	1
New York	15	18	3	2	1
*Ohio	1	1	..
Rhode Island ..	5	6	3	2	..
South Carolina..	2	5	2	2	..
Virginia	8	8	4	3	1
Totals.....	59	123	27	23	3

*Extraordinary session to consider registration measure.

At that time the Massachusetts and Rhode Island legislatures were still in session. The legislature of Louisiana will convene May 11 and that of Georgia, June 27.

ADOPTS NEW POLICY.

Royal Equipment Company Now Guarantees Raybestos Brake Lining for One Year.

Holding that it is the trend of the times among manufacturers who are producing goods of a high degree of merit to give a consumer a more definite assurance of their durability, the Royal Equipment Company, Bridgeport, Conn., maker of Raybestos, announces as its future policy that this standard brake lining will be sold with a definite guarantee of one year's service. This means that if Raybestos does not give a full year's wear the maker agrees to furnish new lining without charge.

It is held by the company that heretofore no lining has ever been given a definite service guarantee and that at present Raybestos is the only one that is guaranteed. It is suggested that this move is evidence that the quality of this product is constantly being improved, and that the manufacturer is now certain that it has reached a stage of perfection which warrants taking this action.

EXPORTS AND IMPORTS.

Former Practically Hold Their Own for February, While Latter Lose 75 Per Cent.

The report of the bureau of foreign and domestic commerce, Department of Commerce,

Washington, D. C., for the month of February, shows that the exportation of automobiles and parts little more than held its own, when compared with the same month in 1913. Imports fell off practically 75 per cent., however. For the eight months of the fiscal year, exports show a gain of nearly 12 per cent., when parts are included, or a little over seven per cent. in automobiles alone. Imports show a reduction of 60 per cent. over the same period for 1913. The detailed report, as to countries, etc., follows:

EXPORTS.

NO CAR OWNER CAN AFFORD TO BE WITHOUT THEM

They are the cumulative result of our nine years' experience in the manufacture of dependable spring suspension.

No matter how hard you inflate your tires, our absorbers insure perfect resiliency and save half your present tire expense. Unnecessary wear and tear on motor, transmission and other components is eliminated because they reduce vibration to a minimum.

The combined efficiency and durability of J. H. S. SHOCK ABSORBERS make them worth all they cost and more—they're the only kind leading mechanical engineers have considered fit to endorse.

For thirty days you can try them at our expense. J. H. S. are made for every known car.

The Reaction Has Set In

against complicated and
overgrown lighting systems

Holtzer-Cabot MAGNETO GENERATORS

do the work with
far less trouble and
expense.

Some Reasons For Their Success

Battery charged through cut-out—Can supply current for lighting direct—No field coils—No failure to generate—Run in either direction—Wiring is simple—Low power consumption.

For FORDS, and other small and medium cars they are unsurpassed.

STANDARD

Polarine has proven its worth in town and country, ashore and afloat, for every sort of motor.

Polarine

Polarine is recommended by the world's largest and most reliable producers of oil, as the best lubricant that science has produced.

Polarine reduces friction to a minimum and ends carbon troubles.

It does not thin out under the greatest cylinder heat, and flows freely down to zero.

Sold in half-barrels and barrels, gallon and five gallon lithographed cans.

Use Socony Motor Gasoline.

COLGATE'S MOTO-GLOSS SOAP

Cleans off the dirt without injury to the lustre of the varnish.

Costs a trifle more than some soaps—but varnish costs still more.

The experience of 107 years of soap making is behind Moto-Gloss.

Get it of your garage man.

A trial size can of Moto-Gloss sent for 6 cents in stamps—sufficient for 2 or 3 washings of your car. We will include a free trial size of Mechanics' Soap Paste—a hand cleanser which takes the dirt and leaves the skin.

COLGATE & CO.
Dept. 22

Packed in pails of 5 lbs., 10 lbs., 25 lbs., also in 1-2 barrels and barrels.

199 Fulton St., New York

Economical Lubrication

is not possible when ordinary oils and greases are used. You should exercise as much care and judgment in selecting a lubricant as you do in selecting a car. If such methods are pursued your choice of lubricants will always be

This effective lubricant, which is endorsed and recommended by the majority of motor car manufacturers, produces a film, between the bearing surfaces, which positively will not thin out under the action of frictional heat, and allow them to come together.

Non-Fluid Oil will not gum and harden in cold weather after the manner of ordinary grease.

Non-Fluid Oil is the most economical lubricant for your car.

Packed only in orange enameled cans bearing the above sprocket-wheel trade mark.

How You Can Help

"A continuous, connecting, improved highway from the Atlantic to the Pacific."

Do you want to be one of that great army of progressive patriots who are helping to build a greater, more beautiful and more prosperous America?

Do you want to join with a million others, in the pushing through of an unselfish work which means more business, more pleasure and more advantages to all?

Do you want to help in the building of an eternal monument to the greatest name in the history of our country, to the greatest man the nineteenth century produced—Abraham Lincoln?

Do you wish to aid in the completion of the most practical enterprise ever undertaken by the American people? A 3400-mile link connecting the two oceans, to be used by, and directly profiting sixty millions of our population?

If you do, join the Lincoln Highway Association.

It's a great organization—a grand work to feel in sympathy with. Costs but \$5.00, payable once. The price of one good dinner, of one ten-cent cigar a week for a year, makes you a contributor and places your name on that vast list of patriots which generations to come will have cause to bless.

Get out your check book now. Here's a chance for you to build a portion of a lasting monument, the longest improved road in the world.

We have a pair of Lincoln Highway pennants, like the illustration, for your car. They will come to you for a dollar, prepaid.

A big map of the United States, showing the route of the Lincoln Way, is a fine thing to have on the wall of your office. It's backed with cloth, printed in three colors and costs \$2.00.

All the real Lincoln Highway boosters are wearing a little red, white and blue lapel button—they're twenty-five cents. Wear one.

Send the five to
The Lincoln Highway Association
 Dime Bank Building DETROIT, MICHIGAN

THE LINCOLN HIGHWAY ASSOCIATION,

"Give me a quart of oil"

This careless request may bring costly penalties

One of the surest ways to invite friction-drag and motor trouble is to say, "Give me a quart of oil."

How to secure the correct oil for your car

Do not say, "Give me a quart of oil."

"GIVE ME A QUART OF OIL" invites Loss of Power

You can get full compression—complete power—only by using oil whose body suits your motor.

Correct body is seldom secured by saying, "Give me a quart of oil."

"GIVE ME A QUART OF OIL" invites Scored Cylinder Walls

Scoring frequently results from oil of low lubricating quality.

Too often the blame can be traced straight to "Give me a quart of oil."

"GIVE ME A QUART OF OIL" invites Wear of Bearings

Bearings differ in type and size.

For every oil that suits your motor bearings, you will find many which will cause undue friction.

An almost sure start toward bearing-trouble is, "Give me a quart of oil."

"GIVE ME A QUART OF OIL" invites Carbon Deposit

Guesswork won't eliminate this trouble.

Suppose the body is too light for the piston clearance. The oil then works too freely into the combustion chambers. In burning, excess carbon accumulates—unless the oil's ash is light and naturally expelled through the exhaust.

An easy road to carbon trouble is, "Give me a quart of oil."

"GIVE ME A QUART OF OIL" increases Maintenance Cost

If the oil's quality is low, more of it is necessary to maintain a film.

If its body is incorrect, you have incomplete protection for moving parts.

In either case excessive friction-drag results. Fewer miles are obtained from each gallon of gasoline. Your fuel and repair bills mount up.

You want an oil whose body is correct and whose quality is best suited to the requirements of your motor.

Ask for that oil and get it.

On request we will send our Chart of Automobile Recommendations.

This Chart was prepared by a company whose authority on scientific lubrication is recognized throughout the world—the Vacuum Oil Company.

It was prepared after a careful analysis of the motor of each make and model of American and foreign car.

Make a note of the grade of Gargoyle Mobiloil specified for your car in this chart. Then make sure that you get it.

In buying Gargoyle Mobiloils, it is safest to purchase in original barrels, half-barrels, and sealed five-gallon or one-gallon cans. Look for the red Gargoyle on the container.

On request we will also mail a pamphlet on the Construction, Operation and Lubrication of Automobile Engines. It describes in detail the common engine troubles and gives their causes and remedies.

The various grades of Gargoyle Mobiloils, purified to remove free carbon, are:

Gargoyle Mobiloil "A"
Gargoyle Mobiloil "B"
Gargoyle Mobiloil "E"
Gargoyle Mobiloil "Arctic"

GARGOYLE

Mobiloils
A grade for each type of motor

They can be secured from all reliable garages, automobile supply houses, hardware stores, and others who supply lubricants.

For information, kindly address any inquiry to our nearest office.

The Sign of a Good Paint Shop

Make sure you take your car to be repainted to a shop where you will get a good job that will last.

There is no better way to judge a good painter than by the varnishes and other painting materials he uses.

This Transparency will be placed in paint shop windows all over the country. It signifies that the painter uses

VALENTINE'S PAINTING MATERIALS

If you see the sign in a garage man's window, he will direct you to the right painter.

Valentine's Varnishes and Colors are a little higher in price, but the man who buys them and uses them will tell you they are worth more than the difference to him, in the finer results he secures.

Ask the painter to use Vanadium Chassis Finishing

on the hood, fenders and under parts of your car. This is the varnish that is not affected by hot or soapy water, mud, road oil, grease, etc. It lasts four times as long as an ordinary varnish.

Write for our booklet, "The Care of the Car".

The Long-Time Car

Reo the Fifth

may demonstrate no better than some lesser cars. It may even look no better. But the chassis is built, in the hidden parts, like no other car in this class. And the results will show in time.

Reo the Fifth is built to endure. It is built for safety, for low cost of upkeep, for long years of perfect service. The man who builds it has for 27 years been learning how to better cars.

Takes Six Weeks

It takes six weeks to build Reo the Fifth. Days are spent on tests and inspections rarely applied to cars. Days are spent to get utter exactness, by grinding and regrinding.

All steel is twice analyzed. The most radical tests are applied

to each part. All driving parts are made to meet the requirements of a 50-horsepower engine. That means 50 per cent over-capacity, at least.

We use 190 drop forgings—15 roller bearings. At much extra cost we use a clutch which prohibits clashing gears. And gears are shifted by a three-inch movement of the hand.

To get super-strength and freedom from trouble we add about \$200 to the necessary cost of each car.

Must Stay New

To prove out this car in every part we keep test chassis running on the road. They are run night and day at a high speed. After 10,000 miles we take the car apart and inspect it. And the requirement is that every

vital part shall remain about as good as new.

New Features

This year we give you the stream line body. We give you the best system of electric starting and lights. We give you dimming searchlights, and many new ideas in equipment.

And we give you a price \$220 less than last year, with electrical equipment. This is due mainly to the fact that all our special machinery has been charged against previous output.

This car will save the average user hundreds of dollars because of our extra care. And legions of men know this.

Ask us for address of nearest dealer. We have them in a thousand towns.

Overland

A British Critic's Appreciation

THE world's most careful and severe motor car critics are forced to acknowledge the value and superiority of the Overland.

Though English authorities have always fought the "invasion" of the medium-priced American car, Overland worth has now convinced even the most skeptical of these critics. Below we reprint, in part, an article recently published in The London Illustrated News, written by W. Wittal, one of the most able motor authorities of the old world:—

"I have had occasion to become more closely acquainted with one American car—the Overland it is certainly exceedingly fine value for the money.

" . . . It has a big, able engine, three-speed gear box, electric self-starter and lighting equipment, magnificent brakes, most comfortable

and roomy seating accommodations for five, hood, screen, lamps, speedometer, tools—everything complete, in fact, save the petrol to drive away with.

" I found the car to run as well as it looks, which is saying a great deal. Quite fast on the level, silent, with a wonderfully good acceleration, and a fine hill-climber withal, I really do not see what more can be desired by the average motorist than the Overland will give. I am no particular friend of the low-priced American vehicle, *but this Overland car is one which would convert the most determined opponent of the Transatlantic cars.* In my analyses of American cars, I have invariably striven to hold the scales fairly, recognizing merit where merit is present. *And certainly it is present in the Overland and that to a very remarkable degree.*"

The Overland is universally accepted as the leader of its class. It costs 30% less than other cars of like specifications.

The Hardman

Single Cure
Wrapped Tread
Sure Grip

Tire

**What is a Single Cure
Wrapped Tread Tire**

?

It's the very latest improvement in the manufacture of pneumatic tires.

THE TIRE IS BUILT AND CURED SIMULTANEOUSLY and the component parts Therefore Must Adhere uniformly.

Whereas, The old style of tire manufacture requires two processes of finishing, virtually the same manner which your repair man uses in recovering old tires, which can never give uniform results.

**If You Are a Progressive Man
You Will Investigate the Hardman Tire**

Don't be skeptical, this is an age of advanced ideas and The Hardman is the most advanced idea in Automobile Tires.

The Process is Right, the Fabric the Best and the Friction Pure and the component parts the results of many years' experience.

**We Have a Live Selling Plan For a Few Dealers.
Why Not Let Us Tell You About It?**

Pawtucket, R. I.

The best oil you can buy is THE CHEAPEST OIL IN THE END

A first-class lubricant will save you *in gasoline alone* more than the difference between its cost and the cost of a poor oil.

And the saving in gasoline is only a small fraction of the running expense of your car which you will save by using

VEEDOL

Engine troubles, the necessity for grinding valves, repair bills, are mostly due to faulty lubrication. Any manufacturer, or dealer, will tell you so. *And you can't get proper lubrication from a poor oil.*

VEEDOL is made from a base which furnishes the best lubrication in the world—Pennsylvania paraffine petroleum.

It is a highly refined oil, containing no free carbon. Its viscosity under high temperature will maintain a constant film between the working parts of your engine. It burns up the cleanest of any oil in the market.

VEEDOL is a proven, tested oil. Our physical laboratory is probably the most completely equipped in the world. It reproduces exactly the condition of the oil in the actual operation of every type of car. It *eliminates all guess-work*. Our extensive chemical laboratories assure an absolute uniformity in every gallon.

VEEDOL is the final result of study and experiments extending over 30 years, in the endeavor to produce a lubricating oil which would give *the most lubrication with the least carbon deposit*.

It is the most nearly perfect cylinder oil ever put on the market. Ask your dealer for it. If he is not yet supplied with VEEDOL he can quickly get it for you.

TO DEALERS

We want a responsible agent for VEEDOL in every automobile center in the United States. Our new sales plan will put you in direct touch with every car owner in your vicinity. It is a big business builder. If there is no VEEDOL agent in your neighborhood, write at once for full information.

No-Rim-Cut Tires

Dropped 28%

During 1913 No-Rim-Cut tire prices dropped 28 per cent. They dropped so fast, so far, that 16 makers have declined to follow.

Now comes this situation:

Sixteen makes of tires are selling higher than Goodyear prices. Some are nearly one-half higher. Higher, mark you, than No-Rim-Cut tires—the tires which once cost one-fifth more than other standard tires.

The Reason Is— Mammoth Production

The difference lies in quantity. In this new factory with its new equipment we are building up to 10,000 motor tires per day. Perhaps twice as many as the largest rival plant.

Factory cost has dropped immensely as our output multiplied. And every saving goes to you. Last year our profit averaged only 6 1-2 per cent.

Those are the only reasons why we undersell 16 other makes.

Extra Features

In fabric and rubber we give you in Goodyears the best tire men know how to build. Our experts have tried a thousand ways to lower cost per mile, and

they say that No-Rim-Cut tires mark the present-day limit. It is simply unthinkable that any maker has learned a better way to build tires.

We give you in addition four great features found in no other tire.

We give you the No-Rim-Cut feature, which we control, and which has ended rim-cutting completely.

We give you the "On-Air" cure, which saves the countless blow-outs due to wrinkled fabric. This one extra process adds to our tire cost \$1,500 daily.

We give you a method—controlled by patent—which lessens by 60 per cent the risk of loose treads. And we give you the double-thick All-Weather tread, the one anti-skid which runs like a plain tread—which is flat and smooth and regular.

No-Rim-Cut Popularity

No-Rim-Cut tires, even when high-priced, came to outsell any other. And now, after millions have been put to the mileage test, we are selling 55 per cent more tires than in any previous year.

They offer you the utmost in a tire at the lowest price possible now. At a lower price than 16 other makes.

PUBLISHER'S AND READER'S PAGE.

The Eighth Annual Touring Number of The Automobile Journal will be issued July 10. Without doubt, this is the most eagerly awaited single number of any motoring magazine published. Each year the demand for this work of reference and routing guide for the ensuing season has increased very materially, and in anticipation thereof provision will be made for an edition several thousand in excess of the regular subscription list.

The 1914 Edition will contain complete routing directions covering every section of the United States and Canada, with particular attention to the short week-end trip, in keeping with the announced intention of the American Automobile Association and the National Automobile Chamber of Commerce to foster such touring through medals and awards. However, the longer tours will not be neglected, and considerable space will be devoted to outlining practical transcontinental journeys, as well as foreign tours of interest.

In Addition to the information applying di-

rectly to the tours themselves, the number will contain numerous special articles respecting the care and maintenance of the machine, the mechanical equipment of the car, complete digest of motoring laws, motoring apparel and every feature making for the comfort and convenience of the tourist.

Listen to What DAVID L. GALLUP Says About Brake Lining

We print herewith an extract from Prof. Gallup's report at the conclusion of a series of tests made of different brands of brake lining. Five samples were submitted—the five which are most widely used in the industry. Prof. Gallup's report is in part as follows:—

"In carrying out these tests all the samples of brake lining were subjected to exactly the same treatment, the conditions chosen being, as nearly as possible, such as are met with in actual practice. The tests were conducted with the object of determining the characteristics of various samples with particular reference to—

No. 1 Braking Ability (Frictional Quality)

No. 2 Heat Resistance (Durability)

No. 3 Wearing Quality (Durability)

No. 4 Effect of wear and heat upon the braking ability

After a careful examination of the brake linings upon the completion of these tests, and an analysis of the results obtained, it is evident that **MULTIBESTOS** stands superior to the other brake linings tested with particular reference to the following points:—

Braking ability under all conditions of service
Durability
Resistance to effect from heat"

(Signed)

TO feel your car move away instantly, smoothly and quickly when you start after being held up at a street crossing; to feel it "take" a hill and "eat it up" with ease and smoothness; to slow down to three or four miles an hour "on high"; to use only 80% of the accustomed quantity of gasoline; these are the things a Rayfield carburetor makes possible for you.

This means nothing more or less than perfect carburetion under any and all conditions.

Our one object for years has been to build a perfect carburetor; engineers who were earnestly striving to build the best cars recognized the Rayfield carburetor as the kind of carburetor that was essential to their success.

We have been determined to build the best carburetor that money could buy; we spared nothing in cost to ourselves, in time, money, or materials; the result justifies it all; it is what we wanted it to be. It costs a little more than the inferior kinds, yes. Why shouldn't it?

Get the best out of your engine by giving it the best—A Rayfield Carburetor. Your reward will come in increased speed, power and flexibility and in decreased gasoline bills.

THE UNITED STATES FORCES IN MEXICO.

A Consideration of the Conditions Under Which It Might Be Necessary to Use Motor Vehicles in the Event of More Extended Military Operations.

WITH the American occupancy of Vera Cruz and the possibility of more extended military action in Mexico, motorists very naturally are interested in learning as to what part, if any, automobiles will play in any advance into the interior of the country. Thus far the operations have not reached the point where the situation can definitely be termed war, but this is the nearest approach to war-like conditions which the nation has faced since the practicability of the motor vehicle was established. It also supplies the first opportunity the United States has had

to test the value of aeroplanes in such work.

Motor trucks, automobile ambulances and aeroplanes have been utilized in war with success—in the Italian campaign in Tripoli and during the more recent Balkan troubles. However,

the conditions in northern Africa and southeastern Europe are by no means parallel with those which exist in the Republic of Mexico. It will prove of interest to consider the character of the country in which motor trucks and automobiles are expected to operate were the present situation to become such as to make occupancy of the City of Mexico advisable.

Aeroplane Scouting in Connection with Manœuvres of French Army—A Scene Likely to Be Repeated Many Times in Mexico.

Mexico City is located in the valley of Mexico, which is in reality a wide plateau, between the Sierra Madre Oriental range on the east and the Sierra Madre Occidental range on the west. The city itself is 7400 feet above sea level, or the level at Vera Cruz, and in travelling the 290 miles between the two cities by train an altitude of 8100 feet is reached. This railroad is practically the only means of transportation to Mexico City from Vera Cruz.

Routes and Road Conditions.

The old national road, over which the American army passed in 1846 is still existent, but Americans resident in Mexico within recent years are authority for the statement that it is seldom used, except by pack animals; at least

hours. Twelve hours are needed from Vera Cruz.

The chief difficulty in reaching Mexico City from the north by road—in times of peace—lies in the presence of numerous "barancas" and the fields of floating sand. A baranca is really a dry canyon. Much of the country is held to have been of volcanic origin, and these fissures vary in depth from a comparatively few feet to many hundreds. Some have been bridged, while others make necessary wide detours.

Automobiles are used in Mexico. The United States shipped 227 to that country in 1913, 274 in 1912 and 297 in 1911. And there are numerous machines of European manufacture sold there. Some of these are utilized by residents of the northern states, near the American bound-

Pierce-Arrow and White Trucks Operating in Connection with Recent Army Manoeuvres in America, Indicating the Character of the Loads Carried—Also Officer's "Mount" in Field Operations Today.

those portions in the two passes through the mountains. In fact, much of the country in these mountains is described as virgin territory, and the railroad winds its way over high trestles, along the edges of precipices 4000 feet deep on concrete retaining walls, and through tunnels, affording abundant opportunities for crippling the train service.

There are two other lines of more or less direct communication between the States and the City of Mexico—one from Laredo, Tex., by way of Monterey and San Luis Potosi, a distance of 800 miles, or a 36-hour run, and the other from El Paso, Tex., by way of Chihuahua and Torreon, a distance of 1200 miles, or a run of 48

hours, and others in the southern states. There are a great many in the City of Mexico, and radiating from this centre are some improved highways—one, at least, is practically 15 miles in length. For the most part, however, these roads only connect the suburbs with the city proper, and there is no such thing as touring in Mexico. It will be remembered, of course, that the Flanders (now the Studebaker) Three Flags car reached the City of Mexico from the north on its trip from Montreal, Can., some two or three years ago.

Machines with Mexican Forces.

There is no means of learning the exact number of motor vehicles at the disposal of the Huer-

Subjecting Motor Trucks to Severe Road Conditions in Foreign Manoeuvres.

ta government, but it is known that 17 armored motor trucks were being utilized by the Federal forces in northern Mexico, in the vicinity of Nuevo Laredo, last August. What proportion

with road conditions contend that it would be impractical to make use of such vehicles on the Vera Cruz route, while they point to the successful journey of the Flanders as proof of the possibility of reaching the capital from either Laredo or El Paso. It must be borne in mind, however, that this statement is based upon the opinion of a civilian rather than that of a military engineer.

It will be remembered that attempts were made to conquer the Mexicans in the war of 1845-6 by taking the interior route, before it was decided to make Vera Cruz the basis of operations. And it was from Vera Cruz that the city eventually was taken. It may prove of interest

Indicating the Manner in Which the Motor Truck Has Supplanted the Horse in Hauling Field Guns Abroad.

of these has been taken by the Constitutionalists or has been placed out of commission in the interim is unknown. These machines were purchased from American sales agencies in Texas, and were fitted with armor in the military workshops at Nuevo Laredo and Monterey, Mexico. Gen. Villa also has been making use of armored trucks in the campaign in the State of Chihuahua. Some of his officers have touring cars and runabouts as well.

Whether or not motor trucks could be utilized to advantage in an American advance upon the City of Mexico must be largely a matter of conjecture. One guess may be as good as another. Americans who are more or less familiar

to review the history of the Mexican war covering the road conditions.

The advance was made from Vera Cruz early in April, following the course of El Rio del Plan

Hauling Artillery in Cross Country Work During French Army Tests.

White Ambulance in Field Work During Manoeuvres of the New York State Militia.

to Jalapa. This was found to be a continuous ascent, with numerous steep hills, and at Cerro Gordo it became necessary to cut a road along the almost perpendicular bank of the river. This permitted the passage of the infantry, but was found to be impracticable for draft horses, and the field guns were drawn through by hand. Later, however, this road was put in such condition that it was thought possible to haul the wagon trains, but of the 28 wagons which left Vera Cruz only four were able to reach the camp. This was some two months after the passage of the infantry, which was then at Pueblo, having crossed the first pass, awaiting the arrival of stores before attempting the more difficult portion of the route into the capital.

Between Pueblo and Mexico City.

It was found that the road from Pueblo led through a cultivated and slightly undulating country as far as San Martin Tesmalusa, then by a gradual ascent for the most part to the pass of Rio Fero, and a few miles further a rapid descent

into the valley of Mexico. After leaving the base of the mountains the way was interspersed with scattered volcanic hills of considerable height and exceedingly rugged. It was necessary to pass the marshy shores of Lake Tezcuco and along a narrow shelf between the northern base of the mountains and the lake, which was easily defended. The army was compelled to make this journey without its wagon train, because it was felt that the crippling of one wagon even would be so readily accomplished, and that the resulting

congestion would make it impossible to retreat should such a course become necessary.

United States Signal Service Men Operating with the Motor Truck.

Great Britain, France, Germany and Austria have perfected subsidy plans, under which motor vehicles always are at the disposal of the war department and are maintained in good and efficient running condition, in consideration of an annual sum paid the owner by the government. Great Britain is the only one of these countries that has attempted to lay down designs to which the vehicles must be built before they are subsidized, although the others provide certain well defined limitations as to weight, carrying capacity, general specifications, etc.

In the case of Italy, and the countries involved in the Balkan trouble to which reference has been made above, the vehicles were purchased

A Party of Skirmishers Utilizing Automobile in California State Manoeuvres.

outright. The same plan has been adopted by Russia, which owns a number of American made machines; Portugal, which also owns American trucks, and some of the other European countries.

Providing for Military Requirements.

Those nations which subsidize vehicles hold annual trials. With the exception of the annual military manoeuvres in Great Britain, these are held for the purpose of determining what type or types of machines shall receive subsidy, and the regulations are prepared by the war department officials with a view to providing strenuous tests. Russia, at least, follows this course before deciding upon the vehicles it will purchase.

In the United States the subsidy plan has not met with favor on the part of the government, and figures are by no means available to give any

The Curtiss Flying Boat in Practice Flight of United States Navy.

machines which were considered most practical for military purposes, reference being had, in this instance, to military transports. This position was clearly set forth in a letter addressed to manufacturers by Lieut.-Col. C. B. Baker, chief, quartermaster corps, in January, 1913, accompanying which was the following statement of specifications:

United States Army Truck Specifications.

Capacity—One and a half tons; safe overload, 20 per cent.

Drive—Either two or four-wheel drive, at option of builder.

Axles—Front and rear semi-floating or full-floating type, at option of builder.

Motor—Thirty-two to 40 horsepower, at option of builder; water cooled and with four cylinders cast en bloc and of the L or T head type, at option of builder. Magneto and battery dual ignition.

Clutch—Cone, leather faced.

Transmission—Selective type; four forward speeds and reverse.

Speed—From one to 15 miles per hour.

Wheels—Wood, artillery type, 36 inches in diameter; demountable.

Tires—Solid rubber, 36 by four inches; single or double, at option of builder.

Curtiss Hydraeroplane Leaving the Deck of the U. S. Armored Cruiser Pennsylvania.

definite idea of the number of machines that have been purchased. Motor trucks and automobile ambulances have been used repeatedly in military manoeuvres, usually in connection with the state militia organizations, but always under the watchful eye of United States army engineers. In addition, there have been held a number of so-called military trials, in which motor trucks and ambulances have been subjected to certain tests to demonstrate their ability to cope with given conditions.

That the army has been watching the situation is evidenced by the fact that motor truck manufacturers have been invited to co-operate with the government in production of

Hangars of the United States Navy at Pensacola, Fla., from Which Hydraeroplanes Were Taken to Mexico.

Tread—Fifty-six inches.
Wheelbase—One hundred and twenty inches to 144 inches, at option of builder.
Steering—Irreversible wheel, located on left side; extra heavy.
Brakes—Two sets, both attached to rear wheels; one set operated by pedal, other by lever.
Springs—Semi-elliptic.
Frame—Pressed channel steel, heat treated.
Body Length and Width—Ten feet by 3.75 feet or 9.25 by four feet. General design of body to be along lines of that of the present escort wagon; dimensions to be the same as for escort wagon, specifications 1908, amended 1911.
Body Material—White oak, reinforced with angle iron.
Top—Collapsible top over driver's seat.
Height of body platform from ground—Not to exceed 45 inches.
Ground Clearance—Eleven inches or more.
Weight—Complete with body, empty, not to exceed 5000 pounds.
Equipment—Two Prest-O-Lite gas headlights, two mineral oil lights, and one mineral oil tail light.
Gasoline Capacity—Twenty-five gallons.
Oil Capacity—Three gallons.

Experiments on the Border.

Since the mobilization of United States troops in Texas, near the Mexican border, as the result of the internal strife in that country, army officials have been experimenting with various makes, types and sizes of motor trucks under conditions approximating those existing in times of war, with the exception, of course, of that element represented by the presence of the enemy. As a result of these experiments, Maj.-Gen. Leonard Wood, until recently chief of staff, and the man who has been selected to direct any possible movement of the army in Mexico, is quoted as saying:

The time is not far distant when the motor truck can be used in almost any part of the country. They will be used chiefly between the base of supplies and the army, where good roads are assured. It is to the motor truck that the army of the United States must look for transportation for supply and combat trains.

Gen. Wood's statement was made some little time ago, before the present situation arose, and it must not be understood that his reference to "country" has any particular application to Mexico. That is to say, the quotation bears testimony to the efficiency of the motor truck as demonstrated by the tests in Texas, rather than to any proposed action in Mexico.

Right to Commandeer.

It is a well established axiom of military law that the government would have the right to commandeer from the commercial community all the motor vehicles it might need in times of war, providing it were found impossible to purchase such machines in the open market. There is little probability that the army would be handicapped in any way in securing a generous supply of such equipment.

The use of motor trucks, or of horse wagons, in times of war, and particularly in the enemy's country is in no respect analogous to similar

use in times of peace. The United States army is much better equipped with engineers than was true in 1845. Conditions which might have offered almost impossible obstacles at that time are much more readily met today. The only attempt that has been made herein is to present the situation as it appears to exist, from information supplied by those assumedly in a position to know. Whether or not motor trucks and automobile ambulances can be used to advantage is entirely a matter to be determined by the army engineer.

Use of Aeroplane.

Insofar as the aeroplanes are concerned, already they have demonstrated their value for scouting to the naval and military authorities in command at Vera Cruz. Hydraeroplanes were transported by the warships sent to take the port and they have been utilized almost continuously in determining the position of the Mexican forces since American control was established. Thus far the aviators have succeeded remarkably well in carrying out movements repeatedly tested at the various government aeronautic stations during the past few years, without getting in range of the enemy's fire, although at least one machine is reported as having returned to headquarters with a rifle shot through one of its wings.

DIXON COMPANY'S OFFICERS.

Largest Meeting of Stockholders Yet Held Re-Elects Old Board of Directors.

At the annual meeting of the stockholders of the Joseph Dixon Crucible Company, held at the company's main office in Jersey City, N. J., April 20, the retiring board of directors, consisting of George T. Smith, William Murray, George E. Long, Edward L. Young, William G. Bumsted, J. H. Schermerhorn and Harry Dailey, was re-elected. The officers also were re-elected as follows: President, George T. Smith; vice president, George E. Long; treasurer, J. H. Schermerhorn; secretary, Harry Dailey; assistant secretary and treasurer, Albert Norris.

The meeting was attended by a large number of stockholders, who expressed satisfaction with the present management and recorded the largest vote ever represented at an annual election—9628 out of a possible 10,000 shares.

George E. Daniels, vice president and general manager of the Oakland Motor Car Company for the past four years, has announced his resignation. He is not ready to make a statement as to his future plans.

THE FIRST CAR TO CROSS THE ANDES.

History Making South American Transcontinental Trip from Buenos Aires to Valparaiso by Johnson Martin and Otto Johanson of the United States.

Arrived safely this morning in Santiago. Highest altitude 13,000 feet. Everything snow above 11,000 feet. Terrible cold. Two weeks in mountains crossing Continental Divide. Feat never before accomplished. Great enthusiasm Santiago and Valparaiso.

JOHNSON MARTIN.

OFFICIAL reports of great accomplishments may fire the imagination, but they lack in romantic detail. When the Pan-American Union in Washington, D. C., received the above cablegram, Feb. 28, the American people were soon made aware of the fact that Johnson Martin, a graduate of Princeton, and Otto Johanson, his mechanic, had at last succeeded in crossing the Andes in an automobile. Complete details are still lacking, but the accompanying story of the trip is compiled from information contained in a letter from Johnson Martin to Franklin Adams, chief clerk of the Pan-American Union, to whom The Automobile Journal is indebted as well for the photographs from which the illustrations were made.

Martin and his companion did more than cross the Andes, although that is in itself a feat which had often been attempted. During the past year there has been decided rivalry between aviators and motorists in South America for the honors now held by these two men. While they were in the mountains, Jorge Newbery lost his life in an attempt to fly over the Uspallata pass from the Argentine side. The distance between Mendoza, Argentina, and Los Andes, Chile, is but 230 kilometers (143 miles), but unexpected irregularities of the air in the cleft through the mountains make flight dangerous, and, thus far, impossible.

The two North Americans not only negotiated the difficult Uspallata pass, but they are the first motorists to make a transcontinental trip across South America. It must not be understood that the machine travelled under its own power the full distance. There were times where it was impossible to make headway without

turning the car on its side—but, to tell the story in chronological order:

The Trip in Detail.

Johnson Martin and Otto Johanson left Buenos Aires, Argentina, Jan. 30, in a Buick car, made by the Buick Motor Company, Flint, Mich. The information thus far received makes no mention of the chassis equipment, other than the magneto and spark plugs, which were Splitdorf, the product of the Splitdorf Electrical Company, Newark, N. J. These performed their respective duties without trouble throughout the entire trip from coast to coast.

They followed the national highways to Villa

Street Scene in Buenos Aires, Argentina, from Which Point the Transcontinental Journey Was Begun.

Mercedes, a distance of 793 kilometers (492 miles), which, because of the many ponds and large swamps encountered, was not reached until three days later. A whole day was spent here, the time being devoted to cleaning the car, before the journey was resumed to San Luis. Here they were delayed again for half a day, on account of a heavy storm.

Leaving San Luis in the night, the trip to Jarilla, about 970 kilometers (602 miles) from Buenos Aires, afforded its full quota of difficulties. The roads were narrow paths and very rough, and in many places it became necessary for the men to walk beside the car in order to

**Laguna Negra, at the Base of Mount Aconcagua in the Uspallata Pass—
Turn Picture to Note Reflection in the Water.**

direct its course. Proceeding under these circumstances, in the dark, and encountering a sharp turn in the road, neither of the men saw some large mesquite bushes which blocked the way. They lost control of the machine, which followed the trail for a short distance, then plunged into the brush, where it soon met with obstacles which stopped the motor.

Crossing the Low Lands.

After vainly searching for the machine for a time, resort was had to a megaphone, which they were carrying for use in case of need. It transpired that the men were only about a league from Jarilla, and a number of persons answered their call, taking them to a storage shed or warehouse at the railroad station. It rained hard during the night, but when the car was found the next morning the only damage was a badly bent axle, which Johanson succeeded in straightening so that it could be used.

At 1 that same afternoon they left for Desaguadero and La Paz, arriving in the latter town about midnight. Here they were refused admission at the hotels, because of their appearance, and it was only after some of the residents had set their dogs upon them that they were able to receive attention. The following morning the axle was taken to a blacksmith shop, where it was repaired.

The next stop was San Martin, which was reached just in time, since the gasoline gave

out as the car stopped in front of a store where the tank could be refilled. Three days were spent in Mendoza, in an attempt to secure information as to practical routes into the pass. At last it was decided to follow a line of telegraph poles, which eventually led to Villavicencio, from which point they easily found the way to Las Higueras.

This town virtually is the entrance to the Uspallata pass, which is the best known of all the passes over the Andes from Ecuador to Patagonia. Through it San Martin's army crept on its search for conquest. Over it all the transmontane mail and

passenger traffic has long been sent. The road from Las Higueras to Uspallata is nothing but an old mule trail, and the motorists found it one of the most difficult and dangerous sections of the entire trip. At one place but four kilometers (about 2.5 miles) was covered in four hours. They were finally compelled to abandon the attempt, and slept on the rocks. In the morning they followed the bed of a dry river and arrived in Uspallata at 12:30 at night.

Here they were entertained royally by a genial Chilean gentleman, Jose Correa, who took great interest in the enterprise and offered all kinds of assistance. One whole day was devoted to exploring the pass for the purpose of finding a road which would permit the car to proceed under its own power, Senor Correa accompanying the party. He was informed that the

Punta de Vacas, on the Road Between Argentina and Chile in the Uspallata Pass of the Andes.

Where Gen. San Martin's Artillery Crossed the Valley of the Horcones, Aconcagua in the Distance.

trails between Uspallata and Punta de Vacas had not been used by wagons or carts, even, since the time Gen. San Martin crossed the mountains with his artillery. When the trip was again resumed the car was accompanied by two of Senor Correa's men and two horses.

Entering the Pass.

It will be understood that at this point the trail begins its ascent to an extreme elevation of 12,500 to 13,000 feet, and the peak of Aconcagua towers above it, 23,392 feet above sea level. The scene is extremely awe inspiring, but it is feared that the motorists failed to appreciate much of its beauties. The car proceeded under its own power for a time, in spite of the hard work, and after much battling in the night the party reached Ranchillo brook, which flows into the Mendoza river, and camped upon the stones.

Getting an early start the next morning, the Pichenta river was soon reached, and here the car was forced to abandon the task for the time being. The only means for crossing the river was by an ancient bridge, constructed for the use of pack animals. As the width of the machine was exactly the same as that of the bridge, it was necessary for the four men to carry the automobile across above the railings. It took 26 hours to cover one kilometer on the way to Cortaderas, and in some places the car had to be turned on its side, the men pushing it along as best they could because of the narrow path.

Soon after leaving Cortaderas as they reached Polvaredas and the Paramillo river, where there was a steep winding road of about 100 meters. Here it was necessary to use the two horses, until one of them fell into a canyon several meters deep and was instantly killed. Still following the river and overcoming obstacles as best they could—the road having been swept away in places by landslides, which occur continuously—Punta de Vacas was reached at 8 in the evening of Feb. 18.

Mr. Martin states that the first tire trouble was had on the way between that city and Inca, which distance was covered in two hours. This certainly speaks well for the make of tires used, and the name of the manufacturer would prove interesting to automobile owners. During the stay at Inca, opportunity was had to test the different kinds of baths which are found there, and it may be added that the rest was needed in view of the fact that the steepest part of the climb was yet to come.

Nearing the Summit.

On the morning of Feb. 20 the journey was continued to Las Cuevas, which was reached the night of Feb. 21, after repeating many of the experiences of the previous days. Mr. Martin does not give any information as to the action of the carburetor in this high altitude, but the remainder of the distance between Las Cuevas and La Cumbre (the summit) was made between daylight and 4 in the afternoon.

One of the Better Sections of the Mule Trail on the Chilean Side of the Pass, on the Way to Los Andes.

Here the car stopped opposite the beautiful statue of Christ of the Andes, marking the division line between Argentina and Chile. For the first time in the history of the world an automobile had crossed the entire country of Argentina. The boundary was not actually crossed until the next morning, after breakfast in La Casa de Piedra (the Stone House).

Chilean Roads Much Better.

The roads on the Chilean side were found to be well kept, and quite in contrast with those in the Argentine Andean section. Good time was made running down the mountain to Caracoles, the route lying near the lake of the Inca, but, due to the fact that this portion of the trip was made at night, the motorists failed to see the high precipices of which they had heard so much. Early in the morning of Feb. 23 they reached Rio Blanco, where they breakfasted, and continued to Los Andes, which was entered at 2:30 in the afternoon. They went immediately to the customs house and the prefect of police, who certified to their arrival.

Leaving Los Andes at 2:30 the next morning, the journey to Santiago was made before 7:30 in the evening. Here they were greeted with great enthusiasm as they drove through Independence avenue. The remainder of the trip to Valparaiso was made over good roads, and was not undertaken until the two men had undergone a good long rest in Santiago.

At the End of the Trip.

A newspaper clipping accompanying the letter tells of the machine's appearance upon its arrival in Santiago, after covering 1900 kilometers (about 1180 miles) since leaving the shores of the Atlantic, as follows:

Showing the effects of the trip, but undaunted, the two brave Yankees arrived in Santiago last night. They were like a pair of gladiators after a battle. They had completed the great trip, and on their faces glowed expressions of triumph and pride, which seemed to sing a hymn of victory and suffering.

Their automobile was on the street below, covered with dirt and mud, broken here, patched there; the pneumatic tires in tatters, the gasoline tank dry, the springs, nuts and gears the worse for wear; the entire machine appearing to the eyes of the wondering multitude like the mail of a fantastic warrior who had valiantly battled for a good cause in an unknown country and had been victorious.

The general offices of the United States Light & Heating Company will be removed from 30 Church street, New York City, to the factory at Niagara Falls, N. Y., May 20. This transfer will result in bringing together all the administrative, sales, engineering and production departments, and is expected to insure the most effective conduct of all in the interests alike of patrons and stockholders.

GLIDDEN TOUR RULES.

Regulations Governing the Night and Day Chicago-Boston Non-Stop Run.

As is already known, the Glidden trophy will be the principal award in the night and day non-stop run from Chicago to Boston, June 29-July 2, under the auspices of the American Automobile Association. There will be three divisions, one for stock cars listing at over \$1200, for which the Glidden trophy is offered; one for stock cars listing at \$1200 and under, for which the award will be the A. A. A. trophy, and a non-stock division for private owners, in which the Anderson trophy will figure as the chief prize. In addition, certificates of economy attesting the fuel consumption will be issued to those entrants of cars indicating their desire for such a test, and certificates of merit to all cars finishing the run without stoppage of the motor.

The cars will leave Chicago at 2 in the afternoon of Monday, June 29, and will reach Boston at 12 noon, Thursday, July 2. A schedule of 20 miles an hour will be maintained between sunrise and sunset, 15 miles an hour between sunset and sunrise the first night, and 18 the other nights. Controls will be established at Bryan and Cleveland, O.; Buffalo, Syracuse, Albany and New York City, N. Y., and Springfield and Boston, Mass. Additional supply stations will be established at intermediate points, where gasoline, oil and water may be obtained. Cars will be penalized for lateness at controls, but not at the supply stations. Penalties will also be imposed as follows:

One point per minute or fraction thereof for lateness at all controls.

Stoppage of motor voluntarily or involuntarily either in or out of controls at any time during the entire contest will disqualify.

No penalty will be imposed for repairs, replenishments, or replacements of tires, or the fitting, repairing, or removing of anti-skid devices, but the time consumed in such tire work will not be added to running schedule. Replacement or cleaning of spark plugs is permitted on the road, but time is not added to the running schedule.

Where penalties are imposed for time consumed in work by drivers, passengers or others, the consumed shall be added to the running schedule.

The use of self-starters is prohibited under penalty of disqualification, and where self-starting is a part of the equipment of the competing car, the self-starter connection shall be disconnected and sealed by the technical committee previous to the start. On all cars the starting crank will be sealed.

Oil or grease may be added to or drawn from the various cases without penalty when in control. Lubricating all parts of cars, such as crankshaft, filling and turning of grease cups and other parts is allowed in control.

No adjustment of carburetors, magnetos, brakes, steering gear, springs, or similar adjustments, will be permitted at any time without penalty.

In case of a tie for the trophies, prizes will be awarded on the basis of a final technical examination and test in which penalties will be assessed for: Faulty brakes, broken radius rod, bent axles, missing cylinder, broken springs, faulty steering gear, faulty gearset.

DETAILS OF THE SALVADOR LIGHT CAR.

THE Salvador light car, built by the Salvador Motor Company, with general offices at 126 Massachusetts avenue, Boston, Mass., and a temporary factory in that city, has been developed to supply the ever increasing demand for a comparatively small vehicle, having seating capacity for two, that has every essential quality of the high priced machine and the added value of extreme economy. The initial cost is small, but nothing that makes for comfort or convenience of the owner or operator has been sacrificed. It is intended for the service of those who desire a comparatively inexpensive machine, with speed the equal of larger cars, that can be used the year round for business purposes if need be, and has such qualities that it may be used with satisfaction by those who have large vehicles that are not desirable for town or general utility service.

The Salvador is not a cyclecar. It is light, having one horsepower for every 50 pounds of weight; it will give 50 miles an hour on any road on which that speed is safe; it is extremely economical of fuel, lubricant and tires; it is as comfortable as the most luxurious touring car; it has every desirable accessory; it is built to have unusual endurance, with wide margins of safety and of high grade materials; it is designed to be practical in all operating conditions; it is so accessible and so well simplified that minimum labor is necessary for care and upkeep.

Use of Gearless Differentials.

As an engineer's work the Salvador car has much to attract attention. It is not conventional in all details of chassis construction. For instance, the power transmission system has been simplified by dispensing with the usual bevel gear differential. Instead of the divided rear axle driving shaft a solid shaft is used on which the bevel gear is mounted. In the hubs of the rear wheels are "gearless differentials", which are in reality sets of two clutches, one of which

engages when the machine is driven either forward or backward, while there is fullest compensation when turning. The clutches are positive in operation and require no attention whatever.

Cantilever Spring Suspension.

The suspension is full cantilever, the body being carried between the extremities of cantilever springs, which take the driving thrust, so that deflection and reflexion resulting from road conditions are minimized. The car is extremely easy riding, remarkably steady at any road speed, responds instantly to acceleration, takes grades with surprising ease, and can be handled with the same certainty obtaining in the larger machine.

The purpose of the designer was to produce a

Salvador Car, Having Full Cantilever Suspension and Unit Power Plant, Equipped with the Standard Luxembourg Body.

vehicle that would not only have every driving and operating quality, but to construct it of material that would endure. The chassis is built of carefully selected materials and the body and equipment are at parity with the constructional standard. Provision is made for every comfort and convenience that would appeal to the experienced motorist, and nothing that could be desired is lacking. The body design is unusually attractive and it is finished with much care. Details have been carefully thought out. The lines are graceful, the seats are spacious, the leg room is ample, the provision for storage is surprisingly large, the running boards are clear, and the arrangement of the accessories is admirable.

The power plant is a unit, the motor, clutch

and transmission gearset being as complete and as well designed and harmonized an assembly as can be found in the highest priced four-cylinder pleasure cars. This consists of a four-cylinder,

Front View of the Salvador Car, with the Effective Streamline Hood and Cowl of the Luxembourg Body.

four-stroke cycle, water-cooled engine of the block type, a leather-faced cone clutch and a selective sliding gear transmission gearset affording three forward speed ratios and reverse. The control is by a centrally located hand lever that is operated in a conventional H slot quadrant. The motor is an L head type with the valves at the right side. At the S. A. E. formula the rating is 12.1 horsepower, but at maximum speed of 1100 revolutions 18 horsepower is produced. The bore is 2.75 inches and the stroke four inches, this giving a ratio of bore to stroke of 1:1.454, which dimensions were determined after careful investigation of the requirements with reference to American roads, efficiency, period of endurance, fuel consumption and smoothness of operation.

Motor Cast En Bloc.

The cylinders and crankcase are cast en bloc with fuel intake and exhaust manifolds integral, the manifolds being with easy sweeps and large areas. The water jackets are ample, insuring positive cooling, these being designed for thermo-syphon water circulation. The walls are uniformly thin, this making for weight reduction.

The crankcase is a barrel form, to which is bolted an oil reservoir of three quarts capacity. The cylinder heads and their water jackets and the water outlet manifold are a separate casting that is fitted with a copper-asbestos gasket and retained by 14 bolts. This construction insures better cylinder castings and machine work and absolutely equal combustion chambers. The water outlet and the passages in the cylinder head casting are very large, to obtain unrestricted circulation. The machine work is done with much care and the cylinders accurately finished. The pistons, as is the cylinder block, are cast of a fine quality of gray iron. They are carefully finished and carry four Wasson compression rings, three above the wristpin and one at the skirt.

Ample Bearing Surface.

The crankshaft is a two-bearing type, of special alloy steel, with flanges to take end thrust and designed to have extreme rigidity. It is drop forged and is machined and ground, double heat treating insuring great strength. The forward main bearing is 3.5 inches length and the rear main bearing four inches, with diameter of 1.5 inches. The crankpins are 1.375 inches diameter. The camshaft is a 15-20 carbon steel drop forging with the cams and gear flange integral. This is also double heat treated and all wearing parts are hardened and ground. The main and camshaft connecting rod bearings are a fine quality of die-cast babbit bearing metal, which are carefully fitted. The connecting rods are I section alloy steel drop forgings that are double heat treated. The wristpins are seamless steel tube, hardened and ground. These are clamped in the small ends of the connecting rods and oscillate in bronze bushings in the piston bosses. The big ends are fitted with caps retained by bolts.

Valve Operating Mechanism.

The camshaft gear is bolted to the flange of the shaft, the gear being of large diameter. The timing gears are of special iron and sized and cut with a view of obtaining endurance, the largest gear being 5.75 inches diameter. The gears are operated in a bath of oil, this minimizing noise. The cams are shaped to be practically noiseless. The valve ports are 1.125 inches diameter. The valves are nickel steel heads and carbon steel stems, electrically welded, and have a lift of .28125 inch. The valve stems operate in bushings in the cylinder block. The springs are helical, oil tempered, and are retained by collars and keys. The tappets are a mushroom type that move in bushings inserted in the crankcase. They are adjustable by screws and nuts. The valve steps, springs, tappets and adjustments

are enclosed by removable cover plates.

The motor is lubricated by a constant level splash system supplied from a reservoir bolted to the crankcase. The oil is drawn from the reservoir by a plunger pump, after filtration, and forced through a tube that supplies the timing gears and the oil troughs beneath the cranks, the overflow draining to the reservoir. The distribution is by splash to the shafts, bearings, tappets, cylinders and pistons. A float gauge shows the volume in the reservoir and an automatic overflow prevents the oil reservoir being flooded. Over-lubrication is impossible and the motor will never smoke.

The cooling is by thermo-syphon circulation of water through a radiator of special design, supplemented by a steel bladed fan on an adjustable ball bearing bracket driven by a flat belt from a pulley on the crankshaft extension. The ignition is by a high-tension oil and dust proof magneto, driven by a gear that meshes with the camshaft gear. By removing four bolts the housing, gear and magneto can be taken off. The carburetor is an automatic float feed double jet type that is stated to be extremely efficient and economical.

Clutch and Gearset.

The cone clutch is in combination with the flywheel and pressure is afforded by three helical springs that insure equal pressure, and which are adjustable. The leather facing of the cone covers three flat springs that insure ease of engagement. The thrust is taken by a self-aligning ball bearing. The leverage is compounded so very slight pedal pressure is necessary. The clutch pedal is rubber padded.

The gearset is compact and the spline or primary shaft is large diameter, supported on ball bearings. The lay shaft gears are keyed on to the walls of a heavy seamless steel tube, bronze bushed at either end, that runs on steel stubs that are hardened and ground. The gears are 8-10 pitch, stub toothed, .6125-inch face, of special analysis steel that is double heat treated and oil hardened. The third speed ratio is direct drive, the second ratio is 1:1.52, the low is 1:3.08, and reverse is 1:3.75. The clutch and the gearset are completely housed and protected from dust, and are effectually lubricated. The materials of the power plant are high grade, all machine work is to close limits, and every part is interchangeable.

Three Point Suspension.

The power plant is mounted at three points, on a cross member at the forward end and by cross arms to the chassis frame at the sides. On

top of the gearset case is mounted the quadrant and the control and brake lever.

Back of the gearset case is the transmission brake, this being a band contracting on a drum carried on the shaft, and operated by the hand lever in the event of emergency. Immediately behind this is a Spicer universal joint, and the end of the rear yoke of the joint is a square sleeve that carries the forward end of the main driving shaft, the shaft having a telescoping movement in the sleeve. Surrounding the shaft is a torque tube that has a Hyatt roller bearing and a ball thrust bearing at the forward end. The rear end of the shaft similarly telescopes into the pinion shaft that is carried on a Hyatt roller bearing and a thrust bearing.

The rear axle consists of two cast steel center sections, two tubes and two cast steel end sections. The driving shaft is a single drop forging with a centre boss on which is mounted the

The Salvador Car as Seen from the Rear, with the Tire Surrounding the Shield Cover of the Storage Space Behind the Body.

bevel gear. At either side of this is a Hyatt roller bearing and a ball thrust bearing. The shaft ends are similarly mounted. The castings forming the axle housing ends carry the brake

flanges and the spring seats. The ends of the axle shaft have fixed upon them the clutch or differential plates, and the rear wheel hubs contain the other sections of the clutches. The clutches are operated by gravity, the clutching being by the falling of small discs that cause engagement, and are instantly released by cessation of pressure upon them. At the clutches are operated dry, and are protected against oil or dust, there is no possibility of defective operation. The cost of renewal, after long period of wear, is trifling.

The Frame Construction.

The chassis frame consists of a side and a front member of pressed steel channel section, with three steel cross members and two spring tierods back of the power plant. The frame is extremely well constructed. The rear springs are mounted at the forward ends with short shackles

in alignment. The front axle is tubular with drop forged knuckle yokes and large pivots that are provided with grease cups.

The wheels are wire construction, 28 by three inches, with steel rims, of the clincher type. The rear wheels carry the service brake drums. The forward wheels are mounted on ball bearings of the cup and cone construction. The machine is driven at the left side with centre control. The steering wheel is 15 inches diameter and the steering gear is a worm and sector design, the tie bar and drag link being behind the forward axle. The wheel carries the ignition control lever. The fuel supply is controlled by an accelerator pedal. The service brake is operated by the right pedal, this actuating internal expanding shoes in drums in the rear wheels. This brake is equalized. The emergency brake is on the driving shaft and is operated by a hand lever.

The gasoline tank has 7.5 gallons capacity and the feed is by gravity. The tank is in the cowl of the body, and in front of this is the instrument board, on which is placed the electric light gang switch, the magneto switch, the clock and speedometer. Under seats is storage space, so running boards are clear.

Side View of Salvador Chassis, Ready for Body Installation, Showing the Power Plant and the Control Levers, Pedals and Steering Wheel.

supported by the front tierod. A third of the length of the spring back of the front end is placed the cast steel saddle, in which is drilled a .75-inch hole. The second tierod extends across the frame and the ends are mounted in castings bolted to the side members. The ends of the tierod fit the holes in the saddles. The rear ends of the springs are carried back and are bolted and clipped to the seats on the rear axle, this preventing extreme stress upon the master leaf. The forward springs are mounted on seats bolted under the frame side members, the shackles also being beneath them, and the forward ends are secured to the front axle by bolts and clips to the extended seats. It will be understood that the drive is through the springs, and the body is supported from the spring ends, so that there is never reflexion above the line of deflection caused by the load. The shackle movement is extremely small. Frequent clips insure the springs being

The machine is lighted by electric lamps, the current being supplied by a six-volt 40-ampere battery, by a single wire system.

Body Lines Attractive.

The fenders are graceful in design, with long sweeping curves, and are flanged. The running boards are covered with rubber matting with metal binding. The body is distinctively attractive, being a Luxembourg model with streamline effects, which is extremely large, and the cowl and hood sweep off to the radiator with very pleasing effects. It is of metal on a heavy wood frame. The body is entered from the right side by an 18-inch door having invisible hinges. The upholstery is of fine curled hair and blue motor cloth that is cravenetted, over high quality springs. The standard finish is dark blue with a ribbon of robin's egg blue at the top of the body. Back of the seat is a large storage space that is reached by lifting a shield, and on this the spare

tire is carried. In this space is carried the battery.

The car is fitted with a one-hand mohair top and a one-piece windshield, 34 by 18.5 inches, that swings at the centre. The car is fitted as regular equipment with electric lamps, windshield, storage battery, vibrating horn, tool kit and wheel jack. It can be equipped as extras with top, speedometer, tire and tube and clock, and an electric engine starter can be installed when desired.

The wheelbase is 100 inches, the tread 46, and the road clearance is 9.5 inches. The weight is 900 pounds and the speed is guaranteed from four to 50 miles on the high speed, so extremely flexible is the engine.

Plans for Production.

The production of the cars is limited this year to 1200, of which 500 have already been sold for exportation, the order of 10 demonstration cars now being made up for as quick delivery as is possible. These must be in England by July 1. The remainder, 700 cars, will be divided between New England and New York sales. The company plans to erect a modern and up-to-date factory in the Boston district in the early fall. This plant is designed to turn out 10,000 Salvador cars annually.

MILLER'S 1914 CATALOGUE.

Facts Concerning a Work That Has a World Wide Circulation of 100,000.

The 1914 catalogue of Chas. E. Miller, 97-103 Reade street, New York City, the pioneer automobile accessory dealer, is just being mailed, and it is announced that it will have a world wide circulation of 100,000 copies. It requires 50 one-ton trucks to make delivery to the postoffice, and such as are intended for foreign countries are shipped by freight to the point of entry, where they are mailed by brokers. Miller pays 15 cents duty on each book thus sent.

The white paper as it comes from the mill, in one continuous sheet, would make a band five feet wide extending from New York to Wash-

ington. The pages laid end on end would make a band 7.25 inches wide that would reach 1925 miles from New York City. The printing surface in the catalogue is 13,721,525 square feet. Piled flat on top of each other, the issue would make a tower nearly 2000 feet higher than the combined height of the three tallest buildings in New York, if they were placed on top of each other. This book will be mailed free on request.

CONCERNING THE KNOX SALE.

Final Outcome of the Company's Affairs Meets with Very General Approval.

Friends of the Knox Automobile Company, Springfield, Mass., are much pleased that the final outcome of its affairs, as related in more de-

Top View of the Salvador Chassis, Showing the Power Plant and the Transmission System, and the Frame Construction and the Rear Spring Design.

tail elsewhere in this issue, has been arranged so satisfactorily. The Knox company was one of the old, original automobile manufacturers in the United States, putting out its first car in 1899, and its product early found its way into every state in the Union.

The recent sale of the property to E. O. Sutton, which has been confirmed by the court, has placed it in the hands of parties who promise to extend the business on a much wider scope of national standing than it has ever enjoyed. It is stated as Mr. Sutton's intention that the active manufacture of pleasure cars, tractors and fire apparatus will be continued.

It is announced by the new management that the company is now selling out all its present limited stock of pleasure cars and trucks to make room for the new product which will shortly be manufactured, and that the factory has been carefully systematized and rearranged to carry forward an enlarged production along the most approved manufacturing methods.

FORTY-FOUR ENTRANTS FOR BIG RACE.

AT LEAST five countries, America, France, Germany, England and Italy, will be represented in the annual international sweepstakes 500-mile race on the Indianapolis motor speedway, Memorial Day. May 1 the entry list showed a total of 44 possible starters, although the number which actually will be permitted to start is limited to 30. Qualifying trials will be held May 27, at which time it is expected that the number will be reduced somewhat. At present, however, the entry list reads as follows:

Stutz, Gilbert Anderson; Stutz, Earl Cooper; Stutz, Barney Oldfield; Mercer, Spencer Wishart; Mercer, Caleb Bragg; Mercer, Edwin Pullen; Peugeot, Jules Goux; Peugeot, George Bollot; Peugeot, Arthur Duray; Mercedes, Ralph Mulford; Mercedes, Ralph DePalma; Delage, Albert Guyot; Delage, Rene Thomas; Excelsior, A. Christiaens; Burman, Robert Burman; Burman, William Knip-

having them in the best of condition for the qualifying trials, May 27. In these trials each machine will be required to show a speed of 75 miles an hour for one circuit of the speedway. Those not ready to take this test on the date specified will be eliminated automatically. Two days previous to the race, all steering knuckles, tierods, etc., must be changed.

SIoux CITY 300-MILE RACE.

Big Purse for Opening Event on New Speedway in Iowa, Independence Day.

The management of the new motor speedway at Sioux City, Ia., has decided to open this track officially July 4 with a 300-mile race, for which a purse of \$25,000 has been hung up. The event will be a class E non-stock race, open to cars with piston displacement of 450 cubic inches or less, and minimum weight of 1600 pounds. The purse is to be divided as follows: First, \$10,000; second, \$5000; third, \$2500; fourth, \$1750; fifth, \$1500; sixth, \$1100; seventh, \$900; eighth, \$800; ninth, \$750; 10th, \$700.

E. R. Schulz, secretary of the Sioux City Automobile Club and the Speedway Association, is manager of the meet. The track and grounds

are located to picturesque advantage just outside the city, and the surface is of dirt, of a character that packs hard when oiled.

The three Maxwell cars entered for the fourth annual international sweepstakes 500-mile race in Indianapolis, Memorial Day, will be equipped with Miller tires, made by the Miller Rubber Company, Akron, O.

In addition to the special Bosch awards already announced for the 500-mile race in Indianapolis this month, the Bosch Magneto Company, New York City, has offered an additional prize of \$500 to the winner, providing the record of 78.72 miles an hour for the race, established by the National car in 1912, is exceeded. This prize is conditional upon the use of Bosch products.

Earl Cooper (in Car) and Barney Oldfield, Two Members of the Stutz Racing Team in 500-Mile Race.

per; Sunbeam, Jean Chassagne; Sunbeam, Harry Grant; Marmon, Joseph Dawson; Beaver Bullet, Charles Keene; Gray Fox, Howard Wilcox; King, Arthur Klein; Stafford, Jesse Callahan; Metropol, Joseph Horan; Maxwell, William Carlson; Maxwell, Teddy Tetzlaff; Maxwell, unnamed; Great Western, John Jenkins; Great Western, Ray Price; Great Western, unnamed; Tulsa, George Clark; Pope Bullet, Mortimer Roberts; Keeton, Louis Chevrolet; Bugatti, Friedrich; Bull Dog, William Chandler; Washington, Melvin Stringer; Dusenber, Richenbacher; Dusenber, unnamed; Mason, Mason; Tatter, Mazzucco; Titz, unnamed; Ray, S. F. Brock; Isotta, Marquise; Rayfield, Hugh Hughes.

Of these cars, the Peugeot and Delage are made in France, the Mercedes and Bugatti in Germany, the Excelsior and Sunbeam in England, and the Isotta in Italy. The others are of American manufacture, although a large number of them are not standard productions.

The speedway management has announced that all competing cars are expected to be on the track not later than May 20, with the purpose of

GENERAL NEWS OF THE INDUSTRY.

New Rates on Liability and Property Damage Insurance Show Material Increase for Commercial Motor Vehicles--Building Plans of Manufacturing Concerns, Etc.

AUTOMOBILE liability rates have been re-adjusted, effective on and after May 1, the change as applying to the New York district not materially affecting private pleasure cars, except in that new rates have been created for public liability only at \$2.50 less than the old, which continue for public and employers' liability. New rates also have been created covering public, employers and compensation under the workman's compensation laws of any state at \$7.50 over the old rates.

The principal change in the new schedule is in the rates for commercial automobiles, which have been advanced 20 to 40 per cent., with a corresponding increase in the cost for property damage coverage. The following table affords a comparison under the various classifications:

	Liability		Property Damage	
	Old	New	Old	New
Class 1.....	\$175	\$250	\$70	\$100
Class 2.....	150	200	60	80
Class 3.....	125	150	50	60
Class 4.....	90	125	36	50
Class 5.....	70	100	28	40

The new rates on these cars for liability are for public liability only, there being an additional charge of \$3.50 and \$5 for the employers' liability, whereas the old rates included both hazards. The classifications are as follows:

Class 1—Baggage transfer, electric light companies, express companies, mail wagons, newspaper delivery, police patrol, street railway companies, telephone and telegraph companies.

Class 2—Boiler dealers or makers, invalid carriages, iron and steel, junk dealers, machinery dealers, railway iron.

Class 3—Bottlers, brewers, department stores, dry goods stores, furniture moving, liquor dealers, news companies, oil distributing companies, parcel delivery, parcel post, safe movers and manufacturers, truck men, warehouse and storage automobiles.

Class 4—Barrel and box manufacturers or dealers, building material merchants, carpenters, cleaners and dyers, coal dealers, contractors, feed and grain dealers, furniture dealers, gas and water mains, ice cream dealers, ice dealers, laundries, lumber dealers, masons' materials, mineral water dealers, piano movers and dealers.

Class 5—Vacuum cleaning automobiles—all commercial automobiles not otherwise classified.

ADOPTS REFINANCING PLAN.

Stockholders of Kelly-Springfield Tire Company Re-Elect Old Directors.

The refinancing plan of the Kelly-Springfield Tire Company, which was presented in more or

less detail in the last issue of The Automobile Journal, was approved by the stockholders at the meeting held May 4, a total of 44,000 of the 51,000 shares being in its favor. Objection was made by A. M. Polack, but only about 1000 shares were voted against the plan.

The stockholders also re-elected the old board of directors, as follows: Van A. Cartmell, president of the company; F. A. Seaman, Austin Poole, Stephen Peabody, Gustave Maas, A. J. Scheuer and J. Oppenheim.

LOCATES IN OHIO.

Midgley Tire & Rubber Company Secures Factory Building in Lancaster.

Word comes from Lancaster, O., that Thomas Midgley, inventor of the Midgley tire, which has been the subject of some little patent litigation in recent years, is to supervise a plant for the manufacture of this product in that city. He formerly was identified with the Hartford Rubber Works Company, Hartford, Conn., now a constituent of the United States Tire Company.

It appears that the Midgley Tire & Rubber Company has been organized by Harry Davis of Pittsburg, Penn., who acquired the patent rights during the time they were the subject of court action. He will be president and Midgley vice president. This concern is understood to have acquired the works of the Ohio Flint Glass Company in Lancaster, where the tires will be made.

SALE HELD IN ABEYANCE.

Bid of \$69,500 for the Assets of the Herreshoff Motor Company Unsatisfactory.

The Lycoming Foundry & Machine Company, Williamsport, Penn., was the highest bidder with an offer of \$69,500 for the entire property of the Herreshoff Motor Company, Detroit, at the receiver's sale in the latter city, May 1. The real estate and buildings were appraised at \$98,000 and the other property at \$40,000, a total of \$138,000. The Lycoming company is the largest creditor.

Referee Lee Joslyn has declined to confirm

Front View of the New Plant of the Weed Chain Tire Grip Company, Located at Bridgeport, Conn.

the sale, and has set a further hearing on the matter for May 14. The Detroit Trust Company, receiver, considers the amount low, in view of the appraisal value.

FORD ELECTRIC CAR.

Company Said to Be Seeking Opportunity to Secure Factory for Its Manufacture.

According to a dispatch from Detroit, those interested in the manufacture of the new Ford electric car are negotiating for the purchase of a plant. Options are said to have been secured on the property owned by the Chevrolet Motor Company, across Woodward avenue from the factory of the Ford Motor Company in that city, and also on a tract on the same side of the street.

TO MAKE KNUTSON STARTER.

Automatic Devices Company Contracts with Galesburg Concern for Its Manufacture.

The Automatic Devices Company, Galesburg, Ill., owner of the patents for the Knutson automatic engine starter for automobiles, has contracted with the Frost Manufacturing Company of that city for the production of 6000 of these starters, to be made in various sizes. The device is the invention of A. W. Knutson of Galesburg, who has been working on it for a number of years. It was thought at one time that it would be placed on the market last year, but it was decided to make certain improvements, which have now been completed.

The Knutson is operated by a spiral spring within a casing, and is said to have demonstrated its practicability in every way on several cars during the past winter. The officers of the company are: President, F. N. Clark; vice president, R. C. Wharff; secretary, E. P. Roberts; treasurer, E. M. Wharff; directors, the above and C. F. Hurburgh, H. A. Niven

and A. W. Knutson. As a result of the contract with the Frost concern, it is stated that considerable new machinery will be installed and that the manufacturing facilities will be increased materially in the immediate future.

OCCUPIES NEW FACTORY.

Weed Chain Tire Grip Company Removes to Bridgeport from New York City.

Accompanying illustrations show the general exterior appearance of the new factory of the Weed Chain Tire Grip Company, Bridgeport, Conn., to which the offices of the company were removed from 28 Moore street, New York City, the first of the month. This means that all branches of the concern's business will be consolidated at this point.

The factory is admirably well situated to meet the needs of production and shipment, and the buildings are equipped throughout with the latest machinery. It is stated that the demand for Weed tire chains has now reached the point where it is necessary to produce 60 miles of chain daily, and this was borne in mind when the new plant was designed and constructed.

The New Weed Tire Chain Factory as Seen from the Rear, Showing the Railroad Siding.

ASSUMES ADDITIONAL DUTIES.

Frank J. Mooney Also Becomes Sales Manager Upon Retirement of R. G. Neighbors.

President J. Walter Drake of the Hupp Motor Car Company, Detroit, announces that Sales Manager R. G. Neighbors has relinquished that position after several seasons of successful executive work, to enter another field. He will be succeeded by Frank J. Mooney, who has been advertising manager of the company for a number of years, and who will head both departments.

Mr. Mooney laid the foundation for his business career at Harvard, where he specialized in English and psychology. After taking his degree he went into newspaper work and was later initiated into the technique of practical advertising under the guidance of T. F. MacManus, well known as an automobile copy writer and advertising counsel. Mr. Mooney entered the motor car industry as advertising manager for the Anderson Electric Car Company, maker of the Detroit electric.

About four years ago the Hupp Motor Car Company needed the services of an expert in organizing its advertising department, and Mr. Mooney was selected. After completing this work he was appointed advertising manager, in which position he has succeeded in developing Hupmobile business, from a comparatively modest product to a point where the annual output is some 15,000 cars, including an export demand of surprisingly large proportions.

ENTERS BRITISH FIELD

Curtis Goes Abroad for General Vehicle Company and Is Succeeded by Fenner.

E. W. Curtis, Jr., has resigned as metropolitan district manager for the General Vehicle Company, Long Island City, N. Y., maker of G. V. electric and G. V. Mercedes gasoline trucks, and is at present on a three months' business stay in England, where he will establish British branches of the company. The interest in electric vehicles, which was awakened in Great Britain as a result of last year's visit of members of the Institution of Automobile Engineers to this

country, is believed to have reached a point where it will prove desirable to introduce vehicles of American make.

Mr. Curtis is succeeded in his New York position by David C. Fenner, who has been prominently identified with the motor truck trade in that centre for a number of years. At one time he was sales manager for the United States Motor Company, and later metropolitan sales manager for the International Motor Company.

NEW KISSELKAR PLANT.

Production Work of the Company Will Again Be Consolidated at Hartford, Wis.

According to information from Milwaukee, Wis., the Westinghouse Lamp Company of New

One of the New Factory Buildings Recently Completed by Kissel Motor Car Company, Hartford, Wis.

York City has made arrangements to take over the former Romadka trunk works in Milwaukee for its western branch factory. This building has been occupied for some two years as a branch plant by the Kissel Motor Car Company, Hartford, Wis.

The latter company has recently completed 60,000 square feet of additions to its Hartford plant, one of which buildings is shown in an accompanying illustration. This will afford opportunity for consolidating the business of this concern at the main works.

The Kissel company entered the automobile industry in a building 50 by 100 feet eight years ago. Today, with the completion of the additions mentioned, it has one of the best equipped plants in the country, where three KisselKar pleasure car models and six types of KisselKar trucks are produced.

KNOX PLANT IS SOLD.

Purchased by Mayo Estate, and There Will Be No Immediate Changes in Plans.

After adjournment from April 24 to April 29, the plant of the Knox Automobile Company, Springfield, Mass., was bid in by Edward O. Sutton, on behalf of the Alfred N. Mayo estate, for \$631,090, at the bankruptcy sale. It is stated that the business will be continued as a going concern, and that there will be no change in production plans for Knox passenger cars and fire apparatus and the Knox-Martin tractor.

On the first date three pieces of real estate, dwelling house property, were bid in by individuals for \$5855, these being subject to encumbrances totalling \$7400. Mr. Sutton's original bid was \$350,000 for the remaining parcels, including the factory, machinery and material in process. At the adjourned sale this figure was increased to \$631,090 for the entire property, it being stipulated that the three pieces of real estate would be turned over to the highest bidders of the previous date at the figures stated in those bids.

The appraisal of the property, made some time ago, placed its valuation at \$1,600,000. The claims of the heirs of the late president, Alfred N. Mayo, are said to aggregate about \$1,000,000.

ADOPTS NEW NAME.

Maker of Titan Storage Batteries Now Making Shipments from Newark Plant.

Announcement is made by the Baltimore Electric Storage Battery Company, Baltimore, Md., that the name of the concern has been changed to the Titan Storage Battery Company. It also has secured new quarters at Chapel street and Lister avenue, Newark, N. J., where the offices of the company have been established for some time, and manufacturing equipment is now being installed. Shipments of Titan vehicle batteries (Plante type) and lighting, ignition and starting batteries from the new location already have been begun.

The officers of the Titan Storage Battery Company are: President, Henry M. Keith; vice president, Daniel C. Spruance; treasurer, Edward S. Hyde; secretary, Henry H. Hanson; board of directors, the officers and Minor C. Keith and John G. Gray; general manager, Dr. W. E. Winship; sales manager, A. H. Mustard; superintendent, Eugene Handler. No change in

policy is contemplated, the control still remaining in the hands of Minor C. Keith, vice president of the United Fruit Company and president of the International Railways of Central America.

CLAIMS BASIC PATENT.

Standard Welding Company of Cleveland, O., Purchases Baker Invention.

As a further step in its effort to secure basic patents on the single-piece transverse split demountable rim, the Standard Welding Company, Cleveland, O., has purchased the patent No. 707,538, issued to John Baker, formerly of Meachem, Ill. This is held to cover the manufacture of an improved rim and felloe for rubber vehicle tires.

The claims of the patent are broad specifying that the object of the invention is to provide a rim that can be contracted to be inserted in an endless tire and then expanded to receive the tire, and be held in such expanded position by the felloe. Means are also provided for preventing lateral movement of the split ends of the rim.

SEMPLE RUBBER COMPANY.

New Concern in Trenton, N. J., Secures Plant for Manufacture of Inner Tubes.

The Semple Rubber Company has been organized in Trenton, N. J., with capital of \$125,000, for the manufacture of inner tubes. The plant formerly occupied by the American Porcelain Works in that city has been acquired and is now being overhauled and rearranged. It is expected that the installation of new machinery will be begun this week, and that production will be under way shortly.

The president of the new concern is C. H. Semple, who was at one time president of the G & J Tire Company, Indianapolis, Ind., and until about two years ago president of the Empire Tire Company, Trenton. F. A. Drake is treasurer and R. H. LaPorte, secretary. It is stated that the company expects to engage in the production of outer casings, perhaps later in the season.

George S. Waite, sales manager of the Grant Motor Company, Findlay, O., maker of the Grant car, reports that carload shipments left the factory recently for Great Britain and Australia. Ten of these went to London and seven to San Francisco, en route to Australian points.

NEW ACCESSORIES FOR THE MOTORIST.

ROMORT ENGINE CLEANER.

Utilizes Kerosene in Form of Spray for Cleaning Motor, Etc.

The Romort Valve Company, 701 East Pike street, Seattle, Wash., is manufacturing the Romort engine

cleaner, which is designed especially for removing oil, grease and dirt from the motor and components of the chassis. The Romort is filled with two quarts of kerosene or gasoline, and air is supplied by a pump, compressor or tire power pump, a standard connection being provided. Turning a knurled rod opens a valve, permitting the fluid to be forced out in a very strong spray, which may be regulated as desired by the operator. The cleaner is equipped with a long spout, making it an easy task to reach parts not accessible by the usual cleaning methods. Being forced at a high pressure the spray removes deposits that would ordinarily require considerable labor to displace by the brush or rag treatment.

MORGAN SPRING OPENER.

Practical and Inexpensive Tool for Separating Leaves of Spring.

The Morgan Manufacturing Company, Newport, R. I., maker of tools, accessories, etc., for the motor car and repair shop, is marketing the Morgan rolling spring leaf opener, a simple and practical design in that it requires no adjustment. It is constructed especially for separating the leaves of a spring, permitting of cleaning and lubricating the bearing surfaces without jacking up the car.

As will be noted by the accompanying illustration, the device comes in two parts, one of which is provided with a chisel point. This is inserted between the leaves of the spring near the end and the edge of the rolling tool on the other side. Previous to this work the small bolts

are removed from the spring clip. By rolling toward the centre of the spring or towards the axle, the leaves will be separated easily and readily.

One of the qualities of the device is that it is manufactured in various sizes, these ranging from that adapted to a cyclecar to that for a locomotive.

ELK SHOCK ABSORBER.

Specially Designed for Ford Cars and Is Adjustable.

The Ely shock absorbers for Ford cars are marketed by the Donnelly Motor Equipment Company, 1785 Broadway, New York City, and come in sets of two and four, being adapted to both the front and rear springs. One of their qualities is that they eliminate the disagreeable vibration when traversing pavements, as well as take care of heavier shocks when operating on rough highways, etc. Another feature of the Ely is that provision is made for adjusting the tension of the coil spring to conform to the varying weight of the equipment, passengers, etc.

As will be noted by an accompany-

ing illustration, the design is of simple construction and is one that should make for efficiency and durability. It comprises a coil spring of a high grade, tempered steel; a carrying iron and a perch. The spring is contained within a brass cover, which is made oil tight in case the use of lubricant is desired. The principle of the Ely absorber is a spiral auxiliary spring providing a pivot point suspension.

The absorbers are easily fitted, the maker stating that any owner can attach them in a few minutes. They are made for both the front and rear springs, and are guaranteed against imperfection of workmanship and material for one year. They come finished in specially prepared black rubber and the selling proposition is an interesting one, both to the trade and purchaser. Being constructed to eliminate minute vibration, as well as shocks, they save tires and the car mechanism from undesirable stresses.

EASYBAK CUSHION.

Supports the Back, Contributing to Comfort When Driving.

The Holden Manufacturing Company, St. Paul, Minn., is marketing the Easybak cushion, which is con-

structed to support the back, thereby eliminating the strain upon the muscles when operating the clutch and brake pedals. The device is also of value to other occupants of the car. The Easybak fills the vacant space and, supporting as it does the entire back, permits one to sit with the muscles relaxed. It is made of a strong water proof fabric in a dark gray or subdued brown to match the slip covers, and in imitation or genuine leather. It is stated that the design will fit all makes of cars.

DANN SPRING INSERT.

Forms Oil Cushion as Well as Provides Constant Lubrication.

The Dann Oil Cushion Spring Company, 2246 Indiana avenue, Chicago, is marketing the Dann oil cushion spring insert, which insures constant lubrication of the leaves. As will be noted by the accompanying illustration, the insert is provided with a large number of apertures, which are filled with a lubricant. Being inserted between the conventional leaves the latter are always lubricated, and one of the qualities of the design emphasized is that the insert will provide lubrication for a considerable period.

It is pointed out by the maker that an ordinary spring having a number of leaves of graduated lengths contains an enormous area of surfaces, which means considerable friction is present if the surfaces are not constantly lubricated. The Dann insert provides this desired lubrication, eliminating squeaks as well as minor vibrations. It is easily installed.

GRAND RAPIDS WORK BENCH.

Built for the Owner and Private Garage and Has a Vice.

The Grand Rapids Hand Screw Company, Grand Rapids, Mich., has brought out a work bench especially

adapted to the private garage and for the owner who does his own repairing. It is well constructed of wood and has drawers partitioned off for the storing of nuts, bolts, screws and small material. The top is of hard wood and is protected by galvanized iron. A continuous screw iron vise is part of the equipment.

The bench is 48 inches long, 24 wide and 36 high. At one end is attached a wire basket to hold waste, rags, sponges, etc. There is also an extension for tire repairing, and the bottom of the bench is fitted with a back rail for storing oil cans, etc.

PERKINS CAMPBELL LINE.

Includes a Number of Specialties for the Ford Car.

The Perkins Campbell Company, 626 Broadway, Cincinnati, O., is manufacturing a number of specialties for Ford cars, these including the Latigo fan belt, steering gear boots, top rest, rebound straps, front license holder, spark plug case, hood strap, license and tire straps, starting crank holder, etc.

The Latigo fan belt shown herewith, is constructed of genuine Latigo leather, which contains no mineral or material employed in tanning. It is claimed to be the strongest leather known, and that it is impervious to the action of heat, oils or water. Special emphasis is laid upon its non-stretching qualities. It is also held to be unusually flexible.

The boots marketed by the company for the steering linkage of the Ford machine come three to a set. They are constructed of the best grade water proof leather, and are of the lace type. By packing these boots with grease the parts are assured of proper lubrication, and the covers also exclude road dust, which

is an abrasive. The entire set is inexpensive.

The Perkins Campbell Company is specializing on water proof seat covers and manufactures these for both the Ford touring and roadster models. The material employed is the best grade water proof cloth, which is cut over special patterns to insure an accurate fit. The maker states that the covers will not stretch or shrink. They are fitted by screw glove fasteners, and can be attached easily by the owner.

APOLLO ELECTRIC HORN.

A Moderately Priced Signal Manufactured in Two Sizes.

The Automobile Supply Manufacturing Company, Brooklyn, N. Y., is marketing a new design of electric horn termed the Apollo. It is a moderately priced signal, but the maker states that the same material and workmanship are incorporated as in the other products of the company. The tone is claimed to be far reaching, but free from harshness. The warning note is held to be specially adapted for city work.

The operating mechanism is stated to be so constructed that it will require no attention, and the horn is accompanied by a three years' guarantee. It comes in two sizes, the

model S having a five-inch bell and overall length of nine inches. Model L is 10 inches long and has a 7.25-inch bell. It comes complete with push button, cord, etc., and is held to be economical in current consumption.

DIMMING DEVICES.

The very general adoption of electric headlights is responsible for the appearance on the market of a number of devices to eliminate glaring effects. The inventors utilize various methods to accomplish their ends, these including electrical and mechanical, while others so frost the glass that the rays contributing to the glare are softened.

That much remains to be accomplished in perfecting a practical and efficient headlight glare remover is acknowledged by those who have made a study of the problem. It must be moderately priced, adaptable to both electric and gas lamps, and require no attention after installation. The proposed legislative action on glaring headlights indicates what may be expected in the near future.

STANDARD SIGNAL LAMP.

Warns Following Vehicle by Use of Colored Compartments.

The Standard Signal Lamp Company, Sanford building, Bridgeport, Conn., is manufacturing the Standard

signal lamp, which is designed to notify cars approaching and travelling in the same direction the driver's intentions. It is a neat, semi-cylindrical housing of three compartments, each fitted with a tungsten bulb, controlled separately or in combination. The "Left" compartment is red; the "Stop" black and "Right" green. The different colors enable the driver of the following vehicle to distinguish the compartment more easily. The device also includes an electric tail light and a bracket for the number plate, which is lighted from the tail lamp.

HICKS FOUNTAIN BRUSH.

Has Long Handle and Adjustable Nozzle and Keeps Hands Dry.

The Howard W. Hicks Brush Company, 826 18th street, Denver, Col., is manufacturing the Hicks perfect fountain brush. It will appeal to owners who wash their cars, as by it the work may be performed without soiling the clothes or placing the hands in the water. The last named advantage makes for comfort when the machine is washed in cold weather and when the garage is not equipped with means for heating the water.

The brush parts are made of aluminum and the 18-inch handle is of nickelled steel, equipped with a rubber grip. The handle is provided with a standard connection permitting of screwing on the ordinary garden hose. The brush is also detachable. One of the qualities of the brush emphasized is that a rotatable water chamber prevents wear on one side. The handle is equipped with a cut-out, permitting control of flow of water as desired, making for economy.

SERVUS HEADLIGHT DIMMER.

Controls Lights from Dim to Bright and Extinguishes Them.

The Servus Equipment Company, Newark, N. J., is marketing the Servus headlight controller for cars

equipped with electric lighting. It is designed to enable the driver to dim, extinguish or brighten the lights without leaving the seat. The device comprises a coil of special resistance wire divided into 10 sections with contact points so arranged as to allow all, any part, or none of it to be brought into circuit. When the lever is placed on the "low" point the lights will burn dimly. Moving the lever to other points increases the strength of the current and proportionately. There is also an "off" position. The device is installed in place of the usual switch and the regular wires are utilized.

CLEAR AHEAD LAMP BRACKET.

Turns Headlights in Same Direction as Steering Wheel.

The disadvantages of the fixed type of headlights are well known to experienced drivers. Even when operating on a straight road the rays of light are not sufficiently deflected to enable a driver to note the condition of the thoroughfare when turning out for an approaching vehicle. And in rounding curves, especially on unknown roads, the light does not illuminate the inside of the curve so as to reveal any possible obstructions that may exist.

The Auto Protector Company, 58 Tyler street, Springfield, Mass., has brought out the Clear Ahead lamp bracket, which is held to solve these problems, and one of the qualities of the design is that it can be attached without alterations. That shown in an accompanying illustration is the bracket made for the model T Ford

machine, and it will be noted that the lamps are turned at the same angle as the road wheels.

Both lamps turn to the right or left or in the same direction as the steering wheel, and the device is so made that the movement is accurate. When rounding a curve the inside light illuminates the sides of the road, while the other lamp lights the centre, thus making for safety.

In addition to the Ford design the company manufactures an equipment for larger machines, a standard size. Both types are moderately priced.

MULCHAHEY DIMMER.

Eliminates Blinding Effect of Headlights by Novel Means.

One of the latest devices for eliminating the glare of the headlights is the invention of Howard F. Mulchahey, 8 Mt. Vernon street, Providence, R. I., and it is stated that it is adaptable to both electric and acetylene lamps. The dimmer or headlight ray controller, as it is termed by the maker, is obtained by treating the glass of the headlight by a special process.

The glass is treated to a point a little below its centre and while the frosting effect eliminates the glare,

it does not reduce the efficiency of the light, as the lower half is left untreated. Consequently the projecting rays are obtained, but the upward members are so softened that occupants of approaching vehicles, and pedestrians are not blinded.

The maker states that he has given his dimmer severe road tests and that one can look into the lamp without any blinding effect, as the bright rays do not reach above the waist of an average sized person. It is also claimed that a better driving light is obtained, as the upward rays are softened, and this should prove of value when operating in foggy weather. One of the qualities of the process is that it is inexpensive, and that the regular glass can be treated or replaced by one of the Mulchahey design. Another feature is that after once fitting no attention is required, and the design is practical for city as well as country driving.

The editor wishes to acknowledge the receipt of descriptive matter from several makers which does not appear in this issue. It will be published in the May 25 issue.

PEDERSEN TERMINALS.

Attachment for Ford Timer Having Accessible Features.

The Pedersen Lubricator Company, 640 First avenue, New York City, maker of lubricating devices,

has brought out a new specialty for the model T Ford motor. It is a simple and inexpensive attachment for the commutator, consisting of two sheet metal stampings, which are utilized as false terminals. They are attached to the regular Ford timer terminals, but are insulated from the two upper ones by fibre strips.

The function of the arrangement is to keep the two lower terminals and their primary wires away from the deteriorating effects of oil, etc., and the design makes it possible to reach the terminals easily when desired.

OAKES CYCLECAR FAN.

New Model is Light in Weight and Blades Have a Peculiar Flare.

The Oakes Company, Indianapolis, Ind., manufacturer of automobile parts and a specialist in radiator fans, has brought out a new design especially adapted for service on cyclecars. As shown by the accompanying illustration, the blades are set at an angle or pitch that has been found to be the most effective under actual tests.

One of the features of the new fan is the use of a peculiar flare on the side of the blades, which is held to be a practise in vogue abroad. The new model, although of light weight, has been constructed with the same high grade material and workmanship for which the products of the company are noted.

DETAILS OF NEW HERFF-BROOKS LINE.

ANNOUNCEMENT is made by the Herff-Brooks Corporation, Indianapolis, Ind., of two models for the present season. These comprise a four and a six-cylinder car, and one of the noticeable features of the latter is that it is the lowest priced six up to the present time. Outwardly the four and the six are practically the same, the only difference being in the power plant. The running gear of the four is the same design as the larger chassis, but smaller in proportion.

The Herff-Brooks line is sold with complete equipment, including the Jesco electric lighting and motor starting system, silk mohair top, rain vision windshield, speedometer, quick acting cur-

in its plant. The design of the crankshaft differs from conventional practise in the number of bearings employed, seven being utilized, and these are 1.75 inches in diameter. This provides ample bearing surface, and the company points out that excellent balance is obtained and that vibration is eliminated. The crankshaft is cut from a solid billet of steel and the bearing material is retained in steel caps. The connecting rod bearings are ample in size, being 1.375 inches.

The single camshaft runs on three plain bearings and actuates square pushrods, the last named members operating in similar shaped, lubricated guides. The valves are 1.875 inches in

Members of the Herff-Brooks Line, Including a Six-Cylinder and a Four-Cylinder Chassis to Which Touring and Roadster Types of Bodies Are Fitted—The Larger Car Is Held to Be the Lowest Price Six Marketed.

tains, extra demountable rim, speedometer light, dimming attachment for the headlights, top cover, robe and foot rails, tools, etc.

The bore and stroke of the six-cylinder motor is four by 4.5 inches, rated at 38.4 horsepower by the S. A. E. formula, but this is held to be very conservative. The cylinders are cast separately, and are of the L head type with the valves on the left. One of the features of the design is the method utilized to enclose the valve mechanism. As will be noted by an accompanying illustration, individual enclosures are employed. These are held to be proof against the entrance of road dust or other abrasive foreign elements, and to be easily removed and replaced.

The company states that all of its parts, even such small material as studs, bolts, etc., are made

diameter and have a lift of .3125 inches. The normal compression of the motor is estimated at 65 pounds a square inch.

The carburetor is a Kingston, located on the left hand side of the motor, and ignition is by a magneto of the same make. The magneto is driven through a universal joint and the instrument is mounted on a crankcase platform. The location of the water pump is unusual, it being in front of the timing gearcase. Drive is through bronze gears. One of the qualities of the arrangement is the accessibility of these components and the ease with which they may be removed.

The lubrication is by a combined splash-pressure system in which the oil is taken by a pump with helical steel gears, actuated by the cam-

shaft, from the sump in the crankcase, forced through a strainer, thence to the dash sight feed. From the last named member the lubricant

Showing the Clean Right Hand Side of the Herff-Brooks Six-Cylinder Motor.

travels to individual troughs in the lower crankcase, into which the ends of the connecting rods dip. The rods are provided with spoons, and all bearings have oil grooves. The timing gears, which are helical steel members, are automatically lubricated. A four-point motor suspension is employed, the crankcase from which the supporting arms project being made of semi-steel.

The clutch is a leather faced inverted cone design, and a special chrome leather is utilized for a facing. Steel springs are employed to make for easy engagement. The design provides means for overcoming the inertia of the flywheel, a form of clutch stop being incorporated which makes it possible to change from one speed to another easily. It is stated that the clutch may be slipped without injury to the release collar.

The transmission is located amidships and provides the conventional three forward speeds and a reverse. The shafts run on ball bearings and gears are considered 50 per cent. oversize, cut from forged blanks, hardened by a special process. All gear centres are ground to insure alignment and the teeth of the main sliding members are faced off to provide easy meshing. The main shaft has four integral splines. Shifting is by heavy bronze forks operating on hardened steel shafts .75 inch in diameter.

Drive from the gearset to the rear axle is through a single universal joint, which has a hollow centre of sufficient grease capacity to insure ample lubrication for 5000 miles of service. The front end of the drive shaft is squared, as is the universal joint, eliminating the use of keys, etc. The drive shaft is enclosed, and its housing is bolted directly to the differential case, by long studs and double nuts.

The rear axle is of the semi-floating type and extra heavy ball bearings are employed throughout. The differential has four pinions mounted on a drop forged spider, and all gears are constructed to withstand severe service. The bevel gear has 56 teeth, and adjustments are provided for changing the mesh of this gear with the pinion. The drive and axle shafts are of a high grade, special steel, 1.375 inches in diameter.

Drive is taken through the rear springs. These members are of the three-quarter elliptical design, very long, and held to be unusually flexible. All springs are provided with grease cups and the spring blocks on the rear axle turn. They are also lubricated.

Centre control is provided, with the driver placed at the right. A special lock is installed on the gearshift lever, preventing the possibility of changing from a direct speed into the reverse. Attention has been paid to accessibility of chassis components, the transmission and differential being provided with large inspection plates.

The matter of brakes has received careful consideration by the designer. Both sets are located on the rear wheel and are of the internal expanding type. The service is operated by pedal and the emergency by the usual hand lever. Both sets are equalized, the equalizers being supported on top of the differential housing and accessible.

As will be noted by an accompanying illustration, the right hand side of both motors is unusually clean. The steering column is set at a comfortable angle and the components of the steering gear and its linkage are ample in size, providing a large factor of safety. All wearing parts are adjustable and means are provided for

The Mounting of the Water Pump on the Herff-Brooks Six is in Front of the Timing Gearcase.

lubrication, grease cups being fitted.

The electric lighting and motor starting system is a Jesco, a unit, which is supported on a

heavy plate at one side of the transmission. The energy of the electric motor is imparted by silent chain to a gear bolted to the clutch sleeve in front of the gearset. The storage battery is supported in a special steel hanger at the rear of the chassis, where it is accessible by removing the floorboards. The wiring has been carefully executed and every precaution taken to prevent short circuits in the lighting, motor starting and ignition systems. The storage battery is of ample capacity.

The Herff-Brooks bodies are of very attractive design, having as they do long, sweeping curves, sloping cowl and a wide curve at the rear. They are a one-piece construction. The fenders follow the outline of the wheels closely, and are finished in baked-on enamel, as are the skirts and enclosed tool box. The members of the instrument board are finished in black and

Illustrating the Right and Left Hand Sides of the Herff-Brooks Four-Cylinder Motor.

nickel and all control units are very accessible to the driver.

The spare tire carriers are placed at the rear of the chassis, and the running boards, footboards, etc., are bound with aluminum. The upholstery is of the Turkish type, very deep and comfortable, as the cushions and backs are tilted. The back of the front seat is protected by a scuff pad. The wheels are heavy and are equipped with 34 by four-inch straight side Goodyear No-Rim-Cut tires and demountable rims.

The four-cylinder model differs slightly from the six. The motor is a block casting and the cylinders have a bore of 4.125 inches and a stroke of five, an L head construction. The same equipment as to carburetor and magneto is used and only in minor points does it differ from the six. The pushrod guides, for example, are retained in place in pairs by clamps.

SAFETY FIRST SOCIETY.

A Brief Statement as to the Objects of the Organization in New York City.

As stated in a recent issue of The Automobile Journal, the Safety First Society of Greater New York has been organized and the following officers have been elected: President, Ogden L. Mills; vice presidents, Jefferson De Mont Thompson, Ogden Mills Reid, Charles L. Bernheimer, Gen. Howard Carroll; treasurer, John K. Woodruff; general secretary, Frederick H. Elliott. On the executive committee are the following: Ralph Folks, secretary, Borough of Manhattan, chairman; Robert S. Binkerd, City Club; Harry A. Bullock, Brooklyn Rapid Transit Company; Mrs. Robert Francis Cartwright, New York City Federation of Women's Clubs; E. R. Hardy, Insurance Society of New York; P. J. Holdsworth, Mason-Seaman Transportation Company; George Keegan, New York Railways Company; R. W. Meade, Fifth Avenue Coach Company; J. A. Ritchies, Interborough Rapid Transit Company; Frank G. Webb, Long Island Automobile Club.

The organization is composed of a number of social, civic and commercial bodies, industrial and transportation companies, etc., with a view primarily to devising and perfecting ways and means for:

1—Lessening the number and degree of accidents occurring in the public street and elsewhere, and the economic waste they directly entail.

2—Minimizing, through more scientific planning of traffic routes and regulation of traffic movement, the great economic waste which, under present conditions, falls as a financial burden directly upon those using the public thoroughfares for the purpose of distribution.

3—Creating a medium for the exchange of ideas as well as for the co-operative effort of those most vitally concerned, financially and otherwise, in a solution of these problems.

What is believed to be the first order for a motor delivery car to be sent by wireless, was received recently by the Commerce Motor Car Company, Detroit, through its western sales manager, W. E. Kenyon, while at Seattle, Wash. The buyer, a department store at Friday Harbor, is located on an island at one of the extreme northwestern points of the United States. Five hours after the order had been transmitted to Detroit the car was en route.

SUGGESTIONS FOR THE NEW CAR OWNER.

Construction, Operation and Adjustment of Delco Ignition System Used on Buick Motors--Cleaning, Adjusting and Removing Premier Multiple Disc Clutch.

THE Buick-Delco system comprises a motor-generator and has the timer and distributor built in the forward end of the front housing.

Fig. 1—Delco Ignition Relay.

These members are driven through a set of spiral gears attached to the armature shaft. Adjustment is also provided for the timer, the function of which is practically the same as the commutator used with battery and coil systems of ignition, to fix the proper interval of time between the sparks. As the primary circuit is broken the distributor makes a contact in the secondary circuit, timing the spark in the cylinder on compression.

The timer mechanism is shown at Fig. 2. It is located directly beneath the distributor head and rotor, and comprises a cam C, which has four so-called lobes or projections, one for each cylinder. Pivottally mounted is a lever or arm which is normally held in contact with the cam member by a spring. The last named part serves to keep the arm from making contact with the bottom contact member, as these points are supposed to touch only when a lobe depresses or moves downward or outward the movable arm. With the magneto type of ignition the spark occurs at the instant the contact points are opened. When dry cells are utilized the vibrating spark occurs when the contacts are opened, and this vibrating continues until the points touch.

Proper maintenance of the gap or break of the contact points is important. Provision is made for wear, etc., and when the contact arm of the timer is directly on top of a lobe of the cam, as indicated by the arrow at B, the distance should be .015 inch. When the lobe of the cam of the timer has broken contact with the arm member, the distance between the points should be about .01, as shown at E.

Adjusting Timer.

The cam C is mounted on the upper end of the shaft, which is adjustable. The timing may be varied by loosening the screw A in the centre shaft and rotating the cam in the desired direction, clockwise to advance and anti-clockwise to

retard. This screw must be tightened securely.

The shaft which transmits motion to the timer from the spiral gears is in the form of a tube, revolved by spiral gears. An inclined slot is cut through the wall of the hollow shaft, and a smaller shaft is carried inside the tube. A vertical slot is cut through the last named shaft. A pin, held by a collar, which is adapted to slide upon the outside of the hollow shaft, passes through the straight slot in the smaller shaft and the inclined slot in the hollow shaft. Obviously, if the collar holding this pin be moved along the hollow shaft it will change the angular relation to the smaller shaft, and this change in the relative position of the two shafts affects the advance of the spark timing. The spark position is governed by the spark lever on the steering wheel. Due to variations in the fuel and other conditions which cannot be held constant, exact settings of the spark lever cannot be given. These points can easily be determined by the owner after the car has been in service a short time.

Ignition Relay.

The ignition relay, which is incorporated in the dry cell circuit and which serves to break the primary circuit immediately after it is completed between the breaker arm of the timer, is shown at Fig. 1, with its components lettered. The

Fig. 2—Showing Components Utilised in Adjusting Delco Timer Employed on Buick Models 36 and 37.

function of the magnet A is to attract the armature B when the circuit is completed through the timer. This action opens the contacts C inter-

rupting the primary circuit. The magnet A has two windings, one of comparatively coarse wire and so connected that the current ceases to flow through it when the contacts C are open, and a winding of fine wire. The last named is connected around the contacts C in such manner as to hold the armature down after the circuit in the coarse wire winding is opened at contacts C. When the circuit in the fine wire is closed the making and breaking of the other by means of the contacts C results in a single spark at the plug, instead of a vibrating spark. This condition obtains when operating on dry cells, as the fine winding circuit being closed when the cam closes the contacts the vibrating spark is prevented until the points are separated.

The adjustment of the relay is at the pole piece E. This maintains the distance between the armature B and the pole piece E, and the

Fig. 3.—Sectional View of Clutch Assembly of Premier Car with Parts Used in Adjusting Lettered.

gap between the contacts C. Adjustment is made by turning the notched head clockwise (looking down upon it) to increase the gap, and vice versa to decrease the gap.

Adjusting Contacts.

The correct distance between the contacts C when the armature is pressed down on the pole piece E is equal approximately to the thickness of one sheet of ordinary catalogue paper. A simple way to make an adjustment is to run the motor on the dry cells. Turn the notched head of the pole piece E in an anti-clockwise direction until the motor stops firing. Then turn it four or five notches in the opposite direction. Under no conditions should the adjusting screws be turned very far in either direction.

If particles of dirt get between the armature and the pole piece at the point indicated at

I, they may be displaced by slipping a piece of smooth paper between the parts mentioned, pressing lightly upon the armature, and pulling out the paper, imparting a movement similar to utilizing a file.

If the armature vibrates rapidly when the ignition lever is in the battery position it indicates weak dry cells or dirt, either between the relay or timer points. The distributor requires no other attention except an occasional wiping of the contacts with a soft, smooth, oily rag, one free from lint. The head of the distributor may be removed by pressing back the metal tongue at the side, rotating the head anti-clockwise until the notch in the rim of the head coincides with the tongue, then lifting the head straight up. The rotor is removed by lifting in a similar manner, which will expose the timer mechanism.

PREMIER CLUTCH.

A knowledge of the construction and operation of the multiple disc type of clutch will be of distinct value to the new owner in cleaning and adjusting it when it needs attention. The following description of the clutch utilized on the series X Premier car will be of service in caring for similar designs.

The Premier clutch is shown at Fig. 3. It is of the multiple disc type, and operates in oil, being enclosed in a dust proof housing attached to the rear of the flywheel. Connection between the clutch and gearset is by means of a hardened floating shaft A, broached at its forward end to engage with the clutch, and having at the rear end a three-jawed coupling B, which engages with a similar part C on the transmission.

The sleeve B, which carries the coupling, slides upon the clutchshaft and may be easily slipped forward by removing the split clamp collar D. To remove the clutch, displace the floorboards and draw the cotter pins E from the .375-inch pins F in the pedal shaft end of the cradle. Remove the split nut D from the clutch shaft A, and slip forward the sleeve B (which connects with the transmission) so as to disengage it from the coupling C. Next, take out the eight .375-inch screws G in the clutch cover on the flywheel, which will permit of removing the clutch and shaft.

To disassemble the clutch, back off the clutch nut H, which will release the clutch spring I, and it may be lifted out. The spring nut H is not employed for making adjustments, as none is necessary. A spanner wrench or two .25-inch pins may be employed for backing off the clutch nut H.

The clutch cover J can be displaced upon removing the spring, and the small and large plates L and K will be found on the clutch plate holder. The plates should be taken off and thoroughly cleaned. If badly worn new ones should be substituted. The small plates L have lugs upon their inner edges, which engage on the spider, and the large plates K have their lugs on their outer edges, to fit into the grooves in the clutch cover.

In reassembling it is important that the lugs of the large discs are so arranged as to fit into alternate slots, thereby providing space between every other plate for the action of the small springs, which must be assembled so as to project toward the rear of the car. The last two springs are arranged so as to touch the inside of the clutch cover. When the clutch pedal is pushed forward the little springs N tend to force the plates K apart, giving quick action and eliminating dragging.

When replacing the clutch assembly utilize shellac under the clutch cover to insure an oil tight fit. Slide the clutch shaft A forward into the clutch until it strikes the bottom of its socket. Slide the sleeve B with the three-jawed coupling rearward into proper engagement with the coupling C on the transmission. Replace the split nut D, screwing it along the shaft until both the shaft and the sleeve are forced securely into place, then screw the nut forward .03125 inch to allow that much end play in the clutch shaft, and tighten the two screws securely.

The maker of the Premier recommends lubricating the clutch every 500 miles. This is accomplished by removing the filler plug and using a funnel to replenish the supply. If the clutch be suspected of chattering or harsh engagement, open the cut-out and make sure that all six cylinders are firing properly. If the fault continues, or if the clutch drags or does not release promptly, inject about a pint of kerosene, running the motor a few minutes with the clutch disengaged, and with the gears engaged. Remove the kerosene and refill with new, clean oil. The clutch linkage ought to be lubricated about every 100 miles and the grease cup just to the rear of the clutch housing turned down frequently. It is attention to seemingly minor details that obtains maximum efficiency at a minimum of upkeep.

E. C. Campbell of the California Corrugated Culvert Company, Los Angeles, reports that his concern has found that the use of Hupmobile cars by salesmen has effected a decided saving in transportation expenses over horses or trains.

COLORADO-TEXAS TOUR.

Motorists in Former State Leave Garden of the Gods May 4 for 2500-Mile Trip.

The tentative itinerary for the 2500-mile sociability run of Colorado motorists through Texas, Oklahoma and Kansas has been arranged by the following committee: W. L. Anderson and J. H. Jenkins, representing the Pueblo Commerce Club; V. M. Friar, Trinidad Chamber of Commerce; Charles E. Bruce, Manitou Springs Hot Iron Club, and Eric A. Swenson and A. W. Henderson, Colorado Springs Chamber of Commerce. The party assembled at the foot of Pikes Peak in the Garden of the Gods, May 4, and it is planned to devote three weeks to the tour. The route lies through the following towns:

Colorado—Colorado Springs, Fountain, Canon City, Florence, Pueblo, Walsenburg, Trinidad.

New Mexico—Raton, Des Moines, Clayton, Texline.

Texas—Dalhart, Channing, Amarillo, Claude, Goodnight, Clarendon, Memphis, Estelline, Childress, Quanah, Chillicothe, Vernon, Electra, Wichita Falls, Henrietta, Bellevue, Bowie, Sunset, Alvord, Decatur, Fort Worth, Dallas, Hillsboro, West, Waco, Temple, Georgetown, Austin, San Marcos, New Braunfels, San Antonio, Cuero, Victoria, Freeport, Galveston, Houston, Conroe, Huntsville, Madisonville, Centerville, Teague, Mexia, Corsicana, Waxachie, Dallas, McKinney, Sherman, Denison.

Oklahoma—Durant, Sulphur, Pauls, Valley Purgell, Norman, Oklahoma City, Guthrie, Perry, Ponca City.

Kansas—Arkansas City, Wichita, Newton, Hutchinson, Sterling, Ellinwood, Great Bend, Pawnee Rock, Larned, Kingsley, Dodge City, Cimarron, Garden City, Syracuse.

Colorado—Holly, Granada, Lamar, Las Animas, La Junta, Rocky Ford, Manzanola, Fowler, Pueblo, Trinidad, Canon City, Colorado Springs, Manitou.

OVERLAND NON-STOP RUN.

North Dakota Agent Takes Novel Means of Demonstrating Car During Local Fair.

During the progress of the midwinter fair held in Minot, N. D., recently, the Minot Auto Company, distributor in that city and vicinity for Overland cars, made by the Willys-Overland Company, Toledo, O., decided upon an interesting method of calling attention to this product. A model 79 Overland was started on the day the fair opened and took part in a non-stop run during the 129 hours the event was being held.

According to the report, no tool was used on the engine throughout the run. The statement continues that only eight pints of lubricating oil were necessary to keep the machine, not only in perfect running order, but under high speed, and less than a glass of water was evaporated from the radiator in keeping the motor cool.

WITH THE CYCLECAR MANUFACTURERS.

Plans Completed for First Run of New England Cyclecar Club---Big Race Meet Scheduled for July in Detroit---New Models Announced and Other Happenings.

PLANS are practically completed for the first annual run of the Cyclecar Club of New England, and the details that have been made public are sufficient to indicate that it will not only be the initial long distance test of these little machines in the East, but one that should go far toward demonstrating the practical efficiency of the type over New England roads. The event will be held May 30-31, leaving Boston the morning of the first day and spending the night in Springfield, with noon stop at Worcester. The second day will take the tourists to Hartford, and return to Boston by way of Willimantic.

This schedule evidently has been prepared with a view to providing exceptional opportunity for calling attention to the newest product

ning of May 30. It is probable that luncheon will be secured in Willimantic the second day. Nearly 40 of the little cars, representing at least nine different makers, will take the trip.

WOMAN SELLS ECONOMYCARS.

Miss Anna Sheely Claims the Honor of Being the First of Her Sex to Take Agency.

Miss Anna Sheely, proprietor of the Sheely Motor Car Company, Passaic, N. J., claims the honor of being the first woman in America to take the agency for a cyclecar. She represents the Economycar, made by the International Cyclecar Company, New York City, in the entire northern portion of New Jersey, and expects to place at least 500 of these machines this year.

Miss Sheely has been an automobile dealer and garage manager for about a year, taking over the business upon the death of her father. She is a young woman, about 20 years of age, and has no assistance in handling the big business of one of the finest garages in northern New Jersey. Already she has succeeded in placing nearly 100 Economycars with sub-agents throughout her territory, and has found it necessary to devote a large portion of her time in demonstrating cyclecars to prospective dealers and purchasers.

TWO NEW IMP MODELS.

Both Have Chain Drive, While One Utilizes a Four-Cylinder Water-Cooled Engine.

It now appears that the W. H. McIntyre Company, Auburn, Ind., which began the production of the Imp cyclecar under the name of the Imp Cyclecar Company, has decided to drop this designation and all correspondence is signed by the former concern, which has been engaged in the production of vehicles of all types for over 44 years.

These little machines have been produced in quantity since September, and it is stated that something over 1200 have already left the Auburn plant. Until the present these have been fitted with a two-cylinder, air-cooled, V motor and long belt drive. Two new models have been

A Suggestion for Imp Owners During Coming Summer.

of the automobile industry. The total mileage is about 250. The first day's run to Springfield will be over good macadam roads, and this same condition will be met on the way to Hartford. After leaving Hartford, however, the macadam extends for a distance of about 10 miles only. Good gravel roads and some of telford construction are to be found on the way to Willimantic, and between that city and Boston there should be little difficulty in finding nearly every character of highway.

The social side of the event will not be neglected. Luncheon will be served at the Hotel Bancroft in Worcester, and a banquet will be held in the Hotel Kimball, Springfield, the eve-

The Mercury Monocar, the First Machine of This Type Produced in America.

announced, although complete details are yet lacking. It is stated, however, that they will not differ greatly in general appearance from the original Imp.

It is explained by the W. H. McIntyre Company that there has been some complaint regarding the belts, largely because it has been a little inconvenient to fit doors to the body. This is suggested, at least, as the reason for making a change to chain drive in the new models. One of these will utilize a two-cylinder, air-cooled V motor, while the other will be equipped with a four-cylinder, water-cooled unit. It is understood that both will have the motor in front, friction transmission and live rear axle, with chain drive.

MERCURY MONOCAR.

A Single-Seated Machine Which Is Expected to Make Its Appeal to Travelling Men.

The Mercury Cyclecar Company, Detroit, which is one of the concerns already making shipments of machines in carload lots, is the first in America to produce a monocar. This is a term applied abroad to cyclecars seating but one person. An accompanying illustration serves to amplify the definition.

According to Sales Manager R. C. Albertus, this type of body was designed to make a particular appeal to the travelling salesman. For that matter, all cyclecars are expected to have a wide sale among men representing commercial houses. However, it may be stated that the Mercury monocar possesses some additional advantages apart from the fact that it provides seating ca-

capacity for the driver only. The torpedo stern has a carrying space 26 by 22 inches, completely enclosed, in which the travelling man may stow away his sample case between stops.

The Mercury chassis already has been described in these columns. Briefly, it is fitted with a De Luxe twin-cylinder motor, friction transmission and V belt drive. The wheelbase is 100 inches, tread 36 and road clearance eight. The monocar weighs 600 pounds. Two other models

are supplied—a tandem passenger car and a light delivery wagon. The latter has an enclosed body with top and rear doors, behind the driver's seat, and its rated carrying capacity is 200 pounds.

THE DUDLY BUG.

Menominee Maker Also Fits Light Delivery Body to Passenger Car Chassis.

The Dudley Tool Company, Menominee, Mich., which is understood to be closely identified with the Menominee Electric Manufacturing Company, has been experimenting in the cyclecar field for the past two years. At first the plans called for the production of an electric machine, but later the secretary, W. J. Tideman, paid a visit to a number of foreign cyclecar factories, and it was decided to utilize a gasoline engine. The Dudley Bug is the result, and this is supplied either as a two-passenger car or a light delivery wagon, the latter of which is shown.

The two-cylinder, air-cooled engine has bore of 3.375 inches and stroke of 3.9, which is held to develop nine horsepower at 1200 revolutions a minute and 14 at 2200. The piston displacement,

Latest Type of Dudley Bug Chassis Fitted with Light Delivery Wagon Body.

69.9 cubic inches, places the machine in the true cyclecar division. Ignition is by the Atwater Kent Unisparker system, and the carburetor is a Schebler.

Power is delivered to the rear wheels by a planetary transmission, affording two forward speeds and reverse, and two non-stretching V belts. Springs are transverse semi-elliptic. Thermoid faced aluminum blocks forced into both rear pulleys by a lever afford the braking effort. Wheels are of wire, carrying 28 by three-inch tires.

The wheelbase is 96 inches, tread 40 and ground clearance nine. The passenger body is fitted with staggered seats, by which is meant that the front of the rear seat is flush with the rear of the driver's seat. This body is entirely replaced by the delivery wagon construction shown herewith.

The maker is also prepared to market a machine with rear seat across the entire back of the car, and driver's seat at right some little distance

mile handicap, classes B and C; five-mile international free-for-all, and 25-mile free-for-all. The first five events will be for stripped stock chassis only.

July 5—One mile, class A, three miles, class B, and five miles, class C, in all of which the cars will be required to carry the regular catalogue equipment and full number of passengers. Free-for-all novelty race, unknown distance, entrants being required to stop their motors in front of the grandstand, crank up and proceed once around the track, stop and drive backward half a lap. Also, 10-mile free-for-all handicap and five-mile handicap, classes A and B. The closing event of the meet will be a 50-mile Cyclecar Grand Prix, free-for-all.

STICKNEY MOTORETTE.

A Machine in the Light Car Division, Which Seats the Driver at the Rear.

While the Stickney Motorette is not strictly a new machine, it is of particular interest, from the fact that it is one of the few cyclecars which seat the driver at the rear, and also because it utilizes a four-cylinder motor of the pronounced long stroke type. The maker is the Charles A. Stickney Company, St. Paul, Minn., a concern which has had 15 years of experience in the manufacture of high grade products.

The dimensions of the motor are such as to place the machine in the light car division. The four cylinders are cast en bloc, with bore of 2.75 inches and stroke of five. The maker's rating is 12-15 horsepower. The thermo-siphon system of cooling is employed. Ignition is by Bosch magneto, and the carburetor is a Schebler.

A friction disc on the propeller shaft works against a fibre wheel on the jackshaft, which is equipped with a bevel compensating gear, and final drive to the rear wheels is by double side chain. Crosswise double semi-elliptical springs, 33.5 inches long and 1.75 inches wide are fitted both front and rear. The wheels are of wire, interchangeable, mounted on ball bearing hubs, and carrying 28 by three-inch tires.

An accompanying illustration shows the seating arrangement, and it will be noted that the driver is placed at the rear. The front seat is 18 inches wide and the rear, 24 inches. The former is made easily removable, and a special delivery body is supplied to take its place. The picture also shows the hand speed change lever in the centre of the car, and the four pedals, one for the service brake, a second for the emergency member and the two others to control the clutch spring. Spark and throttle levers are on the steering column. The wheelbase is 120 inches, the tread 40 and the ground clearance 9.5.

Top View of Stickney Motorette, Showing the Seating Plan and Arrangement of Controls.

forward. It is not just clear whether or not this is designed to accommodate three passengers.

FIRST BIG RACE MEET.

To Be Held in Connection with International Exhibition in Detroit, July 4-5.

The Cyclecar Exhibition Association, a New York City organization, is announcing plans for an international cyclecar exhibition and race meet on the state fair grounds, Detroit, July 4-5. The contests will take place on a dirt track and the cars will be divided into classes according to the definition of the Cyclecar Manufacturers' National Association as follows: A, 71 cubic inches piston displacement and less; B, 71-100 cubic inches; C, 100-125 cubic inches. The events will include:

July 4—Five miles, class A; two miles, class B; 10 miles, class C; five-mile handicap, classes A and B; 10-

THE ZIP IN CALIFORNIA.

Road Ability of Iowa Product Again Demonstrated by Two Long Distance Trips.

Two recent trips made by the Zip cyclecar, the production of the Zip Cyclecar Company, Davenport, Ia., in California, have served still further to prove the ability of this machine to travel long distances. Easter Sunday a Zip left Los Angeles for San Diego, where it was delivered to the agent in that city and vicinity. The inland route between these two cities covers about 180 miles, and only five gallons of gasoline were consumed en route. The speed limit was maintained on all roads, this being 12 miles an hour in the cities and 30 in the open country.

Fred S. Deister, manager of the Standard Cyclecar Company, Los Angeles, who is handling the Zip, recently had occasion to take a business trip to San Bernardino, a distance of 84 miles. Of course he used the cyclecar, and on account of the numerous stops on the way, the running time was slow. The return trip was made in the night and the 84 miles between the two cities was covered in 3.5 hours.

Cyclecars are becoming very popular in California. Fuel sells at 14.5 cents a gallon, and it has been demonstrated that these little machines will average about 40 miles to the gallon on the excellent oiled roads. This is said to mean that a trip of 100 miles can be made at a cost of about 35 cents for oil and gasoline.

SOME RECENT ANNOUNCEMENTS.

The Lulu, the Monmouth, the Wichita and One That Still Is Nameless.

The Kearns Motor Truck Company, Beavertown, Penn., announces the Lulu cyclecar, which seats two persons side by side. The motor is a four-cylinder, water-cooled unit; transmission, three-speed selective; final drive by shaft and the rear axle is with differential. The motor, clutch and transmission are mounted as a unit. The driver is located at the left, with centre control.

The Brown Cyclecar Company, Asbury Park, N. J., states that it will begin deliveries of its Monmouth raceabout model in July. It will have a wheelbase of 100 inches and tread of 52. The motor is to be a four-cylinder, water-cooled unit, rated at 20 horsepower. A cone clutch, sliding gear transmission and shaft drive are other details of construction. The wire wheels will carry 30 by three-inch tires.

The Wichita Falls Motor Company, Wichita Falls, Tex., is producing the Wichita, a tandem seater, designed by Eino Salimen. It utilizes a two-cylinder, air-cooled motor and belt drive, but no information has been received as to its other details.

W. H. Radford, formerly chief engineer for the Warren Motor Car Company, Detroit, is said to have interested New York City capital in the production of a new machine in the former city. This will have wheelbase of 100 inches and standard tread. The water-cooled motor will have four cylinders with bore of 2.875 inches and stroke of four. A three-speed selective gear-set is to be located on the rear axle.

CONTEST MANAGEMENT.

Thirty-Eight Cyclecar Manufacturers Indorse Proposition for Independent Control.

While both the American Automobile Association and the Federation of American Motorcyclists have sought to take charge of the cyclecar contests to be held this year, cyclecar clubs throughout the country have been energetic in their efforts to secure control of such events through the Cyclecar Association of America. In this work they appear to have the support of a large number of the manufacturers, 38 of whom have signed a resolution to this effect. The concerns which have expressed their approval of the plan are the following:

American Cyclecar Company, Seattle, Wash.; Joseph A. Anglada, New York City; Coey Motor Company, Chicago, Ill.; Comet Cyclecar Company, Indianapolis, Ind.; Continental Engineering Company, Chicago; Cresson-Morris Company, Philadelphia; Cricket Cyclecar Company, Detroit; Dayton Cyclecar Company, Joliet, Ill.; De Cross Car Company, Cincinnati, O.; Detroit Cyclecar Company, Detroit; Downing Cyclecar Company, Detroit; Dudley Tool Company, Menominee, Mich.; Euclid Motor Car Company, New York City; Flagler Cyclecar Company, Chicago; W. S. Frazier & Co., Aurora, Ill.; Frederickson Patents Company, Chicago; Greyhound Cyclecar Company, Toledo, O.; Gadabout Motor Corporation, New York City; Hawkins Cyclecar Company, Xenia, O.; International Cyclecar Company, New York City; Malcolm Jones Cyclecar Company, Detroit; Keller Cyclecar Corp., Chicago; LaVigne Cyclecar Company, Detroit; L. A. Cyclecar Company, Buffalo, N. Y.; Roble Cyclecar Company, Detroit; Milwaukee Cyclecar Company, Milwaukee, Wis.; Frank H. Morse, Pittsburg, Penn.; O-We-Go Car Company, Owego, N. Y.; Pet Cyclecar Company, Detroit; Puritan Motor Company, Chicago; Rex Moyer Company, Wyandotte, Mich.; Twombly Car Corporation, New York City; Valley Boat & Engine Company, Saginaw, Mich.; Ward Cyclecar Company, Milwaukee, Wis.; White Manufacturing Company, Waterloo, Ia.; M. C. Whitmore Company, Dayton, O.; Zip Cyclecar Company, Davenport, Ia.; Woods Mobillette Company, Chicago.

The first use of a cyclecar for the delivery of mail has been made by Earl Stacey of Encanto, Cal., near San Diego, who has taken delivery of an Imp. with which to cover his four-mile route.

UNIFORM LEGISLATION.

The action of the American Bar Association, in co-operating with the American Highway Association, by the creation of a joint committee to codify and revise existing road laws, and make recommendation of new ones, is of decided importance. In order to realize the benefits which may result from this careful consideration of the subject by men capable of giving it the best of thought and experience, motorists must do their full share in arousing public opinion.

The situation, at present, is somewhat analogous to that which presented itself at the time prominent citizens of the eastern states met last year as a commission to draft a uniform motoring law. The reception accorded the efforts of these men by such legislatures as have had opportunity to act upon the proposed bill, is not such as to inspire confidence in the minds of men who are willing to give freely of their time and labor in behalf of such movements.

The reason assigned by some of the legislators who refused to consider the proposed uniform motoring bill, was that it was prepared by a commission purporting to represent certain states, without having been legally created. It

does not seem probable that this position will be held by legislatures which will convene next January, because there is abundant opportunity to give the subject such consideration on the part of the people that their representatives may be led to take the view that the efforts of men of such prominence, in an attempt to benefit the public, shall not be set aside because of technicalities.

And, of course, the same condition applies to the work of the joint committee on uniform road laws. It is not to be presumed that any committee will evolve a perfect bill, but the result of their efforts, particularly when it is well established that this represents careful thought and much time and labor, is entitled to every consideration on the part of those who presume to represent the body politic.

WHAT HAS BEEN ACCOMPLISHED.

But mostly the automobile means freedom to us. We're no longer citizens of Homeburg, but of the congressional district. We're neighbors to towns we hadn't heard of 10 years ago, and the horizon nowadays for most of us is located at the end of a 10-gallon tank of gasoline. Why, in the old days you had to go 50 miles east and double back to get into the north part of our county, and more of us had crossed the ocean than had been to Pallsbury in the north tier of townships. Now, our commercial clubs meet together alternate months and about 17 babies in our town have proud grandparents up there.

—George Fitch in American Magazine.

What the automobile has done for Homeburg in George Fitch's story it has done for all the towns, large and small, throughout the country. The paragraph quoted above sums up the situation in a manner that leaves little room for improvement. Of course the statement, in itself, applies alone to passenger cars.

A notable tendency among manufacturers of accessories, parts and fittings this year is found in the provision of equipment for used cars, affording the owner of older models opportunity to secure the same measure of comfort and convenience that is presented in the latest productions. This has an important bearing on the life of machines, and indicates in a manner that cannot be misunderstood that the modern motor car is a creation that can be depended upon to give satisfactory service over an extended period. It also demonstrates that the present day purchaser is giving every consideration to maintenance, with a view to securing the utmost value from his machine.

CROSS COUNTRY RACING IN URUGUAY.

Johnson Martin Tells the Detailed Story of the Second Annual Raid Montevideo-Salto-Montevideo as Seen from the Driver's Seat in the Oakland Car.

BECAUSE of the time required for transmitting mails between Uruguay and the United States, this is the first opportunity which has presented itself for a complete account of the recent second annual "Raid (pronounced "Ride") Montevideo-Salto-Montevideo", a road race organized by Tribuna Popular, a newspaper in the first named city. The account is by Johnson Martin, who subsequently was to make new automobile history by taking the first car, a Buick, across the South American continent, and over the Andes mountains, and The Automobile Journal is indebted to the Pan American Union, Washington, D. C., for permission to present the information contained therein. The story should prove of exceptional interest to those who are by no means familiar with conditions in South America.

There were 18 cars entered, but after several days of hard rains, and because of the knowledge of the course gained from previous scouting trips, the majority of the European machines were withdrawn. At the start only seven contestants appeared—White, Case, Buick and two Oaklands, representing the United States; Vermorel, France, and Excelsior, Belgium. There were two classes, and but three cars finished. The Case proved a winner in the larger class, with Martin's Oakland in second place. The second Oakland took first prize in the smaller class. The distance was approximately 400 miles.

By Johnson Martin.

The first section of the race was over splendid macadam for some 28 miles, then good smooth roads for about 40 miles, then smooth with a few ditches for another 50, and thereafter long stretches of sandy desert tracks, rocky hill roads, very rough gravel and leagues of running through tall grass with mere parallel wheel tracks like narrow footpaths for guidance. Aside from one bridge over the Santa Lucia river, near Florida, and another at Duranzo, and the ferries at Dayman river and at Mercedes, all the rivers had to be forded by the competing cars. Most of

these are sandy bottoms, but the Salsipuedes (Get-out-if-you-can) is rocky and very dangerous to ford.

In the north, from Algorta to Paysandu, and between Paysandu and Salto, the turning point, there are enormous sand dunes, and between these the road leads among palm trees, very beautiful to contemplate, but a region very shy on water for hot radiators between rivers. Returning, the route leads through the Sierra de Mal Abrigo (Poor Shelter mountains), which is a range of hills of outcropping sand stone, presenting a most desolate appearance to the motorist from a height—nothing but rocks stretching away to the horizon with a sort of trail winding around through them, and in some places

Johnson Martin and His Oakland Car, on the Bridge Over the San Lucia River, Near Florida, Uruguay.

leading up over big flat rocks to avoid deep mud holes in the trail. There is also the Arroyo Negro (Black creek) to be crossed, and this is all that the name implies.

The Oakland 45, driven by the writer, with Otto Johanson as mechanic, formerly was fitted with a limousine body, but, in this race, was equipped with a torpedo body made in the General Motors Company's shops in Buenos Aires. It used a Splitdorf magneto. The Oakland 40 was entered as the Gladiator, by its owner, J. Felix Castillo of Montevideo. The White was a six-cylinder car, entered by Harold Reed, the South American representative of the White company. The Buick 16-B was driven by Alan

A Glimpse of the Grazing Country in the Interior of Uruguay, Divided into Estancias by Wire Fences.

Crocker. The Case was entered by the Case company.

Good Time on First Lap.

The first run to Canelones, over the fine road, was made by the White in 29 minutes, the Buick in 30, the Oakland in 31, the Gladiator in 38, the Case in 38 and the Vermorel in 61. The Excelsior stuck a cylinder and quit. The best time to Duranzo was made by the White, with the Oakland close behind. We started last and were second at Duranzo and at Paso de los Toros. We arrived at Paysandu third, two hours behind the Case, having changed and pumped up seven 920 by 120 tires, at 1:02 in the morning.

Taking the required 10 hours' rest at Paysandu, we used it for removing our front axle, which had collided with a big rock in the bottom of a stream we had been trying to dash through so as not to stick. This we straightened and replaced in time to leave on schedule at 11:02 in the morning, for Salto, where we arrived, after bursting two tubes, at 6:30.

So little happens at Salto that the town was wild and we were fairly mobbed while we filled our big tank with 30 gallons of gasoline and got some oil and some bottles of "pop" for use through the sandy desert on the way back. Soon after Florida we had hit a ditch at high speed and made a leak in our radiator. Although we carried a gasoline soldering iron, we did not care to take the time to make repairs, so carried a bucket of water in reserve and refilled at each brook and swamp hole.

Along the road to Salto during the afternoon we had stopped at a farm house, where we were regaled with a tumbler of "cana" or cane juice (pure alcohol), which proved far better

than tire irons in our tired state for removing a shoe. On the return trip we met the Buick crawling along with its clutch slipping, Crocker sleepily hanging onto a big strap tied around the clutch pedal, the mechanic driving and a pampa pilot or "baqueano" perched on the tire tank behind. They told us a story of the gross and inexcusable ignorance of their pilot, who had led them onto a wrong track and taken them into an

immense basin where they ran into a swamp and were only rescued by our same friend of the "cana" sending his boy on a pony to where he saw their big electric searchlight wobbling around in distress. They were in immediate need of water, and we gave them our reserve bucket, taking chances on reaching the next swamp hole.

On the Brink of a Ditch.

With our searchlight, we made very good running time, and at 1 in the morning arrived at the railway station of Quebrachio. These stations are like oases in the desert and are very welcome sights, especially when one is running at night in the big open. An hour after leaving this station our misfortunes began. Up to this time they had been merely nine tire changes.

We were making about 30 miles an hour when Johanson yelled to stop and flopped out over the steering wheel and over me, starting to pull me out as well. On examination we found we had run along the edge of a ditch six feet deep and 10 feet wide (like which we had passed thousands all day, caused by erosion in rainy seasons). It had not been noticed because we were sleepy, and it was just outside the lane of "white houses" which appear to line edges of the field illuminated by searchlight when one is sleepy.

Privately Owned Automobiles Assembled at Montevideo to Welcome the Oakland on Its Return Trip.

We found that our left front wheel was in the air over the edge of the ditch and could be turned by hand, the car resting on the front axle. The left rear wheel was still on the very edge, but the dirt was cracked under it and it would not stand reversing. We got out our 250 feet of one-inch manila rope, with two double blocks, and hooked onto a wire fence nearby. Luckily for us, all Uruguay is fenced into big fields for sheep and cattle raising.

We tied this wire around our rear axle, jacked up the left wheel, dug a trench outside of the right rear wheel, and by repeatedly tipping the jack over dragged the rear away from the edge. Then, cutting a track up the side of the ditch in front and cranking sharply to the left, Johanson down in the ditch in front holding his spade under the wheel and I sitting on the outside edge of the car with only my left leg inside on the clutch, we reversed and backed it up the little

Arroyo Negro called the Paso de la Cadena. Upon arrival we found nearly four feet of water and no oxen or horses to be hired. This was the place we made our fatal mistake. We should have waited a day if necessary and been towed through the river with our carburetor and magneto under our arms. Instead, we talked to an old wood chopper, who told us of the inevitable and invariable better crossing some distance above.

Haste Makes Waste.

We made off for this, crossing the Estancia Pons on the way. This estancia is one of the biggest ranches in Uruguay, and is where we stuck for three hours last year. The owner has a car and had made a bridge over the cattle wallow where we stuck, so we had no trouble, and joyfully made off through the tall pampas grass toward the ford, only to be brought rudely to our senses by sinking into a mire up to our axles. We

Men and Oxen from the Estancia House of Cambara Extricating the Car from the Marsh—Note Wire Fence Defining Estancia Boundary.

trench until it stood on solid, level ground, just as dawn broke.

After rushing the San Francisco river and the Chapicuy, and crawling through the wide and swift Queguay, we arrived back in Paysandu at 6:25 in the morning. From this point onward our trip is well described by the Tribuna Popular as a "Real Odyssey".

Leaving Paysandu we were unable to find anyone who knew the road beyond a league or so; they knew it led somewhere "para afuera" (outside), but all differed as to the proper route to the Arroyo Negro. We forded the Pantanoso river, the Rabon and the Celestino, then met a boy on horseback with an especially wide eyed stare, who seemed to have an honest countenance, but it was only his stare that was sincere, as it turned out.

He directed us back through these streams, to make a detour of 30 miles to a ford on the

should have doubled back along the ridge after crossing the little bridge, but instead we had cut right across in the direction of the spire of the chapel and grove of eucalyptus trees around the estancia house—a real residence.

As we did not appear one of the vaqueros (herdsmen) who had directed us to the little bridge galloped over the hill and tried to pull the Oakland out with his pony. Then he galloped off again and soon reappeared with two more ponies. On one was his young son and on the other, sitting crosswise, was his wife, with a four-year-old boy astride her hips, after the usual Indian fashion. Our friend explained that the men were busy and the wife had asked to have a chance to see the car. They all hooked on their rawhide lariats and we started the motor, threw into low gear and each took a front wheel. In this way we bounced onto solid ground.

We found a pass through the Arroyo Negro,

where it was shallow enough to run slowly, with the water just up to the carburetor, which we had raised especially by shortening the intake pipe. We then passed 200 yards of sand and got almost through the Sandy ford of the Arroyo Sanchez, a notoriously bad place. Three yoke of oxen passing at the time were called into service to complete the passage.

A Night in an Indian Hut.

After a few miles of fine going, through pasture fields, opening gates and racing along with hundreds of cattle stampeding after us—they always come running from all sides to see what is passing—we arrived at the Estancia Cambara. In a low hollow on this farm we came to a place where there was a stream full of rushes and muskrats. There apparently was a way through, over some branches of eucalyptus and rushes at our left. We rushed it, hoping to bounce over, but no, just as our front wheels were nearly through

little bonfire on the dirt floor of the two-room hut, and tried to dry our wet clothing, but it was a hopeless task, for the fire seemed to give off only enough heat to boil the water for the yerba mate outfit, and succeeded principally in producing volumes of smoke, which blinded Johanson and myself to the great amusement of seven little round-eyed children, who squatted around us. We discovered later that we were sitting on their table, and that the pieces of log around the room were the chairs. After a few moments of forced conversation about automobiles and the weather, I lay down in the dirt beside the little fire, Johanson having already tumbled off his log.

Dinner at Estancia Cambara.

When we awoke it was the following morning and the "patron", who had returned, was grinning down at us—a little stocky man, with fine chest, sunburned face and the enormous "bombachas" or bloomers worn by the cowboys

The Oakland Crossing the Difficult River Salsipuedes, the Rocky Bottom of Which Makes It a Dangerous Ford.

we sank down above the hub caps at the rear and nearly as bad in front.

It was just midday and the sun was so hot on the water that it seemed impossible to do anything but sit there and make remarks. After three hours' work with the jack, most of the time with it under water, we found a heavy thunderstorm upon us. Gathering up our rubber coats and some sardines and "pop", remaining remnants of our food supply of previous days, we started back toward a hill over which we had come. On the ridge we sighted a house about three miles away and cut straight for it through the grass. The heavy rain came on meanwhile, with plenty of lightning, but this was nothing compared to the shock we received on arriving at the hut.

The forlorn Indian woman told us the men had all gone to Fray Bentos with a herd of cattle (Liebig beef extract works), and that there were no horses or oxen available until their return late that night or in the morning. We sat around a

of Uruguay. About 9 we started off on foot, following him and two neighbors on fine horses, across the prairie to the car. They were unable to move it, and he trotted off to the estancia house of Cambara, which turned out to be nearer than the hut, and where we might have passed an hour or so and gotten help the previous day had the woman told us.

With six oxen came two young men on a stripped chassis, one of the owner's cars at the estancia, which they were trying out. The oxen pulled us out and after settling with the men we accepted their invitation to stop at the estancia for luncheon. We had had nothing but about 20 rounds of yerba mate (Paraguayan tea) and some hot milk since the day before, when the sardines were shared with the Indian family. The tender hearted wife of the "mayor domo" (manager) ran out first with large, clean towels, a pleasant memory, then spread a table under an arbor, where we devoured an unreasonable amount of puchero (boiled dinner), beefsteak,

port wine with brackish water and loads of ice, preserved pears and weak tea. All desire to win races had disappeared for the moment, and it was 3 in the afternoon when we left.

The Camino de Tropa.

We raced through the field until long after dark, when we came onto the terrible "Camino de tropa" (cattle road) we had been told about for a long way back. It is a wide road of black earth, over which most of the cattle in this region are driven to the enormous Liebig works, where their meat is used to fill neat white earthen jars, we know so well back there at home. It had been raining recently, and the road looked like a ploughed field with regular furrows running from fence to fence, but sun baked hard as stone. Nine leagues of this had to be negotiated, and before it was finished we reached a big pantano (lagoon of mud). Here we had to cut the wire fence and make a detour through the fields.

About midnight we came on a Cadillac touring car of the latest model in the hills with a load of bottled beer. We were set right as to roads and soon came to the ferry at Mercedes. A little later, in the town of Duranzo, we were presented with a large bouquet of roses, tied with white satin ribbon, by the belle of the town. She did not explain what we were to do with it, but as she "desired us the triumph" I thought it only fair to hold it in one hand and steer with the other until we reached the edge of the town, when Johanson took the ribbon for cleaning the mud from his goggles and we confiscated the bouquet.

Coffee and More Puchero.

During the morning we stopped for coffee at Santa Catalina, where we were the guests of honor and were served by two pretty little Basque girls. Here we drank two large soup bowls of coffee in company with a crowd of threshing machine men. Then we raced a dinky train for an hour and 55 minutes to Arroyo Grande. We were able to beat it, which was a comfort.

Soon, however, we were stuck in the mud again and this time we seemed to sink deeper the more we shovelled the sticky stuff. I wrote a note and stuffed it in a cold cream jar, wrapped it in my handkerchief and tossed it to the fireman of a locomotive on the noon train as it passed. An hour later the station agent from Guaycura arrived to tell us he had followed my request to sent us three yoke of oxen from the next farm, and had also told his cook to get ready a big puchero for us to eat. He was a real prince, this young automobile enthusiast, and we were sin-

cerely sorry for him as we drove away from his station, two hours later, leaving him leaning disconsolate against the fence outside the building, with no house in sight on all the horizon.

That afternoon we passed through the Mal Abrigo hills, and punctured two more tires before we arrived at San Jose. Here the girls threw flowers at us from the balconies. To see the pretty girls in the interior of Uruguay is to have a big advantage on the casual tourist who only sees the Montevideo residents, but to have them get excited, snap their wonderful eyes and scream at you, is worth all the shovelling of mud one is compelled to do to experience it.

An hour out of San Jose we were compelled to repair another tire. That night, at 10:30, we drove into Santa Lucia, thinking we were in Canelones, one of the points of control still 20 miles or more away. Here we completed the tire repair, in the presence of the comisario (police judge) and the jefe politico (boss) of the town. We left at 11:30 for Canelones, between which city and Montevideo lay the good road, over which we had made the outward trip in 31 minutes. I had the greatest difficulty keeping my eyes open and ran off the side repeatedly. About 12:30 we met a big touring car full of excited young fellows, who held us up to inquire what had become of the Buick. We decided that we were closely pursued by this car and thereafter had no trouble in keeping awake.

THE OVERLAND BRASS BAND.

Musical Organization Will Escort Toledo Rotary Club on Its Annual Tour.

The Overland brass band, composed of 50 men and boys regularly employed in the big plant of the Willys-Overland Company, Toledo, O., will leave that city June 22 on its second transcontinental tour. This time it will act as escort to the Toledo Rotary Club, the occasion being the annual convention of the International Association of Rotary Clubs, in Houston, Tex.

Five days will be spent at the convention. On the southbound trip concerts will be given in Chicago, Kansas City, Wichita and Oklahoma City. At the conclusion of the convention the band and the 2000 delegates from all over the world will board special trains for a circle tour of Texas, visiting San Antonio, Austin, Waco, Beaumont, Fort Worth and Dallas. On the return trip to Toledo concerts will be given in Birmingham, Atlanta, Chattanooga, Lexington and Cincinnati.

CORRESPONDENCE WITH THE READER.

Traction—J. B. S., Atlanta, Ga.

What is the limit of a car's possibilities for climbing a hill; that is, what is the steepest grade a machine can climb?

At Fig. 1 is illustrated a method of calculating grade percentages, and the dotted line shows the approximate angle at which gravity overcomes traction. If it be assumed that the base of a triangle represents a line 1000 feet long and that the first sloping line represents a road having a rise that brings it 50 feet above the starting point, this is figured as 50 feet in a 1000, or five per cent.; in other words, one foot rise for every 20 feet. The latter distance does not mean distance actually travelled by a car in ascending such a slope, but distance measured horizontally with reference to the slope.

The grade is measured by the tangent of the

Fig. 1—Illustrating Method of Calculating the Grade Percentages.

angle of inclination and not by its sine, so that a grade that represents 100 per cent. corresponds to an angle of inclination of but 45 degrees, and not 90 degrees, or perpendicular, as is commonly supposed.

At the upper end of the next sloping line the elevation would amount to 66.66 feet, equivalent to a rise of 6.66 feet for each 100 feet travelled horizontally. So one in three corresponds to a 33.33 per cent. grade, one in two to a 50 per cent. grade, and so on until a 100 per cent. grade is reached, which, as noted, is the equivalent of a 45-degree angle.

Fuel Gauge—C. H. Need, Cleveland, O.

I have a 1914 Paige-Detroit car. The gasoline tank is under the cowl and is filled through a curved pipe extending into the front compartment of the car. I have

no way of telling how much gasoline the tank contains. Would you kindly inform me what kind of a gauge could be put on this tank and where I may secure one?

There are a number of concerns manufacturing fuel gauges and while they could supply the information desired, it would be better to write the maker of the car, as he would be in a position to know the type best adapted to the system and which could be fitted easily.

Tire Paint—C. H. A., St. Louis, Mo.

Will you kindly give information in your valuable journal, of which I have been a reader for many years, as to what is the composition of the white paint used for painting tires, as I would like to make some for myself and try same on my shoes?

The writer is not familiar with the recipe for making the tire paint referred to. The marketed material is not expensive and would be more economical in the end. The Northwestern Chemical Company, Marietta, O., manufactures Tire-Lac, which is a specially prepared paint for use on tires and rubber mattings, etc. It protects the material from the deteriorating effects of sunlight, oil, etc., and comes in two colors, rubber white and gray.

Crawford Motor—W. Shipley, Peetsburg, N. Y.

Can you inform me as to the opening and closing points of the exhaust valves of the 1906 Crawford motor? It has automatic intake valves, is a four-cylinder engine and has a bore of 4.5 inches and stroke of the same dimensions.

The Automobile Journal's files do not contain the valve timing diagram of the motor referred to. The information can doubtless be obtained from the maker, the Crawford Automobile Company, Hagerstown, Md. In writing, state the number of the motor and the model of the car to insure obtaining the proper diagram.

Dynamo—F. C. G., Trego, Cal.

I would like to know if I could use a dynamo generating 20 volts for lighting purposes on a motor car. Would I have to use a storage battery or could I light the lamps direct from the dynamo? I would also like to know what voltage and candlepower lamps to use with the dynamo.

A dynamo generating 20 volts could be used for lighting purposes on a motor car provided a number of conditions were taken into consideration. In the first place, the maximum output of the generator must be known, else when supplying the lamps direct the filaments are likely to be burned out.

Lighting generators for motor cars generally include means for regulating the output; that is, provision is made to prevent excessive voltages when the car is being driven at high speeds.

There are various types of controllers, these including mechanical and electrical. Their function is, as above explained, to hold the output at approximately a predetermined point.

The ratio of drive is another factor. If the dynamo is driven at crankshaft speed, for example, it is possible that the current generated will not be sufficient to carry the lamp load. On the other hand, if the armature of the generator be driven at double or three times crankshaft speed to obtain the desired efficiency at low motor speeds, it is obvious that at high car speeds the lamps will be overloaded unless some form of regulator is utilized.

If a storage battery is to be employed, which is to be recommended as it makes possible a supply of current when the engine is inoperative, some form of cut-out must be utilized to prevent the battery from discharging through the dynamo.

Best Clutch—Wallace Cox, Hubbard, Ia.

Please publish in your next issue which kind of clutch is the most desirable with a sliding gear transmission, whether a cone or multiple disc running in oil or dry. This information may be of value to other readers as well as myself. I would like the answer published, not by mail.

Any of the types mentioned are desirable and efficient. It is a matter of opinion and all three forms are employed in high grade cars. The writer has driven machines equipped with the types mentioned and, if his personal opinion is desired, would state that one is as satisfactory as the others.

Piston Rings—Information, Salt Lake City, Utah.

In reading your book I have noted reference made to piston rings being cut eccentric and concentric. What is the difference between the two types?

It is a generally accepted idea that if a ring be turned concentric inside and out, then split,

Fig. 2—Piston Ring Construction: A, Concentric Type Open; B, Closed; C, Eccentric, Open; D, Same Closed; E and F, Eccentric Finished to True Circles Inside and Out; G, H and I, Showing Different Steps; J, Diagonally Cut Rings Arranged Oppositely.

mo when the latter is not generating a current in excess of that of the cells. If the circuit between the battery and dynamo were not broken, the former would tend to drive the generator as a motor. The cut-out or control member also serves to connect the dynamo with the battery when the generator develops sufficient energy to charge the cells.

Relative to the proper lamps to use: It would depend upon the maximum output of the dynamo as above explained. If the battery is to be included in the system, it could be floated upon the line; that is, all current used for lighting, etc., could be drawn from the cells and the dynamo used solely for charging purposes. These factors would have to be considered in selecting the lamps.

the outward pressure on the cylinder walls, when the ring is closed and in its place, will not radiate from its centre. This is demonstrated in the illustration at Fig. 2, A and B, showing the ring open and closed respectively. It will be noted that with this design there are three bearing points, one on either side of the split and at the lowest extremity of the circle.

Such a type would not be practical for service in a cylinder, so the ring is turned thicker in the first instance and then turned to a true circle after being closed at the gap, thus giving a full bearing surface all around its circumference. By doing this, however, some manufacturers make it a practise to turn out the inner periphery of the ring eccentric to the outer, in order to equalize the pressure at all points of the ring. This is de-

picted by the rings illustrated at C and D.

A ring of the eccentric type is shown at E and F and costs but slightly more to manufacture than the type previously mentioned. It is turned to a perfectly true circle inside and out with the gap closed, the outer circle being eccentric to the inner. By referring to F it will be noted that not only are the pressures even on all parts of the ring, but less pressure is required to make it gas tight. It is held that there is less uneven wear of the cylinder walls, less heat developed and greater efficiency of the motor.

Relative to joining the rings: There are several methods, some of which are illustrated at G, H and I. That at G consists of a diagonal cut across the face. There is a tendency in this type to rotate in the opposite direction to that in which the lower diagonals point, and some make a practise to cut every other ring in the opposite direction to its neighbor, as shown at J.

Bore and Stroke—A. A. C., Concord, Mich.

Will you please state in your columns for the benefit of a new owner if the decreasing of the bore of a cylinder and lengthening its stroke would add to the horsepower or diminish it? What would be the difference in the horsepower of two motors, one having a bore of 3.625 inches and stroke of 4.5, and the other a bore of 3.75 and stroke of 4.5 inches?

Relative to the first question, it would depend on how much the bore was decreased and the stroke increased; that is, whether the piston displacement was increased over normal or otherwise.

The horsepower of a cylinder, according to the S. A. E. formula—which considers bore only—having a bore of 3.625 inches is 5.1 or 20.25 for a four-cylinder engine of the same dimensions. That of the larger engine is 5.625, or 22.5 for four cylinders. These ratings are based on the formula which squares the bore, multiplies by the number of cylinders and divides by 2.5.

Setting Timer—F. B. T., Westerly, R. I.

What is the best position to set a timer or commutator for a four-cylinder motor, so as to make easy starting without any danger of a kick? Is the Ford timer setting variable or fixed?

The setting of a timer for a four-cylinder motor would vary with the design of the engine. Some make a practise of slightly advancing the commutator when the spark lever is fully retarded, while others utilize what is termed a dead centre position.

The last named is obtained by cranking the motor until the piston of the first cylinder has completed the compression stroke, and the crankthrow is vertical. The contacting member of the timer is then so adjusted as to close the primary

circuit. With a roller and wipe type of commutator, the roller should just make contact with the metal segment, and of course, the segment must be connected with the primary wire leading to the No. 1 coil.

The writer recommends setting by the following method: Place the piston of the first cylinder on dead centre or completion of the compression stroke, then crank the motor until the piston has descended about .25 inch or more on the downward or firing stroke. Next set the timer with the spark lever fully retarded so that the roller just makes contact. This will prevent the possibility of a kick, provided of course, spark linkage is not badly worn, creating undue play.

If it be found that the motor starts hard with this retard, the lever can be advanced slightly, the amount being determined by experimentation. The intensity of the spark and mixture are factors to be considered, and frequently difficult starting is caused by a weak spark at low speeds or too thin a mixture. The last named burns slowly.

The position of the Ford timer is fixed, it being retained on the camshaft or commutator shaft by a pin.

Cork Inserts—Reader, Providence, R. I.

What is the best method to pursue in fitting new cork inserts in the clutch of a type 10 Autocar? What is the proper thickness of the cork?

The best and simplest method of inserting new corks in the clutch of the car referred to is to disconnect the clutch linkage, remove the bolts retaining the transmission housing and slip the assembly back and out. This will permit of easy access to the plate carrying the inserts.

In fitting new inserts, a good grade of cork should be employed, and the new members should be slightly larger in diameter than the openings into which they are fitted so as to retain them. The inserts should not extend beyond the surface of the plate more than .03125 inch, as their function is to minimize the harsh engagement that would otherwise follow when the plates are engaged. If the inserts are too thick they will take the drive, instead of the plates, and it will not only be difficult to fully release the clutch, but is apt to result in trouble. The surfaces of the inserts should be made as smooth as possible and it is not good practise to depend upon service to wear them smooth.

James W. Gilson, formerly with the Mitchell-Lewis Motor Company, Racine, Wis., has become associated with the L. P. C. Motor Company of the same city.

BUYS FOURTEEN OUTFITS.**Ford Motor Company Pays Akron-Williams Equipment a High Compliment.**

It cannot be denied that when a motor car manufacturer of wide reputation selects equipment for its branch houses, care is taken to provide that which is expected to meet every requirement. The Williams Foundry & Machine Company, Akron, O., is therefore justified in considering that it was paid a compliment of no mean importance when the Ford Motor Company, Detroit, recently ordered 14 of its Akron-Williams localized heat tire repair outfits, for installation in each of its service stations throughout the country.

It is explained that this large order was placed on a merit basis, and was only given to the Williams company after careful tests and comparisons with other equipments. It is well to remember, in this connection, that the Akron-Williams vulcanizers have a patented and exclusive feature of localized heat chambers. Each section is heated by three separate and distinct steam chambers, a construction which is held to make it possible to apply the heat precisely where the repair is to be made. Over curing or burning is claimed to be prevented in this manner.

AS TO PURCHASING POWER.**Simplex Automobile Company Discloses Partial Result of Its Investigations.**

Automobile manufacturers and dealers are giving much closer application to the study of local conditions than formerly was true. There is a growing feeling that facts respecting the purchasing power of a given city or district are decidedly important. The Simplex Automobile Company, New York City, through its wholesale manager, Fred J. Titus, has just completed a very exhaustive investigation along this line, and some of the figures obtained have been made public.

For instance, it is found that there are nearly 5000 men in New York State who are known to possess from \$250,000 to \$1,000,000 or more. There are 10,702 who are rated as possessing over \$100,000, and in addition to these 40,000 are credited with being worth \$50,000 and over. In Massachusetts there are 2300 in the \$250,000 class, 4797 accredited as being worth more than \$100,000 and 17,801 who are held to be worth from \$50,000 to \$100,000.

The Simplex company produces a high priced car and naturally is interested in securing data concerning men of considerable means, but the suggestion offered in these figures is one which may be applied locally by each agent. An example is cited in Philadelphia, which has 2110 men worth upwards of \$100,000, according to this same source of information.

JOINS MERKEL FORCES.**Harry Gleisman Will Look After Motorcycle Sales in Middle Atlantic States.**

An accompanying illustration presents Harry Gleisman, who has just joined the sales force of the Miami Cycle & Manufacturing Company, Middletown, O., maker of Flying Merkel motorcycles, covering the states of New Jersey, Pennsylvania, Delaware, Maryland and Virginia. He is well known in the industry, particularly as president of the New York Motorcycle Dealers' Association, which he helped to organize, and is its first and only president.

Harry Gleisman, with Miami Cycle & Manufacturing Company.

Mr. Gleisman has been identified with cycling interests since 1889. He was one of the first members of the old League of American Wheelmen, joining the Massachusetts division in 1890. In 1894 he opened a small repair shop in Thompsonville, Conn., and five years later he had established himself in New York City. In 1903 the name of the house was changed to the Tiger Cycle Company. It was in 1900 that he first became interested in the motorcycle, becoming the proud possessor of an old Thomas Autobike. In 1904 he took the agency for the Rambler motorcycle and was a participant in that memorable endurance run, the first Federation of American Motorcyclists' run from New York to Albany and return. He will use a Flying Merkel exclusively in covering his new territory.

IN THE COMMERCIAL VEHICLE FIELD.

Some Interesting Examples of New Designs in Spring Suspension for Motor Trucks and Business Wagons---Constructional Details of Parcel Post Kar.

BECAUSE of the vibratory influence upon the metal of commercial vehicle chassis, the springs that support the frame are of decided importance. The rubber tire is distorted by pressure upon it, and there is some degree of resiliency afforded by it, but the wheel and the axle are assembled solidly in contact with each other, so that the road shock, which varies with the weight, speed, character of obstruction and the condition of the tire, is communicated through these and is supposedly absorbed by the spring. The frame, and the mechanism it supports, is subjected to the vibratory influences of the motor, which is operated at greatly varied speeds, and these also are assumedly absorbed by the springs. Thus it will be seen that these members perform a double function, insofar as protecting the construction is concerned, to say nothing of protecting the freight.

Chase and Atterbury Designs.

The designing of spring hangers or brackets has been given much attention, inasmuch as these must be sufficiently strong to resist all strain, the stresses must be so distributed that the frame will not be twisted by sidesway, and action must be free at all times. The American practise has been to have the ends of the rear springs so coupled that there will be unrestricted movement, the driving thrust being taken by radius rods, while torque arms have generally been used to resist the braking and traction stresses.

The new Chase three-ton truck and the Atterbury 3000-pound wagon chassis have been de-

signed in accordance with French practise, which is to dispense with radius rods and to use comparatively flat arc rear springs which are pivoted transversely in the forward hangers, as are the front springs in American construction, with the rear ends shackled, all stresses being cared for by the forward sections. Both of these machines are worm driven, and provision is made with telescoping shaft connections to prevent end thrust, for the rear axles will be moved forward and backward slightly with the deflection and reflexion of the springs.

The comparatively flat arcs of the springs (the Chase design is straighter than the Atterbury) minimizes this movement, but there is greater wear at the rear spring eyes. The stresses upon the springs require larger and heavier hangers or brackets, and the Chase hanger is webbed and fitted so that it bears the full width of the frame, and the bearing surfaces are very large.

Details of the Construction.

The master and main leaves are turned to form an eye, the two being an inch thick, and the other leaves are thin and longer than the average, being lipped to prevent separation. The spring bolts are very large and have bearings in bronze bushings. It will be noted by the accompanying sketch of the front end of the rear suspension that this spring is nearly flat when the vehicle is light, and when loaded it is practically horizontal, so that the driving thrust is almost parallel with the line of the chassis frame.

Another sketch shows the manner of retain-

Linkage of Shackles on Pierce-Arrow Two-Ton Chassis; Pivoted Ends of Rear Suspension on Chase and Atterbury Designs; Rear Connection of Walter Front Springs, and Hanger of Rear Spring on the Walter.

ing the underslung spring to the square section of the cast steel axle housing, by long clips that pass through the housing and a saddle on which is seated a large rubber check. The spring seat is formed with lugs that fit at either side of the axle and prevent longitudinal movement of the spring. The rear shackle is a double yoke with comparatively long arms that carry very large bolts, this providing for considerable movement of the spring with practically no resistance.

The Atterbury design has a bracket bolted to the frame side member, with a curved arm extending, in which is an eye. The arm is carried by a boss in the centre of the bracket, and this is bored in the centre to coincide with the eye in the arms. The spring eye is fitted with a bronze bushing and the spring bolt is carried through the arm and screwed into the boss, this giving a very light, but strong construction, retaining the

weakening them by drilling for bolts, and making a solid assembly that can be secured to the axle in such manner as to insure that it will not be affected by the strains upon the clips.

The underslung rear springs are mounted at both ends in shackles, the front hanger being a cored casting that is bolted to the side of the frame, into which is fitted a heavy bolt carrying the usual yoke. The rear shackles are yokes that are mounted on the arms of brackets bolted to the chassis side frame members, the ends being carried by bolts fitted through the spring eyes.

Pierce-Arrow and Buick.

In the Pierce-Arrow two-ton machine, the front part of the rear spring hanger is a large casting lightened by judicious webbing, and this carries at its lower end a long bearing in which is mounted the emergency brake shaft. Arms at

spring rigidly, and bringing the chassis frame very low.

Walter Front Drive Machine.

In the Walter front-wheel driven truck, which has the Latil suspension, the forward ends are shackled and the rear ends pivoted in hangers, so that the machine is really drawn by the springs. To secure sufficient turning radius for the wheels, the springs are mounted under the frame, and as there is not the driving thrust to be endured the principal purpose is to obtain a construction that will not yield under the drawing or pulling strains. This form has been used in France for nine years with satisfactory results.

The springs are carried forward on conventional shackles and there is a very free movement. The centres of the forward members are bonded by sleeves shrunk on while hot, this insuring the retention of the plates without

either end of this shaft are connected with the yoke ends of the pull rods of the brake linkage. The shaft somewhat stiffens the frame and preserves the relation of the frame member and springs. The rear ends of the springs are rigidly connected by a rod.

The Buick delivery wagons are equipped with full elliptic springs at the rear, and the frame is strengthened by a cross member directly above the axle and in line with the centre of the upper halves of the springs. At either side a bracket is bolted that extends diagonally upward and ends in a wide seat to which the upper half is bolted by clips.

Kelly, Packard and KisselKar.

With the forward part of the rear spring bracket on the five-ton Kelly chassis, there is a casting bolted to under web of frame members, and instead of the usual arm there is a rectangu-

Cored Cast Steel Forward Hanger of the KisselKar Rear Spring; Rectangular Bracket and Shackle of Front End of the Kelly Five-Ton Rear Suspension, and Forward Shackle of Rear Springs on Four-Ton Packard.

lar section with a web filling a consideration portion of the space within the rectangle. The spring shackle is rectangular, one section fitting into the opening of the hanger and being secured by a large bolt that passes through both sides. The spring eye is fitted into the opening of the shackle and mounted on a bolt.

The four-ton Packard chassis has the rear springs under the frame, and the forward ends are mounted in shackles with flat side links, but to bring the spring close to the frame and afford ample bearing the bracket is placed in the channel of the frame members. The bracket bearing is the full width of the spring, being supported by the webs. The links are large and the bolts extremely heavy.

The three-ton KisselKar truck frame is mounted above the rear springs, and the forward shackles are carried on hangers that are cored to

secure lightness, the size of the hangers, as seen from the side of the chassis, giving the impression of massiveness and unusual weight.

THE PARCEL POST KAR.

Constructional Details of One of the Newest Light Package Delivery Wagons.

A machine that possesses many features of interest is the Parcel Post Kar, made by the Parcel Post Equipment Company, Grand Rapids, Mich. It is designed as a light package delivery wagon, and may be supplied with either a two-cylinder, air-cooled or a four-cylinder, water-cooled motor. The power plant is located practically in the centre of the chassis, with the driver's seat directly over the rear axle and the package carrying compartment between the front wheels.

The wheelbase is 90 inches and the tread 52. The seat accommodates two persons, with the driver at the left. The parcel van is 56 inches long, 27 wide and 18 deep. This is so installed that it may be withdrawn from the chassis at a moment's notice, leaving the motor exposed for work. In fact, the entire machine may be dismantled readily, as indicated by an accompanying illustration. How-

The Unit Power Plant of the Parcel Post Kar Is So Assembled with the Rear Axle That It May Be Quickly Removed When Necessary.

ever, the engine compartment is equipped with doors which permit easy access to the working parts for minor adjustments, etc.

The two-cylinder engine has bore of 3.5 inches and stroke of 3.5625, being rated by the maker at 10-12 horsepower, while the larger motor has bore of 2.5 inches and stroke of four, and is rated at 12-14 horsepower. Ignition is by At-water Kent Unisparker in either instance. The fuel tank is mounted on the dash in the engine compartment.

Otherwise the construction is the same with either power plant. The clutch is a multiple disc, operated in oil, and the sliding gear transmission affords three speeds forward and reverse. The main driving shaft of the gearset carries a sprocket, and a roller chain transmits the power to a sprocket incorporated with the differential assembly in the rear axle. This chain runs in a path of oil. The assembly is carried on a ball trunnion at the centre of a frame cross member and is supported by the two wheels at the rear, so that by releasing the forward trunnion and the engine connections at the front end, the body and frame may be lifted and the engine supported on two standards for convenient work.

The rear axle is of the usual live type, with the wheels keyed to the driving shaft, which are mounted on Hyatt roller bearings. Springs are transverse full elliptic. The brake lever operates a band fitted with cork inserts that contracts on a drum within the rear axle housing. When this lever is moved to an extreme forward position it can be used to start the motor, which is connected by linkage, with a shaft carrying a pair of ratchet arms that engage with a six-inch gear which in turn meshes with a pinion on the engine shaft. A quick backward movement of the lever brings one of the arms into engagement with the gear, and a clutch is engaged when the pinion is forced into contact with a collar on the shaft. As the pinion is free, it is automatically disengaged when the motor begins firing. This starting device is entirely enclosed and thoroughly lubricated.

The clutch pedal also serves a dual purpose, the first movement disengaging the clutch, while pushing it further forward applies a brake to the transmission.

MINIMIZING WAITING TIME.

Interesting Results Obtained by Method Employed by Buffalo Haulage Contractor.

Another interesting example of the possibilities with mechanical transports in contract haulage, through the use of special equipment, is evidenced by the results obtained with four five-ton Pierce-Arrow trucks, made by the Pierce-Arrow Motor Car Company, Buffalo, N. Y., in service with J. F. Kulp & Sons of that city. The concern has the contract for hauling 590 car loads of marble, to be used in the construction of the new Catholic cathedral.

The stone must be handled carefully, for the reason that it is easily defaced. When the contract was begun, much time was lost in loading the trucks and in unloading at the building site.

One of the Pierce-Arrow Five-Ton Trucks with Specially Designed Equipment, Utilized by Buffalo Contractor in Hauling Marble.

Cranes were used at the railroad terminal, but the unloading was by hand, each piece being handled separately.

In order to overcome this handicap, a number of shallow boxes, termed skips, were constructed, these being mounted on small wheels so as to be moved readily and quickly. At the building site a platform was made with a runway to the ground and plank ways were laid when necessary.

Some of the skips were left at the railroad, where they were loaded by the cranes during the absence of the truck, and at the other end of the route the loaded skips were quickly replaced by empties. By utilizing this method one of the trucks was able to haul between 50 and 55 tons of marble in a nine-hour day, the round trip averaging about eight miles.

BALANCING INTERNAL COMBUSTION ENGINES.

Third and Final Installment of F. W. Lanchester's Paper Dealing with Balancing of Engines in Which Cylinders Are Not in the Same Place.

In the two previous installments of F. W. Lanchester's article on engine balancing, published April 10 and 25, were discussed the defects of balancing which are involved in connection with the different cylinder arrangements, while the question of torque vibration was investigated. In the following article the balancing of engines in which the cylinders are not in the same plane is discussed, the V arrangement of multi-cylinder engines being selected as an example:

A question of some interest in the matter of balancing is raised by offsetting the crank, which has become the practise of many firms during the last few years. The main object of this practise is to obtain a more direct thrust from the connecting rod and diminish the piston friction on the explosion or expansion stroke; incidentally, in many cases advantage is taken of the offset of the crank to secure greater clearances for camshaft and valve mechanism. It is of interest to study to what extent this offset introduces new factors into the balancing of the engine.

In Fig. 1, let the crankshaft centre be represented by the point S, and the cylinder axis by the line OY, the distance SO being the offset measurement. Taking the two opposite positions with the crank at right angles, we have the connecting rod indicated by the heavy lines A_1P and A_2P . The distance separating the points A_1 and A_2 may be reached by the construction shown, in which the point C represents the piston pin position of an engine without offset, and the lines $C A_1$ and $C A_2$ arcs struck from the crankpin positions p and p_1 , or, as shown in the figure as an approximation, tangents to these arcs drawn from the point C. In the position of the stroke shown, it is evident that the angle A_1CA_2 is at its maximum, and since the angle A_1CA_2 is equal to pCp_1 , it is clear that the motion of the points A_1 and A_2 may, to a first degree of approximation, be divided by superposing a harmonic motion of amplitude A_1A_2 on the normal motion of the point of C in an engine in which there is no offset. Thus, if we take a phantom crankpin orbit whose centre is the point O, and out of phase with the main crank by an angle $p_1O D$ and coupled up with a phantom connecting rod, as shown in Fig. 1, we shall have nearly an identity of motion in a phantom piston driven from the crankpin D and crank centre O (without offset), and in the real piston driven by the crankpin p on the crank centre S with offset O S. We may therefore regard the effect of the offset on the piston motion as that of an alteration of phase through an angle $p_1O D$ derived from the construction given in Fig. 1. Thus it follows that the engine with offset is not materially different, so far as its main balance is concerned, from that without offset, the forces and moments being, however, retarded by difference of phase represented by the angle $p_1O D$.

An alternative and more exact treatment may be given as follows:

Case 1. Rod Length Taken as Infinite.

Let offset angle be represented by α , Figs. 2 and 3, and let m and m_1 represent piston pin travel, and let o be point of midstroke. Take radial component of stroke n and n_1 to represent the stroke path of a phantom engine with same crankthrow, but with no offset. Take q_1 , q_2 corresponding positions (on basis of rod length=infinity) by normals to the connecting rod direction, Fig. 4; then the motions and velocities of the actual and phantom pistons will at every instant be in constant ratio and the motion of the piston in the offset engine is therefore, as in the phantom engine, harmonic. Also, since its phase corresponds to the path n and n_1 , which in the actual engine is inclined at angle α to the vertical, the phase of the main piston disturbance will be displaced through an angle α from that of the engine without offset.

Case 2. Rod of Finite Length.

We now require to investigate the octave vibration. This, as we have already seen, is due to the vertical variations in the length of the connecting rod owing to its angularity.

In the offset engine, Fig. 2, eliminating the vertical component of motion, one end of the connecting rod is describing a harmonic motion along a horizontal (as drawn) path p and p_1 , while the other end is describing a path whose horizontal component is of amplitude k and k_1 , which is harmonic to a first degree of approximation, and 90 degrees different in phase from the motion p and p_1 . This is represented graphically in Fig. 4.

Let r =crank radius=on (Fig. 2.)
 b =half distance k , k_1 .
 a =offset angle.

In Fig. 4, let abscissae represent angular motion in circular measure.

Then $B = b / (r + b)$.

And from the properties of the sine curve j is unity (=1 radian), hence

$$B = b / r + b$$

but

$$b/r = \tan a$$

but b is small in relation to r .

Therefore (approximately)

$$B = \tan a,$$

and a coming within the definition of a small angle,

$$\tan a = a \text{ and } B = a.$$

Thus, the octave vibration is out of phase with the main vibration to the extent of the offset angle. Inspection shows this is in direction such as to cancel the offset angle, so that the octave vibration in an engine with offset is the same in direction and phase as for an engine without offset.

That is to say, in a vertical cylinder engine with crank offset—

1. The octave component of the piston motion is vertical.
2. It is in phase with the vertical component of the crank.
3. In the axial line of the cylinder.
4. Out of phase with the main component of the piston motion to the extent of the offset angle.

Balancing of Components in Practice.

Quite apart from the question of balancing in design and the theoretical aspect of the subject, it is necessary to devote some consideration to the actual carrying into effect of the intentions of the designer in the shops. It is useless to devote time and attention to the elimination of vibration on paper unless a reasonable degree of care be exercised in the course of manufacture to insure the necessary degree of accuracy in the weights of reciprocating parts, the proper balancing of rotating parts, etc. On the other hand, the author has of recent years had personal experience of balancing appliances which

in practical use have proved an entire delusion, and we frequently hear talk of a degree of accuracy in weighing reciprocating parts, etc., that is quite beyond the requirements of the case. It is useless, for example, in

the case of an ordinary four-cylinder engine, in which the unbalanced forces may run into half a ton or more, with a reversal of sign twice per revolution, to expect to obtain any advantage whatever by weighing pistons to within a quarter of an ounce or by whittling down connecting rod stampings to a similar degree of accuracy; such fastidious exactitude shows an absence of all sense of proportion.

Until a few years ago it was considered sufficient for the purpose of the automobile engineer to balance statically such items as the flywheel and the crankshaft. The shape of the former, namely, its short axial dimension, renders the possibility of serious dynamic want of balance extremely remote. In the days when cranks were machined all over, the dynamic balancing could be well taken care of by the dimensions assigned on the drawing, but during the last few years it has become almost general to employ stamped cranks which are not machined over their whole surface; consequently at the present time there is something to be said in favor of balancing the crankshaft dynamically.

In the author's own experience it is certain that where dynamic balancing is adopted the machines and method employed should be controlled with considerable care, and made subject to special inspection.

Defects in Balancing.

In one case the author's experience not only illustrates the danger of putting a machine or appliance that requires special knowledge into the hands of an ordinary shop foreman or mechanic, but also incidentally shows the futility of superexact balancing where the ordinary four-cylinder engine is concerned. The circumstances were as follow: A bad case of synchronous vibration in connection with a four-cylinder engine of a new type being under investigation, the author decided at the outset to make sure of his ground by personally testing the balance of all components; the flywheel had previously been balanced both statically and dynamically on a special machine of well known type; it carried the proper view marks and showed evidence of both balancing processes. It was duly removed from the engine and personally tested for static balance by the author, when a defect of over four ounces in the rim was discovered. This was ultimately traced to the fact that the dynamic balancing machine was defective in principle, and, although the static balancing had been quite properly carried out, the subsequent use of the dynamic balancing appliance had resulted in the static balancing being undone and the wheel being passed officially with the error mentioned. Incidentally, it may be stated that the defect in this machine appeared to be that the flywheel was mounted on a cup and peg support, which, owing to its angle of friction, allowed a certain ambiguity as to the axis of rotation. After some investigation the machine was condemned and its use discontinued. As an amusing sidelight on the subject, the fact may be recorded that when the flywheel was put back with four ounces removed from the rim on one side to secure static balance, the vibration of the engine was not distinguishably better or worse! This is not the author's only experience in the same direction; the constitutional error of balance in a four-cylinder engine is so great as entirely to mask anything less than a missing piston or lack of balance of about that magnitude.

Difficulties in Practise.

In connection with the crankshaft, while for the stamped crank dynamic balancing might be of considerable service, difficulties have in practise arisen. When, for example, on the Norton balancing machine, or other machine of similar type, a four or six-throw crank is running at speed, the distortion owing to the unsymmetrical distribution of the throws is so great a disturbing factor as to render the process uncertain and quite uncommercial. Attempts have been made to get over the difficulty by attaching balance weights to the crankthrows in order to prevent their centrifugal force causing flexion, but the whole business becomes far too

elaborate to be of real service.

There are three alternative forms of support that may be adopted when mounting parts for static balancing. The wheel or part may be mounted in ordinary lathe centres, a mandrel being used if necessary; the centres require to be jarred by hammering in order to eliminate the static friction and render this method of support sufficiently sensitive to indicate small errors of balance. Another method is to roll the part (mounted on a mandrel in the case of a flywheel or similar part) on two parallel horizontal straight edges mounted on a cast iron bed. Both mandrel and straight edges should be properly hardened and ground, and the cast iron bed permanently installed and accurately levelled. A third method, which is not easily applicable excepting in the case of a flywheel, is to employ a mandrel furnished with perfectly axial knife edges at its extremities.

Reciprocating Components.

The question of weighing reciprocating components, etc., calls for no particular comment. It is customary in the best class of practise, as represented by the six-cylinder engine, to bring all pistons within a definite weight variation limit, which is usually fixed at about half an ounce or one ounce for pistons and the like, and to weigh the ends of the connecting rods separately, the end not being weighed being supported on a loose mandrel or knife edge. Recently a special weighing machine has been introduced to weigh both ends of the rod simultaneously; an appliance of this kind, however, has yet to justify its existence.

Methods of Dynamic Balancing.

Any running part that is statically balanced may or may not be dynamically balanced; but any piece that is in dynamic balance is of necessity also in balance statically. In the event of a statically balanced piece being out of dynamic balance, it requires two weights of equal and opposite moment to be applied at some definite axial distance apart, and any given want of dynamic balance can always be disposed of by two such weights and two only. It is obvious that in place of definitely adding weights, weight may be subtracted by drilling or otherwise. It appears well to make the above formal statement, since the author has frequently seen wheels or other components after going through the so-called process of dynamic balancing with two or three entirely different sets of drillings, and it is not always easy to convince a foreman that one pair of drillings is all that is necessary if the work is properly carried out.

There are two principles on which the design of a dynamic balancing machine may be based: the one is to run the piece about its geometric axis and measure or indicate the resulting forces or couple, weights being added until such couple is eliminated. The second method is to mount the piece in a springy or yielding support, spinning it at a high speed till it settles down to run on its principal axis; and it is then marked by any usual method to show defect of balance. It is the latter method that is most usually adopted. In this method it is advisable to test and mark the piece, first running in one direction and then reversed, to eliminate the effect of lag.

Dynamic Balancing.

The author does not consider that the question of dynamic balancing has as yet been solved in a thoroughly satisfactory manner; the appliances in use, as already stated, do not, generally speaking, give reliable results in the hands of the ordinary skilled mechanic, and, as at present constructed, they are better placed in the laboratory than in the machine or fitting shop. It has already been pointed out that the indications of a dynamic balancing machine may be entirely masked by centrifugal distortion.

An item of balancing which is of dynamic character, though not dynamic balancing in the sense of the present discussion, is that necessary to determine the moment of inertia of flywheels used in engines in which reverse rotation is employed. Where such flywheels can be made of identical design the matter is simplified, but where this is not possible some ready method of measuring the moment of inertia must be adopted. In connection with the early 12 horsepower Lanchester engine, the flywheels were tested by mounting them on a mandrel to which a pendulum was attached, and the

moment of inertia was calculated from the time period of the pendulum. This apparatus was only used for initially determining the flywheel design, and after the first pair of wheels had been standardized by the pendulum method, the drawings were corrected to suit.

We now pass to the consideration of vibration of a kind entirely different from that dealt with in the preceding sections, involving a departure from our initial hypothesis. We have to deal with vibrations due to want of

rigidity of the structural components of the engine. In the case of an engine having "looking glass" symmetry, such as the ordinary four-cylinder or six-cylinder engine, if we think of the engine as flexible about its middle point, as though the frame and crankshaft were articulated at that point, we can see that the two halves of the engine would rock in a symmetrical manner just as two separate two or three-cylinder components would do if built as separate engines. We can, therefore, see that any want of rigidity in the crankcase and structure of the engine would result in a vibratory bending of the engine itself under the influence of the reciprocating masses; this is one of the forms of vibration now contemplated.

In such a case as the above, and in practically all cases in which distortion of the engine components is concerned, it is quite easy to give the necessary strength to resist the vibratory motion and to prevent it from directly causing trouble; any reasonably good design will suffice for this purpose. The real difficulty arises when the vibration period due to this elasticity coincides with the running speed or with any periodic disturbance associated with the functioning of the engine. Thus, any natural vibration period in the engine structure may pick up the main piston period, or the octave piston period, or even one of the higher harmonics of the piston motion, or in some cases the impulse period may be the exciting cause, so that synchronization may take place at several different running speeds of the engine.

Cause of Vibration.

In certain respects vibration of the character now under discussion resembles the vibration set up in the chassis of a car by direct dynamic vibration of the engine of the type already discussed, and in the case of an engine fitted to a chassis it is frequently difficult to ascertain whether the synchronous vibration found to extend over a certain range of speed is due to resonance in the chassis or in the motor itself. A question of this kind, should it arise, frequently has to be settled by the removal of the motor to the test bench, when any critical period which relates to the resonance within the engine will remain without material alteration, whereas any due to resonance between the engine and chassis will be found to have disappeared, and possibly some new resonance periods will be found related to the natural period of the test bench or its appurtenances.

The period of a resonance within the engine frequently undergoes slight modification when the engine is transferred from a chassis to the test bench, owing to the difference in the rigidity of the mounting affecting the apparent stiffness of the engine itself. In this way it is sometimes found that a threshing point may be moved some 20 or 30 revolutions higher or lower in speed, or it may, in the one case, be found to have a range of some 30 or 40 revolutions only over which it is acute, or it may be found to come on gradually and extend over a range of, say, 100 revolutions per minute, e. g., an engine which on a chassis might show a vibration period ranging from 1400 to 1450 revolutions may, when removed to the test bench, be found to have a threshing point ranging from 1440 to 1540 revolutions; any variation of this character may at any time be expected. In spite of slight variations of this kind, it is usually possible clearly to distinguish threshing points due to internal engine resonance from chassis or test bench resonance; the former are found to be a characteristic of the engine, and soon become generally known as such by the testing staff.

The author has already pointed out that a number of different threshing points may be given by a single source of resonance in the engine, the exciting cause being a different time factor of the engine cycle; at the same time cases undoubtedly occur of multiple resonance in the engine structure; that is to say, it is quite possible for an engine to suffer both from a bending resonance and a crank torsional resonance; in fact, there is nothing actually to prevent a greater number of sources of resonance being present in one engine. Where a single source of resonance alone is present, the threshing points, that is to say, the speed at which they make themselves manifest, are usually found to bear a simple arithmetical relationship to each other, and in such cases the effect of the various factors—the main piston vibration, octave vibration and explosion frequency—may be detected coming successively into evidence as the speed is increased; in a six-cylinder engine it must be remembered that the explosion frequency is three per revolution, and so it is not uncommon in six-cylinder engines to find threshing points related in the relation of two and three or three and four. Where there is multiple resonance, the periods of the two sources may be related to one another by accident, but, ordinarily speaking, there will be no set numerical relation between them, but each source of resonance may have its own series of threshing points.

Eliminating Resonance.

When a new design of engine is under investigation, and it is established that undesirable resonance exists in the engine structure, it is important to ascertain as rapidly as possible its nature, with a view to elimination. The facts discussed in the foregoing section form the main basis of any investigation in this direction. Frequently additional light may be thrown on the subject by tests of the engine under full load and running light, or even belted round at speed, and it is usually not difficult to track down the cause of the trouble. At the present day most of the possible causes have been located, and we are in a position to know what to look for.

Where possible the most satisfactory solution to the difficulty lies in stiffening the parts to carry the period of resonance outside the range of the running speeds, that is to say, so to stiffen the structure of the engine as to make the resonant period above the frequency of any known disturbing cause at the maximum proposed running speed. This method may be said to be applicable to all questions of bending, and to the torsion of the body of the engine itself, but it is not conveniently applicable in the case of the crankshaft.

In the structure of the engine a well designed crank chamber and base is usually sufficient to give the engine the necessary rigidity in flexion; where a block cylinder is used, the rigidity of the engine in this respect can be made quite above question. In certain cases the question of bolting the cylinder groups one to another is worth consideration.

The torsional stiffness of the crankcase, owing to its tubular form, should be, and usually is, sufficient to prevent torsional vibration of the engine as a whole, but it is well to note that if the crankcase be considered a tubular member, the joint between the crankcase and the base must be made a thoroughly sound job. There is frequently a source of weakness here; the attachment bolts are often too light and too widely spaced to do more than act as a means of retaining oil. It should be remembered by the designer that the joint in question is in shear when the crankcase as a whole is in torsion, and either sufficient bolts should be provided to give a sound frictional grip capable of taking shear, or a sufficient number of the bolts should be made a dowel fit. The torsional stiffness of the engine also would be considerably aided by the bolting together of the cylinder groups.

By far the greatest trouble in multi-cylinder engines is on the score of torsional vibration, and in particular crankshaft torsion. At the present time, when this source of weakness has been so clearly established, the possibility of trouble from such a cause seems more than obvious, but it required a considerable amount of labor definitely to locate the disease from which the early six-cylinder engine suffered; it is unquestionably a fact that the popularity of the six-cylinder car was held back for many years by the vibration troubles which, for a time, were not properly understood. More than one firm attempted to market a six-cylinder car, but had for a time to admit failure.

It is difficult to deal with the question of crankshaft torsion solely by giving greater stiffness to the offending member, and the difficulty becomes greater as the stroke-bore ratio is increased. For engines of short stroke up to square proportions, that is to say, when the stroke becomes equal to the bore, it is not difficult to keep out of serious trouble by designing the crank for the maximum stiffness, but for long stroke engines, such as at the present time are in fashion, the crankshaft, if so designed, becomes excessive in weight and costly in bearing friction.

Crank Torsional Vibration.

Before going further, it is desirable to study carefully the exact nature of crank torsional vibration and the manner in which it makes itself felt on the bed of the engine. As a rudimentary model we may take the case of a length of shaft on which two flywheels are keyed. Such a system, which we may assume mounted in bearings, would have a vibration period proper to it, that is to say, that if the shaft were put in torsion and the wheels released, they would vibrate with a certain definite periodicity, the two wheels moving in opposite directions until the vibration is damped out by bearing friction and other causes.

In the six-cylinder engine we have a shaft to which is keyed one flywheel—we have no second flywheel, but we have in place of it a number of crank throws, with parts having considerable mass attached thereto; such a combination is evidently capable of behaving as a second flywheel, and the whole system has a capacity for vibration just as in the rudimentary illustration given.

A slight difficulty occurs in this comparison; the two-flywheel system mounted on the common shaft in bearings would be capable of vibration and torsion to any extent without communicating its vibration to its mounting; from a rotational point of view it is a self-contained system whose vibrations will not be communicated to anything without. In the case of the crankshaft, however, where the pistons form one of the vibrating masses, the vibrations are communicated to the frame of the engine by virtue of the restraint exercised by the cylinders and the connecting rod reactions during the vibratory motion, and so the crankshaft vibrations make themselves powerfully felt on the framework of the engine and its mounting.

Causes of Vibration.

The main exciting causes of torsional crank vibration are to be found in the torque variations, due, firstly, to inertia, and, secondly, to cylinder pressure; the first of these causes is that discussed in our analytical study of the one-cylinder engine, the torque reversal that takes place twice per revolution owing to the give and take of energy between the flywheel and the piston mass. This would manifest itself when the revolution speed of the engine is half the natural complete torsional period of the crankshaft, that is to say, the time of one revolution of the crankshaft is equal to two complete vibration periods of the crank in torsion. The second exciting cause in a six-cylinder engine (and it is here that torsional vibrations give the most trouble) occurs three times per revolution; that is to say, there are three explosion impulses per revolution, and thus the synchronous vibration will take place when one revolution of the engine corresponds to three complete periods of the crank in torsion. Consequently we may expect, in cases of torsional vibration, to have two marked threshing points having speed relation of two to three; the lower of these points will be that consequent on cylinder pressure, the higher of these points will be that due to piston inertia. It is a common experience of designers who have been troubled with six-cylinder engine vibration to have had two marked periods of the character mentioned.

The matter, however, is far from being as simple as set out in the previous section. There is no doubt that

the cylinder farthest from the flywheel, acting as it does on the tail of the crankshaft where its amplitude of motion is the greatest, is the dominant factor in stimulating vibration, but inasmuch as the inertia torque variations of the other pistons also take effect, and these are separated by intervals of a third of a revolution, the total influence is one of some complexity. However, if a number of curves be superposed as representing the piston inertia effect the correct amount out of phase, and if they be given values proportionally to their flywheel value, that is, proportional to the probable amplitude of the vibration, it will be found that the periodicity of the end cylinder predominates.

Changes in Noise.

Beyond the above, it will be found on more closely examining the problem that there is a torsional variation due to the octave component of the piston motion which we may expect to give a synchronous revolution speed half that of the main inertia torsion, so that if, for example, the threshing point due to the explosion torque be located at 1000 revolutions per minute, there will be a bad threshing due to the main piston inertia at 1500 revolutions, and the minor threshing point, due to the octave component piston inertia, at 750. Groups of this character are commonly met with.

In addition to well defined threshing points, or points of resonance, such as discussed, it is often noted in running the speed of an engine up (or letting it down) on the test stand, that there are, as it were, changes of voice at certain speeds, that is to say, changes in the character of the throb or noise; in most cases the author is inclined to attribute this to resonance of an incipient character where the natural damping of bearing oil films, etc., is sufficient to prevent anything in the nature of a defined vibration.

The author has found the solution to the torsional vibration trouble in a vibration damper attached to the tail or free end of the crankshaft. This damper, in the form fitted by the Daimler company, comprises a small flywheel mounted to rotate freely on bearings, and in driving connection with the crankshaft through a multi-disc clutch arranged in an oil bath, ordinary viscous cylinder oil being used as lubrication. The damper, so fitted, does not impede rotational motion in the smallest degree—it is carried round with the crankshaft without offering any resistance—but it forms an immediate and considerable resistance to anything in the nature of angular or torsional vibration. The construction of the damper will be seen from reference to Fig. 5. It is proportioned to render anything in the nature of a crank vibration "dead beat", that is to say, if the crank were twisted through a small angle and let go it would return at once to its state of equilibrium without repeated oscillation. To effect this, as is well known, the law of friction between the clutch surfaces should follow the viscous law of fluid friction; this is secured by the employment of a wide extent of surface, separated by thin films of viscid oil.

Effect of Valve Gearing.

One of the consequent troubles that has been experienced as due to crankshaft vibration has been the difficulty of driving valve gear satisfactorily from the tail end of the crankshaft; that is to say, from the end opposite to that on which the flywheel is placed. Since the introduction of the vibration damper, all difficulty on this score has entirely ceased. It will be understood that, although the vibration damper does not greatly affect the torsional yield of the crankshaft as due to any given impulse, it prevents the accumulation of amplitude; that is to say, we no longer have one disturbing impulse after another coming, so to speak, on the swing of the pendulum. In some cases undamped crankshafts have been known to acquire an amplitude of motion of several degrees owing to the accumulation of energy due to the synchronizing with the exciting vibration periods.

State Senator John Roy of Barnet and Attorney Gilbert A. Davis of Windsor have been appointed a commission by Governor Fletcher of Vermont to represent that state in a conference with a similar New Hampshire commission to act on the elimination of the tolls on 14 bridges over the Connecticut river between the two commonwealths.

During the closing hours of the 1914 session of the Rhode Island legislature an act was passed increasing the registration fees for commercial motor vehicles from \$2 to \$7.

LIGHTING SYSTEMS FOR THE USED CAR.

Factors Requiring Careful Consideration in the Selection of the Dynamo, Its Mounting and Drive---Suggestions for Installing a Moderately Priced Equipment.

MANY owners of used cars desiring to equip their machines with an electric lighting system, one providing means for illumination

Eureka, Jr., Type BC2 Dynamo.

when the motor is inoperative, upon ascertaining the probable cost of installation have decided that the expense was too great. Other owners practically decide upon a certain equipment without first ascertaining its adaptability to

the motor or the material required.

While there are motorists who equip their cars with electric lighting systems, there are many to whom the cost is an important factor. Many times an owner hesitates to expend \$100 or more upon an old machine even if it be in first class condition. This is especially true if it be planned to trade the car in the following spring.

Components of System.

In considering the installation of a lighting system those not familiar with its details are apt to overlook several factors. For the benefit of those contemplating such purchase the equipment necessary will be outlined. It will include the dynamo, and some makers list the cut-out, reverse relay, etc.—that member automatically connecting and disconnecting the generator with the storage battery—as extra. If it be desired to have a supply of current when the motor is inoperative, or in other words, when the dynamo is not generating, a storage battery will be necessary. While some generators are constructed to supply electricity direct to the lamps, the exclusion of the battery means the use of oil side and tail lights.

Two-Bulb Headlights.

While the wires are not expensive, they add to the cost, and a multiple switch will be needed. Some systems provide for an ammeter or a combination instrument. The lamp equipment may be simplified by utilizing headlights having a small bulb in addition to the regular member, an arrangement eliminating the expense of the side

lamps. A tail light, however, will be required, and a new one can be purchased or the oil lamp converted into an electric unit. If it be desired to economize, the side and headlights may be fitted with converters. The writer favors the purchase of a new pair of headlights with the small bulb, and the converting of the tail lamp, as by this arrangement the wiring plan is greatly simplified. Some makers supply the complete equipment, while others furnish only the dynamo, believing that the choice of the lamps, etc., should be left to the motorist.

Mounting the Dynamo.

Having ascertained the cost of the material described, the mounting and drive of the dynamo is considered. Certain makers manufacture brackets for a number of standard type of machines, while others are prepared to submit instructions for mounting their product. Where ready made brackets, pulleys, sprockets, belts, chains, etc., can be obtained, the cost of the installation is considerably reduced.

These factors should be considered carefully, especially the mounting of the generator. It should not prove difficult or expensive on the average machine, and as previously stated, the manufacturer will offer valuable suggestions.

There are several practical lighting dynamos which may be purchased with cut-out, etc., for about \$30. Owing to the various types of lamps it is difficult to give other than an approximate cost, but the balance of the equipment should be obtained for at least \$25. Storage batteries are made in various capacities, each maker of a lighting dynamo recommending a certain type. The prices vary accordingly.

The Kemco Fan Type Generator Installed.

Henricks Dynamo.

Among the concerns making a specialty of lighting dynamos for the used car is the Henricks Novelty Company, Indianapolis, Ind. The Eureka generator is the result of considerable experimentation to develop a practical, moderately priced dynamo for the owner of a large or small machine.

That shown in an accompanying illustration is known as the Eureka, Jr., type BC2, and is specially adapted to the Ford, Maxwell, cycle-cars, etc. One of the qualities of the dynamo is that the price includes an automatic cut-out and a governor. The machine can be employed, if desired, for direct lighting, that is, without a storage battery, and is stated to supply sufficient current for 30 to 35 candlepower lamps in addition to ignition.

Function of Cut-Out.

The generator is of the permanent magnet type and the automatic cut-out is simply constructed, being placed between the magnets and operated by the governor. The cut-out is in the form of a switch which connects the dynamo to the battery when the speed of the generator is sufficient to provide an output of over six volts. The governor is of the centrifugal type and actuates the electric switch of the cut-out at the proper speed of the armature, preventing over-charging of the battery. It is pointed out that the speed of the armature is constant after attaining its maximum, regardless of that of the motor. The charging rate of the generator is 5.5 amperes.

Drive Optional.

The company manufactures brackets for mounting the dynamo on Ford and Maxwell motors, and states that its dimensions are such as to be attached to any power plant where there is room enough to provide a belt or friction drive. The V belt is recommended, but drive can be taken through sprockets and silent chain.

The Henricks Novelty Company produces several types of lighting dynamos, these ranging from \$20 to \$50, also lamps, bulbs, etc. The catalogue describes and illustrates the various designs and equipment and will be mailed free upon request.

Holtzer-Cabot System.

The Holtzer-Cabot JS type magneto generator, shown in an accompanying illustration, was described in the April 25 issue of The Automobile Journal. The magneto has an output of 5.5 amperes continuously at 6.5 volts; is of the permanent field type, very compact, and lists for less than \$25 without the reverse current relay,

which sells for \$3.50 extra. The Holtzer-Cabot Electric Company, Brookline, Mass., will mail free, on request, its booklet on lighting systems for the used car, and it contains many suggestions of value to the motorist contemplating the installation of a lighting dynamo.

Kemco Fan Type Generator.

A lighting generator, differing from conventional practise, in that it replaces the regular fan and is driven by the fan belt, is the Kemco, made by the Kemco Electric Manufacturing Company, 2209 Ashland road, Cleveland, O., and for which the Motor Parts Company, 185 Columbus avenue, Boston, is distributor.

As will be noted by an accompanying illustration the fan and generator are a unit. The output of the dynamo is stated to be sufficient to maintain a storage battery in a fully charged condition and to supply sufficient current for lighting, ignition and motor starting systems.

Holtzer-Cabot JS Type Magneto for Electric Lighting and Battery Charging.

The simplicity of the installation is obvious. Both maker and distributor will supply complete details upon request.

W. J. Johnson of Chicago, Ill., has joined the sales force of the Connecticut Telephone & Electric Company, Meriden, Conn., maker of the well known Connecticut ignition products.

The Perkins Campbell Company, 622-626 Broadway, Cincinnati, O., is making announcement of its new Ford specialties and general catalogue, just coming from the press. The work devoted to Ford specialties covers the company's line of leather goods and seat covers for this car, and the general catalogue includes all leather specialties for automobile work. Either book will be sent upon application.

MECHANICAL NOTES FOR OWNERS.

WITHIN the last year the car manufacturer has been giving attention to minor details, many of which contribute to the comfort

Converting Clutch and Brake Pedals into Adjustable Members: A, the New Pad in Position; B, Showing How the Device Is Retained and Locked.

of the driver and passengers. The compact grouping of the control units and the convenient location of the gearshift lever, for example, make it possible for one to operate a machine for long distances over strange roads with a minimum of effort.

Much of the fatigue experienced by some owners is due to their not fitting the car. By this is meant that a driver below the average height, who rides the clutch and brake pedals, is unable to assume a comfortable position in the seat. To reach and depress the pedals fully he must sit away from the back of the seat, especially when operating in traffic where quick work is necessary. Of course this does not apply to all cars or drivers, but instances where the owner formed the habit of sitting on the edge of the seat are known to the writer, who recalls a particular case in which the operator attributed fatigue to the design of the springs.

The machine was an old model and to disengage the clutch it was necessary to depress it at least four inches. As a result the owner acquired the habit of sitting practically on the edge of the seat. Upon the advice of a repairman, who was consulted as to the advisability of fitting new springs or shock absorbers, the pedals were lengthened as shown in an accompanying illustration. To detach the pedals would have involved considerable labor and expense, so the repairman adopted a novel plan, one having the advantage of adjustment, as well as of not changing the original design.

The face of the pedal was drilled to take two good sized bolts and the latter were threaded to

within .125 inch of the head. The bolts were then placed in a lathe and the square heads turned round and chamfered much in the same manner as an ordinary wood screw.

Two new footpads were constructed of .25-inch stock, the old members being utilized for a pattern, and drilled to take the threaded bolt. The holes were countersunk to fit the bolt heads. After placing the bolts in the pad, a nut and a lock washer were run up on the underside and screwed up snugly. A second nut was then placed on the bolts and the assembly fitted to the old pedals as shown in the drawing. The new members were locked securely by a nut on the portion of the bolt extending through the old pads.

At first the maximum position was utilized, but it was found that better results were obtained by shortening the distance between the pads, which was accomplished easily by slacking off the nuts on top of the old pads and screwing up on the locking members. While two pads did not make as neat an appearance as a single member, the owner found that he could sit well back in the seat, and did not experience the fatigue previously mentioned.

MAKING A VALVE LIFTER.

The average valve lifter will not fit all motors, although there are several marketed which can be universally used. Generally the owner purchases one that is best adapted to his engine, but if the car is sold and another purchased the tool may not be adaptable to the new machine.

Home Made Valve Lifter Adapted to Fit Practically Any Type of Motor: A, Showing the Tool in Position; B, the Lever, Having Slots to Obtain Varying Positions.

A practical valve lifter may be made at a slight expense, as the stock required could be purchased for a few cents. The design shown in

an accompanying illustration was constructed by a mechanic who was awarded the first prize in the weekly contest conducted by the Commercial Motor, an English publication.

To make the tool a piece of steel about 15 inches long, .75 inch wide and .3125 inch thick is necessary. One end is cut in the shape of a fork, as indicated at B in the drawing. Next cut four slots, equidistant. The holes can be made by using a breast drill, then breaking out the walls with a small cold chisel, after which the apertures can be smoothed up with a file.

The fulcrum member shown in position at A can be constructed from an iron rod about 15 inches long and approximately .5 inch in diameter. It is bent to the shape indicated, and the end coming in contact with the valve head is filed tooth shaped so that it will fit the slot in the valve head. It could be made pointed if desired, depending upon the type of valve. To the lower end of the hook member is attached a chain.

The method of using this valve lifter is simple. The valve plug is displaced from the cylinder and the hook inserted as shown at A. The lever member B is then employed in the conventional manner, and the chain passed through an opening, one best adapted to obtain the desired leverage. The chain is prevented from leaving the lever by a small pin.

The advantages of this valve lifter are obvious. The hook resting on the head of the valve prevents the latter from rising when the spring is compressed, and the slots and chain make it possible to change the position of the tool to meet the requirements of different motors, as well as to operate the lifter in different positions.

"BEST IN THE LONG RUN".

B. F. Goodrich Company Cites a Concrete Instance to Prove This Slogan.

For sometime past the B. F. Goodrich Company, Akron, O., has been advertising that Goodrich tires were "best in the long run". Recently Louis Black, vice president of the Bailey Company, Cleveland, O., sent the company a photograph of a tire which had seen 9000 miles of service, and to which special attention was drawn because of the character of the accident which put the casing temporarily out of service at that point. The accompanying letter follows:

This tire was surely out for a record when at 9000 miles a piece of broken auto spring found its way into the tough tread. Nine thousand miles is some record at that, but I am going right on for more mileage on this tire, as the Goodrich repair department has repaired

the cut so well that I believe there are yet many miles of service in the tire. I always get exceptional mileage out of Goodrich tires and have never yet had to ask the B. F. Goodrich Company for an adjustment.

THAT "SERVICITIS" GERM.

Moline Automobile Company Gives Valuable Advice to Dealers and Owners.

L. M. Bradley, director of advertising for the Moline Automobile Company, East Moline, Ill., has addressed an interesting bulletin to all Moline-Knight dealers and agents. The title is "That 'Servicitis' Germ", and the subject is one which has given the industry much occasion for serious thought. In fact, a movement already has been started by the National Automobile Chamber of Commerce in an effort to determine just what service should mean. Because the subject is one to which the owner and prospective owner should give some thought, a portion of Mr. Bradley's bulletin is reproduced herewith.

Of all the words in the motor car language that have been abused, maligned, distorted and twisted, service stands out predominant. Service is the gutta serena word that has rung the death knell of thousands of dealers. It has wiped away their profits and put many a receiver into a job.

Service has made gray hairs grow where dark hairs grew before. It has driven dealer after dealer out of the motor car business entirely, or into the accessory line, or made him a garage proprietor. It has put him onto the road selling goods for someone else, rather than hustling for himself—anything to get away from the word service as now interpreted by motor car owners.

Five years ago service meant a "square deal" to the maker, the dealer and the consumer—and all were satisfied. Today the general public's interpretation of service is "getting all I can for nothing—plus". Motor car owners have, year after year, become more persistent in their demands upon the dealer as to "taking care" of the car after it is sold. There is no class of people in the world that expects so much for nothing as motor car owners.

When a man purchases a motor car he labors under the impression that the sale is all velvet for the dealer, and because he has favored the dealer with an order, he is forever and everlastingly under obligation to him. The buyer does not seem to take into consideration that the dealer has rent to pay, has a pay roll to meet and has the 101 office incidentals just like the man who has purchased the car.

This condition does not exist in any other business. It is a condition that has been brought about not only by the motor car purchaser, but by the dealer. A large proportion of dealers are salesmen and not business men. Many dealers are so anxious to make a sale or so anxious to keep that sale away from a competitor that they throw all business acumen to the winds.

The matter of service, I believe, is a condition that must be adjusted. The motor car buyer must, from necessity, be educated to the fact that the dealer cannot, day in and day out, week after week, take care of the purchaser's car when the breakage or wear is not due to poor workmanship or material.

If a dealer is not making a legitimate profit, and if, after a thorough investigation, he determines that it is a case of "servicitis", it is up to him to rid himself of that disease. He can blame no one but himself if he is going beyond the warranty of the manufacturer. All leading manufacturers have adopted the 90-day warranty as promulgated by the National Automobile Chamber of Commerce. This warranty is standard, it is equitable, and is as fair and square as any motor car manufacturer in the industry can place on his product.

IMPROVED ROADS AND MOTORING LAWS.

Combined Appropriations for 1914 Indicate That \$176,000,000 Will Be Available for Highway Work in the 48 States of the Union During Current Year.

HOW much money is being expended annually for improved highways throughout the United States? It is somewhat difficult to arrive at a definite answer to this problem. Some states are committed to a state aid plan, under which the various counties, districts and towns are required to appropriate certain sums in order to secure the benefit of funds appropriated by the legislature. Other states are working under a state highway plan, in which the amount appropriated by the legislature is expended without regard to any amount contributed by local subdivisions. Still other states are committed to

The amounts which will be expended by counties, districts and townships also are presented in an accompanying table. In most instances these figures are obtained from estimates supplied by highway authorities and published in the year book of the American Highway Association. The office of public roads finds that \$135,739,320 was expended by these local subdivisions in 1912, and it is estimated by that body that such funds are increasing at the rate of about 10 per cent. a year, from which it is suggested that something like \$175,000,000 will be available in 1914. The figures from the year

DETAILED LIST OF STATE, COUNTY, DISTRICT AND TOWN APPROPRIATIONS.

	State	Local	Total		State	Local	Total
Alabama	\$267,165	\$2,100,000	\$2,367,165	Nevada	†150,000	150,000

				Totals	\$43,901,981	\$132,260,849	\$176,162,830

*Also value of convict labor; †estimated on basis of amount expended during 1913; ‡estimate not included in report of United States office of public roads; **value of convict labor only; ††Tennessee has new state highway commission, but figures are not available.

both plans, and a few have no state highway funds.

The United States office of public roads has compiled figures setting forth the amounts available in the state funds for road work during 1914, which show a total of \$42,151,981. To these may be added \$1,000,000 for Connecticut and \$750,000 for New Jersey, which estimates are secured from other sources. This total of \$43,901,981 is held to be an authoritative estimate of the money which the states will expend during the year, although it will be augmented in some instances by bond issues, figures concerning which are not obtainable.

book of the American Highway Association, supplemented by estimates based on the amounts appropriated last year where such figures are not available, shows a total of \$132,260,849, which is less than the amount expended in 1912.

The grand total of the two columns of the table is \$176,162,830, or approximately the amount estimated by the United States office of public roads for the sub-divisions alone. The table is presented as perhaps the nearest approach to a definite compilation of improved highway funds ever made. It shows what each of the 48 states contemplates in the way of highway improvement during 1914.

In this connection, it is of interest to note (quoting again from the year book of the American Highway Association) that the figures reported from the various states show that \$177,537,783 was expended for this purpose in 1913. To this figure the editor of that work adds eight per cent. for increase in local expenditures in 1913 over 1912, where exact figures are not available, giving a total of \$191,739,783. The office of public roads estimates the value of statute labor, in addition to cash, at \$15,000,000, giving a grand total of \$206,739,783.

According to the office of public roads, the 48 states had expended \$106,600,000 of state funds in improved highway construction previous to Dec. 31, 1911. There was available, according to the best information, \$43,819,138 in such funds during 1912, and \$45,024,816 in 1913. It is estimated, however, that only approximately \$155,000,000 in state funds had been expended prior to Dec. 31, 1913, of which some \$19,000,000 was expended in 1912 and \$26,600,000 in 1913. It would appear, therefore, that instead of increasing appropriations for highway construction the states are carrying over a large proportion of these funds from year to year, and that some \$24,000,000 of the \$45,000,000 available in 1913 was thus brought over from 1912. How large a proportion of the \$44,000,000 in state funds available for this year is made up in this manner is not known, but from the above figures it would appear that it is at least \$18,000,000.

CONNECTICUT ROAD PLAN.

Comprehensive Scheme Outlined as Result of Conference with Highway Commissioner.

As the result of a number of conferences between State Highway Commissioner Bennett of Connecticut and a committee representing the Connecticut Good Roads Association, a programme has been adopted, which will be presented to the legislature in January, looking toward a more definite plan for road construction and maintenance. The proposition is fully set forth in the following platform:

1—That we approve the suggestion of Commissioner Bennett that the state must appropriate at least \$3,500,000 for the purposes set forth in his letter to Governor Baldwin.

2—That the money spent in surfacing trunk line roads be expended in permanent pavements.

3—That we favor a bond issue in the amount of \$2,000,000, the proceeds to be expended for purposes of grading, straightening and for building culverts upon trunk line roads at present unimproved, as for example, the trunk line from Hartford to Colchester to New London, and the trunk line from Middletown to Colchester to Willimantic.

4—That we recommend that the state build no more

water bound macadam roads upon the trunk lines, but in the absence of sufficient funds to place a permanent pavement on state roads shall use a gravel surface where possible or leave the road as a well drained dirt road.

5—That we approve the idea of Mr. Bennett that the highway commissioner should be empowered to condemn land for highway purposes; that a proper method of compensating any property owner who is damaged thereby should be provided, and further, that the highway law should be codified so that the same may be uncontradictory of itself and readily understood and applied.

In his letter to Governor Baldwin, Commissioner Bennett set forth that substantially 1420 miles of highway were included in the trunk line system, of which 900 miles have been improved in a more or less permanent manner at a cost of approximately \$10,000,000. Estimating the cost at about \$15,000 a mile, he finds that it will require a further expenditure of \$7,800,000 to complete the remainder. He adds that about \$900,000 a year will be needed for maintenance of trunk line roads already built and badly worn, of which the motorists will pay into the treasury this year approximately \$400,000, leaving a deficit of \$500,000 that must be furnished by the state. He also finds that \$500,000 a year seems to be necessary for the renewal of roads that were cheaply constructed at the beginning, this reconstruction work probably to extend over a period of eight years. He sums up the various necessary expenditures as follows:

Repairs to trunk lines, not including automobile fees	\$500,000
Renewals and construction of trunk lines.....	500,000
State aid roads.....	500,000
Repairs to state aid roads.....	150,000
Engineering and operating department.....	100,000
Total for one year	\$1,750,000
Or, for the fiscal term of two years.....	\$3,500,000

BRIEF NEWS NOTES.

The board of supervisors of Greene county, Iowa, has appropriated \$15,000, to which \$5000 will be added by the Greene County Lincoln Highway Association, for the construction of a 26-foot road across the country, on the line of the Lincoln highway, this year.

M. E. Placek, president of the Nebraska Culvert & Manufacturing Company, has contributed \$1000 worth of corrugated American ingot iron culverts to be used on the Lincoln highway in Nebraska.

Residents of Elkhart county, Indiana, have made arrangements to construct 27 miles of road, brick on concrete, on the Lincoln highway route in that county. The movement was started by John C. Boss and J. W. Fieldhouse, who will build that portion across Bango township at their own expense.

A highway costing \$2,000,000 will be completed between San Francisco and Los Angeles, in time for the opening of the Panama-Pacific exposition next year. If plans of men in each city are adopted. These include setting aside \$2,000,000 of state highway bonds, of which Los Angeles is expected to take \$1,300,000, the remainder to be taken up by the counties interested.

The Toledo Automobile Club, Toledo, O., is interested in a proposition to introduce a bill in the Ohio legislature next year, requiring horse drawn vehicles using the highways during the hours of darkness to display a red light. Other clubs, including some which are not affiliated with the Ohio State Automobile Association, have taken steps looking toward amending the present motoring statute by substituting a green light for the red light now required on motor vehicles.

WILLYS ON RATE INCREASE.

Writes Interstate Commerce Commission That He Approves Such Action.

In view of the numerous objections which have been filed by manufacturers and business men against the proposed increase in freight rates authorized by the Interstate Commerce Commission, it will prove of interest to note that at least one man prominent in the automobile industry indorses the action of that body. This man is John N. Willys, president of the Willys-Overland Company, Toledo, O., and head of half a dozen other big concerns in the industry. He writes the commission as follows:

After considering from every angle the matter now before your honorable body, pertaining to the general increase in rates, I am constrained to write and express to you my belief in the advisability of such action. I am convinced that conditions warrant it and that carriers are entitled to a larger revenue for the service they perform.

So I would respectfully ask to be placed on record as not only not objecting to the increase, but as strictly advocating it, notwithstanding the fact that it will mean a large increase in the expenses of my company.

I might add that the Willys-Overland company and the several companies owned by it and myself, making parts for Overland cars, are, as you doubtless are aware, heavy shippers. The Willys-Overland company alone ships and receives approximately 16,000 carloads per annum, and pays freight charges on inbound carload shipments, exclusive of coal, oil and lumber, considerably over \$200,000 per annum.

FOREIGN TRADE CONVENTION.

American Manufacturers' Export Association Calls a Meeting in Washington.

With a tariff held to have been designed to throw American industry into world wide competition, important problems relating to the sale of American products abroad are believed to demand such attention that steps have been taken to hold a national foreign trade convention in Washington, D. C., May 27-28. The call is issued by the American Manufacturers' Export Association, co-operating with the American Asiatic Association and the Pan-American Society.

The general committee is headed by Hon. Lloyd C. Griscom, formerly ambassador to Italy and Japan. Secretary Redfield of the Department of Commerce will open the convention. The importance of foreign trade to the railroads will be the subject of a paper by Fairfax Harrison, president of the Southern railway. H. G. Herget, president of the Illinois Manufacturers' Association will treat of the situation in the Middle West. Others who will speak and their subjects, so far as they have been announced, are:

E. N. Hurley, vice president of the Illinois Manufacturers' Association, "The Panama Canal and Latin-American Trade Opportunities"; Alba B. Johnson, Philadelphia, "The Possibilities of Stimulating American Exports by a Larger Use of Raw Materials from Partially Developed Countries"; James A. Farrell, president, United States Steel Corporation, and E. C. Simons, head of one of the largest hardware houses in the country.

It is expected that delegates will be present to represent each of the many industries interested in foreign trade.

LYONS-ATLAS A MEMBER.

National Automobile Chamber of Commerce Directors Hold May Meeting.

The Lyons-Atlas Company, Indianapolis, Ind., maker of the Lyons-Knight car, was admitted to membership in the National Automobile Chamber of Commerce, at the meeting of its board of directors in New York City, May 6. The company will be represented in the organization by its president, James W. Lyons.

The directors also decided to co-operate with the American Automobile Association in the promotion of touring during the national automobile touring week scheduled for the last of June, and also to encourage the promotion of week-end tours by automobile clubs. It is expected that a plan will be decided upon arranging for a medal or certificate to be awarded by the American Automobile Association to car owners who shall participate in the three week-end tours to be scheduled.

There was an interesting report from the patents committee, and from the committees on legislation, traffic, shows and roads. For the last named committee, R. D. Chapin reported an increasing interest among the various highway commissioners in the need for more substantial pavements on the main highways, such as brick or concrete, as a result of the excellent service the concrete roads of Wayne county, Michigan, have been giving for the past few years.

Those in attendance at the meeting were: Charles Clifton, Pierce-Arrow; L. H. Kittredge, Peerless; William E. Metzger, Argo; C. C. Hanch, Marmon; Albert L. Pope, Pope-Hartford; H. H. Rice, Waverley; Wilfred C. Leland, Cadillac; Alvan Macauley, Packard; R. D. Chapin, Hudson; Windsor T. White, White; John N. Willys, Overland, and Alfred Reeves, general manager.

NEW CONNECTICUT AUTOMATIC IGNITER.

ANNOUNCEMENT is made by the Connecticut Telephone & Electric Company, Meriden, Conn., of a new ignition system termed the Connecticut automatic igniter, which apparatus was subjected to severe road and laboratory tests before being placed upon the market. It is designed to be used with batteries, either dry cells or storage, and includes a combined timer and distributor and a step-up or transformer coil with an automatic switch which cuts off the current in case the motor should stop with the circuit closed, thus preventing discharge of the battery.

The system presents many interesting features, the most prominent of which are the switch, the elimination of mechanical or electrical lag, and the method of insuring synchronization of the spark. The advantages stated by the maker, in addition to the above, are: A mechanical and synchronized break of the primary current; a large, hot spark with a

Fig. 1—The Connecticut Igniter Assembled.

minimum consumption of current; a practically fool proof construction, one that can only be assembled as intended, and durability.

It is stated that the igniter produces its hottest spark on the slowest motor speeds, and that it increases as the speed decreases, although the spark is much more than ordinarily intense at high speeds. This makes possible easy starting and throttling the motor to very low speeds without sacrificing efficiency, as the propagation of the flame is very rapid.

The igniter, which is supplied either with vertical or horizontal terminals, is very compact, the overall dimensions of a four-cylinder unit being slightly over four inches high and 2.75 wide. The timer and distributor assembled is

shown at Fig. 1. Fig. 2 depicts the device with the distributor cap displaced, while Fig. 4 shows the apparatus completely disassembled.

Referring to the last named illustration, also Fig. 3, it will be seen that the shaft has four longitudinally ribs, equidistant, which act as lifters for the breaker lever. The last named member is in the form of a semi-circle, and by referring to Fig. 3 it will be

Fig. 2—Igniter with Distributor Cap Removed.

seen that the arm is pivoted at one end and has a platinum contact point at the other. The hardened and ground steel roller at the centre is actuated by the shaft ribs, the latter moving the lever and causing separation of the platinum contact points. The breaking of the contact interrupts the primary current and the method is similar to that utilized with magnetos. The breaker arm is well insulated from the base, the points ample in size, and it is stated that no engine ground is necessary in the primary circuit, as its winding is insulated from the secondary ground in the coil. The advantage of the design emphasized is that there is no possibility of the ignition system being affected through any short circuiting of any other electrical circuit, such as the lighting system, for example.

A cap or cover is fitted, carrying at its centre a bearing for the extended

Fig. 3—Dust Cover Removed from Igniter to Show Interrupter and Cam.

shaft; a dowel in the timer case, entering a hole in the cover, makes it impossible to replace the cover other than correctly. A mica window

over the contact points permits of viewing them while running. The cover is retained by a split pin above it. A spring washer constructed of

Fig. 4—Showing Igniter Used with E and G Systems Completely Disassembled.

proper tension, and an anti-friction washer is interposed between the spring washer and the top of the timer cover.

The distributor consists of a central cylinder of insulating material impervious to heat or moisture, and is carried at the top of the shaft, which is cut away where it enters the rotor and fits into a hole of corresponding shape, thus obtaining a drive. The arrangement absolutely prevents improper assembling. Located in the periphery of the rotor is a radial carbon distributing brush, which is pressed outward by a light spring in a recess in the rotor. Connection or passage of the secondary current from the coil to the distributor arm is by means of a light, flat steel spring on the top of the rotor.

The same insulating material as is used in the rotor is employed for the distributor housing,

Fig. 5—Type E Combined Coil and Switch with Cover Removed to Show Terminal Connections.

fired. The contacts are connected to terminals which may be either vertical or horizontal, as previously mentioned, these details being

two small saucer shaped steel members put together with concave sides facing inwardly maintains the

and imbedded in its inner walls are the contacts, these being two, three, four or six, according to the type of igniter and the number of cylinders to be

specified when ordering the equipment.

The switch shown at Fig. 6 is most ingenious. It will be seen that it is provided with three buttons. One is for the battery and another for the magneto, in case a dual system is utilized, or for two sets of batteries. The third member is a releasing button, which automatically throws out any button pushed in, thereby cutting off the current supply. There is ample space between the buttons, permitting their operation with the hand or foot, and the construction is rugged.

The plungers on which the buttons are mounted operate through holes in a plate inside the cover plate; the perforated plate is pivoted and a spring keeps it normally pressed in one direction. When a switch button is pressed the conically shaped end of its plunger slightly swings the plate, which then snaps into a notch under the cone, holding the button down and keeping the circuit closed. When the releasing button is pressed its cone actuates the plate sufficiently to slip it out of the notch in the switch button that has been in engagement, allowing it to move upward.

Fig. 6—Front View of Automatic Switch, a Standard Flush Dash Type.

Mounted on the swinging plate is a sliding bar, the ends of which reach the cones of the button plungers. The length of the plate is such that when one button is pressed, the cone moves it out of the way, that is, towards the cone of the opposite button, and the plunger can be depressed all the way. If, however, both are pressed at the same time, both are blocked by the sliding plate, which is too long to allow both to go down together.

The automatic feature referred to, which throws out the switch disconnecting the battery in the event the operator of the car fails to do so, consists of a vibrator of the electric ball type, the hammer of which strikes the edge of the plate referred to in the description of the

switch, pushing it out of the plunger notch. The current operating the vibrator is cut in by a thermostat, a mechanism that has been employed for many years in Connecticut telephone switches. The thermostat, when heated by a continuous and abnormal flow of current, establishes a contact, the vibrator becomes active, operating the switch, which is released in a fraction of a second, cutting off the current supply. Upon the thermostat cooling, which requires but little time, it returns to its normal position.

It is stated that the time required for the thermostat is controllable by a regulating screw. Ordinarily it is so adjusted that if the timer is short circuited when the driver closes the switch to start the engine, 30 seconds will elapse before the switch is automatically thrown out, allowing sufficient time to start to crank the motor.

The coil utilized with the type E system is shown at Fig. 8. It is of the flush dash type, and extreme care has been taken in the design of the connections and to make the case impervious to heat, etc. It will be noted that a spark gap is incorporated to protect the secondary windings from damage in case a plug terminal becomes disconnected. The gap is enclosed in a glass tube, is easily observed, and is not accessible to fuel vapor, making for a large factor of safety.

The types manufactured comprise the following: E, including the type S igniter and E coil; G, S igniter and G coil; EJ, J igniter and E coil; GJ, J igniter, G coil and type G switch. A feature of the J instrument is that it requires no lubrication of any kind. The company in designing the system had in mind the practise of the average owner to neglect to lubricate a timer, and the bottom bearing for the shaft and the bearing in the timer cover are of a substance formed by mixing graphite and babbitt when the metal is in a molten state. The mixture is subjected to an enormous pressure, and bushings made of it run without lubrication.

Laboratory tests of the Connecticut system are interesting. It has been demonstrated that it eliminates electrical lag; that is to say, there is

no discoverable interval between the interruption of the primary current and the occurrence of the spark at the plug. It is stated that this holds true at all speeds.

It is claimed that the system operating with a fixed spark is productive of more electrical energy than a magneto manually controlled. According to charts there is a remarkable absence of electrical lag. The company believes that with a system free from lag only two positions are necessary, one for safety as when starting, and one for running. It is held that mechanical lag has been overcome in the timer, as the lifting cam acts directly on the breaker arm; that springs, etc., are eliminated, and that the action is not affected by centrifugal force.

The wiring plans for the type G and GJ systems, also for E or EJ, are shown at Fig. 7. If emergency dry cells are not used with the first named system the lead to battery post No. 2 is

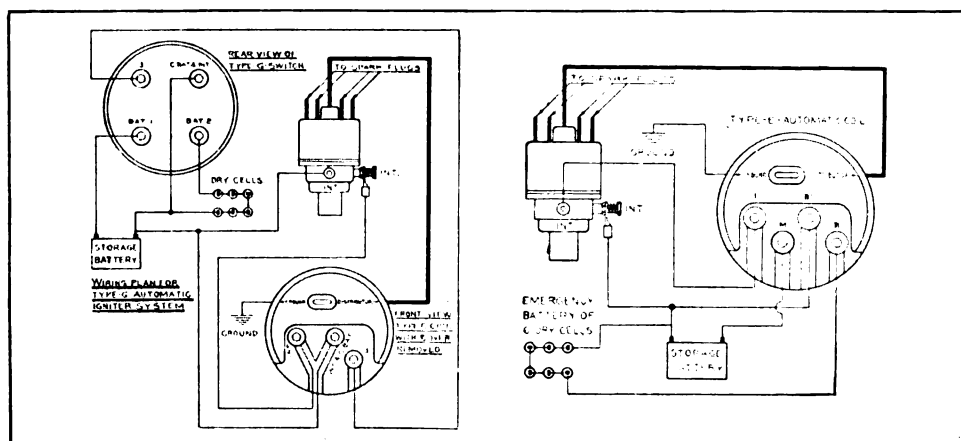

Fig. 7—Wiring Plans of Connecticut System: At Left, Plan for Type G or GJ; at Right, for Type E or EJ.

eliminated. The post B in the E or EJ system is not wired when cells are dispensed with.

As previously pointed out the Connecticut system is especially adapted to cars equipped with lighting dynamos maintaining a storage battery in a properly charged condition. The cost of the four and six-cylinder system is moderate, and the same high grade material and workmanship for which the products of this concern are noted are incorporated.

James App, formerly assistant general manager of the Cartecar Company, Pontiac, Mich., and more recently purchasing agent for the Chevrolet Motor Car Company, Flint, Mich., has become purchasing agent for the LaVigne Cyclecar Company, Detroit, with offices at 521 Lincoln avenue.

MACHINERY, TOOLS, EQUIPMENT AND SUPPLIES.

The Stevens Manufacturing & Supply Company, Fisher building, Chicago, is marketing the Stevens auto tire check valve, shown in complete form and with the dust cap removed in the accompanying illustrations, which are of actual size. One of the qualities of the design is its simplicity, there being but four parts as compared with 11 in conventional types. The maker points out that there are no springs to wear out; that the action is positive, and that the greater the air pressure in the tire the tighter the valve is closed.

One of the features of the Stevens is that the valve operates the full length of the pump compression stroke.

Stevens Auto Tire Valve.

This makes inflating tires easy and insures the proper pressure because of the ease of operation. It is also stated that a child can operate the pump with one hand when Stevens valves are fitted.

The device consists of a hexagon brass barrel with a thread cut on the small end to fit any standard pump connection. The other end is tapped to screw onto the valve stem, and has a channel

through the entire length of the barrel for the passage of the air. The hexagon chamber is taper bored for a rubber plunger, and the chamber is machined true and smooth on the inside to permit the plunger to move freely. A fibre washer prevents air from leaking.

The Stevens can be applied to any valve stem and the maker states that they are used by leading racing drivers. They retail for \$1 the set and are accompanied by a 30-day trial guarantee. Agencies are wanted in all unassigned territory. Terms and discounts will be supplied upon request.

The Rub-On Manufacturing Company, 89 Brayton street, Buffalo, N. Y., is marketing a number of preparations for renewing shabby parts of the automobile, these including restoratives for the top, upholstery, etc. Among these is Rub-R-Tite, which provides a black, water proof, flexible coating for a top, one that will not crack in zero weather, it is stated. The preparation is easy to apply. It comes in various sizes and is adapted for mohair, leather or rubber, and imitations of these materials.

The company also manufactures Rub-On concentrated lining dye, which is prepared especially for tops that have become discolored through neglect or long service. It is applied with a sponge, and it is stated that it is impervious to water and that it will not injure the material. It comes in black only.

Col-R-ol is for renewing the appearance of either leather or imitation cushions and upholstery. It is claimed that it gives a fast, water proof color to the material to which it is applied and that it will dry quickly. It re-dyes the same or a darker color, and comes in black, green, maroon, red or tan.

Adjusting the Auto-Turn Jack.

The elastic or Rub-On varnish is colorless and is for restoring the finish of the body, etc. Gloss Film is also produced by the company, a paste that puts a transparent smooth film over the varnish, thus preserving it.

Sta-Fix radiator mend, as the name implies, is for repairing leaks in the radiator. It stops leaks by forming a hard cement when the fluid becomes exposed to the air. It is mixed with the cooling fluid.

The Stay-On enamel produced by this concern is adaptable for metals and with it a hard, semi-bright, black finish is obtained. It will dry thoroughly when exposed to the air or it may be baked on, as desired. It is applicable to all metal parts of the machine, such as lamps, fenders, radiator, hood, etc., and is held to be very durable and lasting.

The Rub-On Manufacturing Company is also marketing the Auto Turn Jack, by means of which one person can raise the heaviest car easily and place it in the desired location. It is designed to economize space in the garage, as well as to save considerable labor. It has an instant adjustment for all heights of axles, and the length of the handle is five feet. It fulfills practically the same function as a turntable and is placed under a machine very quickly and from different angles. Tipping up the jack handle and lowering the lifting post permit placing the jack under an axle, while pulling down the long handle, causing the jack wheels to run under the machine's axle past dead centre, raises its front end. The company has a free cabinet proposition which will be mailed with complete data on its line, as well as prices.

The Sebastian Lathe Company, 125 Culvert street, Cincinnati, O., is issuing its new catalogue of high grade engine lathes, tools and attachments for automobile and general repair work.

The booklet is finely illustrated and contains complete descriptions of the lathes, and their attachments, as well as dimensions, prices, etc.

The engine lathes are built from entirely new patterns and designs, and are modern and

Sebastian Lathe.

practical in every particular. Special care is given in their construction, and the best of workmanship and high grade material are incorporated. The company builds lathes for manufacturing, jobbing, or the repair shop, and a number of designs especially adapted for the automobile manufacturer and the garage. A postal addressed to the company will bring the catalogue referred to, in which full particulars are given.

The International Metal Polish Company, Indianapolis, Ind., maker of Blue Ribbon metal polish, nickel polish, auto body gloss and radiator cement, has brought out a new article termed the Blue Ribbon cold cream soap. Among the features of the new soap is that it contains no grit and the use of water is not required. It is also stated that it leaves the hands soft and clean, and that chapped hands are avoided because of the absence of water. The company anticipates a large demand for cold cream soap by the owners, and is prepared to supply the trade, which can obtain complete details, as well as a sample, by writing the factory or the New York office, 335 Broadway. The full size can of cold cream soap retails for 10 cents.

Splitdorf Electrical Company, Newark, N. J., maker of the well known line of Splitdorf ignition, is manufacturing a magneto equipment for the model T Ford car. One of the qualities of the system is that the magneto is driven by enclosed gears and these members are assured of proper lubrication. The company issues a booklet entitled "Ford Power Possibilities", describing the system in detail, and it will be mailed free upon request.

The Name Apco is well known to the trade and the owner of this trade mark, the Auto Parts Company, Providence, R. I., is calling the attention of jobbers and

Apco Brake Rod Support.

dealers to its brake rod support in a novel manner. Elsewhere in this issue will be noted the advertisement of the company, which offers to send a sample set of the ball bearing brake rod supports for 75 cents, which is considerably less than the usual price.

The device is shown in an accompanying illustration and it is stated by maker that it is the

only brake rod support that can be attached without removing members to which it is fitted. Only a screw driver is necessary to tighten clamping bolt. The brake rod is prevented from vibrating by a ball and plunger, the tension being automatically maintained by a spring. The brake rod is slipped into position after removing a cotter pin and plunger. Being ball bearing the brake rod support does not interfere with the movement of the rod, in operation. The Auto Parts Company is issuing a new catalogue containing many new Ford accessories, which will be mailed free upon request.

The Monarch Manufacturing Company, 213 North Main street, Dayton, O., maker of welding and decarbonizing outfits, has evolved an interesting proposition for the trade, one that is a departure from conventional sales methods. By it a repair shop, garage, service station, etc., is enabled to obtain a complete welding and decarbonizing equipment at a very small expenditure. Details of the offer will be submitted by the company upon request.

The advantages of such an outfit are well known to the trade, as it permits of saving considerable time in the welding of parts that would otherwise have to be sent outside. The uses to which a welding equipment may be put are so numerous that a large number of shops have installed them. The Monarch Manufacturing Company's equipment is most complete and the concern is prepared to submit interesting figures showing the profits possible with its outfits.

The Frank Mossberg Company, Attleboro, Mass., is manufacturing a special socket wrench set for the model T Ford car and one of the qualities of the equipment emphasized is that certain components not accessible with the usual wrench set can be reached with it. In designing the set particular attention has been paid to producing sockets which will reach every part, and the result is a very practical outfit.

The set is known as the No. 15 and includes the Mossberg ratchet socket wrench No. 350, a tubular extension bar, universal joint, screw driver bit, spark plug socket and nine regular, mottled, thoroughly hardened pressed steel sockets. The last named members include a special oval socket for the three crankshaft bearing bolts, difficult members to reach with conventional types of tools. The equipment comes in a neat wooden box or a flexible

Mossberg Ford Socket Wrench Set.

fibre case and retails for \$5.70. Trade discounts will be forwarded upon request, also catalogue of the Mossberg lines.

The Headlight Support Company, 1212 Dime Bank building, Detroit, manufacturer of auto devices, is marketing Turning Headlights for model T Ford automobile, and one of the qualities of the design is that they may be quickly and easily attached. As the name implies, the device actuates the headlights so that they automatically follow the slightest movement of the steering wheel, thereby throwing the light where it is needed

Showing Advantage of Headlight Support Company's Turning Headlights.

most. When rounding a curve the rays are so projected that the inner portion, as well as the centre of the road, is illuminated, making for safety.

The advantages over the fixed types of lamps are obvious. The Turning Headlights permit of driving with safety over unknown roads, entering curves and turning out for approaching vehicles, as the lamps automatically turn as above explained.

The maker states that the lamps will not rattle or work loose and that they are sold under a liberal guarantee. The retail price is \$10, and the company has territory open, as well as a good proposition for the trade. Full particulars as to sample sets, prices, etc., will be forwarded upon request. The company also markets the Gasolock, which has been described in these columns.

The Brunner Manufacturing Company, Utica, N. Y., is well known among the trade as the maker of high grade compressors for garages, repair shops and service stations. This concern has made a specialty of power driven compressors for years, and each Brunner machine is backed by a guarantee for service, durability and satisfaction. The company calls attention to the statement that some of its compressors have been in use for nine years and are still efficient.

All types and sizes of machines are constructed to meet requirements and an accompanying illustration depicts a garage type, the No. 17

vertical, a compact belt driven unit. The No. 17 is a vertical, two-cylinder compressor, adapted for large garages and service stations where severe service is required. It has a capacity of seven feet of air and 170 pounds pressure at 350 revolutions a minute, and is used in connection with tanks of 80 to 150 gallons capacity. Lubrication is by the splash system.

No. 17 Vertical Brunner Compressor.

The No. 102 Brunner is a two-cylinder unit, lubricated by the splash system and has adjustable safety valves in the cylinders. The company states that it will supply more air and higher pressure with less power than any other compressor made, of same capacity. It supplies three feet of air and 150 pounds pressure at 400 revolutions a minute. The Brunner Manufacturing Company produces a variety of compressors, prices and details of which will be forwarded upon request.

A. R. Mosler & Co., New York City, ignition specialist, is manufacturing the Mosler Vesuvius spark plug, which is designed to withstand severe service. It is made with stone insulation, absolutely gas tight, and is sold with a very liberal guarantee. Complete details and prices will be forwarded upon request.

The C. P. Improved Valve Lifter, manufactured by the Clinton Machine Works, 460 High street, Clinton, Mass., is a practical, universal valve lifter and is inexpensive, retailing for \$1. As will be noted by the accompanying illustration, which shows the tool in service, it operates in a manner similar to a vise, a threaded member being actuated by a lever. By placing the forks of the

C. P. Improved Valve Lifter in Position.

lifter on the pushrod and valve spring, the screwing of the threaded member moves the upper fork upward, compressing the spring. The lower fork carries an oscillating nut, compensating for the movement of the upper fork. As is obvious from the illustration, the spring is locked, enabling the workman to use both hands to remove the retaining key or pin, an advantage where these members are

burred and require force. The design also eliminates the possibility of the tool slipping and injuring the hands. It is adapted to any type and make of motor.

Morgan Utility Tool.

The Morgan Manufacturing Company, Newport, R. I., maker of automobile specialties, has brought out a new brass and metal polish termed MorganBrite, which is not only held to impart a lustrous finish, but an enduring one. It comes in the sealed Polisaver cans, in all popular sizes, and the prices are very attractive. The company has an interesting proposition and samples for the trade, which may be obtained by writing department F.

The Morgan utility tool, as the name implies, is designed for a number of useful purposes. It can be utilized as a valve spring lifter, and its construction is such that it can be locked to hold a load in either direction. The tool can also be employed as a clamp, patch holder, spring compressor or stretcher, hand vise, drill jig, etc. It is made of a very tough steel and will withstand severe service. It comes in sheradized or nickel plate finish, retailing for \$2 and \$2.25 respectively. The Morgan Manufacturing Company will forward its catalogue and trade prices upon request.

Motor Driven Air Pump, Carl E. L. Lipman, Beloit, Wis., assignor to Lipman Manufacturing Company, same city; No. 1,092,495. Filed May 19, 1913.

Funnel, Willie L. Blanchard, Lehigh, Okla.; No. 1,092,517. Filed June 22, 1913.

Vehicle Brake, Russell Huff, Detroit, Mich., assignor, by mesne assignments, to Packard Motor Car Company, same city; No. 1,092,531. Filed July 16, 1909; renewed Oct. 14, 1912.

Wheel, Charles L. Heisler, Schenectady, N. Y.; No. 1,092,573. Filed May 27, 1912.

Rotary Valve Motor, Russell T. Kingsford, Plainfield, N. J.; No. 1,092,578. Filed Nov. 26, 1912.

Speedometer, Edd C. Oliver, Detroit, Mich.; No. 1,092,590. Filed Aug. 22, 1910.

Locking Device for Electric Lamps, Etc., Albert D. Bartlett, Washington, D. C.; No. 1,092,627. Filed June 8, 1913.

Motor Speed Regulator, Richard G. Shirley, Cleveland, O.; No. 1,092,667. Filed May 22, 1913.

Motor Starter, Harry Hinckley Moseley, Atlantic, Mass.; No. 1,092,739. Filed June 14, 1913.

Steering Gear, Edward S. Robinson, Oroville, Cal., assignor to Golden West Motors Company, Sacramento, Cal.; No. 1,092,745. Filed May 24, 1913.

Resilient Wheel, Noah Thomas Sharp, Ludlow, Ky., assignor of one-half to Andrew Houck, Cincinnati, O.; No. 1,092,755. Filed Aug. 27, 1913.

Piston, Ferdinand G. Haas, St. Paul, Minn.; No. 1,092,834. Filed July 29, 1912.

Piston, Edward O. Spillman and Louis P. Mooers, North Tonawanda, N. Y.; No. 1,092,870. Filed July 18, 1913.

Impulse Pump, William H. Stutz, Toledo, O., assignor, by mesne assignments, to E. L. Ackerman, Detroit, Mich.; No. 1,092,873. Filed May 3, 1913.

Licence Number Plate, Stephen S. Adams, St. Louis, Mo.; No. 1,092,887. Filed Aug. 4, 1913.

Folding Top Holder, Harry DeWitt Cox, Richmond, Va.; No. 1,092,898. Filed March 26, 1913.

Mechanical Gearshift, Dean C. Lewis, Reading, Penn.; No. 1,092,922. Filed May 16, 1913.

Resilient Tire, Augustus Tyler, Wheeling, W. Va.; No. 1,092,963. Filed Nov. 5, 1912.

Tire, Charles H. DeVoll, New York City, assignor, by mesne assignments, to American Spring Tire Company, Dover, Del.; No. 1,092,981. Filed July 31, 1911.

Nut Lock, Otto A. Heckel, St. Louis, Mo.; No. 1,093,050. Filed Feb. 10, 1912.

Rotary Engine, Arthur K. Landsmann and Fritz Dippon, St. Louis, Mo.; No. 1,093,056. Filed Dec. 6, 1910.

Warning Device (Horn), Alpheus C. Lippincott, East Orange, N. J.; No. 1,093,058. Filed March 14, 1913.

Motor Starter, Frank Morgan, Melrose, Mass.; No. 1,093,065. Filed March 29, 1913.

Resilient Wheel, Charles W. Rentz, Diller, Neb.; No. 1,093,077. Filed July 26, 1913.

Resilient Wheel, Robert E. L. Crosby, Jonesboro, Ark.; No. 1,093,115. Filed March 1, 1912.

Lamp, Charles E. Godley, Detroit, Mich., assignor to Edmunds & Jones Manufacturing Company, same city; No. 1,093,122. Filed Sept. 24, 1913.

Spring Wheel, George W. Graves, Mosley McCollman and Alexander P. Gibson, Alderson, W. Va.; No. 1,093,124. Filed March 10, 1913.

Steering Mechanism, Charles Lepley Hays, Eldora, Ia.; No. 1,093,130. Filed Feb. 16, 1912.

Electric Heater, George A. Arnold, Middletown, Conn., assignor to Arnold Electric Company; No. 1,093,237. Filed March 19, 1913.

Bearing, Burton L. Lawton, Meriden, Conn.; No. 1,093,194. Filed Oct. 13, 1913.

ROADS IN MEXICO.

A Statement of Conditions as Prepared by the American Highway Association.

In view of the present military situation in the Republic of Mexico, it will prove of interest to note the condition of the roads in certain sections of the country, as prepared by the American Highway Association. The following statement has been issued by that body:

The Laredo-Salttillo road, regarded by army officers as the best, as well as the shortest military route to Mexico City, will present unexpected difficulties to an invading army. Within a few weeks the season of rain will begin in Mexico, and owing to the failure of the officials of that country to maintain their roads, many of the highways will become impassable.

There are three routes by which an invading army might enter Mexico, the one starting at Laredo, which avoids the long desert; another by way of El Paso, and the third by way of Eagle Pass. The roads in Mexico are in such bad condition that the hauling of artillery over them will be very difficult, especially after the rainy season sets in and the highways become heavy with mud.

With the exception of the valley of Mexico and a few mining regions, there are few improved roads. In most sections they are little better than the unimproved earth road, and very little work is done, either in repair or maintenance, except as is absolutely necessary for immediate traffic.

In the State of Chihuahua, where Carranza and Villa have their political headquarters, a government appropriation, amounting to only \$1500 in gold each year, is made with a view to keeping the roads and bridges in repair. On the haciendas, which in some instances are larger than one of our counties, the necessary roads are crudely maintained by the owners merely for their own convenience.

The laws of Mexico provide that the roads be at least 36 feet wide and that they be repaired each year. Failure to comply with these provisions entails a double fine on the offending parties, the fine being paid, theoretically, in either labor or money. There is no attempt to enforce this law, and the roads are given little attention.

HOW TO SELL CARS.

KisselKar Official Finds Prospective Buyers Thoroughly Understand Automobiles.

As the result of his experience in the sale of KisselKar machines, Ralph Ketchum of the Kissel Motor Car Company, Hartford, Wis., offers what he believes to be good advice to those who are engaged in the sale of automobiles. He says:

Every season adds very noticeably to the number of laymen who thoroughly understand automobiles, but the sort of buyer who cares to discuss technical details is still greatly in the minority, and the salesman should always wait for an invitation before plunging into the intricacies of mechanical construction. There are certain points that every prospective purchaser, novice to expert, is more concerned about and regarding which he must be satisfied before a sale is possible. These include the appearance of the car, its attributes of comfort and convenience, its facility of operation and the accessibility of its working parts.

Inspecting and demonstrating the car having cleared up these qualities, the wise purchaser will ask about the experiences of present owners. If the car looks well,

rides well, drives well and, in addition, has a record and reputation for satisfactory service, Mr. Prospect is generally convinced, and it is useless to burden his mind with technique over which, at best, there is always possible argument.

I try to convince the customer that the KisselKar is a fine appearing car; that it is roadworthy, simple and easily operated; of superior riding quality, and last, but by no means least, of high standing among owners for efficient and economical service. If I fail on any one of these counts I expect to lose the sale.

COMING EVENTS.

May.

- May 14—S. A. E. motor testing division meeting, New York City.
- May 15-16—Track meet, Columbus, O.
- May 20—Roadability run, Beach Haven, Penn.
- May 20-June 7—International automobile and agricultural show, Warsaw, Poland.
- May 25-26—Targa Florio race, Italy.
- May 30—500-mile race, Indianapolis, Ind.
- May 30—Track meet, New York City.
- May 30—Track races, Providence, R. I.

June.

- June 1—Coupe Florio race, Palermo, Italy.
- June 1—Reliability run, Philadelphia, Penn.
- June 6-7—Track meet, St. Louis, Mo.
- June 10-11—Isle of Man road race.
- June 17-18—Hill climb, Uniontown, Penn.
- June 19—Track meet, Boston, Mass.
- June 23-26—S. A. E. midsummer meeting, Cape May, N. J.
- June 24-26—Meeting National Gas Engine Association, Chicago, Ill.
- June 27—Race meet, Brooklands track, Weybridge, England.
- June 30—Track races, Sioux City, Ia.

July.

- July 1-3—Non-stop run, Chicago-Boston, for Glidden trophy.
- July 3-4—Mid-summer meeting, American Automobile Association, Bretton Woods, N. H.
- July 3-4—Road races, Tacoma, Wash.
- July 4—Track races, Providence, R. I.
- July 4—300-mile race, Sioux City, Ia.
- July 4—Grand Prix, Lyons, France.
- July 17-18—Speedway meet, Seattle, Wash.
- July 25-26—Grand Prix, Belgium.

August.

- Aug. 21-22—Road races, Elgin, Ill.
- Aug. 27—Race meet, Brooklands track, Weybridge, England.

September.

- Sept. 5—Track races, Milwaukee, Wis.
- Sept. 7—Track races, Providence, R. I.
- Sept. 9—Speedway races, Pomona, Cal.
- Sept. 9—Road races, Corona, Cal.
- Sept. 9—Grand Prix, Italy.
- Sept. 14—Track meet, Milwaukee, Wis.
- Sept. 26—Race meet, Brooklands track, Weybridge, England.
- Sept. 26-Oct. 6—Show, Berlin, Germany.

October.

- Oct. 1—Kerosene motor competition, Paris, France.
- Oct. 2-3—Track meet, Oklahoma City, Okla.
- Oct. 2-3—Track meet, Trenton, N. J.
- Oct. 9—Speedway races, Chicago, Ill.
- Oct. 16-26—Automobile Salon, Paris.
- Oct. 17-24—Show, Pittsburg, Penn.
- Oct. 19-26—American road congress, Atlanta, Ga.

November.

- Nov. 6-16—Olympia show, London.
- Nov. 8-11—Track meet, Shreveport, La.

Governor Glynn of New York State has signed the bill appropriating \$50,000 for the erection of a state plant at the Elmira reformatory for the manufacture by convict labor of vitrified brick to be used for paving on state roads. The act takes effect upon its passage, and Highway Commissioner Carlisle predicts that the plant will be in operation and some new brick roads built before fall.

NEWS OF THE MANUFACTURER AND DEALER.

The following concerns have been incorporated recently for the manufacture or sale of motor cars, accessories, etc.:

Kennedy & Ahrens Company, New York City; \$14,000; to manufacture trucks and automobiles; J. P. Kennedy and others.

Dobbins Automobile Exchange, Newark, N. J.; \$50,000; to deal in automobiles.

Hainlen Company, Harrisburg, Penn.; \$5000; to deal in automobiles.

Auto Clutch Lock Company, Wilmington, Del.; \$90,000; to manufacture locks for automobiles; J. Reichard and others.

Entz Motor Car Corporation, Baltimore, Md.; \$3,000,000; to manufacture cars using the Entz electric transmission.

Grant Motor Livery Company, Chicago, Ill.; \$2500; to conduct a general automobile business.

East Ohio Auto Sales Company, Youngstown, O.; \$10,000; to conduct an automobile business.

Imperial Auto Company, Bowling Green, Ky.; \$8000; J. B. Lucas, J. W. Massey, J. M. Lovell, G. D. Vance.

D. & M. Auto Supply Company, Utica, N. Y.; \$25,000; to conduct a general automobile tire and supply business; S. Mailman, I. Denovsky.

Aulogo Motor Cap Company, St. Louis, Mo.; \$25,000; to manufacture automobile caps and accessories; J. F. Hilbert, Thomas H. Thatcher.

Trautwein & Repair Company, Brooklyn, N. Y.; \$10,-

Penn Spring Works, Baldwinsville, N. Y.; \$28,500; to manufacture springs for automobiles, etc.

Reliable Auto Tire Company, St. Louis, Mo.; \$3000; to deal in tires and accessories.

Johnson Motor Company, Detroit, Mich.; \$30,000; to deal in motor vehicles and accessories.

Pan-O-Lite Grease & Oil Company, Riverhead, N. Y.; \$30,000; M. E. Arthur, E. Gardner, C. Gardner.

Silent Motor Car & Engineering Company, Los Angeles, Cal.; J. H. Grube, E. T. Houston, S. T. Allen, F. M. Casey.

Cleveland Cyclecar Company, Cleveland, O.; \$200,000; C. Savage, W. H. Noyes, R. Clarke, F. H. Schmidt, W. E. Burns.

Interboro 'Bus Company, Albany, N. Y.; \$25,000; J. A. Voght, E. J. Voght, F. Voght.

C. & S. Rubber Sole Company, Brockton, Mass.; \$50,000; H. F. Crawford, F. E. Shaw, E. L. Shaw.

Safety Oil & Supply Company, Brooklyn, N. Y.; \$10,000; J. E. Richardson, G. M. Seckel, W. W. Redfern.

Kahlenberg-Klaus Company, Two Rivers, Wis.; \$25,000; to manufacture internal combustion engines; Louis Kahlenberg and others.

Car-Nation Auto Sales Company, Youngstown, O.; \$10,000; to deal in Car-Nation cars; M. H. Squires, B. O. Schulman, A. Kessler, I. Wikoff, L. J. Schulman.

Tisch Auto Supply Company, Grand Rapids, Mich.; \$20,000; to conduct an automobile accessory house.

WITH THE MANUFACTURERS.

Attractive Window Display Now Being Used by King Sales Agencies in New York City and Boston.

000; Otto Trautwein, Frederick Trautwein, Jr., Walter Trautwein.

United Tire & Rubber Works, New York City; \$10,000; C. Cardum, A. Taraydarian, H. J. O'Connor.

F. W. Walsh Auto Service Company, Newark, N. J.; \$25,000; to conduct a general automobile business; Frederick H. Walsh, H. D. Brangwin, Samuel P. Watson.

H. U. H. Tire Company, Newark, N. J.; \$5000; to deal in automobile tires; Louis Unstaeder, Rosaline Holzman.

International Gasoline & Oil Company, North Tonawanda, N. Y.; \$5000; W. L. Hunt, M. H. Elve, D. H. Bowles.

H. E. Throne Automobile Company, Toledo, O.; \$30,000; to deal in motor cars; H. E. Throne, F. C. Schaal, G. C. Bradley, C. J. Clapp, W. H. Schroeder.

Bryan Automobile Company, Bryan, O.; \$15,000; C. W. Gleason, E. D. Spangler, J. M. Roe, W. T. Gardner, H. W. Gardner.

Wishbone Auto Steel Wheel Company, Butler, Penn.; \$100,000; J. W. Granahan and others.

Flexible Side Car Company, Marion, O.; \$25,000; to manufacture cyclecars, motorcycles, etc.

Model Motor Company, Los Angeles, Cal.; \$1,000,000; to manufacture automobiles.

Halley Garage Company, Halley, Idaho; \$10,000; to conduct a general garage business.

California Auto Tours Company, Los Angeles, Cal.; \$20,000.

Johnson Motor Company, Fort Erie, Ont.; \$1,000,000; to manufacture automobiles.

The King Motor Car Company's New York City and Boston sales offices have been making a decidedly original and attractive display of the King car, utilizing the arch illustrated herewith. The keystone bears the price of the machine and each of the other stones a special feature of the product. The manufacturer plans to furnish each agency of the company with similar displays, providing they have the window space to afford opportunity for their use.

Wilson & Short, Detroit, is to purchase the plant of the Standish Manufacturing Company at Ingersoll, Ont. The company will install machinery and equipment and will manufacture automobile specialties.

The Haynes Automobile Company, Kokomo, Ind., has established a factory branch at 1708 Grand avenue, Kansas City, Mo., which will care for the business of the company in the states of Missouri, Oklahoma, Kansas, Nebraska and Arkansas. J. C. Barcus will be in charge as manager.

The Killen-Straight Manufacturing Company, Appleton, Wis., is to manufacture tractors and commercial cars. The concern has been reorganized, formerly being known as the Killen-Walsh Manufacturing Company, and will greatly enlarge its business and manufacturing facilities. Work has started on additions to its plant. The development and experimental work is said to have been brought to a successful issue.

The L. P. C. Motor Company, Racine, Wis., has leased additional room in the former Racine-Sattley Carriage Works, Racine Junction, a large part of which is already used by the company.

The P. B. M. Manufacturing Company, Los Angeles, Cal., is erecting a new and up-to-date plant for the manufacture of cyclecars and small automobiles. The factory will be electrically operated.

The Wheeler & Schebler Company, Indianapolis, manufacturer of the Schebler carburetors, has joined the group of accessory manufacturers to award additional prizes to the successful drivers at the 500-mile race, May 30. This company will distribute \$1600 among the first four drivers if their cars are equipped with Schebler carburetors. The first prize will be \$1000; second, \$300; third, \$200, and fourth, \$100.

The Whitney Manufacturing Company, Hartford, Conn., has just completed an addition of 27,000 square feet to its plant, which is being equipped with modern machinery.

The Abbott Motor Company, Detroit, is now making parts for the Michigan car, formerly made by the defunct Michigan Buggy Company, Kalamazoo, Mich. A special department has been set aside for this purpose in the new building.

The Harrison Manufacturing Company, Lockport, N. Y., has leased a factory building at Detroit and will produce the Harrison radiators in that city. Gould Allen, who is manager of the Detroit office of the company and representative for the Covert Motor Vehicle Company, which is financed by the same capital, will be manager of the new factory.

The A. R. King Manufacturing Company, Kingston, N. Y., has established offices at 50 Church street, New York City, with William C. Hunter in charge as sales manager. King trucks are produced by the concern.

The Santo Rubber Company, Pittsburg, Penn., has purchased six acres of land at Niagara Falls, N. Y., and awarded a contract to erect a large plant, costing \$60,000. The company will manufacture automobile tires and other rubber goods.

The Standard Motor Truck Company, Detroit, maker of three and five-ton trucks, is now located in its new factory on Bellevue avenue. Albert Fisher, president and treasurer of the company, who owns controlling interest, has purchased adjoining property and will build when additional business warrants it.

The Universal Machinery Company, Milwaukee, Wis., manufacturer of the Mack motor for cyclecars, is now shipping from 25 to 30 motors a day and will almost double this quantity when the additions to the large plant are completed.

The Hayes Ionia Body Company, Ionia, Mich., has started the erection of a large addition to its plant to cost \$20,000. This step was taken in order to produce 150 bodies a day.

The Falcon Cyclecar Company is now well established in its new factory at Staunton, Va., shown in the accompanying illustration. The small building at the left is used as the machine shop and tool room, and the larger structure for the assembling, painting, etc. The plant is located on the main line of the C. & O. railroad, on which the company plans to begin shipping Falcon cyclecars in quantity in the near future.

The Cadillac Motor Car Company, Detroit, is planning to erect a new warehouse and factory that will be eight stories high and of reinforced concrete and brick.

The Rubber Goods Manufacturing Company, New York City, at its annual meeting held recently, elected W. S. Ballou, N. F. Brady, S. P. Holt, F. W. Eddy, J. B. Ford, Ernest Hopkinson, C. A. Hunter, Lester Leland, R. B. Price, H. E. Sawyer and E. S. Williams as directors.

The Chelsea Manufacturing Company, Newark, N. J., will produce the Chelsea light speedster, selling at \$390. The motor, clutch and transmission form a compact unit. The body is the streamline pattern, seating the passengers side by side. Wheelbase is 102 inches.

The Ajax Auto Tractor Company, Portland, Ore., has sold its equipment to the Smith & Watson Iron Works for \$50,000. The machinery is now being moved from the Ajax plant to the Smith & Watson works at Front and Harrison streets, where the company will use it in the manufacture of logging machinery. The Ajax company was organized for the purpose of building gasoline trucks by the late W. J. Corbett.

GARAGE AND DEALER.

The Canif Garage, Caldwell, N. J., has purchased the Cleveland garage on Roseland avenue and will operate it in the future.

Caruth Bros., Williams, Ia., has closed a deal whereby it becomes the owner of two lots on Main street, upon which the concern will erect a garage and repair shop. The firm is agent for Detroit and Jackson cars.

The Fort Bragg Garage & Machine Company, Ukiah, Cal., is contemplating the erection of a first class garage.

The Rockingham Garage is the name of a new firm located at Salem, N. H. Edward Cornwell of Pleasant street is interested.

The Pittsburg Taxicab Company, Pittsburg, Penn., has taken over the taxicab business of the Excelsior

Express & Standard Cab Company. The company announces that in addition to the machines of the Excelsior company it is adding 30 new cars of a type considerably larger than those now in service.

McCready & Sears, Ellendale, N. D., who conducted the Motor Inn on Third street, recently returned to its old location on Second street and has joined forces with H. C. McMaster. Business will be conducted under the name of the Motor Inn.

The Standard Garage, Napoleon, O., has purchased a site for a new building to be erected in the near future. Frank and Henry Harms are the proprietors.

The Alliston Garage, Boston, Mass., located at the corner of Harvard avenue, has been sold to Frederick A. Whitwell and associates.

The Connell-McKone Company, Boston, Mass., has established a large up-to-date service station in the Back Bay section. The company is agent for Overland cars.

H. McElroy, Ennis, Tex., has purchased the Interstate garage from Willis & Horn. He will move his machine shop into the garage and continue the business.

The Citrus Garage, Covina, Cal., has been sold to N. N. Webber of Goldfield, Nev. He will take immediate possession and conduct a first class garage and repair shop.

Cooney Bros., Winsted, Conn., has sold its garage to Elain Slater. The business is located on Main street.

J. E. Sprague, Le Roy, N. Y., contemplates the erection of a first class garage on his Stanley place property, and will operate an automobile repair shop. He

Factory of the Falcon Cyclecar Company, Recently Occupied in Staunton, Va.

was formerly connected with the Watson garage of that city.

The George H. Jewett Company is the new name of the former Jewett Garage Company, Worcester, Mass. The company is located at 172 Shrewsbury street.

The Dyer Electric Service Station, Nashville, Tenn., has opened a service station at 1229 Broadway.

G. C. Stoner, Welcome, Minn., has purchased the Welcome garage, also the livery business. The building will be improved and a full line of supplies will be carried.

Bender & Nelson, Baldwin, Wis., has purchased the Tredway building and is remodelling it into a garage and repair shop. The company is agent for the Ford cars.

The Pittsburg Service Repair Company, Pittsburg, Penn., has taken over the repair department of the Pittsburg Motor Service Corporation. The new plant is one of the largest and best equipped in the state.

The Automobile Club of America, New York City, has secured property on 71st and 72nd streets, East Side, as a site for a new three-story garage to house 350 cars for the use of the members.

The Sieg Iron Company, Davenport, Ia., plans to enter the wholesale accessory trade, and this department will be installed in its quarters at 318 East 5th street. The company is the second accessory and supply wholesale house in the state.

The Auto Truck Storage & Exchange Company, New York City, has leased land on Avenue A, near 22nd street, and will erect a new and modern fireproof garage. It is expected that it will be the largest garage in the state when completed.

WINS IN SOUTH AMERICA.

Hupmobile Finishes 400-Mile Run Six Hours Ahead of 14 Other Contestants.

P. S. Steenstrup, now in Buenos Aires as resident export representative of the Hupp Motor Car Company, Detroit, in South America, reports an interesting reliability run, in which the Hupmobile returned victorious six hours ahead of a field of 15 entries, many of which were high powered French machines. The car was driven by Senor Sanchez, and the run was from Buenos Aires to Mar del Plata, a distance of about 400 miles.

The roads in some places were so heavy that it took hours to go a single mile, and the strain on the vehicles was such as to afford a thorough test of their durability. At one point the contestants had the choice of making a long detour to cross the San Porondon river on a bridge, or of being towed across. The Hupmobile accepted neither alternative, Senor Sanchez wrapping the carburetor and magneto in oiled paper and driving across the stream under the machine's own power. In this manner he gained about one hour over his competitors.

THE RUBBER SITUATION.

Development of Plantations Has Had a Decidedly Important Effect on Prices.

The development of plantation rubber, which in the past few years has not only brought down crude rubber prices, but changed the world's basic supply, has had a marked effect on the tire making industry, according to an official of the Goodyear Tire & Rubber Company, Akron, O. He says:

Four or five years ago Brazil produced most of the world's high grade crude rubber supply, and the price was steadily rising. It reached \$3 a pound in 1910, and the supply was not nearly up to the demand, so that a serious crisis was in sight, and there was danger that the prices of rubber products, such as tires, would become prohibitive and seriously retard the development of the automobile.

Meantime, far-sighted men and companies had established vast plantations of young growing rubber trees, easily accessible, instead of being located in remote jungles, and susceptible to the best scientific training. At first the product of these plantations was very small, but it has grown year after year until it is now greater than the wild rubber supply, and has not, even now, reached its full development. Crude rubber has recently been as low as 60 cents a pound. There has been a little rise, but indications are that the trend will be gradually downward for some time, until a rock bottom price, on a basis of the full development of the plantation system, has been reached.

Brazil, which in the beginning did not take seriously the menace of the plantations, failed to protect herself,

either with extensive plantations of her own or by improving facilities for gathering her wild product and preparing it for market, so that now the big basis of the crude supply is in other parts of the tropical world, such as Ceylon, the Philippines, etc.

As a result of all these things, the Goodyear Tire & Rubber Company, which reduced its tire prices gradually, as crude rubber came down, is now supplying the trade a much better tire, at a much lower price, than a few years ago. This policy is vindicated by the fact that Goodyear sales in 1913 amounted to \$33,000,000, at a profit of 6.5 per cent. on that volume.

OFFERS FACTORY FACILITIES.

National Motor Vehicle Company Places Plant at Disposal of Racing Men.

Following the plan which was adopted by the National Motor Vehicle Company, Indianapolis, Ind., last year, George M. Dickson, general manager of that concern, has placed the factory machinery, facilities and employees at the disposal of the contenders in the forthcoming international sweepstakes 500-mile race on the Indianapolis motor speedway, Memorial Day. In 1913 eight different contestants worked in the National factory, replacing broken parts and adjusting their chassis as the result of practise work on the speedway previous to the race. In making the offer again this year, Mr. Dickson says:

While these drivers and their cars are here to win the 500-mile race and to break the record still held by the National car, we feel it our duty to do anything we can to assist them; to make the race as good as possible, and to give the world the right idea about the Indianapolis people. It has been our pleasure even to help competitors in races where we had National cars entered. We hope nothing will happen to cause anyone to need help, but if they do we extend our facilities gladly.

NEW BOOKS RECEIVED.

Good Roads Year Book—An annual compilation published by the American Highway Association, Colorado building, Washington, D. C., and edited by J. E. Pennybacker. Contains a history of road making, digest of state road legislation, motoring laws, full description of differing types of road construction, highway bridge and culvert construction, list of highway officials, summary of state and local road expenditures, lists of highway associations, etc. The book comprises an authoritative compilation on highway matters and will be retained as a work of reference. Price, \$1.

Everything Electrical for the Automobile, Motor Boat and Motorcycle—A catalogue of the complete line of standard automobile and ignition supplies produced by the Western Electric Company, with headquarters at 463 West street, New York City, and branches in a number of cities. The booklet contains more than 50 pages and is fully illustrated.

Moline-Knight—An interesting illustrated catalogue of the Moline-Knight car, made by the Moline Automobile Company, East Moline, Ill. The typographical work is fully in keeping with the character of the product described, and the text matter is compiled with a view to presenting the subject in a manner calculated to instruct the novice as well as the expert. All the components of the car are thoroughly illustrated and particular attention has been paid to the construction of the Knight sliding sleeve motor, with which this car is equipped.

Tarvia

*Preserves Roads
Prevents Dust—*

*East Front
Street,
Newbern, N. C.*

*The circle shows
the street during
the flood. The
larger photograph
shows it **after**
the flood—the
Tarvia pavement
uninjured.*

Even floods do not affect a Tarvia roadway—

Here is a road that was built in 1911 with a five-inch concrete base and a two-inch macadam surface bonded with Tarvia.

In September, 1913, it was flooded by river and tide in a great storm, as shown in the small picture. When the waters subsided, the tarviated road was unharmed and no repairs were required! The larger photograph was taken *after* the flood.

The City Engineer, Raymond R. Eagle, writes:

"While this was a very severe test on the pavement it stood up perfectly under it and the pavement remained in as good condition as before the storm." He also says: "The Tarvia has given entire satisfaction."

Tarvia is a coal tar product of great bonding power.

It encloses the stone in a tough matrix from which neither water nor traffic can tear it loose.

It vastly increases the durability of the road and usually cuts down the repair bill enough to offset the entire cost of the treatment.

Tarvia is made in three grades: "Tarvia X" is suitable for building Tarvia-macadam roads; "Tarvia A" and "Tarvia B" are thinner grades suitable for roads already in use, to preserve them and make them dustless.

Booklet regarding the Tarvia treatment free on request.

Weed Anti-Skid Chains

At all Reputable Dealers
Weed Chain Tire Grip Co., New York

Don't let the carbon accumulate in your cylinders until they require the drastic DOLLAR-A-CYLINDER treatment.

Clean them every two or three weeks with CARBONOX. Costs less than 5 cents a cylinder. Keeps them as bright inside as a new dollar.

A dollar's worth will remove the carbon from one cylinder twenty times. The cost is so low, the job is so easy, there's no temptation to put it off. It beats the strenuous, expensive way, even as a bath beats powder and perfume or as fresh air, exercise and prunes beat strong physics.

You inject Carbonox, a liquid, at the spark plug openings, or thru the priming cups, turn the engine over a few times and then let set for twenty minutes. When you start it, the carbon will be blown out thru the exhaust. *A sheet of paper placed under the exhaust opening will show the amount of carbon removed.*

CARBONOX does not dissolve the carbon, but attacks and destroys the charred oil which holds the flakes of carbon together and to the metal. It's simple, efficient, "Chemically Correct". Positively non-injurious to metal.

Made by the makers of SE-MENT-OL, the self-acting radiator cement. (Finds-the-leak-and-fixes-it)

J=H=S

**NO CAR OWNER CAN AFFORD
TO BE WITHOUT THEM**

They are the cumulative result of our nine years' experience in the manufacture of dependable spring suspension.

No matter how hard you inflate your tires, our absorbers insure perfect resiliency and save half your present tire expense. Unnecessary wear and tear on motor, transmission and other components is eliminated because they reduce vibration to a minimum.

The combined efficiency and durability of J. H. S. SHOCK ABSORBERS make them worth all they cost and more—they're the only kind leading mechanical engineers have considered fit to endorse.

For thirty days you can try them at our expense. J. H. S. are made for every known car.

ALL ROADS LEAD
to the HAVOLINE GARAGEThe Oil That Enlivens
Both CAR and GARAGE

A WIDELY ADVERTISED OIL

IS

HAVOLINE

REFINED only from *one uniform base* crude oil, the lubricating fraction of which is *admittedly superior* to that of other crude oils. This assures your customer the same high quality and perfect lubricating value, regardless of when he purchases—You can guarantee him uniformity of quality and correspondingly good results for all time.

Motorists Demand HAVOLINE—

Because our "special process" of manufacture exempts it entirely from the detrimental effects of destructive distillation, thereby retaining its molecular cohesion and offering the consumer the highest lubricating value yet the least carbon deposit.

Motor Power

☞ The power your motor produces is based upon the quantity of compression you get in the cylinders,—because compression means power. Where compression is weakened, power is correspondingly reduced.

☞ Perfect compression,—and as a consequence, maximum power,—can only be obtained when gas leakage is rendered impossible, and that result is only to be secured by the use of

LEAK-PROOF

MADE IN ALL SIZES **Piston Rings** **EASILY ADJUSTED**
McQuay-Norris Mfg. Co., St. Louis, Mo.

☞ The old style, one-piece piston ring in common use fails to check gas leakage because it is faulty in both design and construction. The *Leak-Proof* ring directly and completely overcomes these defects—thus.

☞ The opening in the old style one-piece ring,—necessary, of course, to secure elasticity,—is a constant source of leakage. In the *Leak-Proof* there is no unsealed opening,—the two halves interlock tightly, each one closing the opening in the other. The old one-piece ring is an eccentric ring, consequently its bearing on the cylinder walls is unequal,—gas will find its way by. *Leak-Proof* rings are concentric and with opposing points of expansion, so that perfect bearing is obtained always. They are made of special Processed Gray Iron of wonderful smoothness and elasticity—never losing their spring.

Send for our Booklet—It will tell you all about piston rings and their part in motor economy. Why *Leak-Proof* rings are the only rings which make gas leakage an impossibility. The book's free.

How You Can Help

Do you want to be one of that great army of progressive patriots who are helping to build a greater, more beautiful and more prosperous America?

Do you want to join with a million others, in the pushing through of an unselfish work which means more business, more pleasure and more advantages to all?

Do you want to help in the building of an eternal monument to the greatest name in the history of our country, to the greatest man the nineteenth century produced—Abraham Lincoln?

Do you wish to aid in the completion of the most practical enterprise ever undertaken by the American people? A 3400-mile link connecting the two oceans, to be used by, and directly profiting sixty millions of our population?

If you do, join the Lincoln Highway Association.

It's a great organization—a grand work to feel in sympathy with. Costs but \$5.00, payable *once*. The price of one good dinner, of one ten-cent cigar a week for a year, makes you a contributor and places your name on that vast list of patriots which generations to come will have cause to bless.

Get out your check book now. Here's a chance for you to build a portion of a lasting monument, the longest improved road in the world.

We have a pair of Lincoln Highway pennants, like the illustration, for your car. They will come to you for a dollar, prepaid.

A big map of the United States, showing the route of the Lincoln Way, is a fine thing to have on the wall of your office. It's backed with cloth, printed in three colors and costs \$2.00.

All the real Lincoln Highway boosters are wearing a little red, white and blue lapel button—they're twenty-five cents. Wear one.

Send the five to
The Lincoln Highway Association
 Dime Bank Building

AUTO COMFORT

EQUIPMENT

THE HOME OF HARTFORD AUTO COMFORT EQUIPMENT

Modern automobile accessories of merited distinction, each a quality product and the leader in its class—designed to ensure comfort, to promote economy, and to increase the factor of safety.

Truffault-Hartford SHOCK ABSORBER

Prices—Five Models.
\$60, \$50, \$35, \$16.
Special Ford Type, \$16.

"The Pioneer and the Best." The only shock absorber employing the invaluable principle of Rotary Friction. Gives springs full play but not free play. "Makes Every Road a Boulevard," for any car at any speed. Combines economy with comfort by increasing tire mileage, preventing spring breakage and overcoming destructive vibration. Used by 250,000 motorists. Adopted by 25 leading makers.

Hartford CUSHION SPRING

Prices—Four Models.
\$35, \$30, \$25.
Special Ford Type, \$16.

Gives springs the flexibility necessary to banish the continual annoyance of small jars and jolts produced by car tracks, cross-walks, cobblestones, etc. Assures the same comfort in ordinary travel over average roads as Truffault-Hartford Shock Absorbers give on rough roads. Together, these devices offer comfort plus. Hartford Cushion Springs are easily applied to any car.

Hartford Bumper

Absorbs the shock of collision without jolt to passengers or damage to car. Adds the final touch of smartness to any car. Saves repair bills by preventing smashed headlights, damaged radiators, twisted mud guards, etc. Attached to any car in 15 minutes. Four sizes—\$15, \$12.50 and \$10.00. Special Ford Type, \$10.

Guarantee: "Money back if not satisfactory." Under this broad policy all Hartford products are sold. Any article of our manufacture not proving satisfactory after 30 days' trial from date of purchase, can be returned and the purchase price will be refunded.

Hartford Auto-Jack

Strong, Efficient, Rapid, Reliable, Easy Working—the best of its kind. Handsome in appearance—lifts a heavy car with wonderful ease. Just a simple wrist movement required. Costs a little more, but worth it. Price, \$6.50.

Official Road Race Champion

Why we believe in racing

RACING a car is concentrating its use. It is subjecting the car to every possible disadvantage in the shortest possible time. Out of every important racing event has grown a better and truer Stutz—the kind you buy. We race to learn. We build for safety. We seek to develop our chassis to the highest point of efficiency.

And once learned, the lessons of the speed course are not soon forgotten.

We take no chances. Whether the Stutz is built for speedway or road racing or for the long distance grind of every-day service—the owner's own marathon—the Stutz is well fitted for the task before it.

We stake our reputation upon the performance of the Stutz in every-day use. The Stutz is a winner because it is honestly built by men who know how—an organization of experts.

Judge the Stutz by the standard of actual performance and continuous trustworthiness.

VISITING DEALERS: You are invited to call at our factory and see how the Sturdy Stutz is built. Let us send you a complete Stutz racing record and Catalog A-5.

We Prove Overland Spring Quality By The Most Severe Tests Known

THE steel used in Overland springs is as carefully chosen as that in the mainspring of the costliest watch. It must be absolutely perfect before our expert metallurgists accept it as fit for Overland service.

The machine shown above is a special device for testing finished springs. It has a capacity of 6,000 pounds. On it Overland springs are subject to millions of vibrations—a far more severe usage than they can ever receive in actual service.

If, at the end of the test, a spring shows even the smallest flaw or check in material or the slightest tendency towards distortion, it is rejected. Absolute perfection is the only standard we recognize.

The care exercised here is characteristic of Overland construction throughout. No part of the car is unimportant enough to escape the most severe test. Every part and every unit must measure up to Overland specifications—and these specifications are never short of perfection itself.

And because we manufacture Overlands in lots of 50,000, the buyer gets this perfect product for 30% less than smaller makers must ask for cars of like size and power.

The nearest Overland dealer will tell you more about this greatest of all medium-priced cars. Call on him today. Or write for our illustrated catalogues and descriptive literature.

Please address Dep't 52.

SPLITDORF'S WORLD'S RECORDS

Notwithstanding determined onslaughts upon the **WORLD'S RECORDS** gained by **SPLITDORF IGNITION** in the 1912 Indianapolis 500-mile race, it will be **SPLITDORF FIGURES** that must be lowered in the forthcoming race on Memorial Day to stand as **WORLD'S RECORDS**.

Joe Dawson drove the **SPLITDORF EQUIPPED "National"** to a sensational victory in the terrific race of 1912 and set the present **WORLD'S FIGURES**.

Averaging 80.7 for the first 100 miles, 80.3 for the second 100, 75.2 for the third 100, 79.4 for the fourth 100 and 78.5 on the last century, with a grand average of 78.7 miles per hour for the 500 miles, **WORLD'S RECORDS** toppled into the **SPLITDORF IGNITION** basket from the 300-mile mark upward.

No miss—no skip—never a falter under the terrific test—**SPLITDORF IGNITION** was *always there* when Joe Dawson called upon it for his record-breaking achievement.

INSIST UPON **SPLITDORF MAGNETOS** and **PLUGS**.

Suppose Your Motor Won't Work Well

Poorly designed, cheaply constructed spark plugs, are a common cause of a motor going bad.

Your power depends upon your ignition system and your ignition system must include good spark plugs to secure satisfactory performance.

Bosch Plugs

are as good as Bosch Magnetos and the superlative quality of both has been demonstrated over and over again in every important race, in every important test, and in every possible manner in which the comparative value of spark plugs can be demonstrated.

\$1.00 each from your dealer, Bosch Service Stations or direct.

Write for "Locating the Spark Plug". It tells what you ought to know about plugs. Sent free to any motorist upon request.

EISEMANN

The Eisemann Magneto Company is now prepared to furnish a complete high grade magneto outfit for Ford cars, ready to attach with the minimum amount of labor, at the retail price of \$50 for the single ignition set and \$55 for the dual ignition set.

This price includes everything necessary to do away with the trembler coil system of ignition as supplied on your Ford at present and to supply your car with the finest Eisemann Magneto Ignition system it is possible to produce.

In producing this outfit care has been taken to build only the finest product possible for the Eisemann factory to produce rather than a cheap makeshift for a low priced car. All the quality that the name Eisemann implies is found in this outfit from the magneto itself down to the castings specially designed to make the system readily interchangeable.

WILL ISSUE ITS
EIGHTH ANNUAL TOURING NUMBER
JULY 10, 1914

**The Most Eagerly Awaited Single Number of Any
Motoring Magazine Published. WHY?**

It tells where to go, how to go and what to see.
It covers every section of the United States and Canada.
It gives complete routing information in both directions.
It is fully illustrated with hundreds of new photographs.
It presents mechanical data that are invaluable to tourists.
It treats exhaustively of economical care and maintenance.
Its maps are complete in every detail and thoroughly practical.
It contains a digest of the motoring laws of all states and provinces.
In every respect it is a compendium of touring facts—a routing guide and
reference book combined—worth fifty times its price.

THE 1914 EDITION

Will be prepared with particular reference to its serviceability, this applying alike to text matter and to the actual printing and binding of the magazine. The paper used will be of a special high grade and the cover stock has been selected with a view to making a durable volume capable of being carried constantly in the car throughout the touring season.

Hundreds of motorists were disappointed last year, through inability to secure a copy of the Annual Touring Number. In view of this situation and because of the largely increasing demand this year, an edition several thousands in excess of the regular subscription list will be printed.

No manufacturer of cars, accessories, supplies or fittings can afford not to be represented in this Eighth Annual Touring Number.

Reserve Space at Once. Write for Rates.

THE AUTOMOBILE JOURNAL PUBLISHING CO.
Times Building **Pawtucket, R. I.**

PUBLISHER'S AND READER'S PAGE.

Motorists Who Tour—And that includes pretty nearly everybody who owns a car—want to know where to go, how to go and what to see. This is the eighth consecutive year in which The Automobile Journal has been supplying just this information in its annual touring number. No single issue of any motoring magazine is more eagerly awaited, or reaches more automobile owners. It comprises all the usefulness of routing guides costing 50 times as much, and is retained as a book of reference throughout the entire touring season.

The 1914 Edition, July 10, will be even more carefully prepared than its predecessors. This applies as well to the actual printing and binding of the volume as to the text matter, covering routes in every section of the United States and Canada. Not only will this Eighth Annual Touring Number be fully illustrated with hundreds of new photographs, but it will be bound in a specially prepared, durable cover, in order that it may withstand the severe usage it is expected to receive in the car, where it is subjected to constant service.

Order Your Copy Early—Hundreds of motorists were disappointed last year, in spite of the special edition, embracing thousands of copies in excess of the regular subscription list. Your regular dealer will see that you are supplied, or you may order direct. There will be no advance in price. Ten cents places a touring guide in your hands having more practical value than any \$5 route book published. Do not delay. Now is the time—today.

Readers Are Invited to make liberal use of the opportunities afforded to cause the special departments, New Accessories (page 35), Correspondence with the Reader (page 43), and Suggestions for New Car Owners (page 66), to be of particular personal interest and benefit. The Buyers' Guide, on pages 86-96, inclusive, is also of value to those who are in need of anything new in cars, accessories, supplies

or fittings. The concerns listed are thoroughly reliable and worthy of your confidence. It may be added that special attention will be given your communication, if you mention The Automobile Journal when writing to advertisers.

Prest-O-Lite

**The Sure
Cure for
Lighting
Troubles**

**I've quit
worrying
about light!**

"One season was enough for me!

"I tried electricity. I stood for 'expert service' and repair bills and battery and parts renewals. I've kicked and fumed and sweated long enough!

"Now I have sure, safe, satisfactory, saving light! I've taken all the junk off and substituted—

Prest-O-Lite

This is the expression of hundreds of wise motorists. Our correspondence proves it.

You can have more satisfaction and service out of your car if you will eliminate the useless complications.

You can cut down weight—increase your power—eliminate a big percentage of trouble—if you are now attempting to use electricity for light.

For about the cost of one repair bill or battery renewal you can make the change from electricity to Prest-O-Lite.

About Convenience

The Prest-O-Lite, or any other good automatic gas lighter, offers you every "push-the-button" convenience for lighting, dimming or extinguishing your gas lights. The automatic reducing valve prevents the flame from exceeding the proper height.

No matter what self-starter is on your car, be sure your lights are gas lights. Reliable light is just as essential as fuel.

Use the Coupon

Get the real facts about satisfactory light today. Read the letters showing how other motorists have solved their lighting problems. Wake up to the new meaning of gas lighting with every comfort, convenience and economy. Your address brings it.

**of your car,
dangerously skidding
on the slippery
pavement ahead——**

You have neglected to put on Weed Chains.

You anxiously view the slippery pavement ahead, and have a mental picture of your car "side-swiping" a fellow motorist.

Why nurse anxiety and coax calamity — why take such chances when you know

Weed Anti-Skid Chains

Absolutely Prevent Skidding

If you don't equip your car with Weed Chains, and put them on when the roads are slippery and muddy or covered with snow and ice, you are taking chances on your own life and are a serious menace to every road user.

Weed Chains *do not injure tires* even as much as one little slip or skid—They are slipped on in a minute without a jack—*they never fail* in an emergency. Join the *safety campaign*—exercise caution. *Equip your car with Weed Chains today.*

Price, \$1.00 the Year

FOURTH INTERNATIONAL SWEEPSTAKES.

Six Nations Represented Among the 44 Cars Entered for the Annual 500-Mile Race on the Indianapolis Speedway, Memorial Day---Winner May Take \$45,575 in Cash and Trophies---Results in the Three Previous Contests.

WITH a purse totalling \$85,125, this sum including the valuation of trophies, and the possibility that the winner may secure \$26,825 in cash, besides the trophies, there

is small wonder that the entry list for the fourth annual international sweepstakes race for 500 miles on the Indianapolis speedway, Memorial Day, includes 44 names. But there are other reasons for this big array of cars and drivers, the number of which must be reduced to 30 by elimination trials, previous to the actual starting of the race at 10 next Saturday morning.

Three international sweepstakes, 500-mile races, have been held on this course—the first in

1911, when Ray Harroun returned a winner with a Marmon; the second in 1912, when Joseph Dawson secured a record with a National, which still stands, and the third in 1913, when Jules

Goux won in a Peugeot, taking the trophies to France. The international character of the event has never been so marked, however, as it promises to be this year.

In the first race, three nations were represented—Germany by two Benz cars and a Mercedes, Italy by two Fiats, and

America by 35 machines, the total number of starters being 40. Twelve machines finished and 13 more were running when the race was called. America won first and second place; Italy, third;

Jules Goux, Winner of the Third 500-Mile Race of 1913, at the Wheel of the National Car Which Created a World's Record in the 1912 Event.

Germany, fourth, and America the remainder of the 10 prizes. The international aspect was not strong, since Mercedes, Benz and Fiat cars had been competing in American events for some years.

In the second event only 27 cars were entered, 24 started, and but nine finished, although one other was running when the race was called. Of the 12 prizes hung up by the speedway management that year, only 10 were awarded. Germany

was represented by one Mercedes and Italy by one Fiat. The rest were all American made. America finished first; Germany, second, and America took the other eight prizes.

Last year 35 cars were entered, and 27 started.

Prest-O-Lite Trophy, Which Goes to Car Leading at 300 Miles.

Five nations were represented—Germany with a Mercedes and a Mercedes-Knight, Italy with three Isottas, England with a Sunbeam, France with two Peugeotots and America with the others. France finished in first place; America, second and third; England, fourth; Germany, fifth; America, sixth; Germany, seventh, and American cars won the other prizes.

The international spirit was strong last year, and is even stronger this. Six countries are represented, as indicated by the accompanying list of entries. A future evidence of the importance in which the contest is held abroad is noted in the fact that foreign drivers are licensed this year by the Automobile Club de

France, so that any records established will be accepted both in this country and Europe.

Ray Harroun won the first race with his Marmon in 6:42:08, averaging 74.65 miles an hour, and he secured a total of \$14,250 in prize money. Joseph Dawson drove the National the 500 miles in 6:21:06 in 1912, averaging 78.73, a world's record for the distance, which still stands. His share of the prize money totalled \$35,000, including the value of the trophies he won. Last year, Jules Goux's time in the Peugeot was 6:35:05. His average was 75.92 miles an hour—better than Harroun's time, but still some little lower than the record created by Dawson's National. Goux's share of the prize money was practically the same as Dawson's the previous year. This year, if the winner secures all the trophies offered, the value of his day's work may reach \$45,474—equivalent to the

**Remy Trophy for Leader
at 200 Miles.**

annual salary of many a bank president. The prizes offered are set forth in an accompanying table. The G & J trophy will be awarded to the car finishing the first 100 miles in the lead. It was not placed in competition last year, although it has been in existence for several years. The car in the lead at 200 miles will receive the Remy trophy and brassard, now held by Goux. The Prest-O-Lite trophy goes to the car in the lead at 300 miles, and the Wheeler & Schebler trophy to the machine leading at 400 miles. Both of these also are held by Goux. The only condition attaching to these four trophies is that the cars winning them shall finish the race. The Rayfield trophy goes to the winning car, provided it is fitted with a Rayfield carburetor.

Two entirely new prizes are offered this year, one being the Bosch award of \$500, cash, for the car fitted with Bosch ignition exceeding the National's record, and the other, the Waltham efficiency prize.

This latter consists of a handsome Waltham watch, which will go to the car which spends the least time at the pits.

Every precaution has been taken to protect drivers, officials and spectators from accident. A new bridge has been made over the speedway at the starting line, on which the starter and other officials will stand, instead of taking their chances on the track.

**Rayfield Trophy for 500-Mile Ray-
field Equipped Winner.**

DETAILS OF CARS IN FOURTH 500-MILE RACE.

MANY of the machines entered for the forthcoming Indianapolis contest are specially designed, this applying even to some which bear

Georges Boillot and His Grand Prix Peugeot.

the names of standard cars in the open market. The winning of the third race of this series by a French product has served to increase interest in the event on the part of several manufacturers who are making unusual efforts to secure the return of the trophies to America, and this is likewise true of individuals who have been instrumental in the production of cars bearing unusual names. For the most part manufacturers jealously guard the constructional details of their racing machines, but it is proposed to present herein some of the features of several machines, which have been made public.

The Delage Cars finished first and second in the Grand Prix de France at Le Mans, last August, running 350 miles at an average of 76.8 miles an hour. They also competed in the International Grand Prix at Amiens in July, the distance in that event being 570 miles. In each

Jean Chassagne at the Wheel of the Sunbeam.

contest both cars went through the race without mechanical adjustment.

Ball bearings are used throughout in the block motor, and to secure rigidity, as well as lightness, an H section girder is carried under each main bearing. The motor is placed directly on the main frame members, while the five-speed gearbox has three point suspension, the connection between the two being the multiple disc clutch. Two independent magnetos are fitted, and each cylinder has four horizontal valves, operated by vertical pushrod and bell crank, having two arms and actuating a pair of valves.

A gear pump, driven off the intake camshaft, delivers oil through a collector, in which are a hand regulated valve and three leads, one to the main bearings, one to the overhead valve gear, and one to the dashboard pressure indicator. The function of the pump is limited to supplying lubricant to specially designed cages around each

Josef Christiaens and the Excelsior Six.

ball bearing. In addition to the oil in the base chamber, there is an auxiliary tank on the dash with a feed to the motor, the flow from which is regulated according to the conditions under which the motor is running. To prevent an excess, in case of inattention or for any other cause, there is an overflow on the side of the chamber, the superfluous oil being lost on the road.

The Two Larger Peugeots are the machines used by Boillot and Goux in finishing first and second in last year's International Grand Prix. They differ in several respects from the car used by Goux in winning the 500-mile race in 1913. The third Peugeot is the smallest car in the race, and is the machine with which Boillot won the Coupe de l'Auto at Boulogne.

On the front of the motor is a short cross shaft driving a combined oil and air pump at one-

third engine speed. Ordinarily this pump aspires pure air, and, through a pressure regulator, maintains a predetermined pressure on the lubricant tank set within the frame under the driver's seat. By reason of this pressure the lubricant is driven through a single feed pipe to the dashboard distributor, thence through five leads to the crank chamber, overhead camshafts and to the pump and magneto shafts in front, in a powerful stream. There is no provision for the cylinder walls other than by the oil working out of the main bearings and kept in suspension within the motor. As soon as the oil returns to the base chamber it is drawn up and returned to the tank.

Another feature is the provision for taking up wear on the brakes while the car is travelling at high speed. Steel cables attached to the brake levers are brought through the frame and hooked onto short sliding sleeves on a tubular cross member. These two sleeves are connected by a horizontal screw with left and right hand threads, by means of which they can be brought closer

Edwin Pullen in the Specially Designed Mercer.

ber, is in a tank at the rear of the chassis, from which it is led to a pump in the base chamber by means of a large pipe. This pump forces the lubricant to all bearings, etc., after which it returns to the base, when it is forced back into the tank by a secondary pump. It is maintained that in this manner the oil is not long subjected to the heat of the crankcase.

Pullen's Mercer is somewhat different from those of his teammates, having a motor of much smaller piston displacement. In outward appearance it differs materially from the standard design of Mercer cars used heretofore in contest work. There is no secret in the statement that the Mercer organization is making every effort to add the 500-mile race to its recent Grand Prize victory, and the pronounced streamline, cigar shaped body is expected to show decided wind resisting qualities. In fact, the design was suggested by cars which have been making record breaking performances on the Brooklands track in England. Pullen is said to have developed better than 100 miles an hour with this car in tests on the factory track.

The Three Maxwells were designed by Ray Harroun, winner of the first 500-mile race in 1911, and are not standard productions of this company. There is no flywheel, counterweights

Teddy Tetslaff and One of the Maxwell Cars.

together, thus shortening the length of the cable. The screw is just under the floorboards and can be reached by lifting a trap.

Chassagne's Sunbeam has been specially designed for this race, using the motor with which he recently secured the 12-hour record on Brooklands track in England, averaging 89.95 miles an hour. Grant's Sunbeam took part in the International Grand Prix of 1913, and does not depart greatly from the standard touring car chassis made by this concern.

The former has wheelbase of only 83 inches, which has made necessary redesigning the gearbox. This has very short shafts and affords but two forward speeds. It is carried on the same subframe as the engine, being hung from the main frame by three universal hangers. Two carburetors are employed.

Modifications of the oiling system have been made with a view to cooling. The bulk of the oil, instead of being carried in the base cham-

Earl Cooper, 1913 Racing Champion, in Stutz.

Joseph Dawson and the Privately Owned Marmon.

on the three bearing crankshaft of the block motor taking its place. Reciprocating parts have been made exceptionally light, but the cylinders, crankcase and engine base are said to be nearly 50 per cent. heavier than ordinarily employed, even in racing practise, to keep down vibration.

Most racing cars are supplied with extra oil needed at exceptionally high speeds by a hand pump, operated by the mechanic. In case of pump failure for any reason, this results in insufficient lubrication. Harroun claims to have solved this difficulty. The oil is forced by an engine driven pump through large pipes directly from the tank at the rear to the engine bearings, the cylinders being lubricated by spray, but there is no splash chamber in the crankcase. Normally the pump feeds too much oil when the engine is operating at high speeds, so that the crankcase fills too rapidly, unless the hand pump is utilized to force some of it back to the tank through a bypass without going to the engine.

The Bugatti Entry was specially designed by Ettore Bugatti of Molsheim, Alsace, Germany, assisted by the driver, Ernst Friedrich. It is an open secret in Europe that the former is responsible for some of the best work on French cars, although he regularly produces machines bearing his own name. Beyond the statement that this

Spencer Wishart at the Wheel of His Mercer.

car is fitted with a block motor, with 12 overhead valves, operated by inclosed gearing, and that no expense has been spared for materials or workmanship, nothing has been made public concerning it.

The Two Burman Cars were built under the personal direction of Robert Burman at Battle Creek, Mich. The motor is of his own design and is made by the Wisconsin Engine Company. The 16 valves in the head of the cylinders are operated by overhead camshaft. The chassis design is said to incorporate a number of ideas gathered by Burman during his European trip last year.

The King Entry is said to be the only machine in the race equipped with full cantilever springs. In this respect, as well as in others, it follows standard practise with the product of this company. The car was constructed under the supervision of its driver, and it will be noted

Albert Guyot and One of the Delage Entries.

that the body is specially designed for racing at high speed. It will use a Bosch double ignition magneto, Bosch plugs, Zenith carburetor, Rudge-Whitworth wire wheels, Empire and Braender tires and Havoline oil.

The Three Great Westerns are fitted with the new Carter piston valve motor, which is standard equipment on Great Western machines this year. The company states that no attempt is being made to make the ports larger to give them better area for racing purposes, and that it is depending on the great difference in the time of opening and closing of the valves to more than make up for the valve area of the poppet valve motors, and also for securing a speed equal to that of cars in the race with almost double the piston displacement.

The Braender Car is entered by the Braender Rubber & Tire Company, maker of tires bearing

that name. Practically nothing is known concerning this machine, except the bore and stroke, and the fact that it was designed by Ralph Mulford, who drove a Mercedes fitted with Braender tires in the 500-mile race of last year. And it may be noted that this was the first car that ever went through a race of that distance with a set of four tires which were not changed from beginning to end.

The Keeton is the machine that Robert Burman drove in last year's race. It is understood to be a standard production. It is Burman's private entry, and in last year's event it covered one lap of the course in 1:37—the fastest of the race.

The Six-Cylinder Excelsior was specially designed by its driver, Josef Christiaens, for the International Grand Prix of 1913. The only information that has been made public concerning this machine, is that the motor is cast in blocks

John Jenkins and Great Western Stripped Chassis.

of three, with valves all on one side; that the crankshaft is carried in seven plain bearings, to which oil is delivered under high pressure; that two carburetors are employed, and that the transmission comprises a cone clutch, four-speed gearbox and shaft drive.

The Stutz Company is giving out absolutely no information concerning the three machines of its make in the event. It was in the first 500-mile race that the first Stutz car made an enviable reputation by completing the entire distance without mechanical adjustment. It is well known that the Stutz company expects to take this race, and it is suspected that the three cars have been so geared as to be able to cover the course at from 80 to 90 miles an hour, with ease.

DePalma's Mercedes is fitted with a six-cylinder aeroplane type engine, but in other respects resembles the Mercedes machines with which he has been racing for some years. In fact, it is stated that it is the same machine with which

William Chandler and the Braender Bull Dog.

he took the 1912 and 1914 Vanderbilt cup races, aside from the engine. Mulford's car is understood to be a regular racing model. The same thing holds true of the Isotta.

The Metropol made its first appearance in the American market last fall. It is a four-cylinder car, regularly produced by the Metropol Motors Corporation of New York City, in Port Jefferson, N. Y., and designed with a particularly long stroke motor, held to be capable of developing unusual speed. This is its initial contest.

Stafford Cars have been produced in limited quantities by the Stafford Motor Car Company, Kansas City, Mo., for the past year or two. No statement has been made public by the concern relative to the car entered, and it is presumed that it follows standard practise in the main. This is its first racing appearance.

The Rayfield has taken part in a number of short distance races, and is regularly produced by the Rayfield Motor Company, Chrisman, Ill. The Marmon is a privately owned machine, the Nordyke & Marmon Company, Indianapolis, maker of the line, having retired from racing some three years ago. Constructional details of Gray Fox, Beaver Bullet, Pope Bullet, Washington, Tatter, Titze and Ray are entirely unknown.

Arthur Klein at the Wheel of the King Oriole.

DRIVERS IN INDIANAPOLIS CONTEST.

Joseph Dawson, winner of the 1912 500-mile race in the National car, which still holds the record, will drive the Marmon 26. Born in Indianapolis, 25 years ago. First season, 1910, won Cobe, Remy Brassard, Vanderbilt Donor's, Atlanta and Savannah Challenge trophies with Marmon; 1911, three starts, no firsts; 1912, won 500-mile race with National; 1913, two starts, won second place in Chicago Automobile Club trophy at Elgin with Deltal. Practically all of his driving has been without stop. Holds world's speedway records, regardless of class, for 300, 350, 400, 450 and 500 miles with National, and several world's class records with the Marmon. His machine this year is privately owned.

Joseph Massucco, who will pilot the Tatter 45, is credited with being an American, despite the very evident Italian origin of his last name. His work as a driver is entirely unknown. It is understood that he and his brother entered this car in order to prove to the industry that a rebuilt machine could be depended upon for high speed under satisfactory circumstances.

Robert Burman, crowned Speed King at the Indianapolis speedway just before the first 500-mile race, will drive the Burman 1. Born, Im-lay City, Mich., in 1884. Tested first Buick car built. Went with Jackson Automobile Company and soon became head tester. First race, 50 miles, in Detroit, 1906, won with Jackson. Won second race, 24 hours, in St. Louis. Went with Buick, and list of winnings with that car would fill a book. Created world's straight-away records with Blitzen Benz.

Arthur Klein will drive the King 15. He is 25 years old. After graduating from college he entered the employ of the Peerless Motor Car Company as tester. Later with Stoddard-Dayton when that concern built racing cars. Has driven in several events. This is his first big race and he will be its youngest driver.

Barney Oldfield, one of the best known American drivers, appears in this race with the Stutz 3. After creating all manner of world's records in cars of several differing makes, Oldfield was suspended by the contest board of the American Automobile Association early in 1911, and was reinstated late in 1912. Drove Fiat and Mercer cars in a number of events on the Pacific Coast in 1913. Finished in second place with a Mercer in this year's Vanderbilt Cup race and recently created a new dirt track record with a Fiat.

Mortimer Roberts will pilot the Pope Bullet 39. He has been driving for a number of years and has earned an enviable reputation in both long and short distance events. In 1911 he won the Aurora cup with an Abbott-Detroit, and in 1912, he took the first race for the Pabst Blue Ribbon trophy, held in connection with the Vanderbilt and Grand Prize events at Milwaukee.

George Clark will drive his Tulsa of last year's race in this event as the Texas 33. Began driving Jackson cars in 1909. Received a medal from the motorists of San Antonio, Tex., for saving a life during the races in that city in November, 1909. Outlawed by the contest board of the American Automobile Association from 1909 to 1912. Drove Mercedes to victory in several events in the southwest in 1912. Finished third in 200-mile free-for-all on Galveston beach that year.

Jules Goux, winner of the 1913 500-mile race in a Peugeot, will be at the wheel of the Peugeot 6. A modest Frenchman, who has driven Peugeot cars to victory in a number of racing events on the Continent. Won the Sarthe Grand Prix of 1912, averaging 73 miles an hour for the 402 miles, and creating a new European record for the distance. Previous to winning last year's 500-mile race, he created a new one-hour record on the Brooklands track in England. Finished second in the International Grand Prix and the Coupe de l'Auto races in France in 1913. He also serves as racing engineer for the maker of the Peugeot cars. His name is pronounced as though spelled Goo.

Fred Melaun will be at the wheel of the Titze 47. He was prominent in racing circles in 1911, having taken part in seven races, securing four seconds and three thirds. Since then he has been working as a dirt track campaigner, much of the time with Barney Oldfield. This is believed to be his initial appearance on the Indianapolis speedway, and to be his first long distance event.

Harry Grant, twice a winner of the Vanderbilt cup with the same Alco car, will pilot an English Sunbeam. Born in Cambridge, Mass., July 10, 1877. Entered automobile business in 1898. Joined the forces of the Alco factory at Providence, R. I. in 1905. Drove his first race at Readeville, Mass., in 1907. Made a clean sweep of the Readeville races in 1908. Won Vanderbilt cup in 1909 and 1910. Drove Lozier in 1911. Retired to become a salesman in 1912. Drove an Isotta in 1913 500-mile race.

Joseph Horan will drive the Metropoli 29. He is one of the veteran drivers of the industry, although he has not been found among the winners during the past two years. Previous to that time he was prominent as a teammate of Ralph Mulford with Lozier cars, winning several long distance events.

Teddy Tetslaff, who holds the world's road racing record at 78.5 miles an hour with a Fiat, will drive the Maxwell 8. A native of California, he came into prominence with a Lozier car in the Santa Monica race of 1910, when he created a new American road record. Began driving a Fiat in 1911, when he defeated DePalma in a 100-mile race at Los Angeles. Won Santa Monica race and 200-mile and free-for-all at Tacoma, and finished second in the 500-mile race in 1912. Last year he won the Owensmouth trophy at Los Angeles.

Arthur Duray, who has travelled at a speed of 142.9 miles in an hour in his 300 horsepower Fiat, will drive the Peugeot 14. Born in New York, but has lived in Paris since boyhood. Has driven Delage and other cars in numerous events on the Continent. Will drive the smallest car in this year's 500-mile race. His first racing appearance in America.

Albert Guyot, pronounced Gee-O, with the G hard, will be at the wheel of the Delage 10. He has been prominent among racing drivers in Europe for years and there have been few big events in which he has not been numbered among the entrants. Hundreds of medals and trophies possessed by him are testimonials to his success. In the 500-mile race of 1913 he drove a Sunbeam. Upon his return to France he became a teammate of Bablot with the Delage. He also is an aviator of some note.

Edwin Pullen, winner of this year's Grand Prize in a Mercer, will drive the Mercer 22. Entered the racing field as mechanic for Spencer Wishart. Became prominent as driver of Mercer cars in 1912, when he took the 150-mile event at Tacoma, and secured a number of minor victories. In 1913 he failed to win a race of the three in which he was entered. His victory in the 1914 Grand Prize placed him in a position of decided prominence because of the fact that this was the first time an American car had won this event.

Earl Cooper, America's racing champion in 1913, will pilot the Stutz 2. Native of Nebraska and 30 years old. Drove his first race at 17, and won with a single-cylinder Cadillac. Has been driving Stutz cars since 1911. Entered three races that year, won one. Won four out of six in 1912, including 150-mile event at Tacoma. Covered 1595 miles in races in 1913, winning six out of seven long distance events—heavy cars, Corona; free-for-all, Corona; Santa Monica; Potlach trophy, Tacoma; Montmarathon, Tacoma, and 200 miles, Fresno.

Jean Chassagne (Chas-saw-in) will drive the Sunbeam 9. A Frenchman occupying the position of chief racing engineer to the Sunbeam company in England. Has taken part in a large number of important events on the Continent and the Brooklands track, Weybridge, England. Holds 12-hour record with Sunbeam on Brooklands track. Has served in the French navy and has something of a reputation as an aviator. First appearance in America.

Ray Gilhooley will pilot the Isotta 49. He is one of the older racing drivers, whose name has not been found among the contestants in recent years. Ralph DePalma once said of him that he was the only man he feared, because he never could tell what the "wild Irishman" was going to do next. Twice, he has crashed through a wooden fence at full speed, only to return to the course and continue the race to its finish. It will be his first contest on the Indianapolis speedway.

Louis Disbrow will drive the Burman 17. He has been racing for nine years and has appeared in all the big meets of the country, being a winner time and time again. In both 1912 and 1913 his name was second on the list of drivers for number of starts and victories. Holds numerous records, created with cars of several different makes. Has competed in all the 500-mile races, and has driven in most of the prominent hill climbing events. Won several free-for-all events on Galveston beach.

Ernst Friedrich, pronounced Freed-rish, will drive the Bugatti 34. Born in Alsace-Lorraine, and is typically French, despite his German moniker. As driver of the smallest racing car in Europe he has won for himself an enviable reputation, having defeated machines five and six times the size of his own, both in hill climbing and road events. This is not only the first time he has appeared in America, but the first race over a specially prepared speedway course, in which he has competed.

Willie Haupt will be at the wheel of the Dusenber 43. His home is in Philadelphia, where he is particularly well known as a hill climb driver, having secured a large number of records in such events. First drove a Chadwick in 1907, and later an American. Established two records on Point Breeze track with a Thomas in 1910. Drove a National early in 1911 and changed to a Buick later in the year. Drove a Mason in 1913 500-mile race.

John Jenkins, who retired from racing for good in 1912 and came back in 1913 to drive a Schacht in the 500-mile race of 1913, will be at the wheel of the Great Western 35 this year. He is an ex-puglist, and has two broken hands as a result of his work in that field. Born 35 years ago, he saw his first racing experience with Venus, an Italian driver, in Europe, and first raced in America in 1910. It was during a 24-hour race at Los Angeles in 1911 that he became prominent, driving a Cole.

Spencer Wishart, credited with being a millionaire, will pilot the Mercer 19. He is 25 years old. Withdrew from New York society circles a few years ago to enter the racing field. Until 1913 he pinned his faith to cars of foreign make, entering and driving his own machines. Joined the Mercer team late in 1912. Created world's dirt track record for 200 miles in Mercer at Columbus, O., that year. Finished third with a Mercer in 1912 Vanderbilt cup event, and second in the 1913 500-mile race.

Hugh Hughes, formerly head of the Mercer racing team, will pilot the Rayfield 46. He is an Englishman, 28 years old. Drove a De Dietrich car in the 1904 Gordon-Bennett race in France. Brought Allen-Kingston to this country for 24-hour contests. Went with Walter Christie to drive the Christie front-drive racer. Drove Parry cars in 1910, then went with the Fal-Car. Organized Mercer team in 1911. Won Kane county trophy, 1911; Aurora cup, 1912.

Charles Keene, driver of the Beaver Bullet 5, formerly was connected with the Mercer factory force. Inasmuch as he is now a resident engineer in Beaver Falls, Penn., and as his name does not appear on the list of winning drivers for the past three years, it is assumed that he was an engineer rather than a driver, while with that company. However, he is a veteran racing man, having been a member of the Pope-Toledo racing team in 1903. Before that he was a road tester.

William Carlson will drive the Maxwell 25. Carlson was practically unknown, outside of Pacific Coast racing circles, until the recent Vanderbilt cup race, in which he finished third with a Mason car. He won his first big race, a 200-mile event, at Point Loma, San Diego, March 2, 1913, being the only man to defeat the Cooper-Stutz combination on the Coast last year. In that event he drove a Benz. That he has been selected as a teammate for Tetzlaff is a measure of his reputation as a careful driver.

Roy Price, who will be Jenkins' teammate at the wheel of the Great Western 38, is one of the few drivers in the race about whom very little is known. It is understood that most, if not all, of his previous work has been as an amateur, and that his racing experience has been confined to local events in and about Peru, Ind., where the Great Western is produced. That he was selected by Jenkins, who is largely responsible for the Great Western racing team, is evidence that he is considered an excellent driver.

Rene Thomas, known as the Parisian acrobat, is the pilot for the Delage 16. Thomas, pronounced Tohmah, gained an enviable reputation as a motor bicycle rider in the earliest days of the industry, and is said to possess sufficient medals to cover the walls of his dining room. During the last few seasons he has been driving Schneider cars, changing to the Delage this year. Although his name did not appear among the winners of long distance events abroad in 1913, his work has been such as to make him a warm favorite.

Georges Boillot is a teammate of Jules Goux in the Peugeot 7. Like Goux, he is a racing engineer for the Peugeot company and has a large number of foreign victories to his credit. Won the International Grand Prix at Amiens, France, in 1913, and also the Coupe de l'Auto at Boulogne later in the year. This is his first appearance in America, and because of the fact that he defeated Goux twice in the important events mentioned above, he is looked upon as a favorite, as between these two. His name is pronounced Boll-O.

William Chandler will be at the wheel of the Braender Bull Dog 38. While he has been driving cars of various makes for several years, he came into particular prominence last year as a Mason pilot, winning 12 firsts, six seconds and two thirds out of 22 starts. He finished second with a car of that make in the 100-mile free-for-all on Galveston Beach, and in the 100-mile race at Latonia, Ky. His car was specially designed by Ralph Mulford and is entered by the maker of Braender tires, which were used with splendid success last year.

Joseph Christiaens (Krees-ti-an) will be at the wheel of the Excelsior 12. Native of Belgium, about 30 years old. Associated with Darracq at the inception of the industry. Later went with Vivinus company in Belgium as chief engineer. Took Liederkkerke cup in 1909. Among the first 12 men in Europe to secure aviator's license, with Voisin biplanes. Last three years with Excelsior as chief of racing department. Holds all the world's records in the 850-cubic inch class. Has covered a half-mile at 108.3 miles an hour, and a mile at 106.86.

Gilbert Anderson, the man who made the Stutz famous in a day during the first 500-mile race, will drive the Stutz 24. Born in Norway, came to this country as a boy, and became a marine engineer. As mechanic for Monsen in Crown Point races of 1909, lay for 50 miles on the hood of a Marmon car adjusting carburetor. Finished second with Stutz in Fairmount park race, 1911. Finished second in Illinois trophy race, and third in the Grand Prize, 1912. Won Elgin National trophy in 1913.

Ralph DePalma, twice a winner of the Vanderbilt cup, will drive a six-cylinder Mercedes, fitted with an aeroplane type engine. Made his debut in Briarcliff road race, April, 1908. Has secured many world's records, and won many victories since. Won Jepson cup, Santa Monica, with Mercer, and Elgin National trophy and Vanderbilt cup with Mercedes in 1912; Chicago Automobile Club trophy with Mercer in 1913, and Vanderbilt cup at Santa Monica in February, 1914, with Mercedes.

Guy Ball will drive the Great Western 37. His name first appeared on the list of winning drivers in 1912. Last year he finished second in the Los Angeles-Phoenix road race, driving a Marmon car. And it was at the wheel of another Marmon that he secured second place in the fifth race for the Grand Prize at Santa Monica in February, this year. All of his previous work has been done on the Pacific Coast, and this is his first appearance on the Indianapolis track. His work in the 1914 Grand Prize entitles him to a place among the favorites.

George Mason will drive the Mason 44. He is a son of the president of the Mason company. His first racing experience was at the wheel of a Mason car in the contest for the Wisconsin trophy, held in connection with the 1912 Vanderbilt cup and Grand Prize events in Milwaukee. He finished in second place. His previous work has been confined very largely to road races, and this will be his first appearance on a specially prepared speedway. He is expected to do credit to the house of Mason, however.

Howard Wilcox, holder of the world's stock chassis straightaway mile record in a National car, will drive the Gray Fox 4. Born, Crawfordville, Ind., 25 years ago. Won in his first race at New Orleans, Nov. 20, 1909. Won 100-mile race, Amarillo, Tex., 1911. Was a member of the winning National team in the 500-mile race of 1912, and retired to go into the taxicab business with Donald Herr when the National company withdrew from racing. Drove a Fox special in last year's 500-mile race.

William Knipper will drive the Keeton 31, this being the same car in which Robert Burman competed in several events in 1913. First race in Chicago in 1904. Competed for Gordon Bennett trophy in France in 1905. Drove Thomas car in hill climbing events in 1906. Drove first machine through to Mexico City in 1909. Won Lowell road race and 100-mile race at Atlanta in 1910. Won International light car race at Savannah in 1911. Competed in first 500-mile race with Benz, and 1913 event with Henderson.

S. P. Brock will be at the wheel of the Ray 45. He is a resident of Portland, Ore., where he is well known as a motor boat expert, owning one of the two claimed to be the fastest gasoline craft afloat. So far as can be learned he has had no previous automobile racing experience—certainly not in long distance events on a specially prepared speedway. His machine was built in Indianapolis under his personal supervision.

Jesse Callahan, pilot of the Stafford 28, is one of the old time drivers whose name has not been found among those taking part in contests during recent years. He is considered a careful man at the wheel. Melvin Stringer, who will drive the Washington 41, is almost as little known as the car he will pilot. He has taken part in a number of minor events in the Middle West, however. One car, the Maxwell 32, is as yet without a driver.

Caleb Bragg, winner of the 1912 Grand Prize in a Fiat, will be at the wheel of the Mercer 21. Born in Cincinnati, O., 26 years ago. Raced as an amateur until 1910. Won two out of four races entered in 1911. Finished second in Santa Monica road race, and took three out of four events entered in 1912, including the Grand Prize. His success last year was by no means as marked, having failed to secure place in any event. Holds a number of speedway records, made with a Fiat.

Ralph Mulford, who made his debut as a professional racing driver six months after he learned to handle a car, will pilot the Mercedes 23. He is 29 years old. First race, with Lozier, at the Point Breeze track, Philadelphia, in 1907, when, with Harry Michener, he set a new world's 24-hour record. Won Elgin National trophy in 1910 and Vanderbilt cup in 1911, both with Lozier. Drove Knox cars in 1912. Won 200-mile race at Columbus, O., and took several minor events with Mason in 1913.

SPECIAL AMES PRIZES.

Clarence N. Peacock & Co., Announces Awards for Users of Ames Shock Absorbers.

An entirely unexpected feature in the prizes to winning drivers in the fourth annual international sweepstakes, 500-mile race at Indianapolis, Memorial Day, is the offer of three awards to users of Ames shock absorbers, by Clarence N. Peacock & Co., 1790 Broadway, New York City, exclusive licensee for this make. The purse is \$500, divided as follows: Winner, \$250; second place, \$150; third place, \$100.

The surprise comes from the fact that heretofore this concern has made no bid for racing equipment. The Ames equalizing spring, as the device is termed, is rapidly coming to the front, and it is expected that there will be several cars in the contest equipped with this product.

MILLER TIRES AND RACING.

Tetzlaff and Carlson Will Drive Machines Fitted with This Make of Shoes.

Ever since Teddy Tetzlaff secured the world's road racing record in the Santa Monica race of May 4, 1912, using Miller tires, made by the Miller Rubber Company, Akron, O., he has been a consistent advocate of this make of shoe. It is not surprising, therefore, to learn that his Maxwell, in the forthcoming 500-mile race, will be fitted with Miller equipment.

It is understood, as well, that the two other Maxwell cars will use Miller tires. One of the drivers has not been named as yet, but William Carlson will act as Tetzlaff's teammate, and he has followed the example set by the record holder.

GRAPHITE IN MAXWELL CARS.

Product of the Joseph Dixon Crucible Company Being Used by Racing Designer.

The three Maxwell cars built by Ray Harroun for the forthcoming 500-mile race on the Indianapolis speedway, will contain several novel lubricating features, as set forth in more detail elsewhere in this issue. In addition, it is stated that Dixon's graphite lubricants, made by the Joseph Dixon Crucible Company, Jersey City, N. J., will play an important part in these machines.

The faces of all bearings and pistons will have many small holes drilled in them, and these

holes will be filled with Dixon's lubricating graphite. In this manner, Harroun expects to provide lubrication not possible with oil alone. Should the oil feed fail, it is anticipated that the graphite will still insure sufficient lubrication. All the bearings, axles, etc., throughout the entire machine will also be taken care of by Dixon's graphite automobile lubricants.

In view of the fact that Ray Harroun is well known as one of the country's foremost racing drivers, having won the first 500-mile race, and a score of other important events, his use of the Dixon graphite lubricants in this connection is worthy of special mention, and of particular interest to motor car owners and users.

CRESCENT TUBE GUARD.

Protects Tube from Pinching, Chafing and Punctures Without Sacrificing Resiliency.

The Dahl Company, 1309 Race street, Philadelphia, maker of the Dahl punctureless tire, is marketing the Crescent tube guard, a resilient, durable cushion strip from .625 to one inch thick, according to the tire size, which is placed between the tube and the tread of the shoe. The function of the guard is to raise the tube out of reach of puncturing material, and it is stated that the insertion of the guard in the casing and its use does not interfere in any way with the tube. The guard is made with butted ends, and is retained in position by reason of the air pressure in the tube and is a perfect fit. In addition to preventing punctures it is held that the guard reinforces the casing.

HAS NARROW ESCAPE.

Factory of Commerce Motor Car Company in Detroit Exposed to Fire Danger.

The Commerce Motor Car Company of Detroit, maker of Commerce trucks, had a narrow escape from serious damage by fire May 22, when an explosion in the adjoining plant of the Mexican Crude Rubber Company caused the complete destruction of that building.

While the explosion was of sufficient force to cover several Commerce workmen, engaged in assembling delivery cars, with a shower of glass, the damage to the Commerce plant was restricted to broken windows. Sales Manager George B. Wilcox reports that production in his plant will not be interrupted.

ELECTRIC CAR CONVENTION.

New England Section Takes Action on Motor Truck Bill in Massachusetts.

Electric vehicle men from all over the New England states were present at the two-day convention of the New England section, Electric Vehicle Association of America, in Boston, May 19-20. Day Baker, president of the Electric Motor Car Club of Boston, presided, and several papers of unusual interest were presented, among them being the following:

"The Relative Fields of Electric, Gasoline and Horse Trucks", by H. F. Thompson of the Massachusetts Institute of Technology; "Touring by Electric Automobile", J. S. Codman of S. R. Bailey & Co., Amesbury, Mass.; "Recognition of the Electric", prepared by Hayden Eames of Cleveland, O., and read by Charles H. Miles; "Co-Operation", by William H. Blood, Boston, formerly president of the national body; "Garaging and Service", J. C. Bartlett, Philadelphia; "The Electric Vehicle Association of America", A. Jackson Marshall, executive secretary; "What Constitutes a Good Electric", A. E. Faeh, Cleveland, O., and "Utility of the Electric Vehicle, Pleasure and Commercial", E. J. Bartlett, Cleveland, O.

Action also was taken requesting Governor Walsh of Massachusetts to grant a hearing on the so-called motor truck bill, now before the Senate in that state, under the terms of which motor trucks are to be taxed \$5 a year for the first ton and \$3 a ton above that figure. The bill has passed the house, and the electric vehicle men ask for a hearing before the governor makes his final decision regarding signing it and making it a law.

It is understood that motoring organizations in Massachusetts are preparing to test the constitutionality of the proposed law in the courts.

TO CATCH AUTOMOBILE THIEVES.

Organized Motorists in New York State to Take Decisive Action on the Matter.

During the past two years the list of stolen automobiles in New York State has increased out of all proportion to the increase in automobile owners, as large as the latter is, and it is believed that the thieves employ a regular system in disposing of the machines. To meet this situation and to assist the authorities in apprehending the culprits, the New York State Auto-

motive Association, which comprises nearly 20,000 motorists, is now organizing a bureau for the prevention of automobile theft, and particularly for the express purpose of assisting members in recovering cars which have been stolen.

An expert is now working out the details, and it is expected that when they are completed it will be possible to act promptly upon the receipt of a telegram from any member of the association. The 63 clubs throughout the state are unanimous in actively supporting the new plan.

ANOTHER CLUB ORGANIZED.

Metropolitan Motor Association Is Formed by Motorists in Boston and Vicinity.

Another motoring organization has been added to the long list of such bodies in Boston and vicinity, this being the Metropolitan Motor Association, plans concerning which are said to have been under way for some weeks. The new club is not in any sense a social organization, its chief aim being to work for good roads and good laws, and to represent the whole Metropolitan district in such work.

The officers are: President, Samuel L. Powers; vice president, Charles E. Hatfield; treasurer, Arthur F. Clarke; secretary and assistant treasurer, James Fortescue. The organization will be affiliated with the Massachusetts State Automobile Association and the American Automobile Association. Its headquarters are at 98 Massachusetts avenue.

LOUISIANA JOINS THE LIST.

Automobile Owners of That Commonwealth May Have to Pay License Fee Hereafter.

The annual session of the Louisiana legislature convened in Baton Rouge, May 11, and, almost immediately, a bill was introduced for the licensing of automobiles. Louisiana is one of the very few states which has had no motoring law, hitherto, although the cities and parishes have been permitted to exact certain fees for the use of motor vehicles.

It is understood that the proposed law was laid before the board of directors of the Motor League of Louisiana, and that it has the unanimous indorsement of that board as presented. It is added that it is expected that it will pass both houses without delay, and that it will provide at least \$200,000 annually for improved roads in that commonwealth.

KISSELKAR ADOPTS TWO-DOOR BODY.

THE Kissel Motor Car Company, Hartford, Wis., announces the adoption of a two-door single compartment body as a standard fitting with its new KisselKar 48 Six. The company has been building this design to order for several months and it was first shown at the Boston show. A certain number of chassis were equipped with the body and sent to the leading agencies of the company as samples, which found ready purchasers and were productive of orders for duplicates. This, and the fact that the design makes for convenience, led the company to adopt it as standard for the new chassis.

As will be noted by the accompanying illustrations, depicting a five and four-passenger

the dash. One of the features of the panel is that the body may be displaced without disturbing the wires or their connections. The new body is very attractive and may be classed as a perfect streamline design. The new chassis will also be equipped with the conventional four door, five or seven-passenger bodies, the last named having disappearing seats. The upholstery of the new bodies is of a high grade, long grain, hand buffed leather, and the linings are of the same material.

A number of mechanical features have been refined, but in the main the chassis is constructed along those lines which have proven satisfactory in service. The improvements make for greater

KisselKar 48 Six, a Seven-Passenger Touring Car with Disappearing Seats and Complete Equipment.

body, but two doors are utilized and these are located centrally. These doors are 26 inches wide, providing an easy entrance and exit to both the front and rear seats. The arrangement of the front seats is of particular interest. They are of the individual type, large and roomy, and the design should make for extreme comfort. Between them is an eight-inch aisle, the advantage of which is obvious. It permits a passenger changing from the rear to the front seat, or vice versa, without leaving the car. Where long trips are undertaken this makes possible a change of drivers without stopping the machine.

The individual driver's seat will be appreciated especially when traversing rough roads and in traffic, as there is sufficient room for the operator to swing the wheel quickly without interference. The driver is placed at the left with the control units compactly mounted on a panel on

accessibility, and this is held to be particularly true of the pushrods.

The new motor is built in its entirety in the Kissel plant and is held to be unusually quiet and efficient. Fuel economy and flexibility are also emphasized in the design. It is a block casting with the valves located on the left and the cylinders have a bore of four inches and stroke of 5.5. The S. A. E. horsepower rating of 38.4 is said to be very conservative. All bearings are ample in size and the valves are large, contributing to maximum efficiency.

Carburetion is by a late type Stromberg, water jacketed, and equipped with a control of the air for enriching the mixture for starting. Lubrication is by a force feed system. The oil is forced through a bored crankshaft to all bearings and working parts, being supplied from an ample sized self-contained reservoir to which the over-

flow returns. A special Mayo radiator of the Mercedes type, with belt driven fan, assists the centrifugal water pump, and it is stated that the

The steering gear is of the irreversible worm and worm wheel type and all components are ample in size, making for a large factor of safety.

Provision is made for taking up lost motion. The steering column, which is surmounted by an 18-inch wheel, is set at a comfortable angle at the left, with the change speed lever in the centre.

The Kissel electric lighting and starting system comprises separate units and the motor starter is operated by a convenient foot plunger. All indicating instruments are illuminated at night by lamps concealed under a cornice.

The equipment of the new KisselKar is very complete and includes the Golde one-man top, ventilated clear vision

windshield, Solar head and tail lights, Warner speedometer, Klaxet horn, robe and foot rails, jack, pump, tools etc. The headlights are equipped with a dimming device, eliminating need of side lamps. All open bodies mounted on the 48 Six chassis are the same price, and the finish is in keeping with the high grade characteristic of the product of Kissel Motor Car Company.

Although option is given on the ordinary four-door body, the Kissel Motor Car Company

KisselKar Two-Door, Four-Passenger Car with Rear Seats Divided—Note the Spacious Aisle Between the Front Seats.

proper temperature of the water is maintained under the severest of service. The unit power plant is mounted on a special sub-frame, with bearings in front, rear and on either side.

The clutch is a leather faced cone with adjustable spring inserts, and it is readily accessible for inspection or adjustment. The gearset is of the selective type, providing the four forward speeds and a reverse with direct drive on the third. Spicer universal joints are employed between the gearset and the differential. The rear construction is the same design which has proven so efficient in service. All components are sturdily constructed and very accessible.

Both sets of brakes are actuated by pedal, equalized and operate on 14-inch diameter drums with five-inch face. The front springs are semi-elliptic, 38 inches long and 2.25 wide. Three-quarter elliptic members are utilized at the rear, these being 52 inches long and 2.5 wide. Lubrication is by grease cups.

A pressure fuel feed is utilized and the container has a capacity of 24 gallons. It is located at the rear of the chassis, well protected, and is provided with a dial gauge which is illuminated at night through a bull's-eye in the tail light.

New KisselKar Two-Door Body Having Individual Front Seats, Making for Easy Exit and Entrance, and Changing of Seats Without Leaving the Machine.

does not expect that there will be many orders for the design in preference to the two-door type, because of the latter's convenience.

DAWSON SECURES NEW RECORD.

Rounds the 2.5-Mile Course at Indianapolis at 1:36.4 in Four-Year-Old Marmon.

While practising for the forthcoming 500-mile race, May 22, Joseph Dawson, at the wheel of his Marmon, rounded the 2.5-mile oval in 1:36.4. This is the fastest time in which the Indianapolis track has been covered, the previous record having been made by the late Lewis Strang, in 1910, when he drove a 200 horsepower Fiat the 2.5 miles in 1:37 flat. This record was equalled in last year's 500-mile race by Robert Burman in a Keeton.

It may be stated in this connection that the car driven by Dawson is a four-year-old Marmon, made by the Nordyke & Marmon Company, Indianapolis, Ind., but entered in this event by its private owner. It has been driven in a number of contests, having finished fifth in the 500-mile race of 1911. Its S. A. E. rating is 32 horsepower.

TO USE AIRLESS TIRES.

Charles Keene, Driver of the Beaver Bullet, Will Utilize This Product in Race.

A curious side light on the doings of the drivers and mechanics who are preparing their cars for the Indianapolis speedway race, is found in the fact that Charles Keene, driver, and in part the designer of the Beaver Bullet, has received a set of Dayton airless tires, made by the Dayton Rubber Manufacturing Company, Dayton, O., for use in this event. It is stated that the choice was made only after repeated tests with this car, using pneumatics and the airless tires, in which Keene is said to have reported that he found the latter much more resilient than the former.

He is confident that one set of these tires will carry his car throughout the entire 500 miles of the race, and he believes that the question of tire equipment will play an important part in the event. He is said to have found that he is able to take turns at 110 miles an hour, and make even higher speeds on the straight stretches, without tire trouble, using this equipment.

ANNOUNCES KNUTSON STARTER.

Device Made in Two Styles Is Placed on the Market by Automatic Devices Company.

For the past three years, A. W. Knutson, who is well known as the inventor of the rotary trol-

ley retriever, in wide use on electric street and interurban cars, has been working on the development of an automobile engine starter, embracing the same principle. As a result of his efforts he completed the Knutson automatic engine starter, about 18 months ago, and this has been very carefully tested in practical use by a number of drivers since that time.

The device is now being placed on the market by the Automatic Devices Company, Galesburg, Ill. It is of the automatic spring design, strong and simple in construction, and is claimed to require no attention except an occasional oiling. It is being made in two types, one for Ford cars and the other for all kinds of machines, and it is stated that it is easily attached to old or new cars of any make.

WESTERN AUTOMOBILE MAPS.

Denver Company Is Publishing a Comprehensive Series Covering 15 States.

In anticipation of the increased interest in transcontinental touring, as the result of the Panama-Pacific exposition of 1915, the Clason Map Company, Denver, Col., is issuing a series of 15 handbooks for motorists, which will prove of decided value. The books are inexpensive and each contains information of one state, the 15 states treated being: Arizona, California, Colorado, Idaho, Kansas, Montana, Nevada, New Mexico, Nebraska, Oklahoma, Oregon, Texas, Utah, Washington and Wyoming.

In each book is a map, printed in colors, with the principal automobile routes in red. It also presents information concerning the cities and towns, the roads over which they may be reached, and useful data in preparing for the trip. It is believed by the officials of the company that the series will meet a long felt want on the part of those who are seeking reliable information concerning the various routes to and from the Pacific Coast, and those available for reaching places of unusual interest.

Fuel economy is to be emphasized in the Chicago-Boston non-stop run, for the Glidden and other trophies, through the offering of a cup by P. C. Crenshaw, general manager of the Standard Oil Company of Indiana, for the most economical car in the use of gasoline.

W. A. Frise of Detroit has taken the Michigan distribution of Tuthill vehicle springs, made by the Tuthill Spring Company of Chicago.

GENERAL NEWS OF THE INDUSTRY.

Ford Motor Company Grants Men Leave of Absence for 30 Days and Advises Them to Seek Employment Elsewhere--New Concerns, New Buildings, Etc.

THE Ford Motor Company, Detroit, has posted the following bulletin throughout the factory:

In the regular course of business we have reached the quiet season. In line with our policy to be just and fair to the individual employee, we have planned as follows: Employees will be given a leave of absence, without pay, or, if you please, laid off for a period of 30 days. If, during the leave of absence or "laid off" period, the employee can find other employment, the company recommends that he do so. If at the end of 30 days our men have found no other employment and desire to return to work, they may apply and the company will endeavor to find employment for them.

It is explained by James Couzens, vice president of the company, that men will be laid off in rotation if necessary, single men first and married men only after being held as long as possible. It will be remembered that the Ford company recently established a profit sharing plan, under which the wages of employees were doubled, and a number of new employees were added. Concerning this phase of the situation, Mr. Couzens is quoted as follows:

When we established the profit sharing plan we knew that we could not employ all the men all the year round, but we thought we were giving them sufficiently high pay, so that they could afford to lay off a month in the summer time. I cannot say at present what is the total number of men we shall lay off. It may average 1000 a week for the next six weeks. There is nothing unusual about this lay off, as it always occurs at this the slack season of the year.

It may be added that the Ford Motor Company has just declared an extra cash dividend of 100 per cent., or \$2,000,000. This took place on the 11th anniversary of the organization of the company, and it is stated that Henry Ford, with 56.5 per cent. of the 20,000 shares of common stock, received \$1,170,000, and James Couzens with 10.9 per cent. got \$218,000. Other large shareholders and the amounts they are said to have received are: John F. Dodge, Horace E. Dodge, Horace H. Rackham and John W. Anderson, \$100,000 each; David Gray estate, \$210,000; R. V. Couzens, \$2000.

NEW SIX-CYLINDER CAR.

Gary Automobile Manufacturing Company Organized for That Purpose in Gary, Ind.

The Gary Automobile Manufacturing Company, Gary, Ind., has been incorporated for about

\$250,000, to produce six-cylinder touring cars and speedsters. Dr. G. Pass is president of the concern, and others interested in it are C. J. Flannigan and D. C. Throckmorton. E. T. Birdsall, chairman of the Detroit section, Society of Automobile Engineers, is said to have been retained as consulting engineer and purchasing agent.

A factory has been established and plans have been laid for the production of about 100 machines the first year. The motor is to have bore of 3.75 inches and stroke of 5.5. Wire wheels, streamline body, 130-inch wheelbase, Timken axles and Westinghouse lighting and starting system are among the features.

KNOX MOTORS COMPANY.

Capitalized for \$2,500,000 to Take Over Business of Knox Automobile Company.

Following the announcement of the sale of the assets of the Knox Automobile Company, Springfield, Mass., to E. O. Sutton, as made in the last issue of The Automobile Journal, comes the information that the Knox Motors Company of that city has been incorporated with capital of \$2,500,000 to take over this business. The officers of the new concern are: President, Harry G. Fisk; treasurer, E. O. Sutton; clerk, C. H. Beckwith.

The capital stock is divided into \$1,250,000 preferred and \$1,250,000 common. The company will continue the production of Knox pleasure cars, trucks and fire apparatus, and Knox-Martin tractors for general haulage and fire apparatus work.

ERECTING NEW BUILDING.

Work Begins on New Plant of Pittsburg Model Engine Company in That City.

Contracts have been let and ground has been broken for the erection of the new Pittsburg plant of the Pittsburg Model Engine Company, a reorganization of the Model Engine Company of Peru, Ind. The concern owns four acres on the main line of the Pennsylvania railroad at Homewood station, 12 minutes from the heart of the city. The land, proposed buildings and

equipment will cost more than \$500,000. The main structure will be 247 by 235 feet, the power plant 67 by 67, and the office building 50 by 80, all of fireproof construction, steel, brick and glass.

The company will continue to operate its Peru plant until further notice, and in addition to the manufacture of the poppet valve engine for automobiles and tractors, it will specialize in its new plant, in the production of the Carter piston valve motor, which it owns and controls. It is stated that the decision of this concern to locate in Pittsburg was brought about very largely through the efforts of the Pittsburg Industrial Development Commission, which has induced 24 industries to locate in that city during the past two years.

JACKSON'S PRESIDENT DEAD.

George A. Matthews Dies Suddenly While at His Office in Jackson, Mich.

George A. Matthews, president and general manager of the Jackson Automobile Company, Jackson, Mich., died very suddenly May 13, while working at his desk in the office of the company. He is survived by two sons, Howard and George A., Jr., who are actively identified with the business of that concern.

Mr. Matthews had long been identified with the industry and with other interests in Jackson. He organized the Jackson Automobile Company in 1900, becoming secretary and treasurer. Previous to this he was connected with the Fuller Buggy Company and the American Wheel Company, his work with these companies also being of value to the automobile industry. At the time of his death he was a director in one of the Jackson banks, and always had the welfare of the city and its various industries at heart.

SELLS SPRING BUSINESS.

Alloy Steel Spring Company Organized to Handle It in Jackson, Mich.

The Lewis Spring & Axle Company, Jackson, Mich., has disposed of that portion of its business devoted to the manufacture of springs, to a company styled the Alloy Steel Spring Company, of which the following are officers: President, Fred Keiser, vice president of the Lewis company; vice president, Casper Haehnie; secretary and treasurer, A. L. Wuster.

Under the terms of the sale the Lewis inter-

ests acquire the E. C. Clark Motor Company of Jackson, of which Mr. Lewis is treasurer. Except that springs will hereafter be made by the Alloy Steel Spring Company, which has purchased a plant for that purpose from the Lewis company, the latter concern will continue its business as in the past.

BECOMES SALES MANAGER.

William T. Helfer Assumes That Position with the Jeffery-Dewitt Company.

The many friends of William T. Helfer, throughout the automobile industry, will be glad to learn that he has accepted the position of sales manager of the Jeffery-Dewitt Company, Detroit, Mich., maker of spark plugs. He was for a number of years sales manager of the Springfield Metal Body Company, Springfield, Mass., and left that concern in May, 1910, to go with the Racine Manufacturing Company, Racine, Wis. His past experience and his wide acquaintance should prove of decided value in his new position.

William T. Helfer, Sales Manager, Jeffery-Dewitt Company.

The Jeffery-Dewitt Company has recently added several new buildings, including a three-story structure used exclusively for the manufacture of porcelain insulators, with a production capacity of 20,000,000 porcelains a year, and a kiln with capacity of 120,000 porcelains.

REORGANIZE AMPLEX COMPANY.

Mishawaka Concern Capitalized for \$200,000 to Produce Medium Priced Car.

A charter has been issued by the secretary of state in Indiana for the Amplex Manufacturing Company, Mishawaka, which has been incorporated with an authorized capitalization of \$200,000. The directors and principal stockholders

are Harold M. Pulsifer, E. J. Gulick and R. W. Randall, who some weeks ago purchased the assets of the Amplex Motor Car Company, in that city.

The Amplex Motor Car Company was formerly the Simplex Motor Car Company, and built the Amplex car for some years. It recently went into the hands of a receiver and the assets were purchased as stated above. At the time of the sale it was announced that the purchasers intended to produce a medium priced car.

FILES FINANCIAL STATEMENT.

Hood Rubber Company Makes Public Its Condition at Close of Fiscal Year.

The Hood Rubber Company, Watertown, Mass., has filed with the secretary of state for Massachusetts a statement of its financial condition at the close of its fiscal year, which shows the following comparisons for 1912 and 1913:

Assets.		1913	1912
Real estate	\$1,408,756	\$1,343,893	
Machinery	322,897	315,005	
Furniture and equipment.....	468,345	441,100	
Material, stock in process.....	1,146,923	1,015,867	
Cash and debts receivable.....	2,533,258	1,951,410	
Patent rights	1,000	1,000	
Investments	392,296	458,253	
Total	\$6,273,478	\$5,526,530	
Liabilities.			
Capital stock	\$2,600,000	\$2,500,000	
Capital stock subscriptions.....	400,000		
Floating debt	1,190,000	965,000	
Surplus	2,083,478	2,061,530	
Total	\$6,273,478	\$5,526,530	

ADDITION TO PLANT.

Four Wheel Drive Auto Company Is Erecting New Structure in Clintonville, Wis.

The Four Wheel Drive Auto Company, Clintonville, Wis., has begun work on another addition to its plant, which will be known as unit No. 6, consisting of a building 40 by 80 feet, to be used as a paint shop. This will give the concern a complete plant in every detail, and it will have approximately 46,000 square feet of ground covered with solid brick buildings, or over one acre under roof.

Since the company moved into its first building in August, 1911, the factory has been running continuously every day. During the past year it was working 10 hours a day. Orders for trucks have been increasing steadily and it is stated by the officials that the entire plant will

be taxed to its utmost capacity in trying to keep up with the demand.

NEW TRUCK COMPANY.

Reedsburg Motor Truck Company Formed to Resume Production of Piggins Line.

The Reedsburg Motor Truck Company, Reedsburg, Wis., has been incorporated with capital of \$100,000, for the purpose of engaging in the manufacture of a line of motor trucks formerly produced by the Piggins Manufacturing Company of Racine. Among the incorporators are E. E. Montgomery, Edward Thom, J. Seamans and E. M. McNab.

Mr. McNab formerly was designer for the Piggins company. It is not understood that the line will be continued under that name, but will be known as the Reedsburg.

SHOCK ABSORBER PATENT.

Judge Sanborn Gives Maker of Velvet Decision Over Producer of J-M Design.

A decision of much interest to the automobile industry is that handed down recently by Judge Sanborn of the United States district court, sitting in Chicago, in the action brought by the John W. Blackledge Manufacturing Company of Chicago against the J-M Shock Absorber Company of Philadelphia, alleging infringement of patent rights and asking that the defendant company vacate. The former concern makes the Velvet shock absorber and the latter the J-M.

The suit involves a situation which is somewhat unusual, in that the Velvet shock absorber is made under letters patent No. 988,229, issued to Charles A. Tilt, March 28, 1911, while the J-M is produced under letters patent No. 1,015,682, issued to L. P. Jaquet, Jan. 23, 1912. Both Tilt and Jaquet claim to have solved the problem of eliminating sidesway and preventing excessive shock being transmitted to the car and passengers.

Judge Sanborn holds: "The J-M shock absorber has the same elements as the Velvet but is different in details. It has everything found in the Velvet, as well as many other good things". The decision was for the plaintiff.

S. E. Hibben, Chicago attorney for the J-M company, is quoted as stating that an appeal would be made by the New York attorney. The Blackledge company will ask for a decree granting a preliminary injunction restraining further manufacture and sale of the defendant's product.

JOINS HAYNES SALES FORCE.**C. J. Corkhill Becomes District Sales Manager in Southwestern Territory.**

The Haynes Automobile Company, Kokomo, Ind., has appointed C. J. Corkhill, district sales manager for the states of Nebraska, Missouri, Oklahoma, Kansas and Arkansas. He will divide his time between headquarters established in Omaha and Kansas City.

Mr. Corkhill has been identified with the automobile industry for a number of years, and is particularly well fitted for his new duties from his knowledge of conditions in the southwest and his wide acquaintance among the trade in that territory. Salesrooms have been opened in the two cities named and service departments, in charge of competent mechanics, will be maintained for the benefit of Haynes owners.

EMPLOYEES BUYING STOCK.**United States Rubber Company Making It Possible to Yield Good Returns.**

In financial circles it is stated that the United States Rubber Company, of which the United States Tire Company, New York City, is a constituent, is making it possible for its employees to purchase common stock on a partial payment plan at \$60 a share. This price is understood to compare with \$65 in 1913 and \$45 in 1912.

Last year, a total of 5.5 per cent. was paid in cash dividends, and four per cent. in 1912. A 20 per cent. extra stock dividend also was paid in 1912. For 1914 it is understood that the subscribing employees will receive the regular six per cent. dividend, and, in addition, an extra cash bonus of three per cent. a share. At the above price, \$60 a share, this disbursement yields the employees 15 per cent. on their money.

KLAXON AND LONG HORNS.**Lovell-McConnell and G. Piel Company Come to an Agreement as to Production.**

Announcement is made of an agreement between the Lovell-McConnell Manufacturing Company, Newark, N. J., maker of Klaxon horns, and the G. Piel Company, Long Island City, N. Y., maker of Long horns, whereby each concern is to continue the production of its present types of hand operated signals under their several patents. In addition, the latter company is to

develop and place in the market a line of motor driven electric horns of similar construction to the hand operated product of that concern.

In connection with this announcement comes the information that the litigation in which these concerns have been involved for some time has been discontinued. The H. W. Johns-Manville Company will continue to market all the horns manufactured by the G. Piel Company.

NASH SUCCEEDS DANIELS.**Head of General Motors Company Will Direct Management of Oakland Concern.**

Following the announcement that George E. Daniels, for the past four years vice president and general manager of the Oakland Motor Car Company, Pontiac, Mich., had resigned, comes the information that Charles W. Nash, president of the General Motors Company, of which the Oakland concern is a constituent, has assumed the duties of these offices, in addition to those already attaching to the office of president.

Charles W. Nash, President, General Motors Company.

Mr. Nash entered the industry when the Flint Road Cart Company, Flint, Mich., became the Durant-Dort Carriage Company, in which concern he arose from a position in the trimming department to superintendent, vice president and director. In the fall of 1910 he became general manager of the Buick Motor Company of Flint, a position in which he exhibited splendid executive ability. He became president of the General Motors Company in November, 1912.

In connection with the above announcement it is of interest to note that Oakland sales for April, 1914, showed an increase of 47 per cent. over those for April, 1913. It was the largest single month's business in the history of the company.

BUYS COLUMBUS BUGGY PLANT.

Understood That It Will Be Combined with That of E. R. Thomas Motor Car Company.

According to a dispatch from Columbus, O., the plant and business of the New Columbus Buggy Company in that city has been sold to Charles A. Finnegan and Eugene D. Hofeller, both of Buffalo, N. Y. Mr. Finnegan purchased the assets of the E. R. Thomas Motor Car Company in Buffalo, and it is understood that the new plan involves the removal of what remains of the Thomas business to Columbus, there to be incorporated with the production of cars heretofore conducted by the Columbus Buggy Company and its successors.

The Columbus Buggy Company was organized some 42 years ago, and produced carriages and phaetons, previous to the inception of the automobile industry. C. D. Firestone, its head, early began to experiment with motor vehicles, and for a number of years the concern manufactured the Firestone-Columbus gasoline car and the Columbus electric machine.

Jan. 25, 1913, the company went into the hands of a receiver, and June 7 the assets were sold to a creditors' committee. Jan. 23, 1914, the creditors organized the New Columbus Buggy Company, with the following officers: President, George W. Lattimer; treasurer, George W. Bright, and secretary, D. N. Postlewaite. E. R. Sharp and B. G. Watson also were on the board of directors. This is the concern which is said to have made the sale to the Buffalo men.

CAMERON COMPANY'S FAILURE.

Schedule Shows Liabilities Totalling \$121,998.38 and Assets of \$48,631.47.

The Cameron Manufacturing Company, New Haven, Conn., has filed a schedule in bankruptcy showing liabilities of \$121,998.38, including secured claims amounting to \$91,858.50 and unsecured claims totalling \$28,275.59, and assets of \$48,631.47, represented in real estate, amounts due on open accounts and \$8.30 cash in the bank. The real estate is subject to a mortgage to the Parmelee company and to Pierpont B. Foster, and the machinery, fixtures and tools to a \$40,000 mortgage. Included in the assets, also, are claims against a number of men who subscribed for stock and who have not paid up.

E. S. Cameron, designer of the Cameron car, built his first automobile in Brockton, Mass., in 1901. For a number of years Cameron air-cooled

cars were made by the Cameron Car Company in Beverly, Mass. The concern was reorganized as the Cameron Manufacturing Company about a year ago, and subsequently removed to the old Mathushek Piano Company's plant in West Haven, Conn. About the time of the reorganization a new water-cooled car was projected.

For some time past Mr. Cameron, as well as several men connected with the Cameron Manufacturing Company at the time of its removal to New Haven, including Frank S. Corlew, sales manager, have been interested in the formation of the Euclid Motor Car Company, with headquarters in New York City. The latter concern is to manufacture a cyclecar of the light car type, utilizing an air-cooled engine designed by Mr. Cameron.

AGAIN ANTICIPATES OBLIGATIONS.

General Motors Company Purchases Another \$2,000,000 of Its Five-Year Notes.

According to the Wall Street Journal, the General Motors Company, Detroit, has purchased, for the sinking fund, \$2,000,000 of its six per cent. first lien, five-year gold notes, in anticipation of its obligation to pay, Oct. 1, \$2,000,000 cash to the trustees for sinking fund purposes. This makes a total of \$7,099,000 in notes that have been purchased, leaving outstanding \$7,901,000 of the notes which will mature Oct. 1, 1915.

There were originally issued \$15,000,000 of these notes, the sinking fund requirements on which were as follows: Oct. 1, 1911, \$1,500,000; Oct. 1, 1912, \$1,500,000; Oct. 1, 1913, \$2,000,000; Oct. 1, 1914, \$2,000,000. Most, if not all, of these obligations have been anticipated by the company. The current fiscal year, which ends July 31, is proving very prosperous for the company, and the notes above stated were purchased through the Central Trust Company, trustee.

NEW LUBRICANT PRODUCER.

Continental Asbestos Company Begins Operations in Worcester, Mass.

The Continental Asbestos Company has been organized in Worcester, Mass., with capital of \$200,000, but with privilege of increasing this later to \$1,100,000, for the production of lubricants. It is understood that the materials, before manufacture, come from Quebec. The company has begun operations in a factory at 7-11 Summer street.

NEW ACCESSORIES FOR THE MOTORIST.

JACKSON UTILITY VISE.

Designed Especially for Owner and Is Easily and Quickly Operated.

The Utility vise is manufactured by C. J. Jackson, M. E., Easton, Penn., and one of its qualities is its adapt-

ability for holding a variety of material in a number of different positions without the aid of clamps, bolts, etc.

Operation of the front jaw of the vise is by a steel screw and a bronze nut. The four-faced revolving rear jaw is in the form of a hollow cube, having one side left open to permit of using a wrench for actuating the locking screw nut. This construction permits of utilizing the jaws singly or in combination.

A type smaller than the standard size is manufactured, and is especially suited for the motorist who undertakes his own repairs. One of the features of the design is the rapidity with which the work may be clamped into position and removed.

BERLING MAGNETO.

High-Tension, Dual, Water and Oil Proof Type for Cyclecars.

The Ericsson Manufacturing Company, 1119 Military road, Buffalo, N. Y., is producing the Berling magneto, a high-tension instrument of the dual type for two-cylinder V type cyclecar motors. The dual feature is obtained by a simple combination of the collector ring and distributor, and it is stated that gears and extra bearings are eliminated. The interrupter and timer are combined.

A transformer or dash coil is utilized for the battery current. The high-tension cables are so connected to the magneto that the possibility of short circuits is prevented, and a felt washer protects the driven end bearing from foreign elements.

The frame is a solid unit, and it is stated that there are no screws to

loosen, causing short circuits. It is also claimed that the instrument is oil and water proof. Extreme efficiency is emphasized in the design, it being stated that the magneto will give off a spark of .1875 inch at 75 revolutions a minute.

The air gap between the armature and the field is about .005 inch and the armature is carefully wound. The bearings employed are imported and the platinum contact points are ample in size. The insulating material is noted for its high dielectric strength, and the interrupter mechanism is very accessible, as are other components utilized in service.

SECURITY AUTO LOCK.

Controls Fuel Supply by Ingenious Use of Combination Valves.

One of the most practical and efficient methods of preventing use of the car by others than those intended is to lock the fuel supply. When the flow of fuel is cut off, the amount remaining in the carburetor will be sufficient to operate the machine but a very short distance, and even this

can be prevented by running the motor a little while after the fuel is locked.

The Security Auto Lock Company, 1733 Broadway, New York City, is making the Security auto lock, which is an ingenious device for incorporation in the fuel line, convenient to the operator. It comprises four valve members in a row, each having a passage for the gasoline. The fuel enters and flows as indicated by the arrows in the illustration, but it can pass only when the valve mechanism is set in a certain position. The failure of one of the valves, of course, locks the device.

At the top of each valve is a numbered ring, and the passages are made to register by turning the plug members with a small wrench key until those forming the combination are properly set. One of the qualities of the invention is that the numbered rings can be removed and replaced, providing an endless number of combinations known only to the owner.

GEMCO DASH CONTROL.

Neat, Compact Device for Controlling the Carburetor Components.

The Garage Equipment Manufacturing Company, Milwaukee, Wis., maker of Gemco specialties, has

brought out a dash control for the carburetor. As will be noted by the accompanying illustration the device is inserted through the dash at a convenient angle, and is provided with a neat handle.

The construction is such that either a wire or a rod may be utilized for connecting the operating handle with the carburetor, and by an ingenious ball and socket arrangement various degrees of adjustment or opening can be obtained.

The control is adaptable for priming or flushing the carburetor, closing the butterfly air valve to enrich the mixture when starting etc. There are several practical purposes for which the control member could be utilized.

HANS POWER TIRE PUMP.

Is Inserted in Spark Plug Opening and Equipment Is Complete.

The Hans Motor Equipment Company, La Crosse, Wis., has brought out an automatic tire pump, which comes complete with gauge and 12 feet of high grade flexible hose. It is the spark plug type; that is, it is provided with a threaded end for insertion in the spark plug opening.

The pump is constructed of brass, has two independent checks in the secondary pump, and the bottom inlet is double. Nothing but pure air is forced to the tire, and one of the qualities of the design emphasized is that it will not overheat in service. The gauge supplied is known as the standard No. 3. The material and workmanship are strictly first class.

KERN WATER CIRCULATOR.

Assists Cooling System of Ford Motor, Improving Efficiency.

The Pittsburg Manufacturing Company, Ltd., 703 East End Trust building, Pittsburg, Penn., is marketing

the Kern water circulator for model T Ford motors. It is designed to augment the flow of the cooling fluid, and comprises a simple propeller incorporated in the lower pipe shown in the accompanying illustration.

The propeller is actuated by a pulley driven by belt, and the water is circulated in proportion to the motor speeds. It is estimated that the device will circulate eight gallons at 500 revolutions a minute and 18 gallons at 1100. The maker states that it does not interfere in any way with the thermo-syphon cooling system of the motor, and that it will keep the water at a temperature making for the greatest efficiency. The design is easily attached and is accompanied by a liberal guarantee.

PRENTISS KITCHENETTE.

Includes Stove, Full Set of Dishes, Cooking Utensils, Etc.

The Prentiss Manufacturing Company, Racine, Wis., is making a specialty of cooking outfits for tourists, and the steel kitchenettes, as they are termed, are very compact and may be carried on the running board of the car. That illustrated is the No. 1 or six-party outfit.

It contains a full set of dishes for six persons with the necessary knives, forks and spoons, and, in addition, containers for coffee, sugar, salt and pepper. There are also frying and baking pans and other cooking utensils. The dishes are made of the best white enamelled ware.

The case is made of No. 22 gauge auto steel, nicely finished in black, and adjustable leg supports are fitted to the outer leaf of the table. All openings are felt lined to exclude dust and foreign elements. The case

measures 28 inches long, 17.5 high and 12 wide. The weight is 75 pounds.

The folding stove utilized with the equipment employs gasoline as fuel and has three burners, two of which are for cooking and the other for the oven. The last named folds out of the way when not in use.

ALDERMAN MASTER VIBRATOR.

A Compact Unit Providing Battery and Magneto Control.

The Alderman Manufacturing Company, Inc., Rochester, N. Y., has brought out a new master vibrator intended for service with the model T Ford motor. The Alderman design is very compact, cylindrical in form, and the switch arrangement incorporated with the vibrator provides for control of the battery and magneto currents, as well as the usual "Off" position. The switch lever is very neat, and the terminals are not only sturdy, but well designed.

The special feature of the design is the condenser, the company stating that it absolutely prevents burning

of the platinum contact points and that these members will not require attention. The advantages of a master vibrator with multiple-unit coils is well understood. Synchronization of the spark is obtained, and when batteries are utilized it makes for economy of current. The Alderman is moderately priced, is finished in black enamel, and can be supplied in brass or nickel if desired. It is sold under a 30-day trial.

The editor of this department wishes to acknowledge the receipt of several communications from manufacturers requesting that their product be mentioned. As the articles have been described and illustrated within the year in these columns, it is deemed advisable not to discuss their merits again. The data submitted, however, are filed for reference, and for the benefit of readers of The Automobile Journal who may make inquiries for such devices.

Several accessory manufacturers have forwarded descriptive matter of new accessories without illustrations. As previously stated, suitable illustrations should accompany the data. This will insure publication and in the order received.

CUNO INSPECTION LAMP.

A Novel Tube Design Having Reel for Winding up Cord.

The Cuno inspection lamp is marketed by the Cuno Engineering Corporation, 80 South Vine street, Meriden, Conn.

It has a black enamelled wooden handle with a special type of Ediswan socket, and the 10-foot extension cord is attached to a hard rubber plug connector. The bulb is protected from damage by a bronze spring guard projecting from the socket mounting. When not in service the bulb is protected by a brass tube which slides over it and the guard.

This provides a light for general purposes or concentrated rays, according to the position of the tube. The cord is wound up on a reel, a brass frame attached to the tube serving to accomplish this operation. One end of the reel frame provides a hook for suspending the light when in service. All metal parts are nickel-plated and polished, and the dimensions of the light are 1.5 inches diameter and 7.75 length.

LIVINGSTON RADIATOR.

V Type, Honeycomb Design for Model T Ford Cars.

The Livingston Radiator & Manufacturing Company, 146 West 52nd street, New York City, is marketing a V type radiator for the model T Ford car. It is of the honeycomb design, constructed with bronze tubes, and the water channels are sufficiently large to flush out foreign deposits easily. Small corrugations, which are formed in the sides of the tubes, are designed to give additional strength, to increase the radiating surface and to allow for expansion. The radiator holds 4.5 gallons of water, is finished in polished brass or German silver and a new starting crank is included.

PERFECTION PISTON RING.

Is Constructed in Four Separate Sections and Is Very Light.

The Automobile Construction Engineering Company, 3324 Ludlow street, Philadelphia, is marketing the

Perfection piston ring, which differs from conventional design in that each ring is made up of four separate members, all of which fit the single piston ring groove. It is claimed that they are lighter in weight than ordinary members, and that they cannot be broken when fitting as the piston can be entered into the cylinder without compressing them. An even tension and leak proof qualities are also claimed. Better lubrication is held to be obtained with the Perfection than with ordinary types.

ALDERMAN PRIMER.

Operates from Seat and Combines Fuel Mixing Device.

The Alderman primer and power magnifier is produced by the Alderman Manufacturing Company, Rochester, N. Y., and, as the name implies, combines a priming and mixing device. The primer is constructed to be operated either from the seat or in front of the car and includes, in addition to the actuating means, a tube placed inside of the intake manifold. The fuel is led to this tube by a special connection, and when the piston descends on the suction stroke, the gasoline is sprayed, forming a rich mixture. Condensation is held to be eliminated. It is stated that the device can be fitted without drilling, etc.

The magnifier mixes superheated air in the proper proportion with the vapor from the carburetor, the heat of the exhaust being utilized and being carried through a special tube to

the power magnifier. The control unit is mounted on the dash and is provided with a lever, enabling the driver to cut down or increase the air supply according to conditions. When a motor starter is utilized a press button is included.

The fitting of the combined primer and power magnifier does not require any alterations, other than incorporating a union in the fuel line, and this member, as well as all necessary bolts, gaskets, screws, etc., is supplied with each outfit. The company is making a special design for Ford cars.

E. Z. SHOCK ABSORBERS.

Employ Coiled Spring and Are Constructed for Ford Cars.

The Forest City Electric Company, 5006 Windsor avenue, Cleveland, O., is marketing the E. Z. Rider shock absorbers, which are especially designed for the model T Ford automobile. They come in sets of four, two for the front and two for the rear springs, and the principle involved is the use of a sensitive coil spring. One of the features of the construction is that they are inter-

changeable with the spring brackets, and can be easily and quickly installed.

It is stated that the springs absorb all jars, bumps and vibrations caused by rough roads, contributing to the comfort of the passengers, as well as making for tire economy. The complete set with all fittings, etc., weighs 18 pounds.

PORTABLE VULCANIZERS.

Among the practical, standard accessories is the portable type of vulcanizer, by means of which the motorist may accomplish repairs to tubes and casings at a minimum of expense. These vulcanizers are not only moderately priced, but they have been so perfected that they may be successfully operated by the most inexperienced. Being very compact, and generally utilizing gasoline as a fuel, they may be carried in the tool box, permitting of making roadside repairs in less time than is required by the usual patching method. Generally the vulcanizer comes complete; that is, with rubber, cement, shears, fabric, etc. Detailed instructions are also supplied.

WARD LEONARD DYNAMO.

New Generator for Cyclecars Having Six-Ampere Output.

The Ward Leonard Electric Company, Bronxville, N. Y., maker of electric lighting and starting sys-

tems, has brought out a generator especially adapted for service on cyclecars. Dynamos, such as utilized on automobiles, are not adapted to the cyclecar motor, as the lamp load of a little car is approximately five amperes.

The output of the new Ward Leonard design is about six amperes at 1800 revolutions a minute, and it is a very compact generator, one having the same high grade material and workmanship for which the products of this concern are noted. The method of controlling the output of the new machine is the same as that used with standard types made by this company.

POSITIVE VULCANIZER.

Utilizes Heat from Steam and Is of the Portable Type.

Among the more recent types of portable vulcanizers designed particularly for the small garage and motorist is that manufactured by the Positive Supply Company, Davenport, Ia. In designing the vulcanizer the company had in mind the owner who is not familiar with vulcanizing and who wishes to perform repairs to casings and tubes.

It is stated that the Positive will not burn or overcure when employed by inexperienced persons, as the gasoline or fuel chamber is separated from the tube or casing by a water compartment.

It has a face measurement of three by four inches, weighs three pounds, and is so constructed that it may be securely mounted on the work bench, insuring accurate repairs to tubes. To vulcanize, the rubber is placed on the tube, the vulcanizer filled with fuel and water and the gasoline lighted.

ACTIVITIES OF THE CYCLECAR INDUSTRY.

Memorial Day to Mark the Opening of the Contest Season—National Association Assumes Control of Such Work—Latest Models Announced by Manufacturers.

MEMORIAL Day will mark the official opening of the first cyclecar season, at least, insofar as the contest situation is concerned, several of the clubs throughout the country having arranged for runs on that day. The New England body will occupy two days in covering most of central Massachusetts, the Detroit and Chicago clubs will travel overland to the 500-mile race in Indianapolis, the New York club will run to Cape May, N. J., and the New Jersey organization will spend the day at President Percival's farm in Teaneck, where an interesting programme of sports has been arranged.

While hundreds of cyclecars have now been shipped from the factories, most of these are still in the hands of dealers, for the reason that prac-

others may be developed by the performance of cars in the hands of users. The results of the Memorial Day events will be awaited with interest.

PLANS ARE CHANGED.

Revised Itinerary Shows New England Club Run Will Be Confined to Massachusetts.

Although it was originally announced that the first run of the Cyclecar Club of New England, May 30-31, would enter three states, Massachusetts, Connecticut and Rhode Island, it has been decided to change the itinerary so that it will be confined to the first named commonwealth. The following detailed itinerary has been made public by E. P. Blake, Boston, president of the club:

Saturday, May 30—Leave Hotel Oxford, Huntington avenue, Boston, at 8 sharp; to South Framingham, Framingham, Marlboro and Worcester; due in Worcester at 12:15 for luncheon; to Spencer, Warren, Palmer and Springfield; due in Springfield at 5:30; banquet and cyclecar show in Hotel Kimball.

Sunday, May 31—Leave Springfield at 8; due in Chicopee at 8:25; to Holyoke and Easthampton, due 8:50; to Northampton and South Deerfield, due 9:20; Deerfield, 10:30; Greenfield, 11:30; one hour for lunch at Hotel Weldon or Mansion house; to Millers Falls, Athol, Templeton and Gardiner, due 2; Fitchburg, 3; Leominster, 3:30; Lancaster, 3:45; Clinton, 4:45; South Framingham, 5:05; Wellesley, 5:30; Needham, 5:45; Dedham, 6; Hyde Park, 6:15; Boston, 7.

DRIVES ONE FRONT WHEEL.

Designer of Rex Small Car Presents New and Novel Features of Construction.

"When is a cyclecar not a cyclecar?" asks the Rex Motor Company, Ford, Mich. "When it is an automobile", is the answer given by this same concern. However, the Cyclecar Manufacturers' National Association says that a cyclecar that has a motor with piston displacement of 106.9 cubic inches is a small car. The Rex Motor Company appears to have no quarrel with the C. M. N. A., and is quite content to have its product listed either as a cyclecar or an automobile as best meets the fancy of the purchaser.

The Rex is a two-passenger roadster model, with wheelbase of 100 inches and tread of 56, weighing 700 pounds complete with top and

Detailed Construction of Rex Left Front Wheel Drive.

tically no concern is as yet in a position to produce machines in sufficient numbers to supply the necessary demonstrators. It is expected that this is a condition which will be remedied very shortly, and the demand for cyclecars has been so insistent and so general that there is every reason for believing that the interest in these little machines will increase rather than diminish as it becomes possible to gratify the desire for possession.

Designers and engineers have the benefit of the experience gained by the automobile industry, but the history of the larger car is such as to warrant the suggestion that certain changes may be demonstrated as desirable as the result of racing and other contest work, and that still

windshield. The motor is a four-cylinder, water-cooled unit, cast en bloc, with bore of 2.75 inches and stroke of 4.5, being rated by the maker at 16 horsepower. Ignition is by the Stevens system.

But the chief feature of interest in connection with the Rex is the method of transmitting power from the motor to the left front wheel. The transmission consists of a single leather fibre disc fastened directly to the driving shaft, which moves across the face of the flywheel. This shaft has two universal joints, and a pinion on the outer end is on a short stub, the inner end of which is mounted on a large universal joint, the axis of which coincides with the axis of the steering knuckle pin.

An internal gear, which with the pinion affords a very considerable reduction, is mounted in a housing bolted to the hub of the wheel. The inner side of the housing is closed by a plate which does not rotate, being part of the knuckle, and has a flange extending over the periphery of the gear housing provided with felt packing to exclude dust. Ball bearings carry the main universal joint, and the wheels also are on ball bearings, all of which are of the adjustable type.

Except when the wheels are turned for steering, the main universal joint has no work to do, as the shaft is, of course, straight. The outer section of the main driving shaft is set at a slight angle so as to be perpendicular to the plane of the wheel, which is slightly cambered.

The front springs are semi-elliptic and the rear, cantilever. The front axle is of I beam section, with a drop in the centre, and the rear axle is of tubular construction, full floating. The wheels are of wood, carrying 28 by three-inch tires. The driver is at the left, and the motor is started mechanically from the seat. The equipment includes a top, windshield, lamps, tools, etc.

ISSUES A PROCLAMATION.

Cyclecar Association of America Formally Assumes Charge of Contest Matters.

It would appear that the matter of controlling cyclecar contests had been definitely decided, insofar as the Cyclecar Association of America is concerned. Ever since the appearance of the lit-

tle machines the question has been open to discussion, both the American Automobile Association and the Federation of American Motorcyclists having offered to assume charge of this matter. The president of the C. A. A. has made public the following proclamation, which is self-explanatory:

CYCLECAR ASSOCIATION OF AMERICA.

PROCLAMATION.

Whereas, the cyclecar interests of the United States, represented by four-fifths of the manufacturers and by a large number of cyclecar clubs, have deemed the cyclecar movement of sufficient importance, individuality and strength to control their own destiny; and,

Whereas, the Cyclecar Association of America has been formed by duly accredited representatives of said cyclecar clubs, for the purpose of assuming and carrying on the control of cyclecar contests and of otherwise promoting all that is for the good of cyclecar interests; and,

Whereas, the following pledge of support of said association has been voluntarily signed by 41 manufacturers of cyclecars:

Rex Model Is Distinctive Because of Its Single Front Wheel Drive.

Believing the cyclecar movement of sufficient strength and individual importance to be independent, and capable of serving its own best interests, the undersigned hereby pledge their (or his) support to the Cyclecar Association of America in all matters pertaining to the government of cyclecar racing and contests, with the understanding that the Cyclecar Association of America shall recognize the Cyclecar Manufacturers' National Association in the formation of rules and shall endeavor to complete working affiliations with other sport governing bodies.

Whereas, the following manufacturers of cyclecars have ascribed their signatures to said pledge, in writing:

(Here follows the names of the makers of the Grant, Liberty, Coey, Jr., Comet, Ceco, Duryea, Cricket, Dayton, DeCross, Detroit, Downing-Detroit, Dudley Bug, Euclid, Flagler, Frazier, Frederickson, Gadabout, Greyhound, Hawkins, Economycar, Malcolm-Jones, Keller Kar, Los Angeles, LaVigne, Roble, Milwaukee, Morse, National, O-We-Go, Pet, Puritan, Rex, Twombly, Saginaw, Ward, White, Whitmore, Zip and Woods Mobilette.)

Whereas, the organization of the Cyclecar Association of America has been completed and is in full working order, now,

Therefore, I, Charles P. Root, president of the Cyclecar Association of America, by authority vested in me by said association at a meeting held in Chicago in the month of February, 1914, hereby declare the Cyclecar Association of America the governing body in all matters pertaining to cyclecar contests of any nature and kind within the United States of America; and I further

declare that all promoters of cyclecar contests and all entrants of such contests shall apply to said association for authority or sanction to hold or compete in such contests or suffer such penalty as said association, through its contest committee, shall inflict; and, further, I hereby name as chairman of said contest committee, for the period of said association's first fiscal year, Richard F. Kelsey of New York, and delegate him power to select his own associates, with the approval of the undersigned.

Given under my hand and seal this 15th day of April, 1914.

(Signed) CHAS. P. ROOT,
President, Cyclecar Association of America.

Attest:
(Signed) F. ED. SPOONER,
Secretary, Cyclecar Association of America.

PERCIVAL IS CHAIRMAN.

Well Known Transcontinental Motorist and Pathfinder Heads Touring Committee.

Charles P. Root of Chicago, president of the Cyclecar Association of America, has announced

New LaVigne Model, Which Places the Product in the Light Car Division.

the appointment of Dr. Charles G. Percival of Teaneck, N. J., president of the Cyclecar Club of New Jersey, as chairman of the national touring committee, with power to choose his associates from the various cyclecar clubs in the United States comprising the national body.

Dr. Percival is peculiarly well fitted for his new position, having crossed the continent eight times by automobile and having made one journey entirely around the border of the United States and from the city of Monterey, Mexico, to Carmack, Yukon Territory, north of 64 degrees in the Arctic Circle. He also is well known as a pathfinder, having first routed the Pacific highway, from Tia Juana, Mexico, to Vancouver, B. C., and the Old Trails route across the continent.

The Cyclecar Club of New Jersey seems particularly fortunate in securing national committee chairmanships, R. F. Kelsey, chairman of the

contest committee, being a member of that organization and a resident of Montclair, N. J.

NEW LAVIGNE MODEL.

Large Water-Cooled Motor Places the Machine in the Light Car Division.

The LaVigne Motor Company, Detroit, Mich., makes announcement of a new model LaVigne car, which takes the product of this concern out of the true cyclecar division and gives it a rating as a light car. This means that a new motor is being utilized and some of the other components have been changed as well. The wheelbase has been lengthened to 100 inches, from 96, and the tread is made standard, 56 inches, instead of 50. This necessitates a slight change in the outward appearance of the machine. The weight is 800 pounds. The two passengers are seated side by side, with the driver at the left.

The present motor is a water-cooled unit with bore of 2.75 inches and stroke of four, giving a piston displacement of 95.03 cubic inches, instead of the 69.8, with the old air-cooled motor of 2.375-inch bore and four-inch stroke. Ignition is by high-tension magneto, carburetion by a standard automatic float feed type instrument, cooling by thermo-syphon and lubrication by constant level splash, maintained by positive pump. The maker's rating of the new motor is 16-20 horsepower.

The multiple disc clutch, two-speed selective transmission and worm driven rear axle are retained. The springs are semi-elliptic in front, 32 inches, and three-quarter elliptic at the rear, 36 inches. The service brake operates on the rear wheels and the emergency on the propeller shaft. LaVigne demountable wire wheels are fitted, these carrying standard automobile 30 by three-inch tires.

The equipment is very complete, including two eight-inch electric headlights with dimmers, rear lamp with connector switch, ventilating windshield, top, envelope, curtains, spare wire wheel, mechanical starter operated from the seat, jack, tire pump and tool kit. As will be noted the new body is streamline in design, and the upholstery is in smooth, black leather. The gasoline tank is in the cowl of the dash.

ADOPTS CYCLECAR DELIVERY.

Maker of Leak-Proof Piston Rings One of the First Manufacturers to Do So.

That concerns closely allied with the automobile industry are satisfied that the cyclecar is a thoroughly practical vehicle is amply demonstrated by the accompanying illustration, which shows the machine utilized by the McQuay-Norris Manufacturing Company of St. Louis, Mo., maker of the well known Leak-Proof piston rings. Business men will be particularly interested in this installation.

The McQuay-Norris company found that the demand for its Leak-Proof rings from all the garages and repair shops, as well as directly from owners of automobiles and motor boats, was such that it was forced to take some action toward facilitating delivery of the orders. Parcel post proved far too slow to be of much assistance, and the local express service was found to be equally unsatisfactory.

After giving the cyclecar situation very careful consideration from every angle, this machine was purchased, and the city and suburban towns are now taken care of by it. Although the machine has been in commission only a short time, the company states that its usefulness has been demonstrated abundantly.

By this action the McQuay-Norris company becomes a pioneer in the use of the cyclecar for delivery service, and the neat, trim, little green car shown, with its uniformed driver, buzzing busily through the streets of St. Louis, or along the suburban highways, has occasioned much interest and comment. It will be noted, as well, that every advantage has been taken of the opportunity to make the machine pay from an advertising standpoint.

RECENT ANNOUNCEMENTS.

News of New Models and Information Concerning Factory Plans of Older Companies.

The Gadabout Motor Corporation, which has had its executive offices in suite 707, 29 Broad-

way, New York City, is now housed in a factory at the corner of Badger avenue and Runyon street, Newark, N. J., where it is expected that the production of Gadabout cyclecars will be begun in a short time. The present intention of the company is said to be that of manufacturing about 75 cars this first year.

The Twin City Cyclecar Company, 804 South Ninth street, Minneapolis, Minn., announces the Twin City, a true cyclecar, with wheelbase of 101 inches and tread of 36. The machine will seat two persons side by side. The motor is a four-cylinder unit, with bore of 2.5 inches and stroke of 3.5, giving a piston displacement of 67.6 cubic inches and a horsepower of 16-20, according to the maker's rating. Transmission is friction and drive by single chain.

The Dayton Cyclecar Company, Joliet, Ill., is planning to increase its factory facilities, the

Cyclecar Utilized in City and Suburban Delivery Service of McQuay-Norris Company, St. Louis, Mo., Maker of Leak-Proof Piston Rings.

concern having recently been fully capitalized for \$50,000. The officers are: President, Bruno Schwill, Chicago; vice president, T. F. Donovan; secretary and general manager, W. O. Dayton; treasurer, W. E. Gerry. Other capitalists interested are H. J. Winsten, Racine, Wis., and P. F. Carroll, Joliet.

More complete details of the Cleveland cyclecar, made by the Cleveland Cyclecar Company, Cleveland, O., include the following: Motor, four-cylinder, water-cooled, with bore of 2.25 inches and stroke of four, giving a piston displacement of 63.6 cubic inches, and rated by the maker at 10-16 horsepower; friction transmission, V belt drive, 96-inch wheelbase, 36-inch tread, two passengers, side by side.

THE BURGESS-DUNNE HYDRAEROPLANE.

IN VIEW of the important part which aeroplanes are expected to play in any military occupancy of Mexico, it will prove of interest to

Burgess-Dunne Hydraeroplane in Flight Over Marblehead Harbor.

give some attention to the Burgess-Dunne hydroaeroplane shown in the accompanying illustrations. This is particularly true, as it is rumored that the Burgess company, Marblehead, Mass., has been notified by the War Department to be prepared for rush orders. This report cannot be confirmed, officials of the company explaining that they have been requested to have nothing to say about dealings with the government.

It is known that the United States government has contracted with the Burgess company for a number of machines. Aeroplanes designed by army officers have been produced by this concern, and the works in Marblehead have been regarded more or less in the nature of an experiment station for machines suitable for army and navy work. The company has been engaged in producing aeroplanes since 1908, and undoubtedly has turned out more different types than any other concern in America—most of these on special order.

Early in the present year the Burgess company acquired the sole American rights under the Dunne patents. It also works under the Wright patents. The Dunne machine is of special interest, because of its inherent stability, a factor that was demonstrated very forcibly in the first model flown by its designer, a Capt. Dunne in Ireland. It has been found that American army and navy flyers have learned to operate the Burgess-Dunne in two days, while with some other types it has required at least a month.

Capt. Dunne claims to have been the first

aviator to fly without using the control levers. That is to say, in his initial flight with the first model he found it was possible to take his hands from the controls and permit the machine to glide on an even keel. This is held to be due to the fact that there is not a right angle at any point on the machine. The centre of thrust passes absolutely through the longitudinal centre of gravity.

The length of the Burgess-Dunne is 24 feet eight inches; the width, 47 feet, and the height, 11 feet. The total area of the sustaining surface is 482 square feet. The length of the hydroplane is 17 feet eight inches, and this is fitted with five water tight bulkheads. The beam is 31 feet and the depth 15 inches. The motor is a Curtiss model OX, rated at 100 horsepower. The eight-foot propeller is two-bladed. The total weight, ready for flight, is 1450 pounds. It has developed speeds of about 55 miles an hour.

It has been found that the machine rises from the water readily, glides with the power shut off at a moderate angle, and alights on the water with extreme ease. The control levers for the elevators are equipped with an automatic lock, which enables them to be set at any point desired, where they remain until the operator wishes to change his angle or direction. On his fourth flight, Clifford Webster, an aviator with the Burgess Company, allowed the machine to fly itself. There was a puffy wind of 12 miles velocity, but the machine maintained its lateral and fore and aft balance perfectly, although it is stated that a careful observer would have noticed

A Near View of the Burgess-Dunne Hydraeroplane, Approved by the United States Government.

a slight oscillation, in each case immediately overcome by the reaction set up in the various points of the supporting surfaces.

CORRESPONDENCE WITH THE READER.

Over-Running Clutch—F. L. Tarbox, Dorchester, Mass.

What is an over-running clutch? If you have any paper giving a diagram of same, or can tell me what it is, I would like to hear from you.

At Fig. 1 is shown a type of electric motor starter employing an over-running clutch installed on a well known make of motor. The electric motor is secured to a flange on the crankcase of the gasoline engine and the armature shaft carries a small gear F, which drives through three gears, B, C and D, providing a reduction of 40:1, meaning that the gear F makes 40 revolutions to one of the gear, which is on the crankshaft.

The over-running clutch body L is pinned to the crankshaft and revolves with it when the motor is operating, rotating inside the gear B on the line K and in the direction indicated by the arrow. On the face of the clutch body L are three flat surfaces M cut at an angle to the inside of the gear B, on each of which is a hardened steel roller A, held against the flat surface of the clutch body and inside of the gear by a light spring. The roller travels with the clutch and runs free against the side of the gear B when the engine is operating and when the starting gears are idle.

Drive is through the train of gears previously explained. As the clutch body is idle the rotation of the gear B rolls the three rollers until they are bound between the clutch body and the gear, rotating the latter. As the engine speed increases the gear B is rotating at about 70 revolutions a minute and the clutch body several times this, so that the contact of the rollers is broken.

Batteries, Etc.—G. A. Cohasset, Mass.

Please answer the following questions through Correspondence with the Reader:

1—What is the advantage of a Mazda tungsten lamp or bulb for automobile, garage or general lighting?

2—Is the Willard storage battery a non-sulphating battery?

3—How can a person make distilled water for use in a storage battery?

4—Does the Willard storage battery require distilled water or will ordinary water do?

5—Is the electrolyte of all storage batteries composed of one-fifth sulphuric acid and four-fifths distilled water?

6—Which is the stronger, a 14 or a six-volt battery?

1—The advantages of a tungsten filament lamp are: A greater illumination, longer life and less consumption of current as compared with the ordinary carbon incandescent bulbs.

2—No.

3—Distilled water can be made by condensing the steam of ordinary water. It is imperative

that the vessels be clean and free from impurities. It would be cheaper and more satisfactory to purchase distilled water than to attempt to make it, provided, of course, only small quantities were required, such as for a storage battery for example.

4—Distilled water is not absolutely required in the battery mentioned, but it should be pure and free from mineral deposits. Pure distilled water is recommended by all makers of batteries. Ordinary water should not be used until it has been analyzed, as it may contain the impurities above referred to. As previously stated, the distilled water is not expensive and its use will insure satisfaction.

5—The proportion of acid to water in mixing the electrolyte will depend upon the make of bat-

Fig. 1—Illustrating Construction and Operation of Over-Running Clutch Utilised with Motor Starters.

tery; that is, there is variation in the standards fixed for the electrolyte. With LBA cells, when the battery is fully charged the specific gravity of the electrolyte should be between 1.275 and 1.300. With the US cells it is stated: "That the electrolyte must be a chemically pure, dilute sulphuric acid of 1.285 degrees specific gravity, or 32 degrees Baume, or a mixture of approximately one part pure acid to 2.75 parts distilled water by bulk or volume. * * * At the end of the charge the gravity should read 1.280 degrees".

The acid used in mixing electrolyte is assumed to be commercially pure, which is rated at 1.835 specific gravity. Taking this as a basis it is found that at 60 degrees an electrolyte having a density of 1.250 specific gravity will contain 35.50 per cent. of sulphuric acid, and that at 70 degrees it will show 1.247 specific gravity, at 80 degrees 1.244 specific gravity, at 90 degrees,

1.241 specific gravity, and at 100 1.238 specific gravity.

Taking a certain make of battery as an example, the maker states that the best operating result is obtained at a temperature between 70 and 90 degrees, and assuming the average of the two, or 80, as that which will be satisfactory, and desiring an electrolyte of 1.275 specific gravity, it is found that it will contain approximately 39.75 per cent. acid. The exact specific gravity of a 39.75 per cent. acid solution is 1.277, which at 90 degrees would drop to 1.274, and at 100 degrees to 1.271.

There is a difference of 21 degrees, approximately, in the reading of the specific gravity of an electrolyte containing a given volume of sulphuric acid because of the temperature alone, between 30 and 100 degrees Fahrenheit, the density increasing as the temperature decreases. It will be seen that the specific gravity of the elec-

a 40 ampere-hour battery. What size bulbs should I use and how much service will I obtain from one charge of the battery? How are the capacities figured; that is, how many hours lighting would the battery give?

The term ampere-hour as applied to storage batteries is employed to denote its capacity in a closed circuit. A battery that will keep a two-ampere lamp burning for eight hours is said to have a 16 ampere-hour capacity. In a similar manner a 40 ampere-hour battery would operate the same lamp 20 hours. The voltage does not enter into the calculation of the ampere capacity.

The term wattage or watts is now employed in lamp ratings, although candlepower is still referred to by the makers. Regarding the term watt-hour, it may be stated that a current of one ampere flowing in a closed circuit with an electromotive force of one volt is equal to one volt-ampere or one watt. The voltage of the circuit multiplied by the rate of current flowing in am-

peres gives the rate of work or energy expended in watt-hours. Therefore one volt multiplied by one ampere may be stated to be equal to one watt.

It is not necessary to utilize all these units in computing battery and lamp capacity and to simplify matters the ampere and watt may be employed. The voltage may be eliminated insofar as the straight storage battery system of lighting is concerned, as the majority of lighting batteries are rated at six volts.

It will be noted that the lamp catalogue gives the

mean horizontal candlepower in fractions, and the total watts vary from the given figures slightly. For instance, a Mazda six-volt lamp is listed as having a mean horizontal candlepower of 6.1, and the total watts are given as 7.5. The Mazda lamp, it may be stated, is a form of tungsten.

Assuming that the lamp equipment for the car consists of two 10 candlepower headlights, two four candlepower side lights and one two candlepower tail light, the entire equipment, aggregating approximately 31 watts, a 120-ampere-hour, six-volt battery, would give 23 hours continuous lighting.

To simplify matters, let it be assumed that one ampere is equivalent to six watts, inasmuch as it has been explained that an electromotive force of one volt with a current strength of one

Fig. 2—L-P-C Motor, Used in Lewis Six, Designed by M. Petard.

trolite is an important factor in storage batteries and the manufacturer should always be consulted as to the specific gravity of the solution to be used, also as to charging.

6—The practical units utilized in electrical calculations such as applied to the storage battery are the volt, ampere and ohm, and these are defined in terms of one another as follows: Ohm, the resistance of a conductor through which a current of one ampere will pass when the electromotive force is one volt. Ampere, the quantity of current which will flow through a resistance of one ohm when the electromotive force is one volt. Volt, the electromotive force required to cause a current of one ampere to flow through a resistance of one ohm.

Lighting Batteries—Reader, Cuero, Tex.

I desire to wire my machine for electric lights, using

Fig. 3—Sectional View of Dorman Marine Engine with Entirely Enclosed and Lubricated Valves.

lamps may be computed on the same basis. The accompanying table will give approximately the candlepower of lamps, amperes and watts:

C. P.	Amperes	Watts	C. P.	Amperes	Watts
2	0.3	2.46	10	1.6	12.30
4	0.6	4.92	16	2.4	14.76
6	1.0	7.38	20	4.0	24.60

The battery referred to would not supply a group of five lamps or the headlights and tail lamp with current for any great length of time. It would be better to employ a lighting battery of at least 120 ampere-hour capacity. This would depend, of course, on the number of lamps to be utilized and the service expected of the lighting system.

Oil for Valves—L-P-C Motor Co., Racine, Wis.

One of the trade papers in its editorial columns discusses the question of "Oil for Valves", claiming that a British manufacturer has brought out a valve mechanism which is entirely included within the crank chamber and therefore is continuously and positively oiled by the splash of the cranks.

The L-P-C Motor Company in the Lewis designed this valve construction and has used the idea for at least a year. M. Petard, the engineer and designer of the Lewis Six, had plans for this construction in 1912 and as far as we know originated this idea as applied to the automobile motor.

The sectional view (Fig. 2) illustrates fully the complete lubrication of the valve gear, including springs. It will be noted that while there is a plate to facilitate valve adjustment, the entire mechanism, including springs and guides, is within the crankcase walls. The valve guides are exceptionally long, thus eliminating side thrust with perfect lubrication, which is not true of the ordinary valve construction as employed by all other manufacturers. Another feature is the oil bath given the springs, this acting as a cooling agent, adding to their life and insuring a perfect tension at all times.

It will be seen that a rocker arm, which is in constant contact with the cam, is used instead of the ordinary tappet. This, together with the fact that we secure continuous and positive lubrication from the crank splash, insures not only the elimination of valve noise, but absolute freedom from dirt, and is consequently a saving in wear on the valve gear, with a correspondingly silent action of the motor for a longer period than has heretofore been the case with the old construction.

The motor referred to is evidently the Dorman, an engine designed by W. H. Dorman &

ampere is capable of developing an amount of energy called a watt. Having ascertained the number of watts the sum divided by six would denote the number of amperes utilized. Various groups of

Co., which was exhibited recently at the Aero and Motor Boat Exhibition in England. A sectional view is shown at Fig. 3. The entire valve mechanism, including springs, is enclosed, and no tappets are employed, although between the cam and the valve stem a rocking finger is interposed. The valve guides are of exceptional length, almost as long as the valve stems, reducing side thrust to a minimum.

This engine was designed for marine purposes, but in commenting upon the construction. The Autocar of England states that it could be adapted to motor car practise by slight alterations, such as placing the cover plate somewhat higher to make for accessibility, and that the valve springs could be made more accessible without the main feature being lost.

Closely following the publication of the description of the Dorman engine was a letter from F. W. Hudlass, club engineer of the Royal Automobile Club of Great Britain. He claims to have designed the motor shown at Fig. 4 seven years ago. It was a six-cylinder unit and as will be noted the valve mechanism is entirely enclosed in the crankcase, has long valve guides, the components are thoroughly lubricated, and the cylinders are supported from a central position.

Fred H. Caley, secretary of the Cleveland Automobile Club, Cleveland, O., has completed arrangements for the fourth annual special train from that city to Indianapolis and return, for the accommodation of those who desire to attend the 500-mile speedway race, Memorial Day.

Fig. 4—Transverse Section of a Six-Cylinder Engine Designed in 1907 by F. W. Hudlass, Chief Engineer to the Royal Automobile Club of Great Britain—It Will Be Noted That the Valve Mechanism Is Entirely Enclosed.

WITH THE MOTORING INTERESTS ABROAD.

Ingenious Arrangement of Lamps on Windshield, So Designed As to Throw Light in Any Desired Direction--Gyrocar and Hydrocar---General Foreign News.

AMONG those in attendance at a recent race meet on Brooklands track, Weybridge, England, attention was directed to a new system of electric lighting presented on a Sunbeam car. It is further stated that the same system also has been adopted by the maker of the Sheffield-Simplex. A windshield is termed a screen in Great Britain, and the new arrangement of the lamps is termed a screen light.

It consists of a neat mahogany molding 2.5 inches deep, recessed to hold 12 lamps with their reflectors side by side. It is maintained that the lights can be supplied with current from any dynamo or battery, though those now in use are made for 12 volts. The 12 lamps are wired in parallel, and it is claimed that the failure of one of the bulbs will not greatly depreciate the total volume of illumination for the road. It will be understood, of course, that this screen light entirely replaces the customary headlights.

Arrangement of English Screen Light.

The control is such that all of the 12 lamps can be used together, or three on each side of the central six may be cut out, or the 10 central ones can be cut out, leaving the two outside members as side lights. In fact, the two end lamps are so arranged as to be moved to the ends of the board to better delineate the extreme width of the windshield.

It is stated that the rays can be directed at any desired angle from the horizontal by means of a suitable lever. The light can be thrown down upon the road close to the front of the car, or upward to read a signpost, etc. The beam thrown for driving purposes can be set at an angle best suited to the driver, while the light from some or all of the lamps can be directed upon the engine. With enclosed cars, if preferred, the lights may be placed across the front portion of the roof and adjusted and regulated in exactly the same manner as when mounted on

the windshield. Although the size of lamps utilized is not stated, it is assumed that they are of small candlepower.

CONTINENTAL TOURING FORMALITIES.

An Instance Indicating Reason for Giving Consideration to Foreign Associations.

Because the United States of America is unable to become a signatory to the international convention, which would permit its citizens to motor in foreign countries without being subjected to all manner of customs formalities at the various borders, American motorists are forced to depend upon the good offices of automobile associations in Europe. Many secure membership in the Automobile Association & Motor Union of Great Britain, while others prefer the Automobile Club de France.

These bodies are very willing to act for American motorists, but it sometimes happens that the tourist neglects to make plans sufficiently far in advance. A recent instance of this nature will serve to indicate some of the steps which must be taken by the foreign association in order that the tourist may not be delayed, when essentials have been overlooked.

An American desiring to tour Continental Europe secured membership in the Automobile Association & Motor Union of Great Britain, notified the officials of that body that he would arrive in Southampton by a certain steamer, and requested that he be fitted out with triptyque and other papers in time to take the first boat from Newhaven across the channel.

The boat arrived so that the passengers began to disembark at 8:05 in the morning. At 8:25 the tourist stepped ashore, and within seven minutes he was posed before a camera, in order to comply with the rule insisting that a portrait of the driver using the international permit be sealed on the document. Registration plates, and a specially engraved dash plate required on cars visiting the Continent were then ordered, and an English driving license was obtained. At 10:16 the car was landed, and by 11:10 the tires, which had been removed for shipment, were fitted and the machine was ready for the examiner to obtain the necessary information for the various

spaces on the triptyque and international pass. Next came the driving examination in order that the continental driving certificate could be obtained, and at 1:30 in the afternoon the motorist was on his way to Newhaven, having received, in addition to triptyques for France, Germany, Italy, Switzerland and Austria and the international pass, his shipping tickets, delivery note, and even the strip of transparent green paper which must be affixed to right side lamp to conform with continental regulations.

DURAY'S HIGH POWERED FIAT.

Machine with Which He Is Said to Have Exceeded Burman's Kilometer Record.

Arthur Duray, who is at present in this country in order to drive a Peugeot in the Indianapolis 500-mile race, was forced to leave his 300 horsepower Fiat in France. This machine is shown herewith, and it is stated that Duray recently covered a flying kilometer in Belgium at the rate of 142.9 miles an hour, this exceeding the mark of 141.75 miles an hour set by Robert Burman in the 200 horsepower Blitzen Benz at Daytona, Fla., April 23, 1911.

An attempt was made to secure this record on the beach at Ostend, Dec. 2, 1913, but the speed attained was not sufficient. Burman's mark still stands because Duray was compelled to drive his Fiat under European regulations, which require mean time taken in covering the measured distance in both directions. He hoped to bring the machine to America in order that he might attack the record under American regulations. He says the car is capable of covering the distance at the rate of 150 miles a minute.

DR. SCHILOWSKY'S GYROCAR.

Londoners Are Given Opportunity to Witness Its Initial Public Test.

A few weeks ago announcement was made in these columns that the Wolseley works in England was engaged upon the production of a new two-wheeled gyrocar. At that time it was impossible to present details, and this is still true

in a measure, despite the fact that this machine recently was given its initial public test in London. The design is that of Dr. Pierre Schilowsky.

The machine is briefly described in the dispatches as a two-wheeled, single-track, three-ton, 20 horsepower pleasure car. The motor drives a dynamo which supplies current for working the gyroscope by means of a pendulum on either side of the car, each ordinarily free on a ratchet device. It is explained that when it becomes necessary for the speed of the gyroscope to be increased, the pendulum engages the ratchet until the gyro has been hurried to the desired number of revolutions, when a slight noise is heard, this being made by a spring disengaging the ratchet device. Power is transmitted to the single rear wheel by an ordinary gearbox of the standard Wolseley ratios, although a new transmission is under consideration.

Arthur Duray and His 300 Horsepower Fiat Car, with Which He Has Attained a Speed of 142.9 Miles an Hour.

The gyroscope is utilized for maintaining the car's balance when turning corners, when standing still with the motor running, etc., and it is stated that the public test demonstrated that it is capable of performing its functions satisfactorily in every respect. Two sprag wheels, one on each side, are lowered when the car and motor are stopped. It is stated that the gyroscope absorbs about 1.25 horsepower. The two road wheels are shod with pneumatic tires.

LAMBERT HYDROCAR.

Interesting Amphibious Machine Has Made Its Appearance from Scotland.

If a boat that is supplied with wings is an hydroplane, and an aeroplane that is fitted with floats is an hydraeroplane, there seems no good

reason why a motor car that is designed for use on land and in the water should not be an hydro-car. To be sure, amphibious automobiles first made their appearance some few years ago, but, if memory serves correctly, those machines were designed to operate only where the wheels could touch bottom, so to speak.

Leslie Lambert of Drumchapel, near Glasgow, Scotland, has produced an automobile of the cyclecar type, fitted with a single-cylinder, water-cooled engine of 4.5 horsepower, which not only operates satisfactorily on land, according to the reports received in this country, but is equally well adapted for water service. It is supplied with a small propeller at the rear, actuated by a two-speed gearbox and an extra bevel gear engaged by means of a dog clutch. When taking to the water the machine floats and is manoeuvred like a boat.

FRENCH LIGHT CAR TRIALS.

Eighteen of 22 Starters Complete 2000-Mile Endurance and Fuel Economy Tests.

Eighteen of the 22 starters completed the 2000-mile endurance and fuel economy tests around France early in the month. The event occupied 10 days, and the road and weather conditions were ideal throughout. The largest car in the competition had piston displacement of 153 cubic inches, and the smallest, 54. The result for gasoline economy was as follows:

Car	Gallons	M. P. G.
Hurtu	46.03	42.4
Alva	46.22	42.3
Majola	47.89	40.7
Automobilette	51.40	38.1
Autorette	53.46	36.5
Phoenix	54.36	36.0
Gep	55.02	35.0
Ponette	57.55	34.0
Sigma	59.70	32.8
Automobilette	62.30	31.4
Scap	62.30	31.4
Aquila-Italians	63.95	30.6
Diatto	64.04	30.5
Arlan	71.25	27.4
Scap	75.52	25.9
Fox	79.23	24.7
Hispano-Sulza	94.64	20.7
Humber	96.55	20.3

NEWS NOTES FROM ABROAD.

The authorities of French Indo-China have begun a series of engineering works for the establishment of a motor road 1000 miles long between Hanoi and Saigon. Ten bridges are to be built, and the highway will cross no less than three mountain ranges.

There were 5115 motor cars imported into Argentina during 1913, as compared with 4281 during 1912. Recent reports show that there are 6453 automobiles in Buenos Aires alone, of which 2470 are privately owned passenger machines, 3940 taxicabs and 243 commercial vehicles.

Thirteen cars already have been entered for the Austrian Alpine tour, as follows: Puch, Archduke Josef

Ferdinand; Puch, Archduke Heinrich Ferdinand; Graf, Baron Vladimir Steinhell, St. Petersburg, Russia; Darracq (three cars), Darracq et Cie; Puch, Count Carl Lemberg; Fiat, Martin Schneeweiss; Graf, Rudolph Lenbacher; Opel, R. K. Rosenheim; Minerva-Knight, Dr. B. Bleichroeder; W. A. F., Francis Fuchs; Vauxhall, Tinsley Waterhouse.

With the exception of the cars of two manufacturers, all the machines entered for the French Grand Prix this year will be equipped with Rudge-Whitworth wire wheels. It is expected that one of the remaining two will yet adopt this equipment.

The Imperial German Automobile Club has arranged to hold a reliability tour in October, under the patronage of Prince Henry of Prussia. The contestants will be divided into two classes. The distance will be about 800 miles, covered in two days by large cars and in three by small machines. Entries close Aug. 15, with the Kaiserlicher Automobil Klub, Leipzigerplatz, 16, Berlin, W. 9.

Word has been received from Sydney, Australia, that a Metz car, made by the Metz Company, Waltham, Mass., was a winner in the recent reliability trials between that city and Melbourne, securing a total of 598 points out of a possible 600. This was the same car that won in 1913 with a perfect score. The gasoline consumption was 51.5 miles to the gallon, indicating a cost of a little less than .5 cent a mile.

IN RE SOUTHERN TREAD.

Improvement of Highways in That Section Is Gradually Eradicating the Distinction.

While but few northern motorists may be aware of the fact, practically all automobile manufacturers have been producing cars a little differently equipped to meet the demands of the trade in the South. That is to say, machines built especially for the southern buyer have a tread of 60 inches instead of 56.

The conditions which first brought about this distinction have been the subject of argument among vehicle manufacturers for many years. General opinion seems to agree, however, that, on account of the road situation which once prevailed south of the Mason and Dixon line, the wider tread was adopted to insure needed stability and prevent overturning.

The standard was established long before the day of the motor car, but even when automobiles began to be used more generally there was still a disposition on the part of the southern buyer to give preference to a wide tread machine. That there has been a marked lessening of this tendency during the past two seasons is stated by E. R. Benson, vice president of the Studebaker Corporation, Detroit, in charge of automobile distribution. He adds:

The day is past when the southern motorist was compelled to ride as best he could in the wagon ruts of the country roads. Highways in many parts of the South are now not merely equal, but actually better than those in many parts of the North, populated with similar density. Even in the mountain districts where wide tread wagons are still generally used, the motorist will find roads that are almost always crowned, and often macadamized. A large majority of the cars we have been shipping to our southern dealers this year have been equipped with standard tread. So marked has been this trend that it seems only a matter of education until the standard becomes general.

GASOLINE CONSUMPTION RECORD.

Rayfield Carburetor and Motorol Help Chandler to Win Coveted Honor.

What is believed to be a national record for gasoline consumption with a six-cylinder machine was made recently in Chicago by W. C. Gruner, representing the Thomas J. Hay Company, local distributor for Chandler and Hupmobile cars, with a Chandler car, made by the Chandler Motor Car Company, Cleveland, O. The machine was equipped with a Rayfield carburetor, made by the Findeisen & Kropf Manufacturing Company, Chicago, and utilized Motorol, the product of the New York & New Jersey Lubricant Company, 165 Broadway, New York City. The test was superintended by F. E. Edwards, chairman of the technical committee of the Chicago Automobile Club, assisted by Darwin S. Hatch.

One gallon of gasoline carried the car 24.4 miles during a period of 1:15:00, with an average speed of 20 miles an hour. The test combined three features, fuel economy, acceleration of speed in the third gear mounting Hubbard Woods hill, and acceleration from a standing start up the same incline. The car carried its full equipment, including windshield and spare tires, and was occupied by four persons. Tires were 34 by four-inch, fitted to demountable rims. The machine weighed 3030 pounds without passengers, and with them 3700 pounds.

At the start the carburetor adjustments were soldered and even the dash adjustment was removed. A special one-gallon tank was filled with ordinary gasoline, showing in the cold temperature a specific gravity of 60 degrees. The day happened to be decidedly unfavorable for such a record. The wind was strong from the northeast, and the temperature but 52 degrees at the start and only 56 at the finish.

SPEARE SELECTS BETHLEHEM.

Maplewood Hotel Will Be American Automobile Association's Headquarters.

Lewis R. Speare of Boston, chairman of the special committee in charge of the arrangements

for the midsummer meeting of the American Automobile Association, has decided upon Bethlehem, N. H., as the meeting place, and the Maplewood hotel as the official headquarters. The dates selected are July 3-5.

Mr. Speare has added a number of names to the committee, which now includes Frank X. Mudd, Chicago; Dr. H. M. Rowe, Baltimore; Laurens Enos, Buffalo; Robert P. Hooper, Philadelphia; Alfred Reeves, New York, and James Fortescue, Boston.

PREMIER ADDS TO LINE.

Announcement Is Made of a New Series Utilizing the Weidely Chassis.

Announcement is made by the Premier Motor Manufacturing Company, Indianapolis, Ind.,

Chandler Six, Equipped with Rayfield Carburetor and Using Non-Fluid Oil, at End of Its Recent Record Breaking Gasoline Consumption Test.

of a new series Premier 6-49, utilizing the Weidely chassis and being equipped with a six-cylinder motor having bore of 4.5 inches and stroke of five. The streamline body is designed and constructed along the most up-to-date lines.

Recently, E. S. Partridge of New York City, one of the pioneers of the industry, having been connected therewith since its inception, made a tour of the Middle West, and during his visit to Indianapolis took advantage of an opportunity to try out two of the Premier-Weidely chassis on the speedway in that city. He succeeded in averaging 68 miles an hour, and attaining much higher speeds on the straightaways. At the conclusion of the test he expressed himself as highly pleased with the performance of the machines, and particularly with the action of the Weidely motor under all the conditions to which it was subjected.

fer upon the industry as a whole.

It is somewhat indicative of the tendency toward strictly business methods, which has been in evidence most conspicuously during the past year, to note that this spirit of organization is being extended to other branches of the mechanical force. Men more directly responsible for constructional details, than is true of the engineer, are forming societies for the purpose of exchanging ideas and listening to authorities relative to the proper means to be employed in securing definite results.

The automobile owner may not be conversant with the respective merits of case hardening, case carburizing, heat treating, etc., but he expects the manufacturer to delve into these mysteries, and when he learns that shop foremen and heads of departments are devoting time to the scientific study of such matters, he immediately has greater confidence in the product of the industry. The practicability of the motor vehicle has long been established. The efficiency of motor vehicle production is now receiving marked attention.

KILLING THE GOOSE.

Motorists in Massachusetts have been contributing more than \$700,000 annually in registration fees toward highway maintenance. Until now there has been practically no objection.

The state highway commission, which instigated the present plan for increasing the registration fees on motor trucks, reports that horse vehicles do much damage to roads, yet makes no provision for requiring that they be made to bear their share of the maintenance cost. Actual figures show that the ordinary horse will cut some 12,000 holes in a roadway for every mile travelled. Also, it can be demonstrated that motor trucks on the highways comprise less than 10 per cent. of the traffic, while the horse drawn vehicles comprise about 40 per cent. Hundreds of motor trucks never go outside the cities.

Since the supreme courts of Mississippi, Ohio and Michigan have decided that laws enacted recently were unconstitutional, because they imposed double taxation on motor vehicles, the motorists of Massachusetts may be pardoned if they are considering the advisability of testing the existing statute, and any others that may be passed, in the courts. Many attorneys state that they would win.

STUDYING EFFICIENCY METHODS.

The automobile industry has grown very rapidly. It is but a comparatively few years since practically the entire attention of the mechanical department was devoted to the matter of making the machine run. There still are a large number of subjects involving questions of design and construction, about which engineers and owners will long continue to have differences of opinion. Some of these are of sufficient importance to warrant consideration in the light of selling points, and, therefore, to be made the basis of argument among all connected with the industry, in whatever capacity.

However, it is proper to refer to the present day motor vehicle as a standardized product, and it is possible for those directly responsible for design and construction to form themselves into an association for the advancement of ideas and the consideration of suggestions, as is demonstrated by the successful history of the Society of Automobile Engineers. The average automobile owner may have little interest in the proceedings of such organizations, but he cannot fail to appreciate the benefit they are able to con-

PRODUCING MOTOR CARS IN QUANTITY.

Manufacturing Methods Utilized by the Studebaker Corporation Which Builds 65,-000 Automobiles Annually---Factors Contributing to a Large Production.

IT IS a well known axiom of manufacturing that production in large quantities enables the builder to lower notably the cost of each article he makes. The automobile manufacturer whose product runs to five figures annually necessarily must have almost unlimited resources, with his plants located at points of vantage, adjacent to trunk lines, waterways, and in juxtaposition to materials of the desired stamp. Sanitation, light, heat and pleasant surroundings are most carefully utilized in modern factories, as the quality of the product increases with the output under these conditions. It is the advance that has been made in automatic machines and tools and methods that is responsible for production in large quantity, and it may be stated that quality is on a higher plane than formerly.

The motor car manufacturer whose plants have a capacity in excess of 50,000 machines a year can afford to command the best engineering

talent, and to employ the most efficient heads of departments and expert labor. The purchase of material is a well known factor in manufacturing, and it is obvious that competition is keen among makers of raw material when it is to be supplied in enormous quantities. It follows that the car manufacturer, concentrating his efforts on one or two models, and producing in large quantities, can install equipment that will produce parts at a minimum of cost.

The Studebaker Corporation of America, Detroit, exemplifies the quantity production, as the capacity of its plants is 65,000 cars annually. The units entering into the construction of its product are built in the Studebaker plants, which are equipped with specially designed machinery for turning out accurate, perfect fitting components. Throughout attention is given to those minor details which make up one harmonious, well balanced whole. From the time the raw material

The Chassis in the Paint Shop—The Illustration Gives Some Idea of the Production in Large Quantity.

enters the factories until it leaves in the finished product, the automobile, the processes are interesting, and few motorists realize the detail attendant upon the work.

In kinetic machines, such as automobiles, alloy steel is necessary in many of the more important parts, and even the components that are fashioned from the more ordinary grades of steel are made from better materials of better selection than would be true in many other genera of machines. The development of steel from iron is a science, and the quality of the product varies widely. The steel utilized in the Studebaker cars is supplied according to specifications determined by the company's engineers and samples of each invoice are cut off and sent to the laboratories, where they are ground to dust and scientifically tested. Even the finished material, such as axles, connecting rods, etc., is placed in special machines, subjected to twisting and breaking stresses, and the energy required carefully noted. The broken parts are then inspected.

Every piece of steel utilized in Studebaker cars is subjected to at least from four to six special

heat treatments, previous to which the grain of the metal is coarse and easily discernible. After the forging operations, and application of the right degree of heat, the grain is much finer, as the particles are much closer together and the substances more compact. When the forging and heat treating is scientifically determined, the grain is absolutely uniform and free from fissures or flaws of any kind, and there is an even solidity of the structure throughout.

Different kinds of heat treatment are required for various steel and the exact method is determined by exhaustive and painstaking study. The components of the chassis are called upon to meet certain specific and widely different strains and stresses, and it is the duty of the engineers to provide a steel that will not only withstand these stresses but obtain a margin of safety.

If, for example, the steel is to be employed for a camshaft, a part requiring a hard surface to withstand the wear on cams and bearing surfaces: After being approved by the experts it is given its first heat treatment, after which it is forged to shape. The second heat treatment anneals the steel and refines the grain, after which it is milled or machined. The shaft is then packed in a compound, which, under the application of heat, will cause carbon to combine with the steel. This heat treatment is continued under a predetermined temperature for several hours, and during the process carbon slowly combines with the steel to a depth of a .0625 inch, leaving the surface very hard.

The fourth treatment is interesting. The camshaft is plunged into a bath of molten lead heated to exactly the right temperature. The lead is utilized for several purposes. It secures a uniform heat, excludes air and prevents the oxygen in the air oxidizing or scaling the surface of the steel. This treatment refines the grain of the core, making it extremely tough.

At Left, Assembling Studebaker Six Motors at the No. 1 Plant; at Right, Chassis Lined up for Dynamometer Tests—The Cars Run Under Their Own Power and the Capacity of This Room is 90 Chassis Daily.

At Left, Hoods for the Studebaker Four and Six in the Process of Manufacture; at Right, Placing the Finishing Touches on the Crowned Fenders.

The fifth heat treatment is also a bath of molten lead, used to harden the carbon surface, which has been slightly softened by the previous treatment. The temperature is just sufficient to harden or temper the outside, but not so great as to toughen the core. After this the camshaft is plunged in a bath of oil, and when taken out is ready for the final milling or grinding operations, special emery wheels being utilized, as the metal cannot be touched by ordinary tools. Gears pass through similar treatments and in addition are given a sixth heat treatment and quenched in oil to eliminate brittleness. The hardness of the heat treated steel is tested by a diamond pointed instrument, called the scleroscope, which measures the degree of hardness with unvarying accuracy.

Although there may be as many as 25 operations in the manufacture of a certain part, the Studebaker inspection system provides for an inspection after each step. The inspector must see that parts are milled to certain standards of accuracy and a very fine measuring device, termed a dial faced gauge, is utilized. By a system of gears the gauge measures easily and accurately a thickness less than that of the thinnest paper. It also measures the degree of angles, the centering of gear wheels on their axis, and tests the side of a gear wheel to see if it is perfectly true.

Crankshafts are balanced by placing the end bearings on knife blades, supported on a steel frame. If any side of the shaft is heavier than

another, the shaft will turn until the heavy part is underneath. If not perfectly balanced the inspector returns it for grinding. The gear wheels, differential and timing gears are tested with master gears under various pressures to insure perfect engagement of the teeth, and the slightest variation is indicated on a slide rule. The limits are very close.

An important factor in motor construction is the proper casting of the cylinders, pistons and upper part of the crankcase. The casting is made of a certain proportion of best iron ore and scrap steel melted together in a cupola, a coke furnace generating tremendous heat under forced draft. At the bottom of the cupola the molten metal is poured off free from slag or flux into the forms constructed by expert workmen. After the forms, or cores as they are called, are made, they are placed on mammoth trucks and rolled into an immense oven, where they are baked slowly until

View of the Final Assembly of the Studebaker Four at Plant No. 3.

The Studebaker Technical School Where Free Instruction Is Given to Dealers and Their Employees—A Three Weeks' Course Is Provided.

the sand is firmly cemented together by the action of the heat on the compound mixed with the sand.

These cores form the hollow place in the casting after it is finished. They are set in sand molds and the iron is poured around them, forming a wall between the core and the mold. After the metal hardens, the sand cores are pulverized, the reinforcing wires drawn out through openings in the casting, and the rough piece is then complete. All sand remaining in the mold is jarred out by placing the castings in a revolving receptacle.

The grinding is accurately performed by a large machine and after the surfaces are perfectly square, the cylinders are placed on another machine, where auger drills accurately set to a one thousandth of an inch, grind them out, four and six at a time. Special multiple spindle drills in connection with jigs bore out the passages for the valve stem and pushrod bushings, valve seats, etc., a single operation boring the openings simultaneously. After the cylinder is complete it is placed in a testing apparatus and subjected to compressed air and water under test, which insures a perfect motor casting.

The Studebaker pistons are not only made to standards requiring extreme accuracy, but the borings for the wristpin bearing must square absolutely to the side of the piston in either direction. Two steel plugs are utilized for testing, one with a diameter of one one-thousandth

greater than the other. The smaller one must exactly fit the boring.

After the motor is assembled it is sent to the testing building, where it is clamped in a steel frame and run under its own power for several hours under a load similar to that in service. This and other tests reveal any imperfections. The assembly of the rear axle is made as carefully as that of a motor. It passes through a block test, being clamped to a frame and operated under power and load. Specially built trucks are utilized to transport the chassis to the testing room, eliminating the use of axles and wheels. An accompanying illustration shows the chassis of the Studebaker Six lined up for dynamometer test in the No. 1 plant, with the cars running under their own power. The capacity of the room is 90 completely tested chassis in the nine-hour working day.

When the chassis is finally assembled, it is turned over to the testing department, fitted with a rough body and loaded with several hundred pounds of iron to bring the weight up to that of a finished car with its complement of passengers. The machine is operated over country roads, at different speeds, on grades, etc., and if any part does not meet the exacting requirements it is returned to the proper department. After receiving the tester's O. K. the body is removed, the chassis washed and sent to the paint rooms.

Even the springs utilized are tested. They are placed in machines which apply forces corresponding to those met in actual use. The spring is rapidly vibrated under this pressure for days at a time, and finally, when it wears out, its structure is studied by metal experts. This

Illustrating the Final Steps in Preparing the Studebaker Cars for Shipment.

method has resulted in the production of springs which will withstand three times the usage under which springs of two or three years ago would have collapsed.

Pressed steel stampings are very tough and can be made to withstand severe strain in every direction, and they can be made to be very light in weight without sacrificing toughness and durability. The Studebaker Corporation maintains a large stamping plant and such parts as running board brackets, clutch cones, crowned fenders, lower part of the crankcase, etc., are made of stamped steel. The steel is rolled out in strips of predetermined thicknesses and pressed under immense dies into the shapes required. Attached to the stamping plant is a series of enamelling ovens where the fenders and other exposed parts are given a baked finish.

The framework of each Studebaker body, like the other components of the car, is specified and requires certain standard materials. The wood employed is first quality seasoned ash, cut by automatic machinery to unvarying standards. It is reinforced by steel bracework, forged in the forge plant. The backs of the seats and cushions are upholstered by hand, and the tops are built on the body and not on a frame or jig, insuring a perfect fit.

The finish on Studebaker cars comprises 24 paint and varnish operations. The various coats of filler paint are carefully applied and rubbed before the first touch of color goes on and sufficient time is given for each coat to age before the next is applied. The varnish room is especially adapted for producing high grade work.

After the chassis is painted it is wheeled through a door and over a short bridge to a final assembly room, where the body is applied. As the sills are accurately made there is no occasion for fitting, economizing in time. The fenders, top, hood, windshield and other various parts are assembled in order and new wheels and tires, of course, replace those employed in the road testing. The electric lighting and motor starting system is included in the tests and inspection, and the completed machine is ready for the shipping docks of the factory.

The facilities are adequate and before the seal is placed on the freight car door, an inspector must place the final O. K. on the shipment. It is duty to see that every part is complete and perfect and that none is likely to become damaged in transit.

It is the careful inspection of the raw material and that of the various steps in the process of manufacture until the machine is ready for ship-

ment that has made the name of Studebaker well and favorably known to the motoring public of two hemispheres.

TUTHILL TITANIC SPRING.

Eliminates Centre Hole and Is Guaranteed Against Centre Breakage.

It is estimated by those familiar with motor car spring construction that a large majority of broken springs is traceable to the centre hole utilized for a bolt, which binds the leaves together. A spring that presents practical features and one which is guaranteed absolutely against centre breakage is the Tuthill Titanic, manufactured by the Tuthill Spring Company, 760 Polk street, Chicago.

As will be noted by the accompanying illustration, the centre hole is eliminated and that section is made the strongest. An upward curve, in connection with a retaining plate between the two clips, holds the leaves in position, as well as makes for great strength. In addition to this feature the steel utilized is manufactured according to a special formula and two analyses

Tuthill Titanic Spring.

are made of each lot before being utilized. The completed springs are given a series of tests before passing inspection, which is very rigid.

The company carries in stock a large number of types adapted for standard makes of machines and is prepared to produce special designs at short notice. A feature of the policy of the Tuthill Spring Company is its service. Price lists and complete details will be supplied on request.

Ralph F. Herrick, Arcata, Cal., reports to the Paige-Detroit Motor Car Company, Detroit, Mich., that he recently drove his Paige car over what is known as Mathews hill in that town, which has a grade of 38 per cent. A certificate accompanying the report states that this is the first time the hill has been ascended by a motor car.

Roy Daniel, New Albany, Ind., reports that he has covered more than 125,000 miles with his 1907 Kissel Kar, made by the Kissel Motor Car Company, Hartford, Wis., and has been using it for some time as a converted machine, for transporting plumbers' tools and supplies.

IMPROVED HIGHWAYS AND MOTORING LAWS.

Over 1000 Miles of Road Secured Attention in New England During the Last Year---Automobile Manufacturers Outline Policy for Highway Authorities.

SOMETHING over 1000 miles of highways in the six New England states were constructed or improved during 1913, according to the best figures available. Nearly half of this mileage applies in Massachusetts, where the state highway commission completed over 49 miles of state highway, treated 500 miles of state highway with bituminous materials and resurfaced 33 miles of the older roads. Of the 980 miles of state highway in that commonwealth, 881 have now been treated with some form of bituminous material, either in resurfacing or on the surface.

Maine entered the list of states appropriating large sums for state highways in 1913, the legislature having set aside \$2,000,000 for such work.

NEW ENGLAND EXPENDITURES FOR 1913.

	State.		
	Construction	Maintenance	Total
Maine	\$750,676.44	\$8,207.36	\$758,883.80
Massachusetts	1,034,902.00	819,854.47	1,854,756.47
New Hampshire	313,022.75	109,660.57	422,683.32
Rhode Island	279,733.00	260,864.00	540,597.00
Vermont	385,000.00	90,000.00	475,000.00
Totals.....	\$2,763,334.19	\$1,288,586.40	\$4,051,920.59
Connecticut			1,850,000.00
Grand total.....			\$5,901,920.59

Cities and Towns.

Maine	\$1,500,000.00
Massachusetts	9,559,681.00
New Hampshire	240,000.00
Rhode Island	390,000.00
Vermont	225,000.00
Connecticut	1,250,000.00

Total..... 13,164,681.00

Total expenditures, state and local.....\$19,066,601.59

*Connecticut funds undivided.

During the year 163.3 miles of road work was done under the supervision of the state highway department. Plans have been laid for an even larger amount of such work during 1914.

Vermont built some 200 miles of road during 1913. The plan of improvement remains the same, being that of constantly improving the worst places throughout the 4000 miles of selected highways, using gravel or gravel-telford construction.

New Hampshire contributed 106 miles toward the present total of 840 miles of hard surface roads in that commonwealth. All roads built are completed partly at the expense of the

state and partly at the expense of local subdivisions.

According to reports from state highway officials, as appearing in the year book of the American Highway Association, the expenditures by state and local authorities in these six states for the year were as presented in the accompanying table.

OUTLINES ROAD POLICY.

National Automobile Chamber of Commerce Advises Highway Authorities.

After carefully considering the subject of improved highways, the National Automobile Chamber of Commerce has formulated a road policy which it suggests for the benefit of highway authorities who desire to reconcile the demands of automobilists and business men for permanent intercity highways and of farmers for improved tributary roads with the objection of taxpayers to increased road taxes. The suggestions take the form of the following:

Take a census of traffic to ascertain the number and kinds of vehicles using the state roads at different points.

Build brick, concrete or other durable roads wherever there is much heavy teaming, motor trucking and automobile driving.

Such roads should be built wherever the cost of properly maintaining any other kind would amount to more in 25 years than the cost of maintaining the durable road plus its extra first cost and interest on the excess.

Issue 15-year to 25-year bonds to pay for permanent work if sufficient funds are not available. It is sound economic policy to raise money with bonds for all road work that will out-live the term of the bonds.

Pay out of current funds provided by general taxation and assessment the cost of surfacing with any material that is not as durable as brick or concrete.

Make gravel roads where traffic is comparatively light and there is not much automobile travel, first grading and draining the foundation thoroughly.

Extend the mileage of permanent highways with money saved by building gravel roads instead of macadam roads.

Confine construction as much as possible to durable roads and gravel roads so that the total cost will not exceed that of an equal mileage of macadam roads nor increase the state or county expenditure.

Use quartz, shells, burnt clay or a mixture of sand and clay where gravel is not readily obtainable. They are all good substances.

Grade and drain the earth roads and insist upon having them dragged in spring and fall. If necessary, get a drag law passed similar to those in Iowa and Ohio. Drag the gravel roads also in spring and fall, and apply new gravel to ruts and depressions.

Concentrate the expenditure of state funds on the improvement and maintenance of intercity or trunk lines, because they carry about 80 per cent. of the total traffic.

Instead of depending for road funds upon uncertain

appropriations by legislature, provide by law for an annual levy on all taxable property.

Work convicts on the roads and in the production of road materials, thereby cutting down the labor cost.

Have the state or county acquire or lease gravel and sand pits and install modern excavating, sifting and washing machinery to reduce the cost of materials.

Select the most suitable materials nearest the roads to be improved, remembering that haulage is a large item of expense.

Call for bids on long stretches or big mileages of road in one locality, to be built at one time, thus enabling contractors to use motor trucks or tractors for hauling and other special labor and time saving machinery.

Test all materials before use and see that the contractors live up to specifications. Also make certain that the most successful methods are followed in building brick and concrete roads.

TO INTERPRET LIGHT LAW.

Massachusetts State Highway Commission Asked to Reconcile Wording of Statutes.

When the Massachusetts legislature recently enacted the amended light law, applying to horse drawn vehicles, it apparently overlooked the wording of the motoring statute respecting this matter as applied to automobiles, and, as a result, motorists in that commonwealth are somewhat undecided as to their future action. An appeal has been made to the state highway commission to interpret the two laws, so that they may not conflict.

Chapter 578 of the Acts of 1911 reads as follows:

Every vehicle on wheels, whether stationary or in motion, on any public highway or bridge, shall have attached to it a light or lights which shall be so displayed as to be visible from the front and rear during the period of one hour after sunset to one hour before sunrise; provided, however, that this act shall not apply to any vehicle which is designed to be propelled by hand, or to any vehicle while upon any lighted street or highway where street lights are maintained at a distance of 500 feet apart or less, or to any vehicle designed for the transportation, as its principal freight, of hay or straw while loaded with such freight.

Chapter 182 of the Acts of 1914 amends this act by striking out the words, "Or to any vehicle while upon any lighted street or highway where street lights are maintained at a distance of 500 feet apart or less". This not only changes the statute so that it applies to horse drawn vehicles, but it conflicts with the wording of the motor vehicle act, which provides that motor vehicles shall display lights during a period of one-half hour after sunset to one-half hour before sunrise. It may be pointed out that the original law, Chapter 578, did not conflict in the same manner, since automobiles were required to carry lights even where street lights were maintained as stated. Police officials hold that the motoring law still applies to automobiles, and motorists are lighting their lamps one-half hour after sunset, in order to be on the safe side.

SYSTEMATIZING METHODS.

United States Government Studying Systems Employed in 100 Counties.

In an effort to determine the points of excellence or defects in existing local methods of building and maintaining roads, which will aid the state authorities in placing local road management on a systematized basis, the division of road economics of the United States Department of Agriculture has begun a study of such work in 100 counties in the various states of the Union. It is understood that the highway department heads are co-operating cordially in this work, and it is expected that satisfactory results can be accomplished in this manner.

Those in charge of the work state that this investigation has been prompted by the fact that there is at present very little knowledge as to the most effective and economical methods by which a county can develop its roads. The methods of financing local road improvements vary from calling on farmers for a certain number of days labor in lieu of a road tax, or the use of county prisoners in road construction, to bond issues or maintenance of roads from dram shop license funds. Moreover, there is no standard system of keeping accounts, and as a result among various counties with the same conditions, the cost for excavation or other labor is anything but uniform, and many counties, because of the absence of definite knowledge, fail to use local and cheap materials and construct roads which are unnecessarily expensive for the purpose, or which will wear out before the bond issues are redeemed. The investigation also will include a careful study of the use of convict labor in road construction.

BRIEF NEWS NOTES.

The Massachusetts Senate has passed the act forbidding the operation of motor vehicles of any kind in the Town of Nantucket, on the island of that name, having amended the original bill so as to provide a penalty of not less than \$10 nor more than \$100 for each offense.

Governor Oddie of Nevada has announced his intention of appointing a good roads day for some time in June, on which work will be commenced on the Lincoln highway in that state.

Attorney-General J. C. Bell of Pennsylvania has brought a third mandamus action against Auditor-General A. W. Powell, to compel him to honor requisitions from the state highway commission in the matter of automobile fees under the act of 1913. The action is for the purpose of securing an early court decision on the constitutionality of the law on this point. The fund has now reached something over \$900,000, which, it is claimed, should be expended on highway improvements.

County Commissioner M. G. Robson of Logan county, Ohio, has unearthed an old law, prohibiting the use of the highways to vehicles of more than 4200 pounds, except they are fitted with five-inch tires. This is held to apply to motor trucks and pleasure cars.

MACHINERY, TOOLS, EQUIPMENT AND SUPPLIES.

THE need of some form of chain hoist in the garage and repair shop is more marked than formerly when the practise was to cast the

Simplex Two-Speed Chain Hoist.

motor cylinders singly and in pairs. The en bloc casting is difficult for one or two men to handle, especially if the engine is a six-cylinder unit.

J. G. Speidel, Reading, Penn., is manufacturing the Simplex chain hoist, one of the qualities of which is that it is a two-speed device, a construction saving time where the load to be lifted is of

varying weight. As will be noted by an accompanying illustration, an endless chain runs over a chain wheel, which, in connection with a pinion and a brake wheel with ratchet teeth in the outer rim, forms the automatic brake, which prevents the load from descending. These three parts, when assembled, make practically a unit construction, and turn loosely on the reduction extension of the main shaft.

The pinion attached to the hand chain wheel drives a spur gear, which is keyed to a second shaft, at the end of which is another pinion. The last named member engages with an internal spur gear, which is keyed to the opposite end of the main shaft, to which is attached the lift chain wheel. Motion is transmitted from the hand chain to the lift chain, and by pulling on the hand chain, in either direction, the load is lifted or lowered. When hoisting a load the brake wheel, with its ratchet teeth on the outer rim, rotates freely with the hand chain wheel and pinion, and without resistance, as the ratchet pawl runs freely over the teeth. When the pull on the chain wheel ceases, the pawl engages with the teeth of the ratchet on the brake wheel, preventing it from running backward, and so keeping the load suspended.

In lowering the load the hand chain is pulled in an opposite direction, and but little effort is required to overcome the friction of the automatic brake, thus permitting the load to descend and holding the same suspended again, as soon as the workman stops pulling on the hand chain. The load can be lowered at a good rate of speed by a continuous pull upon the hand chain.

By means of an ingenious arrangement of the lower block, the lift chain is locked to the chain wheel of the lower block, providing the two speeds referred to, making for economy of time in handling light loads. Closed rings attached to a swinging frame provide guides for the hand chain, enabling the operator to stand away from under a load, pulling the chain at an angle, without producing any appreciable amount of friction or wear on the chain or guide. The construction eliminates the possibility of the chain wedging between the wheels and guides. Price lists will be supplied upon request.

GEMMER-DETROIT PUMP.

Electrically Driven Garage Equipment Designed to Withstand Heavy Service.

The Gemmer-Detroit Starter Company, Detroit, which concern has announced a pneumatic starting system for motor cars, is manufacturing electrically operated pumps for the garage, and one of the types is shown in an accompanying illustration. This is a portable design.

Gemmer-Detroit Garage Pump.

Efficiency is one of the qualities of the outfit emphasized. The pump is a four-cylinder, air-cooled unit, the cylinders having a bore of 1.5 inches and stroke of 1.75. The tank has sufficient capacity to inflate 15 34 by four-inch tires with one filling. It is stated that the pump will renew the air supply quickly, and that 175 pounds pressure can be pumped up in 20 minutes.

One of the features of the equipment is the elimination of the usual platform. The running gear is of heavy metal strips welded directly to the tank, and the rubber tired wheels are swivelled to these strips.

AMERICAN TURNTABLE.

Consists of Steel Frame and Plates and May Be Utilized as a Wash Rack.

The Minneapolis, Minn., branch of the American Bridge Company, is producing the turntable

American All-Steel Turntable.

shown herewith, which is constructed in two sizes, 14 and 15 feet respectively. The table consists of a steel frame constructed of three-inch I beam section, carrying .25-inch steel plates. The table rolls on 12 cast iron wheels, these being carried on a spider having spacing bars. The top plates of the table are perforated, permitting of its use as a washstand if desired. One plate is made removable so that inspection and lubrication are made easily.

GROETKEN PUMP.

Is of the Self-Measuring Type and Is Adaptable for a Number of Purposes.

The J. J. Groetken Pump Company, Aurora, Ill., is manufacturing a pump for the convenient and economical handling of gasoline, kerosene, oils and other liquids. It is of the self-measuring type and can be made to serve a number of

purposes. One of its qualities is that it can be employed with barrels as well as with underground systems. The construction is simple and accuracy in measuring is emphasized in the design.

The pump proper consists of two seamless brass cylinders, to which are attached an iron cap and base. The cap is made in two sections, with the lower member chambered to permit the use of a fibre gasket, into which the ends of the cylinders are seated, making a tight construction. The base is machined and chambered where joined to the cylinders to provide an absolutely tight joint. The assembly is rigidly retained by four .3125-inch bolts, and the lid of the cap is clamped to the cap with .25-inch cap screws. It is stated that the gland stuffing box utilized in this pump prevents leakage around the crankshaft. The cap of the pump forming the housing for the crankshaft, also acts as an air chamber, facilitating the flow of the liquid.

The pump head is 15 inches overall, and all pumps have one-inch standard pipe intake and .75-inch outlet. All parts are machined carefully and each pump is tested after assembly. Prices and complete details will be forwarded upon request.

Groetken Pump.

MORGAN SCRAPERS.

A Flexible Tool with Ends Bent to Make Easy Removal of Carbon from Cylinders.

The Morgan Manufacturing Company, Newport, R. I., is marketing the Morgan carbon scrapers which come in sets of three. The tools are constructed of a high grade of steel, are flexible, and two have their ends bent to right angles and sharpened for removing deposits from the top of the cylinders or pistons. The third tool is straight, but both ends are sharpened for scraping around valves and their seats, etc

Morgan Flexible Carbon Scrapers.

BURD PISTON RINGS.

Utilizes a Bronze Coupler to Obtain a Gas Tight Construction.

R. L. Burd, 818 South Main street, Rockford, Ill., is manufacturing the Burd high compression

Burd Compression Piston Ring.

ring shown in an accompanying illustration, and the ring is shown relaxed and coupler detached, ready to be sprung over the piston. After the ring is sprung over the piston, the bronze coupler is inserted, and it is stated that the two lock together as the cylinder is slipped over the construction.

It is claimed that the design provides an equal pressure on the cylinder walls, and that the coupler seals the opening effectually, preventing the passage of oil or the mixture. The maker states that the rings have been subjected to severe tests in service and that they will considerably improve the compression of any motors, particularly old engines. The Burd rings come in standard sizes up to six inches.

MORGAN HOSE CLAMP.

Is Quickly Attached and Fits Intermediate Sizes Within Its Capacity.

The Morgan Manufacturing Company, Newport, R. I., is marketing a clamp or coupling for hose which presents several practical features, the most noticeable of which is that it will fit any intermediate sizes of pipe within its capacity. As

Morgan Hose Clamp.

will be noted by the accompanying illustration, it includes a flat band and buttress, and a slot in the latter permits of quick attachment. The band is secured by a T head bolt carrying a wing nut, and one of the qualities of the design is that no tools are necessary to adjust the clamp. As will be noted by the drawing, the band is provided with several holes for the purpose of fit-

ting different sized hose. The type 10 is constructed of stamped brass with nut of similar material and the steel screw has a fine thread. The clamps come in different sizes and are inexpensive.

MASTER GARAGE PUMP.

Hartford Machine Screw Company Marketing Moderately Priced Electric Unit.

The Hartford Machine Screw Company, Hartford, Conn., is producing a line of electrically operated garage pumps, one of which, the model G, is illustrated herewith. It is provided with a storage tank mounted beneath the platform and the container has a capacity of 2300 cubic inches. It is stated that it may be pumped up to a pressure of 200 pounds a square inch in less than 10 minutes.

The motor is a standard type and the company supplies either an alternating or direct design for 110 volts, the direct listing at \$5 extra. The regular equipment includes a connection plug for the light socket, 20 feet of heavy lamp cord and 20 feet of high grade air hose

Master Electric Garage Pump Unit.

with tire pressure gauge attached. The overall dimensions are: Length, 40 inches; width, 24; height above floor, 33, and weight from 375 to 450 pounds, depending on the type of motor utilized. The platform is sturdily constructed, equipped with wheels, and a convenient handle is provided. The equipment can be moved easily about the garage or rolled out on the road when tires are to be inflated. It is stated that when thus used the tank will inflate four 37 by five-inch tires to 90 pounds pressure without starting the motor.

The company manufactures a similar but smaller type, known as model N. It is portable, but no tank is provided, the pump connecting directly to the tires. It is stated that the pump will inflate a 37 by five-inch tire to 90 pounds pressure in 2.75 minutes. The regular equipment includes 10 feet of air hose with pressure gauge attached and 20 feet of flexible lamp cord with plug connector. The overall dimensions are: Length, 28 inches; width, 16; height from floor, 18. The weight is about 100 pounds with

alternating or direct current motor, both being 110-volt. The model N is also supplied mounted on a base for stationary work. Data on garage pumps will be supplied by the company upon request.

THE CALCULAGRAPH.

Prints Elapsed and Actual Working Time in Hours and Minutes, or Fractions.

The advantages of keeping an accurate record of the time spent on each job is appreciated both by the car owner and the proprietor of a garage or repair shop. Instances of a motorist questioning the time charged to him in a repair job are not uncommon, especially if the shop is not equipped with some form of time keeping instrument or practical system.

A device that is stated to maintain an accurate record of the time spent by the workman on a job, and which prints the elapsed time or actual working time in hours and minutes or fractions of an hour, is the Calculagraph, made by the Calculagraph Company, 13 Maiden lane, New York City.

The clock is shown in an accompanying illustration and stamps on on a card the time the work is started, completed and the elapsed time. All the workman has to do is to insert a card in the clock and pull the stamping lever. When the job is completed he places the card in the clock again and the time consumed is automatically recorded.

The advantages claimed for the system are: Saves time wasted when the workman makes out his time slip, simplifies bookkeeping, as the actual time is recorded, and insures accuracy.

The calculagraph has three dials. That at the right shows the time the work is commenced

and the other two the time employed, the left indicating the hours and the centre the tenths. When the card is inserted in the machine the handle is pulled in one direction and this stamps the starting time, also the figures of the other two dials. When the job is completed the handle is moved the other way and this stamps two arrows, indicating hours and tenths on the card. Each arrow and its dial rotate together. A date printing attachment is supplied if desired.

NEW BARNES LATHE.

Sliding Gap Extension Machine Adapted to a General Class of Work.

A new 22 to 36-inch sliding extension gap lathe, having a bed 102 inches long, and adapted to a general class of work in a shop where the demands are of large range, has been brought out by the Barnes Drill Company, Rockford, Ill.

The lathe will take work between centres, with the gap closed, 50 inches in length, while the gap has a maximum opening of 36 inches. The top bed, which is 24.875 inches wide, extends beyond the main bed to provide a firm support for the carriage when turning large diameter work in the gap. This is held to eliminate the necessity of an auxiliary brace.

The lathe has a cone pulley drive, with a four-step pulley. There are 12 spindle speeds, ranging from 2.3 to 400 revolutions a minute, with a countershaft speed of 200 revolutions a minute. There are six geared feeds ranging from .008 to .123 inches a revolution of the spindle. Any number of threads ranging from two to 20 can be cut. Two sets of back gears, having ratios of

Barnes New 22 to 36-inch Sliding Extension Gap Lathe.

8:1 and 44:1, respectively, are provided. The net weight of the machine is approximately 5300 pounds.

IN THE COMMERCIAL VEHICLE FIELD.

Additional Features of Design and Construction Recently Incorporated in Trucks on the American Market---New Four-Wheel Drive Machine for German Army.

TWO American trucks have radius rods designed with heavy springs incorporated with the forward sections, there being a telescoping coupling to permit the spring action, in addition to the usual provisions for compensation of vertical and horizontal movement of the back axles. The first of the designers to adopt this construction developed the Velie three-ton model, and the same feature has been utilized for the two-ton chassis.

The rods are of conventional length and construction, aside from the spring and the coupling of the two sections, being mounted on the rear axle and jackshaft hanger. The spring is helical, of square section metal, with comparatively little space between the coils. This spring surrounds the rod and the rear end is seated

heavy helical springs that have practically the same effect, being installed around a short telescoping section of the forward ends of the rods. The springs are much shorter, however, and the metal is round section, but the convolutions are close together. The design differs in that the forward section of the rod, which is carried on the jackshaft hanger, has a fixed collar, and the rear collar is threaded on the rod, back of this being a large nut with a scored edge, against which the collar is seated.

Turning the collar and the check nut will afford any adjustment of the spring, the tension being such as will permit compression whenever the shock is excessive. The coupling is such that the spring will carry all the load when fully compressed, and there is comparatively little thrust

Spring Buffer Radius Rod of Velie Three-Ton Chassis; Jackshaft Hanger on Republic One-Ton Wagon, and Spring Equipped Radius Rod on Atterbury Two-Ton Model.

against a collar fixed on the rod. The forward end contacts with a large adjustable collar, so that the tension of the spring can be adjusted to whatever pressure is desired. The spring is of such strength that the movement is comparatively slight, but there is a sufficient cushioning effect whenever the shock is excessive, this protecting the chassis as well as lessening the strains upon the tires. The springs are long, this being necessary because of the number of the convolutions and the minimized movement under compression, and they are sufficiently back of the service brake drums to be easily accessible for any adjustment that may be desired.

The rods installed on the Atterbury chassis, from one to five tons capacity, are fitted with

directly upon the chassis frame. The springs and connections are packed with grease and protected with leather boots, so there is practically no wear upon them.

Pierce-Arrow Features.

One of the features of the Pierce-Arrow two-ton chassis is the manner of equalizing the emergency brake pressure, which is accomplished through linkage that is actuated by a direct forward pull, a yoke being linked to arms clamped to a divided shaft that is mounted in extensions of the brackets carrying the spring shackles. These brackets are connected by a tubular cross member that ties the frame and supports the forward end of the torque arm. This hanger also supports the forward ends of the radius rods.

Practical Methods of Brake Linkage: Equalizer of Pierce-Arrow Two-Ton Chassis; Simple Device for Double-Acting Rear Brake on Walter, and Shaft and Sleeve Form of Brake Rod Connection on the Kelly Five-Ton Truck.

The driving shaft of this machine is supported in the centre of the frame by a cross member that is slightly dropped, and on which is mounted a self-aligning bearing of large size. Just forward of this is a universal joint that is completely housed to protect it against dust and abrasive substances. This construction is held to eliminate all side pressure and end thrust, no matter what the distortion of the chassis may be.

The rear axle of the 3000-pound Atterbury worm driven truck is somewhat out of the ordinary, in that the spring seats are of unusual length to insure against stresses from the drive through the springs, and the steel axle housing is formed of a centre and two end sections bolted together. On the centre section is bolted the mounting of the worm shaft. The end sections of the axle housing carry the brake shaft brackets, which are cast integral and machined, instead of being separate fittings. The axle is trussed to insure maximum strength.

An equalizing device that is extremely simple is that used on the Walter front drive truck, there being a rod extending back in the centre of the chassis frame. This is connected with the service brake pedal, so that pressure applied to the pedal will actuate the transmission brake, as well as the rear wheel brake, the effect being in all four wheels. The rod has a turnbuckle section and a yoke end that is pivoted on a cross bar that is slidable in guides beneath the frame side members. The ends of the cross bar are drilled for the bolts of yokes that are in turn yoked with the adjustable ends of the brake pull rods. Thus every possibility of pressure preventing the effective operation of the brake is held to be obviated. The pull rod is also so connected with the emergency brake lever that movement of this increases the pressure upon the brake shoes in the rear wheel drums, but does not affect the service brake.

The brakes of the Kelly trucks are internal

Long Skeleton Type I Section Torque Arm on Velle One-Ton Chassis; Centre Frame Member, Supporting Self-Aligning Bearing and Main Driving Shaft on Pierce-Arrow Two-Ton Model, and Sectional Rear Axle of Atterbury 3000-Pound Wagon.

expanding in the rear wheel drums, and these are operated by pull rods at either side of the chassis, within the frame. The brake shafts extend across the frame, consisting of a solid shaft and sleeve, the latter carrying a yoke that clears the rod, the longest arm forming the lever, and the shaft carries a similar lever arm. Both are connected by pull rods with lever arms mounted on short shafts and sleeves at either side of the rear axle.

Republic Service Brake.

The Republic truck service brake is installed on the jackshaft, the drums being of a conventional type, with the brake bands contracting upon them. The sprockets and the brake drums are carried on flanges on the shaft ends, and the jackshaft hangers, bolted to the frame, each has a bracket slightly in front of the drum, on which the bands are hinged. The clamping lever of the brake is pivoted at the rear on a similar bracket, and the pull rod is carried forward in a direct line and coupled with the linkage. The jackshaft

Dusseldorf. The machines furnished were equipped with guns adapted to be fired at balloons, aeroplanes, etc.

The motor is a four-cylinder unit, with bore of 130 mm and stroke of 150 mm (5.1 by 5.9 inches), rated at 50 horsepower. The two central bearings of the crankshaft are carried in the upper half of the base chamber, while the two end bearings are divided, one part being supported in the top half and the other in the lower portion of the crank chamber.

The change speed gear, which is connected to the engine through a leather faced cone clutch, is adapted to give four forward speeds and reverse. There are three shafts in the gearbox, these all being located in the same plane, one above the other. The sliding pinions are mounted on the top shaft, which is castellated for this purpose. The gears on the two lower shafts are constantly in mesh, the lowest carrying a differential gear, and also are provided with uni-

versal joints at each end, which transmit power through propeller shafts extending forward and backward to the front and rear wheels, respectively, both of the last named being driven through bevel and differential gearing.

In the front, as well as in the back axles, the live shafts

Plan View of Ehrhardt Four-Wheel Drive Chassis, Recently Delivered to the German Military Officials.

hanger also carries the forward end of the radius rod.

The Velie one-ton delivery wagon is shaft driven and the rear springs are shackled at either end. The driving and braking torque is taken by a long torque arm at the left side of the driving shaft that is pivoted on the axle housing and spring supported at the forward end. This arm is an I section, with the web at the rear end cut to reduce weight.

EHRHARDT FOUR-WHEEL DRIVE.

Some Details Concerning New Truck Supplied to German Military Authorities.

Accompanying sketches set forth the constructional details of the new Ehrhardt four-wheel drive wagon, recently supplied to the German military authorities by Heinrich Ehrhardt.

are enclosed in a casing. On the front axle, built up with the steering pivots, is a dust and grease tight casing which encloses a series of bevel pinions, enabling the drive to be transmitted to the front wheels at whatever position they may be turned under the action of the steering wheel.

The rear wheels, which are mounted on the axle casings, and receive their driving effort through dog clutches fitted to the ends of the axles, are of special type, built up of sheet steel discs and shod with twin solid rubber tires. On each side of the wheels extension rings are bolted, so that when the vehicle is travelling over soft ground, into which the tires may sink, there is a rim surface 15 inches wide, which assists in preventing loss of traction.

The capacity of the chassis is assumed to be limited to small loads, in view of the class of service for which it is intended.

QUICK LUMBER HANDLING.**Combination of Loading Crates and B. A. Gramm's Truck Minimizes Time and Labor.**

Another example of the methods that may be employed to insure efficiency and economy in

Crated Load on Hand Truck Ready for Transferring.

the use of motor vehicles is noted in the service of the Hawkeye Lumber & Coal Company, Cedar Rapids, Ia. The concern is one of the largest lumber dealers in that city, and makes deliveries covering considerable distance outside of the municipality. For this so-called long haul work it purchased a two-ton B. A. Gramm's truck, made by the Gramm-Bernstein Company, Lima, O.

It early was demonstrated that, in order to realize the maximum value of the truck, it would be necessary to secure some more efficient method of loading and unloading. As an experiment, a number of crates were built, these consisting of a stout platform with stanchions or stakes at either side. These are placed on yard hand trucks and wheeled to a loading platform, so arranged that the decks are on about the same level as the platform body of the motor truck.

The plan involves loading the hand truck in the yard or lumber sheds, and when the motor truck returns from a trip it is backed to the loading platform. The platform of the crate is dropped onto a roll set slightly above the deck of the motor truck, and by turning this roll with a hand crank the crate is drawn into place, other rolls taking the load as it advances. One man operates the crank and the loading is accomplished rapidly and with little labor.

When the loaded crate has been transferred to the motor truck it is secured with a binding chain or rope. At the destination the load is un-

bound, and by reversing the movement of the rolls it is dropped to the ground. The crate is picked up at convenience or when the next load is delivered. Accompanying illustrations indicate the method of transferring the lumber when loading.

ARMY OPENS TRUCK BIDS.**War Department Will Purchase Four 1.5-Ton Trucks for Aerial Squadron.**

The War Department opened bids May 22 for four 1.5-ton trucks for service with the aerial squadron at Galveston, Tex. The specifications call for machines having an overload capacity of 20 per cent., with either two or four-wheel drive through a shaft. The motor must have four cylinders cast en bloc, water-cooled, with dual ignition and preferably with three point suspension. The clutch must be a leather faced cone. Other details include: Four-speed transmission, 120-inch wheelbase, irreversible steering, semi-elliptic springs of chrome silico-manganese steel. The vehicle must not exceed 5000 pounds in weight, empty.

The body must be three feet four inches wide, one foot nine inches deep, nine feet six inches long at the bottom and 10 feet at the top; all according to the standard army escort wagon specifications, complete with bows and canvas cover. It also must be detachable back of the driver's seat. The material must consist of white oak, reinforced with angle iron, and the floor

Lumber Completely Loaded Ready for Delivery Trip.

must be protected by four strips of wearing iron, 1.5 by .1875 inches, running lengthwise the full length of the body.

SUGGESTIONS FOR THE NEW CAR OWNER.

Attention Necessary with the New Automobile, with Special Reference to the Model T Ford---How a Selective Sliding Gearset Operates.

In response to a large number of communications from owners of small and popular priced automobiles, asking for information as to their construction, adjustment, repair and maintenance, there will be presented in this department a series of educational articles dealing with the above named subjects. Each make will be treated separately and the discussions will deal with the principles involved and their application in practise.

To maintain a motor car economically, and to prolong its usefulness, it is desirable that the owner be familiar with its construction, and when the function of each part is understood the work of making adjustments or completing repairs is not difficult. There is much satisfaction in knowing one's car. It not only enables the owner to correct minor troubles while on the road, but eliminates the repair bill due to a lack of knowledge, as well as other expense.

For the benefit of those owners not mechanically inclined, and who hold that the construction of certain components is too complicated to be mastered, the discussions will be devoid of technical terms. Each part will be taken up in logical sequence and its function clearly shown by illustrations. The serials will be concluded by practical suggestions for economical maintenance.

MODEL T FORD—PART I.

When the agent delivers the new car to the purchaser, general instructions are given as to the fuel, oil and water supply. The novice is told to keep the radiator filled with water, oil in the crankcase and gasoline in the tank, but in learning to operate the machine he generally forgets the reasons advanced by the salesman for attending to these details.

As the motor will not run unless supplied with fuel, a complete consumption of the gasoline results in no other trouble than annoyance and a replenishing of the supply. Cooling and lubrication are important and too much emphasis cannot be laid upon the necessity of providing a proper supply of both fluids, especially with a new motor, the working parts of which are more or less stiff.

Cooling the Motor.

Dealing first with the cooling system, it should be borne in mind that the explosion of the mixture in the combustion chamber of the cylinders results in considerable heat, and were not means employed to keep the temperature within certain well defined limits, the metal would become so hot that it would ignite the mixture upon its entrance into the cylinder, bringing about what is termed preignition.

Water is utilized to cool the engine, the fluid being circulated in spaces termed water jackets, and through the radiator, the last named member being utilized to cool the heated water. The

amount of water necessary is computed by the designer and it is important that any losses through evaporation or boiling be compensated for by renewing the supply. Until the operator learns to utilize the spark to advantage he is apt to rely upon the throttle, and also is prone to race the motor, all of which tends to raise the temperature of the cooling fluid, especially in warm weather.

Filling Radiator.

The radiator should be kept filled with clean, soft water, and it is good practise to completely empty the cooling system at least once a week and refill with fresh water. The use of hard water should be avoided. If the radiator is emptied, renew the supply slowly to avoid forming air pockets. If the radiator is filled to its capacity, upon the water becoming heated it will expand, causing a slight overflow through the pipe provided for this purpose, but should the fluid boil unduly, it is well to examine the radiator to note if the water is circulating. The radiator should be cooler at the bottom than at the top. As the cooling system will be taken up in detail in another article the subject may be dismissed here with the above general suggestions.

Lubrication.

The function of a lubricant is to prevent wear of the working parts and to minimize friction. It prevents actual contact of the moving parts and a good oil has capacity for storing and carrying away heat. A new car requires a greater supply of lubricant during the first 200 or 300 miles, as the bearings, etc., are more or less stiff. Provision is made for noting the supply on hand, which is stored in the flywheel housing. The last named member is provided with two petcocks, the upper denoting the level to be maintained until the motor has been operated sufficiently for all bearings to have become worked in. The lower petcock may be termed a safety level, in that under no circumstances should the supply be allowed to get below it.

Motor Lubrication.

The replenishment is made through the breather pipe. Previous to renewing the supply the upper petcock should be opened, and if oil does not flow, pour in the lubricant slowly until it does. The opening in the petcock should be kept free at all times, as it is obvious that the

motor would be flooded should the oil fail to run out of the petcock when renewing the supply. After the parts have become what is termed limbered up, the supply may be cut down, filling to a level between the two petcocks. With the new car it will be necessary to give close attention to the oil supply. A high grade, light oil is recommended by the maker.

Oil and Grease Cups.

All parts of the chassis subject to friction are provided with lubricating means, either oil or grease cups. Beginning with the power plant, there is the fan bearing to be lubricated, and it will not be amiss to oil the bearing of the starting crank shaft. The commutator should be oiled about every 200 miles and it is good practise to first clean it by injecting gasoline or kerosene to displace any particles of metal or grit.

any surplus oil to prevent the accumulation of dirt. Observe similar precautions in renewing the supply of grease in the cups provided, and when purchasing grease always insist on the best, one free from acid or corrosives. Cheap lubricants are dear at any price.

COLE TRANSMISSION.

The operation of the change speed lever is familiar to those who drive a machine having a sliding gearset, but how the different speeds are obtained is not so well known. A knowledge of the construction and operation of the gearset will be of value to the new owner, as it will explain to a certain extent why trouble is experienced in changing speeds under given conditions.

The gearset of the Cole series eight is shown

Chart of Model T Ford Chassis Showing Parts Requiring Lubrication and According to Mileage.

The transmission is lubricated by the oil poured into the reservoir. Nothing but oil should be used in the motor, as graphite or other compositions have a tendency to diminish the efficiency of the flywheel magneto.

The best method to insure proper attention to the parts requiring occasional lubrication is to tack up on the walls of the garage a lubricating chart showing the components requiring oiling and grease. The accompanying chart will be found useful, it being arranged according to the instructions of the maker of the car discussed.

Renewing Supply.

In renewing the supply of lubricant in the oil cups, it is best to first wipe the cup clean to prevent any road dust being carried by the fresh oil to the working parts. Road dust is a fine abrasive and its cutting powers are rapid. Wipe off

in an accompanying illustration as it would appear if it were to be removed from the housing, and as it is of a conventional type with its components lettered, the explanation of its operation can be followed easily.

The male member of the clutch, that part which is withdrawn from contact with the flywheel when the clutch is disengaged, slides freely on the shaft XX, yet turns with it, as there are four spines integral with the shaft, these absorbing the torque. Attached to the shaft XX is the drive pinion A, which is always in mesh with the larger gear CM, and these two are termed the constant mesh gears. Whenever the shaft XX turns, the lay or countershaft on which the gear CM is mounted, also rotates, but, as the drive pinion A is considerably smaller than the gear CM, it rotates much more slowly.

The gears CM, D, O and R, the second, low and reverse members, are practically integral with the countershaft and rotate with it. Gears E and F are sliding members. While they revolve with the mainshaft H they may be moved forward or backward, or in an axial direction, because of the splines which fit into slots in the gear hubs.

The movement of the gears E and F is accomplished by shifter forks K and C, these being attached to the shafts S1 and S2, the low and high speed shifter rods respectively. Stops are utilized to prevent the rods from moving of themselves. The plunger stops are placed in holes provided to receive them and drop into notches cut into the shifter rod at the proper point. They are pressed against the rod by

Components of Selective Sliding Gearset Lettered to Define Their Construction and Operation.

means of springs and the hole back of the spring is closed by a threaded plug.

The operation of the gearset is best explained by the progressive steps, as when changing speeds. Beginning with the first or low speed, the placing of the change speed lever into its correct slot moves the shifter rod S1 in the direction opposite to that of the arrow. The motion is transmitted through the shifter fork K to the gear F, and the latter moves forward into mesh with the gear O below it on the countershaft. Upon the clutch being engaged the energy is transmitted in the following manner:

The drive pinion A rotates the gear CM, and consequently the low speed gear O. The last named member being in mesh with the gear F the

latter is rotated, also the shaft H, which is connected to the drive shaft actuating the rear axles.

The second speed is obtained by disengaging the clutch and unmeshing the gears F and O, and sliding the gear E into mesh with D, the sliding member in this instance being moved forward. As was the case with the low speed the drive is imparted through pinion A and gears CM, D and E to the mainshaft. With both the low and second speed the mainshaft H rotates at a slower speed than the motor, thus obtaining the reduction between the engine and the mainshaft.

With the high gear or direct drive none of the transmission gears is in mesh; that is, those providing a reduction between the motor and the mainshaft. The gear E is provided with four jaw clutches J and these engage with similar members on the drive pinion A. When the sliding gear E is moved forward, these clutches mesh. The mainshaft then becomes the driving member, transmitting energy to the driving axles.

With the first, second and direct drive, the mainshaft rotates clockwise, or in the same direction as that in which the crankshaft of the motor rotates, and this holds true when either of the first and second speed gears of the countershaft is in mesh with those on the mainshaft. It will be noted that the countershaft rotates anti-clockwise. When any of its gears are in engagement with those on the mainshaft, the latter will rotate clockwise.

The reverse is obtained by rotating the mainshaft anti-clockwise. An idler gear RI is always in mesh with the gear R. The latter is secured to the countershaft and rotates with it. When the gear F is moved into engagement with the gear RI the mainshaft will turn anti-clockwise, as the drive is through the gears A, CM, R and RI to F. Gear R rotates anti-clockwise, gear RI clockwise and F anti-clockwise.

It will be observed that there is a difference in the size of the sliding gears and the fixed members, and it is this variation that is a factor in the changing of speeds. To obtain easy and noiseless engagement it is important that the speed of each be approximately the same, which requires acceleration, etc., of the motor, although the spinning of the clutch is a factor to be considered.

Several Metz cars, made by the Metz Company, Waltham, Mass., are being used by Gen. Villa and his officers in the Constitutionalist campaign in Mexico.

WILL STUDY EFFICIENCY.**Automobile Men Interested in the Formation of Detroit's Executives Club.**

Through the combined efforts of F. F. Beall of the Packard Motor Car Company, Alvin S. Knoblock of the Northway Motors Company and E. St. Elmo Lewis of the Burroughs Adding Machine Company, the Detroit Executives Club has been formed for the purpose of studying and preaching efficiency in all branches of manufacturing and retail business in that city. The club is composed of members of the Detroit Board of Commerce, and its active membership is limited to 50. Boyd Fisher, formerly associated with the Efficiency Society of New York, has been engaged temporarily to devote his entire time to the work which will be carried on.

The by-laws provide for a small, compact working, efficiency organization. The object is set forth as follows: "To propagate a wider knowledge of the principles of efficiency and such other subjects as may be determined upon by the executive committee. The first two activities of the club will be confined to: First, a thorough survey of the firms in Detroit that are studying and applying principles of efficiency in the operation of their business, and second, an exhaustive study of the subject of profit sharing plans which have been adopted by various industrial and business enterprises, not only in this country, but in Europe.

PHILIPPINE IMPORTS.**Those of Automobiles and Accessories Have Shown a Remarkable Increase.**

Imports of automobiles and accessories into the Philippine Islands have shown a greater increase in recent years than probably any other commodity, in spite of the rather straightened financial circumstances which have been prevalent during the past two years, according to G. C. Bristol, manager of the foreign department of the Motz Tire & Rubber Company, Akron, O.

In the fiscal year of 1911 there were imported 429 automobiles, valued at \$567,177, and in 1913 this had increased to 624 cars, valued at \$886,710. Imports of accessories increased in value from \$147,597 in 1911 to \$271,237 in 1913. Of the last named amount, \$180,823 was represented by the value of tires imported.

Mr. Bristol states that his company's shipments to the Philippine Islands have increased

tenfold during the past two years, and that the Bachrach Garage & Taxicab Company of Manila, distributor for Motz cushion tires in the Orient, reports the trade for 1914 promises considerable additional business.

CHALMERS' NEW YORK PLANS.**New Factory Branch Will Become Distributing House for Entire Eastern District.**

Some little interest attaches to the plans of the Chalmers Motor Company, Detroit, in purchasing the business of Carl H. Page Company of New York City and establishing the Chalmers Motor Company of New York in its place. The sale was announced in these columns recently, and the actual transfer of the property was consummated this month.

The new concern is to be a direct factory branch, and, while it will continue to act as the local retail representative of the company, it also becomes the general wholesale distributing house for the entire eastern district, embracing New England, the Middle Atlantic and Southern Atlantic States. George Stowe, who has been associated with Carl H. Page in directing the affairs of the old company, has been appointed branch manager.

NAME SPECIAL COMMITTEES.**Automobile Engineers in New York City Seek Information on Timely Topics.**

As a means of gathering timely information on a number of important topics, the Metropolitan section, Society of Automobile Engineers, New York City, has organized a number of special research committees. The plan has been devised in order to shed new light on questions to which a great deal of attention is being directed, but which involve complications that are considered a hindrance to progress. The following list of committees indicates the character of the problems selected thus far:

Gas-Electric Vehicles—David Beecroft, William P. Kennedy, Lars G. Nilson.

Kerosene Carburetors—A. B. Browne, W. Rautenstrauch, Joseph Tracy, Roger B. Whitman.

Greases—H. M. Martin, George K. Bradfield, W. F. Parish, L. P. Prossen.

Non-Electric Continuous Torque Transmission—L. M. Dietrich, Morris Machol, John R. Cautley.

Engine Characteristics—James L. Breese, Lloyd G. Busby, Robert McA. Lloyd, Finley R. Porter, W. M. Power.

Governors—Arthur J. Slade, C. W. Fletcher, H. G. McComb.

RACING EVENTS AND OTHER CONTESTS.

Metz Company Is Barred from Defending Its Title to Glidden Trophy by Rules Adopted for 1914 Tour—Hill Climb Result in the South—Notes and News.

THE Metz Company, Waltham, Mass., may be pardoned for asking a reconsideration of the rules laid down by the American Automobile Association for this year's Glidden tour. It will be remembered that this classic trophy—one of the most famous in the history of the industry in this country or abroad—is now held by that concern, having been won with a team of three Metz cars in the national reliability tour from Minneapolis to Glacier Park, Mont., in 1913.

The rules governing this year's contest were published in the last issue of The Automobile Journal. They provide that the Glidden trophy shall be the award in the class for cars selling at over \$1200. Since the Metz car lists for \$475, it is obvious that the present holder will be unable to defend the honor, unless the regulations are changed.

The Metz car is not entirely excluded from the contest, since it is eligible for the class confined to cars selling at less than \$1200, for which the award is the A. A. A. trophy. It might also compete as a privately owned machine, in the division for which the Anderson trophy is the award. But, as the rules now exist, it will be impossible for the Metz to retain the Glidden trophy after July 2.

VANDERBILT AND GRAND PRIZE.

Will Be Held Two Weeks Apart During Panama-Pacific Exposition in 1915.

It is understood that the contest board of the American Automobile Association has awarded a sanction to the Panama-Pacific Exposition for holding the ninth race for the Vanderbilt cup and the sixth contest for the Grand Prize. The former events also will be sanctioned by American Automobile Club, and both by the Motor Cups Holding Association, of which W. K. Vanderbilt, Jr., is president.

The races will be held some time in the spring, the exact date to be determined later. They will be held two weeks apart, the Vanderbilt Cup event coming first. The details will be arranged by a special racing committee composed of: W. L. Hughson of the firm of Hughson & Martin, well known in Pacific automobile

circles, chairman; H. P. Scott, Union Iron Works; M. H. Young, San Francisco Chronicle; R. A. Crothers, San Francisco Bulletin, and H. E. Cooley, chief of special events.

RESULTS AT ATLANTA.

Marmon Takes the Feature Event and Studebaker Captures Two Cups.

A Marmon car, owned by Dr. Frank Edmonson, and driven by W. T. Edgar, took the feature event, the free-for-all, in the Stewart Hill climb of the Atlanta Automobile & Accessories Association, Atlanta, Ga., May 9. By winning in the 451-600 inches class for the third consecutive time, L. C. Crane took permanent possession of the A. A. & A. A. cup with a Pope-Hartford. The summary follows:

161-230 Inches. (Georgian-American Cup.)		
Car	Driver	Time
Studebaker.....	Odum	1:04.2
Studebaker.....	Rooney	1:12.0
231-300 Inches. (Journal Trophy.)		
Studebaker.....	Cohen	0:58.0
Studebaker.....	McCune	1:00.0
Ford.....	Alexander	1:11.6
301-450 Inches. (Constitution Cup.)		
Stearns.....	McKinstry	1:05.0
Overland.....	Boyers	1:12.8
Pope-Hartford.....		1:16.4
451-600 Inches. (A. A. & A. A. Cup.)		
Pope-Hartford.....	Crane	0:51.4
National.....	McKerrall	0:52.0
Free-for-All.		
Marmon.....	Edgar	0:47.4
Pope-Hartford.....	Crane	0:50.2
National.....	McKerrall	0:51.0

IOWA'S LITTLE GLIDDEN.

Tourists Will Leave Des Moines in Time to See Races at Sioux City Track.

The Iowa Little Glidden tour will be held this year under the auspices of the Iowa State Automobile Association and the direction of Earl E. Butler of Des Moines, chairman of the contest committee of the Polk County Automobile Club. It will be a combination sociability and reliability run, leaving Des Moines, July 1, with the intention of reaching Sioux City in time for the 300-mile race, July 4.

The first day's run will be to Mason City and Clear lake, the night being spent on the shores of that body of water. The second night will find the tourists at Spirit lake, while Storm lake will be the noon control the third day. After witnessing the race the party will leave Sioux City the morning of July 5, going to Council Bluffs and Omaha. The last day will take the tourists back to Des Moines over popular routes.

STUTZ A DOUBLE WINNER.

Car Bearing That Name Takes Both the Junior Vanderbilt Cup and Grand Prize.

Alexander Pabst of Los Angeles, 15 years of age, recently piloted a Stutz car, an exact replica of the white car in which Earl Cooper rode to fame on the Coast in 1913, insofar as outer appearance was concerned, in both the Junior Vanderbilt Cup and Grand Prize races on the one-mile Ascot park track in that city. The former event was for 15 miles, which were covered in 27:47, and the latter for 25 miles, Pabst's time being 34 minutes flat.

The car is shown in an accompanying illustration, and it may be described briefly, as follows: Wheelbase, 60 inches; tread, 36; tires, 20 by four-inch (aeroplane type); motor, Flying Merkel, twin-cylinder, air-cooled, rated at six horsepower; drive, V belt; steering gear, spindle and flexible wire.

In his description of the race, the owner of the car, Walter M. Brown, general manager of the Walter M. Brown Company, Los Angeles agent for the Stutz, made by the Stutz Motor Car Company, Indianapolis, Ind., and backer of Earl Cooper, says:

The little No. 8 is some car, and little Alex Pabst is some driver. He made a Garrison finish in the Vanderbilt Cup event, coming from behind in the 13th lap and passing the pacemaker, when the latter's car lost an engine bolt and was forced to stop. The following day, when the Grand Prize was run, Alex went out after a record—and got it. He was not forced to stop once, and defeated 12 of the speediest "foreign and American" cars. There were no mechanical adjustments, the motor ran perfectly, no water was taken on during the race and the radiator was absolutely cool after the 25 miles were covered.

Because of lack of entries, the two-day track meet of the Columbus Automobile Club, Columbus, O., scheduled for May 17-18, was abandoned.

RACING NOTES AND NEWS.

The automobile dealers in Sioux City, Ia., have raised a purse of \$50,000 for the inaugural race meet on the new speedway. The feature event will be the 300-mile race, July 4, but it is now proposed to add other events to be held June 30.

Heavy rains caused a postponement of the Colorado-Texas tour, which was to have started from Colorado Springs, May 4. On account of the fact that several bridges in Texas had been washed out, it was decided that the time was inopportune for such an event.

H. E. Deneger, Asbury Park, N. J., is responsible for a novel zone system in connection with the runs to that city, May 29-30. The first zone will comprise New York City and Long Island; second, Hudson and Essex counties in New Jersey; third, Middlesex county; fourth, Mercer county; fifth, Camden county and Philadelphia. Separate prizes will be awarded to motorists residing in each of these zones.

In the recent secret time run of the Quaker City Motor Club of Philadelphia, to Atlantic City, N. J., the first award was made to George D. Wright, driving a Chevrolet car. As in past years, the "secret time" was determined by averaging the elapsed time of the several con-

Alexander Pabst and His Miniature Stutz with Which He Won the Junior Vanderbilt Cup and Grand Prize Races.

testants. This resulted in 6:24:45. The Chevrolet's time was 6:22:10. William Oliver, at the wheel of a Mercer, took second prize, his time being 6:20:40. Ralph D. Earle in a Moline was third, with 6:19:43. Miss Erma Hardart took the ladies' cup.

J. B. Giquel, representative of the White Company, Cleveland, O., in Havana, Cuba, reports that a White car driven by Raul Monocal won the recent race held in that city under the auspices of the dealers of Havana. The entries included three Whites, and three each of two other American makes and of seven foreign cars. The winner received a large silver cup, and each of the drivers taking part in the event received as their compensation the car which he drove in the race.

The contest board of the American Automobile Association has adopted a new form of stock car certificate for non-speed events. Under the head of motor are listed the following: Number of cylinders, how cast, bore, stroke, displacement and valve location. The carburetion, ignition, lubrication, lighting, starting, cooling and transmission systems are covered in their important particulars, as well as tires, accessory equipment and bodies.

B. R. C. DYNAUTO HAS NOVEL FEATURES.

AMONG the more recent electric lighting systems brought out abroad is the B. R. C. Dynauto, marketed by Fenestre, Cadisch & Co.,

Fig. 1—Wiring Diagram of the B. R. C. Lighting System, Having Several Interesting Features, Including Control of Voltage.

London. It employs an ingenious principle and is termed a constant voltage dynamo, in that at all speeds above a certain minimum limit the voltage is constant for a given load. This should not be read too literally, as it does not necessarily follow that the voltage of the dynamo is the same when the lamps are not burning or extinguished, or the same when the battery is partially or fully charged.

To understand the principle involved an explanation of the simplified wiring diagram presented at Fig. 1 will be of service. In this diagram F C represents the coils around the field magnets of the dynamo. These coils are wired in shunt with the main circuit, and it will be noted that the field coils are in series with the resistance coil R C. At the left of the last named construction will be noted the shunt coil S H, which is wound around the iron core of the automatic cut-out, which also carries a short series coil S C, which when the contacts C are closed, forms a part of the completed main circuit.

At the other end of the cut-out core is a vibrator blade V provided with a tungsten or iridium contact point which normally makes contact with the contact screw C S, thereby providing a passage of low resistance for the current that passes through the field coils F C. This passage is alternative to the one provided through the resistance coil R C.

Upon the dynamo speeding up the core of the cut-out becomes sufficiently magnetized to attract the cut-out lever C L, making a contact between the two points and completing the main

circuit. The current then flows around the series coil S C to the battery and the lamps L. Upon the dynamo attaining a speed at which the current flowing around the shunt coil S H is sufficiently strong to attract the vibrator blade V, the contact between the points is broken. When this takes place the current through the field magnet coils is prevented from flowing by the easiest possible path, and must pass through the resistance coil R C.

This reduces the strength of the field current, which in turn tends to reduce the output of the dynamo. The output being slightly reduced the current flowing through the shunt coil is no longer strong enough to hold the vibrator blade V in contact with the other point, and it moves back again, making contact at C S, allowing the current to flow by the easiest path. These operations are repeated very rapidly so long as the output of the dynamo is above that at which the movement of the vibrator blade begins. It will be noted that the current flowing through the coil S H has nothing to do with that flowing through the main circuit, but is dependent entirely upon the voltage across the terminals of the dynamo. The control of output for any given load is that of voltage, not of current.

It is pointed out that if the dynamo control had no connection with the current flowing through the main circuit there would be certain disadvantages in the system. Among these would be the difficulty of charging the battery to its capacity, and to charge the cells at a proper rate when they were more or less exhausted. This is held to be overcome by the utilization of the se-

Fig. 2—Components of B. R. C. Dynamo: At Left, Arrangement of Brush Gear; at Right, Diagram of Automatic Cut-Out; Lower, Diagram of Voltage Regulator.

ries coil S C, previously referred to.

When a strong current begins to flow, as, for example, when the battery is in a discharged

condition, this coil is stated to be more effective in assisting the coil S H than it would be were the cells nearly fully charged. The two coils working in conjunction actuate the vibrator V much sooner than the coil S H would have done if acting alone, and so, by reducing the voltage permitted across the field coils, reduce the strength of the current in the main circuit, preventing too strong a current flowing to the battery. The presence of the series coil S C must mean a slight variation in the voltage at the dynamo terminals according to the number of lamps that are burning. With the battery disconnected it is evident that any increase in the number of lamps tends to reduce somewhat the voltage at their terminals.

The field magnets are cylindrical and carry two pole pieces, and the commutator of the armature is constructed with the insulating strips exactly flush with the copper segments. Provision is made for easy disassembly of the dynamo and the inspection of components.

The automatic cut-out and voltage regulating device are carried under the end cover of the machine. The brushes are wide and shallow, and current is taken from them through flexible connections to the dynamo terminals. The arrangement of the brush gear is shown in the upper left hand view at Fig. 2, the components being lettered as follows: B, brush; C, commutator; F, flexible connections to terminals; G, brush holder; R, rod which can be drawn back to facilitate removal; T, S, spring holding brush in position on commutator terminal.

An end view of the machine is shown at Fig. 3. It will be noted that the fuse is placed at the right and is retained by a strong clip of copper. Above it is the voltage regulator, separated by the wound cut-out core mechanism on the left. The cut-out lever is controlled by a spiral spring S S, shown at Fig. 2, and carries at its end a semi-cylindrical contact piece C P which, when the cut-out armature core is pulled up towards the core, presses on a flat brass contact surface C S. The cut-out mechanism may be displaced readily by loosening two nuts on the bolts, the further ends of which are pivoted.

The voltage controller mechanism shown in the lower part of Fig. 2 is equally accessible. The vibrator blade V is held by a short spring S S, the tension of which is very carefully regulated, so that the mechanism will operate at the required voltage. The blade carries a contact point O P made of tungsten, and facing this point is a contact screw C S provided with similar metal. This screw is adjusted by the maker and sealed

by a light cover to prevent tampering with its setting.

Three dynamos are produced, the No. 1 having a rated output of 80 watts; the No. 2, 100 watts, and the No. 3, 150 watts. The drive generally employed is a V belt, the ratio being 2:1 in the case of the No. 1 machine and 3:1 in the larger model, which is supplied when current is desired for operating lights and devices other than the headlights, tail and side lamps. The No. 2 is constructed for fitting under the hood and is driven at engine speed.

A single wire system is utilized; that is, the return to the dynamo is through the frame of the car. It is stated that the voltage of the Dynauto is so steady that the battery could be dispensed with, although it is recommended for a source of current supply when the motor is not operating. The switchboard employed is very

Fig. 3—End View of B. R. C. Dynamo, Showing Location of Voltage Regulator and Automatic Cut-Out.

neat and compact, and the battery is smaller than that generally utilized with lighting systems.

An instance of the enthusiastic manner in which Canada is purchasing automobiles is afforded by the standing order of the Breen Motor Car Company, Winnipeg, Manitoba, which receives each day a complete car load of Studebaker cars from the Canadian factory of the Studebaker Corporation, which is located at Walkerville, Ontario.

During the 26 working days of April the Hupp Motor Car Company, Detroit, averaged more than 90 Hupmobiles a day. The record shipping day of the month was the 30th, when 120 machines left the factory.

MECHANICAL NOTES FOR OWNERS.

Suggestions for Constructing and Fitting Storm Front to Old Machines—Removing and Replacing Universal Quick Detachable Rims.

THE modern motor car comes to the purchaser completely equipped and the buyer of a new machine is not compelled to spend several hundred dollars for a top, windshield, headlights, etc., as was formerly the case several years ago. There are, however, hundreds of old models in service today, which are not equipped with windshields, and some do not even have a storm front to protect the passengers in the front seat in rainy weather.

A suggestion for a storm front is made in the Carriage Monthly, and, while the design is for a commercial vehicle, the plan could be utilized for a pleasure car. These storm fronts are generally made of the same material as the top is trimmed with, and made loose; that is, made to

knob all around, so that they can be taken off when not in use.

To make a storm front curtain, cut a piece of the goods the size required to fit on the job. First divide the space on top curve for five fasteners and mark them

Fig. 1—Storm Front for an Old Car.

with chalk where they are to be placed. Mark the centre on goods and tack temporarily to centre of curve, then drive tacks through goods up to chalk marks for fasteners. Next tack the goods to the dash, driving four tacks through the goods to the dash, spaced equally two inches below the top.

Mark goods and dash where the fasteners should be placed, also on the curtain. Mark where the celluloid window should be, and be careful to have it in the right place. When all is marked remove the goods and make up the curtains. Cut two inches from tack holes where the fasteners are; at top and bottom mark so that the curtain will be even with outside of dash when finished. Turn a hem and sew on the

machine. Put on fasteners, using a brass turn button fastener on top of bow, and buckle and strap on the bottom of the curtain, the buckle and strap finish allowing more play for the possible sagging of the top. When all this is done the celluloid is put in the curtain.

The best and quickest way to place the celluloid is first to sew a one by a .5-inch piece of goods in the centre of the celluloid and sew around the outside edge; then turn the curtain over and cut out the centre of the goods, allowing enough so as to have .5-inch turn down all around. Sew down on the machine, and the front is ready to put on the machine. The fasteners can be placed on the job, when the tack holes are made, while fitting it.

Q. D. UNIVERSAL RIMS.

It is surprising the number of owners who employ a hammer and other heavy tools in removing and replacing a tire. This is not necessary with the modern rims, for force is not needed unless the rims have become rusty or "frozen". In the majority of instances noted by the writer the motorist failed to make an easy removal and replacement because of a lack of knowledge of the rim construction.

The quick detachable or Standard Universal No. 2, such as fitted to the Overland cars, may be manipulated easily with no other tool than a screw driver. With this design the tire is retained by two side flanges, the outer member locking the inner against the shoe.

To displace these rings, remove the dust and valve cap, and push the valve stem up as far as it will go, being careful not to injure the threads. Turn the wheel until the valve stem is at the top, as shown as Fig. 2 A, insert the end of the screw driver blade under the rounded end of the split locking ring as shown, and pry it outward. The ring can then be removed easily, provided it is not rusted. Undue force should not be employed as the ring may be sprung, making replacement more or less troublesome. The other end of the ring is retained in position by a stud meshing in a hole in the rim proper. The inner ring should slide off easily.

Examine the rims and if rusty clean and

graphite as has been suggested in this department. After replacing the shoe and inner ring it is only necessary to push these as far back

Fig. 2—Displacing Q. D. Universal Rings: A, Removing Split Locking Ring; B, Showing the Inner and Outer Rings.

as they will go to fit the locking ring. First insert the stud in its hole and work the rim in from this point all the way around. It will not be necessary to utilize a hammer if these instructions are carried out.

The quick detachable rims used on the Overland model 79 differ in that a single locking ring is utilized and it has a latch lever. A screw driver is the only tool needed to remove it. The first step is to release the latch lever. When in position it is as shown at Fig. 3 A. Insert the blade of the screw driver between the lever and base of the rim, and pull up on the screw driver, releasing the lever lug from the hole in the rim. Swing the lever outward until it is at right angles with the rim as indicated at B, releasing the locking mechanism.

To remove the ring to permit of displacing a casing, insert the screw driver in the notch at the base of the detachable ring as shown at C, pushing downward on the handle of the screw driver, prying the ring from its groove. It will then be an easy matter to remove the ring with the fingers. To replace the ring the steps are reversed.

PAINTING HINTS.

Some owners paint their cars, and the writer has seen several jobs which, although not bearing the earmarks of the expert, were very good indeed. Of course, it is not to be expected that the varnish work will be perfect, for the flowing and wiping up of varnish requires considerable experience, as well as suitable conditions for performing the work.

The common practise is to paint the running gear of a motor car and touch up and varnish the body. Many owners have an idea that the varnish is utilized to obtain a smooth appearance, to beautify the car as it were, but this is not

wholly true. Varnish is used as a protector of the colors, just as a top is employed to keep the passengers dry in rainy weather.

When a good, reliable varnish employed in the touch up and varnish job is applied to a car, other things being equal, the cost of repainting may be postponed for some time and the wear of the original paint prolonged. Motorists who formerly owned carriages have, as a rule, obtained through the experience, the knowledge necessary to know when their machine needs touching up and varnishing. Some make it a practise to have this work done every spring. It makes for economy, as the novice will learn when he compares the cost of a burn off job with that of retouching and varnishing.

Ordinarily the amateur painter makes the error of not properly cleaning the car, especially the chassis. The cost of painting a motor vehicle is, as a rule, in excess of that of a carriage because of the extra labor involved in cleaning. And when the car is an old one, the chassis is covered with grease and oil soaked road dust, all of which must be entirely removed before any attempt is made at touching up, let alone varnishing.

Ordinarily the body does not give much trouble and the foreign elements may be removed by vigorous rubbing with turpentine and pumice stone flour. The surface will then need merely rubbing fine and uniform all over, sufficiently to take away the gloss and remove the sediment of gases and scum certain to affect the varnish.

The work of cleaning the chassis is much more difficult. Some form of scraping knife, such as a putty or case knife, or other sharp instrument will be necessary to peel the cement like collections of oil, grease and road dust. Removers utilized for this work comprise mixtures of two parts crude oil and one part turpentine,

Fig. 3—Rims Used on Overland Model 79 Cars: A, Locking Lever in Normal Position; B, Same Open; C, Using Screw Driver to Start Detachable Ring.

equal parts denatured alcohol and turpentine, and also sal soda and caustic soda, the last named being a very powerful alkali. After the motorist

has completed the work of cleaning the chassis—that is, properly—he will understand why it costs more to prepare and paint a motor car than a horse drawn vehicle.

In connection with this work it should be stated that all traces of lubricant must be removed from crevices, else the result of the completed work will be very disappointing. The cleaning cannot be slighted in the least. It is very important.

Gouges or surface bruises will require attention. They should be well cleaned out, then touched up with some half lead and pigment colored to match the field color. Next plug the cavities with common, hard drying putty, and smooth it level with the surface. The putty should be allowed to dry over night, then faced down with a block of rubbing stone dipped in turpentine. The next step is to match some color with that which had been used on the car.

The matching of color is, in the opinion of the writer, a difficult task, and it will bother the expert to match some faded and bleached colors. Because of this it will be well for the owner-painter to use the color sparingly in retouching and as thin as possible consistent with proper covering power. Touch only the defect, and avoid daubing. For small spots employ a swan quill lettering pencil. Make the touch-up with a varnish gloss, and give all colors plenty of time to dry perfectly before attempting to varnish. Some colors, notably greens, have a tendency to show off-color shades if varnished before they are thoroughly dry.

The final step is varnishing, and in selecting the material use none but the best, a varnish especially adapted for the work. Cheap varnish is a waste of time. It should be flowed on full, and have ample depth.

ADJUSTING BULBS.

A maker of electric lighting equipment recommends the following for adjusting the focus of headlights: To focus the lamps, open the swinging front of the lamp and direct the light upon some smooth vertical surface at a distance of about 10 feet. Loosen the adjusting screw on the slide at the rear of the reflector, and move the bulb and socket out or in until all rings disappear in the illuminated area. Then tighten the adjusting screw and close the lamp. Any further adjustment of the lamp must be made by bending the arms of the lamp bracket with a heavy wrench until the light of each lamp strikes the road at the point desired.

CARE OF ALL-METAL WHEELS.

All-metal wheels, such as were fitted to the two-cylinder Autocar runabout for example, require inspection from time to time. The construction is not solid, and the thickness of the felloe is such that if allowed to rust there is, in time, danger of the metal becoming weakened.

The rust should be removed with sandpaper and the surface thoroughly cleaned. Next prepare a mixture of shellac and powdered graphite, using as much of the latter as possible. Paint the cleaned surface and allow the coat to dry hard before replacing the tire. If the shellac treatment is not favored, use plenty of graphite mixed with enough oil to form a thick paste.

SECONDARY CABLES.

The attention of readers has been called to the importance of renewing the secondary wiring whenever it is suspected of being faulty, especially on old machines where more or less lubricant escapes from the working parts of the motor. Cables that have seen considerable service, and which have been exposed to heat, may be the cause of missing at low speeds or a baffling, intermittent miss. Certain types of secondary cable are more or less susceptible to oil, and when the insulation has become swelled, it is best to throw away the wire and purchase new.

PHYSICAL EXAMINATION PAYS.

Plan Adopted by Goodyear Tire & Rubber Company Results in Greater Efficiency.

Excellent results are said to have been realized by the Goodyear Tire & Rubber Company, Akron, O., from a system inaugurated Jan. 1, under which every prospective employee is submitted to a physical examination. This is given as one of the reasons why the Goodyear plant, now employing about 7500 men, a number not much larger than the number employed last year, is producing double the product turned out in 1913.

The examination itself is not so formidable as it sounds, and the presence of various ailments revealed by it does not necessarily bar candidates from employment by the company. On the other hand, the information thus obtained enables the placing of the men where they will be the most efficient and where they can work with minimum discomfort and secure maximum returns for themselves.

TO REBUILD OLD CASINGS.

Motor Tire Reconstruction Company Organized Under New Jersey Statute.

The Motor Tire Reconstruction Company has been incorporated under New Jersey laws, with capital of \$250,000. Offices have been established in New York City, and it is stated that the business of the concern will be that of rebuilding worn-out casings, in contradistinction to the usual practise of retreading them.

The process is said to be the invention of I. S. McGhiehan, who is interested in the manufacture of Mogul tires, and to be practically the same as that used by that concern. It is planned to establish agencies in practically every city and town of consequence in the country, and to supply full equipment and a license to use the process within a particular district.

ANOTHER ORDER OF SALE.

Only One Bid Made for Property of the Walpole Tire & Rubber Company.

At the contemplated sale of the property of the Walpole Tire & Rubber Company, Walpole, Mass., scheduled for May 11, only one bid, of \$800,000, was filed, and the sale was declared off by Judge Dodge of the United States district court. This bid was made by C. G. Metzler, representing the stockholders' reorganization committee, and was far below the upset price of \$1,500,000 fixed by the court in ordering the property sold. The receivers have been instructed to draft another order for sale.

The property has been in the hands of Robert O. Harris and Robert C. Fisher, receivers, since last summer. It is stated that they have been running the business at a profit of \$20,000 a month. They are understood to have \$170,000 on hand at present, from which it is expected that a second dividend will be paid shortly. The first dividend was one of four per cent.

TAILOR MADE BODIES.

Maker of the Marmon Finds an Increasing Demand for Distinctive Coach Work.

That there seems to have been a decided change during the past two years in the demands of the owners of high priced cars, is the statement made by F. E. Moskovics, commercial manager of the Nordyke & Marmon Company,

Indianapolis, Ind., maker of the Marmon line. He adds that they no longer purchase a machine simply on its price and past reputation, and no longer like their car "ready made", so to speak, but insist that their coach work be distinctly "tailor made", or different from their neighbors.

Mr. Moskovics asserts that this demand has become so insistent that the company makes nearly every job a special order to meet the requirements of customers, and as a result of this policy it is doing a tremendous business. He finds, as well, that the demand is not confined to the so-called smart set, but includes a large number of people of good taste and refinement, who dislike to ride in machines that look as if they were all cut out of the same pattern.

OAKLAND MAINTENANCE COST.

Tennessee Owners Report 2.41 Cents a Mile, Which Company Says Is Not Unusual.

The question of maintenance cost, or the expense of running an automobile, is one which interests many motorists and prospective car owners. In a recent letter to the Oakland Motor Car Company, Pontiac, Mich., M. C. Jansen, Jr., of Nashville, Tenn., states that he operated his Oakland machine 53,000 miles last year at a cost of 2.41 cents a mile his itemized statement being as follows:

Gasoline0150
Oil, including transmission and cup grease.....	.0024
Washing and polishing.....	.0052
Extras0015
Total.....	.0241

The extras included the following: Three dollars for a dash light, \$2.50 for a tool box to put on the step, \$1.50 for two headlight globes and \$1.50 for a wire connection on the dash so that he would not be compelled to pump the tires by hand. Mr. Jansen explains that he was at no expense for repairs, and made no attempt to achieve a low expense record. Officials of the company state that less than 2.5 cents a mile is nothing unusual for a normal year's service with an Oakland car in the hands of an average owner.

According to H. R. Radford, vice president and general manager of the Cartercar Company, Pontiac, Mich., one of the company's model 7 Cartercars recently hauled three freighting wagons, loaded with lumber, the combined weight of which was over 12 tons, in the streets of Douglas, Ariz. The car itself also contained five passengers.

NEWS OF THE MANUFACTURER AND DEALER.

The following concerns have been incorporated recently to manufacture or deal in motor vehicles, accessories, etc.:

Camden Auto Company, Camden, Me.; \$5000; to deal in automobiles, etc.

Champion Motor Car Company, Wilmington, Del.; \$100,000; to deal in automobiles.

Mutual Motor Service Company, Dover, Del.; \$22,500; to manufacture automobiles, power boats, etc.

China Vehicle Company, Ltd., Portland, Me.; to manufacture motor vehicles of all kinds.

Shea's Market, Lake Placid, N. Y.; \$50,000; to deal in automobiles, etc.; H. D. Hayford and others.

J. N. Johns Manufacturing Company, New York City; \$25,000; to deal in motor vehicles.

Emme, Young & Co., New York City; \$25,000; to deal in aeroplanes, sporting goods, yachts, etc.; H. D. Emme, F. C. Young, E. Day.

Barter & Longtin, Watertown, N. Y.; \$5000; to deal in automobiles and motorcycles.

Union Automobile Service Company, Detroit, Mich.; \$4000; to deal in automobiles.

Milwaukee Garage Company, Milwaukee, Wis.; \$3000; to conduct a garage.

Lotus Garage Company, New York City; \$10,000; to conduct a garage and repair shop; A. Larney and others.

Willard Storage Battery Company's Detroit Branch.

Empire Electric Vehicle Company, Wilmington, Del.; \$200,000; to deal in automobiles.

Lake Auto Company, Raleigh, N. C.; \$25,000; to deal in automobiles, etc.

Lincoln Rubber Company, Akron, O.; \$10,000; to manufacture rubber goods; J. Hadfield, I. Hadfield, W. E. Slabaugh, M. Siberling, S. A. Allen.

Central Automobile Company, Alexandria, Va.; \$1000; to deal in automobiles; W. H. Heymel, J. A. Eggborn.

Lipman Air Appliance Company, Beloit, Wis.; \$100,000; to manufacture air compressors; C. E. Ernst, E. K. Lipman and others.

Americo-Syrian Petroleum Company, Bristow, Okla.; \$25,000; to deal in oils; K. Wasaff, J. G. Adamie, J. Abraham.

Braun-Hoff Electrical Company, Canal Dover, O.; \$50,000; to manufacture motors and electrical apparatus; W. A. Braun, J. D. Baker, S. L. Holmes, C. E. Krieter, O. A. Keyser.

United States Air Compressor Company, Cleveland, O.; \$25,000; to manufacture air compressing machinery; R. L. Buchar, G. A. Hunter, W. G. Smith, W. W. Beauman, L. H. Bacher.

Herreshoff Light Car Company, Mechanicsville, N. Y.; \$100,000; to manufacture cars; C. E. Herreshoff, N. R. Holmes, A. L. Johnson.

Duryea International Motor Corporation, New York City; \$50,000; H. S. Owen, B. Thomas, W. R. Root.

Rubber Tire Accessories Company, New York City; \$10,000; to deal in tires, etc.; O. Eahart, T. J. Nugent, S. K. Ellenbogen.

George Smith Plumbing & Auto Metal Company, Springfield, Mass.; \$50,000; J. J. Moynihan, George Smith, M. H. Smith.

Prawapum Tire & Repair Company, White Plains, N. Y.; \$1000; R. J. Rennie, N. M. Gidley, J. J. Hayde, Nellie M. Gidley.

John Dickens Company, North Paterson, N. J.; to deal in automobiles; Anna Dickens, John Dickens, Ellen Farley.

Burrows Cyclecar Company, Ripley, N. Y.; to manufacture cyclecars; J. Watson Burrows, Robert P. Burrows, Robert Burrows.

Globe Ball Bearing Company, New York City; \$50,000; to manufacture ball bearings and other metal devices; George W. Carroll, Charles F. Bultemeyer, Ralph Royall.

Consumers' Gasoline Supply Company, Dover, Del.; \$250,000; to manufacture and sell lubricating oils and grease of all kinds; William Boyd, W. I. N. Lofland, W. F. P. Lofland.

Fred G. Rinker Auto Company, Indianapolis, Ind.; \$1500; to deal in automobiles; Fred G. Rinker, Charles V. Kinney, Charles F. Redding.

Automobile Accessories Company, Buffalo, N. Y.; \$25,000; to deal in automobile accessories; A. B. Floyd, W. H. Linford, T. R. Thomas.

Kelvin Electric Company, New York City; \$25,000; to deal in electrical apparatus and supplies; C. McMillan, S. Popper, K. Tikios.

Dunbar & Co., New York City; \$200,000; to deal in rubber goods, etc.; G. W. Utter, A. T. Gibbs, F. W. Dunbar.

Jaeger Engine Company, Taunton, Mass.; \$150,000; to manufacture automobile engines; C. J. Jaeger, W. R. Davenport, C. S. Day.

Taxis & Motors, Ltd., Montreal, Can.; \$200,000; J. A. Ducharme, E. Halley, C. Migeron, F. Beslere, A. Deschenes.

Crafton Garage & Supply Company, Crafton, Penn.; \$10,000; to conduct a garage; J. I. Andrews, C. E. Golden, James R. Redman, John Cramer, F. E. Miller.

Dallas Motor 'Bus Company, Dallas, Tex.; \$25,000; Ralph Robertson, R. E. Taylor, W. M. Smith.

Graham Automobile Company, Chicago, Ill.; \$2500; to deal in automobiles; Charles E. Graham, A. S. Robertson, N. J. Shupe.

WITH THE MANUFACTURERS.

The Willard Storage Battery Company's Detroit branch, shown in an accompanying illustration, is located at 736-740 Woodward avenue, and is only one of the branches and service stations maintained by the company. The front portion of the building is occupied by the general offices and private office of Manager M. G. Hillman, the charging room and service station being in the rear. The shipping and receiving departments are sufficiently extensive to admit the entrance of two or three large trucks at a time.

The Kelly Springfield Motor Truck Company, Springfield, O., recently closed a contract for 104 five-ton trucks and one two-ton truck for the Pacific Motor Coach Company, Los Angeles, Cal., which it claims constitutes the largest sale of motor driven vehicles direct to the consumer ever consummated. The order is said to represent \$500,000.

The Maxwell Motor Company, Detroit, is now prepared to furnish repair parts for the two-cylinder cars formerly made by the Maxwell-Briscoe Company, from its parts plant at Newcastle, Ind.

The Emil Grossman Manufacturing Company, Inc., Brooklyn, N. Y., has been licensed under the Hammond patent, No. 1,086,820, dated Feb. 10, 1914, to manufacture the Holdfast battery connector. The company is the first and thus far the only manufacturer to be licensed under this patent.

The Keller Pneumatic Tool Company, Fond du Lac, Wis., which was organized recently, has commenced the manufacture of a line of compressed air tools of all kinds and will make a specialty of garage and repair shop devices.

The General Motors Truck Company, Pontiac, Mich., has just completed additions to its equipment, having

installed a 100,000-gallon reservoir as an added protection against fire. A number of cement floors also have been put in the factory.

The Milwaukee Cyclecar Company, Milwaukee, Wis., manufacturer of the Billiken cyclecars, has elected the following officers: President, Stanley H. Eigel; vice president, Samuel P. Carroll; secretary and treasurer, Fred W. Bollow. Mr. Carroll is also chief engineer.

The Hudson Motor Car Company, Detroit, announces the shipment of the new five-passenger light six model to its dealers.

The Bosch Magneto Company, New York City, states that the 12-cylinder Sunbeam car which covered the half-mile at the Brooklands track, England, on March 18 last, in 0:15.03, averaging 119.6 miles an hour, and which covered the mile in 29.82 seconds, averaging 120.73 mph, was equipped with a Bosch magneto.

The Paige-Detroit Motor Car Company, Detroit, shipped 1227 Paige cars from the loading platform shown in the accompanying illustration during the month of April. The snap shot, from which this reproduction was made, shows only a portion of one day's shipment. The company is celebrating its recent removal to its new factory by doing four times the business in one month that was done during the whole of its first season three years ago.

The Hillard Clutch & Machinery Company, Elmira, N. Y., manufacturer of multiple disc clutches for automobiles, has taken over the business of the Elmira Pattern Works.

The Woods Motor Vehicle Company, Chicago, Ill., announces that it has opened a large and elaborate salesroom at Michigan avenue and Peck court, one block south of the Blackstone hotel. The factory showrooms of the company are located at 25th street, Calumet and Cottage Grove avenues.

The Reo Motor Car Company, Lansing, Mich., reports the production of 65 cars daily. Last year at this time 40 cars was the limit of production, but additions to the plant and increased factory facilities have resulted as above.

The Apple Auto Top Company, Miamisburg, O., contemplates the erection of a large factory on Smith street. The structure will be two stories in height and 250 feet in length. The company manufactures automobile tops and casings.

The Herreshoff Light Car Company, Troy, N. Y., has been incorporated and will manufacture a small four-cylinder, water-cooled car, which it expects to be in a position to deliver in quantity by July 1.

Dodge Bros., Detroit, manufacturer of pleasure cars and accessories, has awarded contracts for the construction of a four-story reinforced concrete factory building to be used mainly as a woodworking shop. It is stated that the new car to be produced by this company will sell for less than \$600.

The Consolidated Rubber Company, Ltd., Regina, Sask., is erecting a warehouse on Broad street north.

The Fulton-Walker Company, Philadelphia, designer and builder of automobile bodies and business wagons, and the oldest wagon building firm in the city, is now completely established in its new factory at 337-45 South 12th street. An elaborate office and showroom are included among the many prominent features of the new building.

Gray & Davis, Inc., Boston, Mass., has reduced its factory time schedule from 52 hours a week to 50. In addition to increasing the time the men have to themselves, the new schedule also provides for added remuneration for overtime work and therefore does not in any way involve a reduction in wages.

GARAGE AND DEALER.

The Henderson Motor Company, Chicago, Ill., will be known as the Kloeber Motor Company in the future.

Barry & Mathias, Algonia, Ill., has dissolved partnership. Mr. Mathias will operate the business hereafter.

William McVittie, Niagara Falls, N. Y., has purchased property on Main street and will build a modern garage. He handles the Cole cars.

The Joseph W. Woodell Company, Pittsburg, Penn., has opened a new garage at 205 Wood street. The company carries automobile accessories and supplies.

The Hudson Machine Repair Shop, West Hoboken, N. J., has opened a modern garage and repair shop at 601 Summit avenue.

Irvin T. Donohoe, Washington, D. C., has taken possession of the new automobile supply store at 830 14th street. He carries a full line of automobile accessories and supplies.

The Grand Rapids Republic Truck Sales Company, Grand Rapids, Mich., has opened new quarters at the corner of Michigan street.

The Consolidated Fuel & Lumber Company, Marquette, Mich., has secured the agency for the Pruden steel portable garage.

John L. Guerlin, North Brook, Mass., has opened an up-to-date garage at Lake Quabog.

N. W. McDonald, Elizabeth, Penn., is to erect a large addition to his garage on Second avenue.

The L. S. Lord Company, Cleveland, O., has moved to 6010 Euclid avenue. The company carries Monogram oils and deals in automobile specialties.

The Syracuse Buick Sales Company, Syracuse, N. Y., will remove its garage to South Salina street. A new building is being erected for the company at 840 South State street and will be ready for occupancy Sept. 1.

The Porter-Cable Machine Company, Syracuse, N. Y., has installed a repair department and service station. The company is located at East Water street.

The Aber Schults Automobile Supply Company, Austin, Tex., is now located in its new home at 105 West Fifth street.

The Tacoma Auto Exchange, Tacoma, Wash., has been formed by P. Smith, formerly with the Studebaker Motor Car Agency.

Wald Herrick, Duxbury, Mass., is erecting an up-to-

A Portion of One Day's Shipment of Paige Cars from the New Factory in Detroit.

date garage on the state road, near Bailey's corner. New machinery will be installed.

G. Marvel, Danbury, Conn., has erected a public garage on his property at 9 Franklin street.

Burdge Bros., Middletown, N. J., has opened a new garage at Locust Point. It is modern throughout.

The New York Service Depot of the Philadelphia Storage Battery Company has yielded to the demands of a growing business and moved to larger quarters at 651-655 West 43rd street, New York City. The company occupies the entire ground floor. The plant has been considerably enlarged and is modernly equipped. It is devoted exclusively to the construction, repair, recharging and sale of storage batteries and supplies. Walter L. Thompson is in charge, with offices at 1789 Broadway.

The Sears-Cross Company, New York City, announces the removal of its service station to 218 West 65th street. The company's executive offices are now located at the factory, 147 41st street, New York City.

The Dayton Rubber Manufacturing Company, Dayton, O., has moved its New York City branch to 1851 Broadway, and now has one of the most attractive and up-to-date tire offices in that city. The company manufactures Dayton airless and Dayton pneumatic tires.

The Peerless Motor Car Company of St. Louis, Mo., has a large room set aside as a chauffeur's clubroom which is fitted with telephones, piano, pool tables and a bath.

RECENT PATENTS.

Wheel, Lycurgus Anderson, Lake Creek, Tex.; No. 1,096,817. Filed Jan. 26, 1914.

Changeable Tread for Automobiles, Eli O. Anderson, Glenwood, Fla.; No. 1,096,818. Filed Aug. 15, 1913.

Internal Combustion Engine, Gustav A. F. Ahlberg, Racine, Wis.; No. 1,096,819. Filed Jan. 9, 1913.

Valve Mechanism for Air Compressors, Hugh V. Conrad, Pittsburg, Penn., assignor to the Westinghouse Air Brake Company, same city; No. 1,096,828. Filed Dec. 19, 1910.

Tire, George Kelly, Hinsdale, Ill.; No. 1,096,842. Filed June 25, 1912.

Universal Joint Coupling, Allen Loomis, Detroit, Mich., assignor to Packard Motor Car Company, same city; No. 1,096,850. Filed June 29, 1911.

Magneto Ignition Apparatus, John Lewis Milton, Chicago, Ill.; No. 1,096,853. Filed July 15, 1908.

Rotary Engine, Charles A. Rhoades, Pampa, Tex.; No. 1,096,862. Filed July 27, 1912.

Valve Mechanism, Guido Fornaca, Turin, Italy; No. 1,096,900. Filed Dec. 17, 1912.

Motor Fuel Supplying Apparatus, Alfred Freschl and John Lyon Freschl, Chicago, Ill.; No. 1,096,901. Filed April 18, 1912.

Lubrication for Engines, Arthur Constantin Krebs, Paris, France, assignor to Societe Anonyme des Anciens Etablissements Panhard & Lavassor, same city; No. 1,096,924. Filed March 17, 1913.

Spring Suspension, Geoffrey Hamilton Norman, Blackheath, England; No. 1,096,938. Filed Jan. 18, 1913.

Running Gear, Winfield Scott Proskey, Reno, Nev.; No. 1,096,947. Filed Oct. 28, 1909.

Internal Combustion Engine, William John Robb and Walter Henry Welch, Bristol, England, assignors to Banner Motors, Ltd., same city; No. 1,096,952. Filed Oct. 7, 1912.

Pneumatic Spring Wheel, Albert O. Schoelch, Shelbyville, Ind.; No. 1,096,959. Filed Jan. 31, 1914.

Explosive Engine, Frederic S. Thornley, Clarion, Ia.; No. 1,096,968. Filed Sept. 11, 1912.

Muffler, Otto C. Unke and William H. Unke, Milwaukee, Wis.; No. 1,096,970. Filed July 30, 1913.

Carburetor, William A. Bentley, Chicago, Ill.; No. 1,096,989. Filed March 10, 1913.

Internal Combustion Engine, Herbert T. Herr, Denver, Col.; No. 1,097,021. Filed May 14, 1908.

Internal Combustion Engine, Delbert E. Lane, Chicago, Ill.; No. 1,097,032. Filed May 7, 1913.

Carburetor, Jesse F. Miller, Albany, N. Y.; No. 1,097,039. Filed Sept. 21, 1911.

Motor Tractor, Henry T. Preble, Berkeley, Cal.; No. 1,097,044. Filed Nov. 13, 1912.

Frictional Shock Absorber, Fridolin Schimmel, Faribault, Minn.; No. 1,097,050. Filed Oct. 30, 1911.

Combined Internal Combustion and Hot Air Engine, William J. Wright, Franklin, Penn., assignor to Wright Engine Company, Pittsburg, Penn.; No. 1,097,068. Filed April 3, 1911.

Clutch Lock, Frank H. Coon, Minneapolis, Minn.; No. 1,097,081. Filed Dec. 19, 1913.

Dirigible Lamp, Sidney Mills Freeborn, San Antonio, Tex.; No. 1,097,087. Filed Aug. 12, 1913.

Spring Wheel, Carl Lauritis Henreck Wraae and James Liddell, Cuba, Wis.; No. 1,097,114. Filed Nov. 1, 1912.

Nut Lock, Charles P. Dyer, Somerville, Mass., assignor to Mariner S. Fickett, Chelsea, Mass.; No. 1,097,121. Filed Sept. 26, 1912.

Rotary Aerial Engine, Louis Vallez, Lille, France; No. 1,097,150. Filed Aug. 9, 1912.

Spray Carburetor, Max Bucherer, Cologne, Germany; No. 1,097,165. Filed July 8, 1913.

Internal Combustion Engine, Fred D. Calkins and Alfred C. Johnson, Sunnyvale, Cal.; No. 1,097,166. Filed Jan. 30, 1913.

Top Frame, James W. Schnabel, Johnstown, Penn., assignor to one-half to Charles F. Schnabel, same city; No. 1,097,192. Filed Oct. 18, 1913.

Shock Absorber, David C. Shaw and James F. McGilivray, South Chicago, Ill.; No. 1,097,194. Filed Jan. 31, 1914.

Gearing, Donald M. Ferguson, Detroit, Mich.; No. 1,097,217. Filed Oct. 18, 1913.

Nut Lock, Frank W. Newton, Danville, O., assignor to one-half to Robert G. Baker and one-fourth to William Wagner, same city; No. 1,097,257. Filed Jan. 2, 1913.

Motor Truck, Francis M. Platt, Stuart, Fla.; No. 1,097,261. Filed Aug. 29, 1913.

Shock Absorber, John Baker, Jr., Los Angeles, Cal., assignor to one-half to Walter P. Shaw, same city; No. 1,097,286. Filed June 12, 1913.

Engine, William S. Harley, Milwaukee, Wis.; No. 1,097,315. Filed July 7, 1913.

Shock Absorber, William O. Olson, Chicago, Ill.; No. 1,097,353. Filed April 14, 1913.

Control Mechanism for Electric, Frederick G. Peck, Buffalo, N. Y., assignor, by mesne assignments, to Buffalo Electric Vehicle Company, same city; No. 1,097,358. Filed Oct. 16, 1909.

Spring Clip, William H. Smith, Los Angeles, Cal.; No. 1,097,370. Filed April 22, 1913.

Spring Clamp, Charles A. Boreham, Coalinga, Cal.; No. 1,097,386. Filed March 10, 1913.

Jet Carburetor, Peter Donndorf, Stuttgart, Germany, assignor to Daimler-Motoren-Gesellschaft, Unterturkheim, Germany; No. 1,097,401. Filed Feb. 11, 1913.

Motor Starter, Eugene Fuller, Providence, R. I.; No. 1,097,419. Filed Sept. 24, 1910.

Wheel, Frederick Joseph Hadfield, Ringsfield, Beccles, England; No. 1,097,427. Filed Jan. 8, 1914.

Separable Rim, Henry Brinner Kelper, Lancaster, Penn.; No. 1,097,444. Filed Aug. 30, 1913.

Brake, Thomas E. Linfoot, Flint, Mich.; No. 1,097,451. Filed Nov. 24, 1913.

COMING EVENTS.

May.

May 30—500-mile race, Indianapolis, Ind.

May 30—Track meet, New York City.

May 30—Track races, Providence, R. I.

May 30—Track meet, Washington, D. C.

June.

June 1—Coupe Florio race, Palermo, Italy.

June 1—Reliability run, Philadelphia, Penn.

June 4—Orphans' Outing, New York City.

June 6-7—Track meet, St. Louis, Mo.

June 10-11—Isle of Man road race.

June 17-18—Hill climb, Uniontown, Penn.

June 19—Track meet, Boston, Mass.

June 23-26—S. A. E. midsummer meeting, Cape May, N. J.

June 24-26—Meeting National Gas Engine Association, Chicago, Ill.

June 25—Track meet, Portland, Wash.

June 27—Race meet, Brooklands track, Weybridge, England.

June 30—Track races, Sioux City, Ia.

July.

July 1-3—Non-stop run, Chicago-Boston, for Glidden trophy.

July 3-4—Mid-summer meeting, American Automobile Association, Bretton Woods, N. H.

July 3-4—Road races, Tacoma, Wash.

July 4—Track races, Providence, R. I.

July 4—300-mile race, Sioux City, Ia.

July 4—Grand Prix, Lyons, France.

July 17-18—Speedway meet, Seattle, Wash.

July 25-26—Grand Prix, Belgium.

August.

October.

Oct. 1—Kerosene motor competition, Paris, France.

Oct. 2-3—Track meet, Oklahoma City, Okla.

Oct. 2-3—Track meet, Trenton, N. J.

Oct. 9—Speedway races, Chicago, Ill.

Oct. 16-26—Automobile Salon, Paris.

Oct. 17-24—Show, Pittsburg, Penn.

Oct. 19-26—American road congress, Atlanta, Ga.

November.

Nov. 6-16—Olympia show, London.

Nov. 8-11—Track meet, Shreveport, La.

PASSES 10,000 MARK.**Goodyear Tire & Rubber Company Celebrates Notable Date in Its History.**

One day early in the month the people of Akron, O., were somewhat surprised to hear 10 sharp blasts from the factory whistle of the Goodyear Tire & Rubber Company. Investigation revealed that the company was celebrating the fact that for the first time in its history the daily production of pneumatic tire casings had passed the 10,000 mark. The exact figure was 10,635.

Only a few years ago, at a meeting of Goodyear officials, President Seiberling made the enthusiastic prediction that "one of these days" Goodyear would be making 500 tires a day. He and his assistants, at that time, believed this to be a mark well worth striving for. Now, statisticians at the factory have figured out that one week's production, if piled on top of each other, would make a stack of tires higher than Pikes Peak.

CHICAGO TRADE BODY.**Important Work That Has Been Undertaken by Automobile and Accessory Dealers.**

The Chicago Automobile Trade Association, Chicago, Ill., was organized in 1907, and its membership is composed of the leading automobile and accessory dealers of that city. Headquarters are maintained at 2430 Michigan avenue, these being open daily from 8:30 in the morning to 6 in the afternoon, in charge of the assistant secretary. The officers for the current year, elected recently, are: President, H. M. Allison, representing the Packard Motor Car Company; vice president, C. W. Steiger, Stromberg Motor Devices Company; secretary, D. E. Whipple, Anderson Electric Car Company; treasurer, Henry Paulman, H. Paulman & Co.; directors, C. E. Gregory, Chalmers Motor Company; W. J. Hughey, W. J. Hughey & Co.; L. B. Garrison, General Motors Truck Company; Ralph Temple, Ralph Temple Automobile Company; H. C. Tilton, Stromberg Motor Devices Company.

The association conducts an information bureau, at which complete details of all American and foreign cars and accessories are available, accompanied by the name and address of the local representative. An employment bureau seeks to place manufacturers and dealers in possession of information as to salesmen, clerical as-

sistants, shop help, chauffeurs, etc., who are seeking employment. The second hand car market is also made the subject of special reports, issued quarterly. Membership cards are accepted by the police department in lieu of bonds, etc., in case of alleged violation of the motor vehicle laws or ordinances, and an attorney is retained to defend such cases.

Special attention is paid to legislative and good roads matters, and the association has been decidedly instrumental in co-operating with the Illinois Highway Improvement Association and the Associated Roads Organization of Chicago and Cook county. Last year it was extremely active in securing the defeat of 32 bills before the legislature that were detrimental to the interests of dealers and owners. It also co-operates with the Chicago administration in seeking to enforce the city ordinances and in preventing the passage of unjust and discriminating laws.

ORGANIZE RESEARCH CLUB.**Detroit Case Hardening and Heat Treating Foremen to Study Kindred Subjects.**

The majority of case hardening and heat treating foremen in Detroit, and several from out of town, met recently in that city to form the Steel Treating Research Club. The organization will meet once a month, to listen to metallurgists and men that can impart scientific knowledge of case carburizing, heat treating of carbon and alloy steels and various grades of tool steels.

The object will be to get the practical case hardeners and heat treaters together to discuss the various troubles which confront them. It will also enable them to exchange ideas, and to help each other in these lines of work. The membership will be limited to foremen, assistant foremen in these departments, toolsmiths and tool hardeners. The officers are: President, H. J. Lawson, Cadillac Motor Car Company; vice president, J. B. Ethier, Metal Products Company; secretary-treasurer, D. W. Bauer.

At the annual convention of the Pennsylvania Motor Federation in Erie, Penn., recently, the following officers were elected: President, Robert P. Hooper, Philadelphia; vice presidents, Albert H. Jarecki, Erie; Peter Meixell, Wilkesbarre; Stedman Bent, Philadelphia; David Johnson, New Castle, and John M. Core, Uniontown; secretary and treasurer, Paul C. Wolff, Pittsburgh. The next convention will be held in Reading, Penn.

TWO NEW TRUCKS ANNOUNCED.

The Steele and the Bay State Make Their Initial Appearance in Massachusetts.

The first Steele truck, made by W. H. Steele at Worcester, Mass., has made its appearance on the streets of Boston. It is understood that among its distinctive features are a new speed controlling device invented by the maker and the use of larger wheels than standard. Mr. Steele formerly made commercial vehicles, utilizing some of the parts of the Morgan truck, which was produced in Worcester and the assets of which he purchased in 1912.

The Britton-Stevens Corporation, which was organized recently in Cambridge, Mass., is building the Bay State truck in that city. The designer is said to be W. C. Guildler, formerly identified with the maker of the Mack truck in Allentown, Penn. He has been made vice president and general manager of the company.

SELL AMERICAN ASSETS.

Good Will Passes to Philadelphia Concern and Supplies to Chicago House.

At the sale of the property and assets of the American Motors Company, Indianapolis, Ind., conducted April 30 by Samuel L. Winternitz & Co., Chicago, which recently purchased these at a bankruptcy sale, the good will, patents, jigs, dies, etc., passed to the Levene Motor Company, Philadelphia, the bid being \$4000. All supplies, finished cars and parts were struck down to the Auto Parts Company of Chicago.

According to an announcement of the Levene company, it will continue the sale of parts and service for the approximately 45,000 American cars now in use. The supplies and parts taken over by the Auto Parts Company will be placed on sale at greatly reduced figures.

MOLINE-KNIGHT FORCE BUSY.

Whole Factory Working 12 Hours a Day and Automatic Machinery Night and Day.

Every possible effort is being made by the officials of the Moline Automobile Company, East Moline, Ill., to keep abreast of the demand for its Moline-Knight cars. Starting May 1 the entire force began working 12 hours a day, and the automatic machinery is running day and night. President W. H. Van Dervoort is authority

for the statement that there will be no over-production this year, so far as the Moline-Knight is concerned. The present difficulty is that of producing the cars fast enough to meet orders, keeping in mind the high degree of quality demanded by the Moline organization.

INDORSES PYRENE EXTINGUISHER.

State Fire Marshall of Indiana Makes Report for Department's First Year.

It is stated that 41 automobile fires have been reported to the state fire marshal of Indiana, since the office was established in May, 1913. But six fires resulted in the total loss of the machine. The causes, as shown by the statistics gathered by the fire marshal, were:

Gasoline explosion	12
Defective wiring	3
Carelessness with matches.....	3
Overheated exhaust	1
Adjoining fire	1
Unknown	22

The fire marshal makes comment as follows:

Gasoline is naturally the chief cause of all automobile fires. Since the explosions which occur not only result in fire, but very often in serious injury as well, owners cannot be too careful in seeing that all hazards are minimized.

One of the most dangerous practises followed by automobile drivers is the use of gasoline for cleaning the machine in a closed garage. This is doubly dangerous, if the gasoline is sprayed from a tank by air pressure, since the liquid quickly vaporizes and fills the garage with a highly explosive mixture of air and gas. But one pint of gasoline will make more than 200 cubic feet of air very explosive.

All automobile owners should take every precautionary measure against fire in the garage. No driver should put up his machine without first making sure that the lights are out, the engine cool and that no sparks are resulting from loose battery connections. One of the most dangerous practises permitted about the garage is smoking.

The small Pyrene extinguisher is recommended for extinguishing automobile fires. It is advised that all automobile drivers carry fire extinguishing apparatus with them in the car at all times.

The Bi-Motor Equipment Company, 180-182 Massachusetts avenue, Boston, an exclusively wholesale accessory house, is mailing free to the trade its annual catalogue. The book contains nearly 250 pages of illustrated and descriptive matter dealing with automobile supplies, accessories, etc. The company lists a most complete line of tools and shop equipment and carries a most comprehensive stock. The No. 65 catalogue is intended for the wholesale trade only.

The Reo Motor Car Company, Lansing, Mich., held a special stockholders meeting May 19 for the purpose of declaring a stock dividend of 100 per cent., payable in July.

ON ANOTHER LONG TRIP.

Vice President Westgard of National Highways Association Leaves New Orleans.

Announcement is made by the National Highways Association that A. L. Westgard, vice president and director of transcontinental highways in that organization, left New Orleans, La., May 12, on an 18,000-mile automobile trip through the Southwest and Middle West. He uses a large six-cylinder touring car, and, in addition, a light runabout for carrying spare parts, etc.

He will take up his work in Texas, where he left it last in December, and after surveying several routes in Texas, New Mexico and Oklahoma, he plans to go north as far as the Canadian border, then west to Yellowstone park, returning to cover the principal routes in the Middle West.

OPENS CLEARING HOUSE.

Milwaukee Auto Specialty Company Inaugurates New Business Under That Name.

The Milwaukee Auto Specialty Company, Milwaukee, Wis., has opened the Automobile Clearing House in its new fireproof garage at the corner of Seventh and Chestnut streets. The business will be conducted under entirely separate management and is held to be something entirely new in the automobile field.

The garage has about 36,000 square feet of floor space, and already about 150 cars are being shown. It is stated that there is room for 150 more. All owners who wish to sell their machines can place them on the floor at no cost.

AMERICAN EFFICIENCY SURVEY.

New Organization Perfected in Chicago to Study Motor Car Units.

While no definite information has been made public concerning the work it seeks to accomplish, some little interest attaches to the announcement of the recent incorporation of the American Efficiency Survey of Motor Car Units in Chicago. The officers are: President, Harry Newman; vice president, Kenyon W. Mix; secretary, David Minard Shaw; treasurer, Charles S. Castle. The offices of the organization are at 30 North Michigan avenue, Chicago.

It is stated that the organization is composed of engineers not connected with the automobile

industry, and that provision has been made to secure the use of the testing laboratories of the Purdue University in Lafayette, Ind. It would appear from the advance announcement that the survey expects to undertake the testing of motor car units, and place its seal of approval on such work as is submitted to it and found worthy, in order that the general public may be assured that it is purchasing goods of the proper quality. It is added that a more detailed announcement of the aims and purposes of the organization will be made shortly.

ERECTING NEW PLANT.

Works of the C. H. Stoddard Tire Company Now Nearing Completion in Millbury, Mass.

Following the completion of arrangements conducted by the Millbury Board of Trade, the C. H. Stoddard Tire Company has acquired the so-called Walling property in Millbury, Mass., and construction work is under way for the first of a series of buildings to be erected by that concern. The foundation already has been laid and carpenters are now engaged in raising the structure.

This will be of wood, 32 by 64 feet, with 14-foot posts, mill construction, with flat roof of tar and gravel. It is expected that machinery will be installed during this month, and that the work of producing tires will be begun in the near future.

FOR ORPHAN'S DAY.

Boston Automobile Dealers' Association Will Hold Annual Outing, June 10.

Chester I. Campbell, secretary of the Boston Automobile Dealers' Association, Boston, Mass., is completing arrangements for the annual orphan's day outing of the association at Nantasket Beach, June 10. It is expected that about 2500 crippled, orphaned and destitute children will be entertained by the dealers on that day, and for this purpose some 700 automobiles will be required. Members of the association will provide half of the cars, and owners in Boston and vicinity, the remainder.

The affair is non-sectarian in every respect, the list of children being supplied by Jewish, Catholic, Protestant, Salvation Army and other religious and civic societies. A luncheon and an elaborate programme of sports, etc., are planned for the enjoyment of the youngsters.

RAID OVERLAND FACTORY.

Two Hundred Hoosiers Decide They Will Not Wait for Cars to Come by Freight.

Some 200 residents of Indiana have notified the Willys-Overland Company, Toledo, O., that they will arrive in that city May 27 for the purpose of taking possession of that number of Overland cars. Although these people have been informed that the factory is turning out 230 machines a day with clock like regularity, they have decided that they will not await the arrival of these cars by freight.

The visitors will be entertained by the Willys-Overland Company during the day and over night, hotel accommodations having been arranged, and the grounds of the Overland club will be turned over to them. Wednesday afternoon, after a parade, which undoubtedly will be the longest procession of one make of machines ever seen, has been recorded on a moving picture film, the cars will be parked in Armory square. The start for Indianapolis, over the road, will be made early Thursday morning.

KISSELKAR IN WAR SERVICE.

Texas Man Purchases Machine That Is Scarred by Bullets of Mexican Soldiers.

Gail L. Jacoby of Corpus Christi, Tex., writes the Kissel Motor Car Company, Hartford, Wis., that he has recently purchased a 60 horsepower 1912 KisselKar that carries the marks of strenuous duty in the Mexican war. This machine, with three other KisselKars, was seized by the Constitutionalists and placed in service during the siege of Torreon.

There it was taken by the Federals and turned back to its owner, who fled across the Rio Grande and sold the car to Mr. Jacoby. The latter states that it is punctured with several bullet holes, but is in good shape mechanically and far from a "pensioner".

The Cadillac Motor Car Company, Detroit, secured two gold medals at the recent Philippine exposition in Manila, one for "the most instructive special automobile exhibit", won by a Cadillac chassis in operation, and the other, "for an example of special excellence".

J=H=S

**NO CAR OWNER CAN AFFORD
TO BE WITHOUT THEM**

They are the cumulative result of our nine years' experience in the manufacture of dependable spring suspension.

No matter how hard you inflate your tires, our absorbers insure perfect resiliency and save half your present tire expense. Unnecessary wear and tear on motor, transmission and other components is eliminated because they reduce vibration to a minimum.

The combined efficiency and durability of J. H. S. SHOCK ABSORBERS make them worth all they cost and more—they're the only kind leading mechanical engineers have considered fit to endorse.

For thirty days you can try them at our expense.

J. H. S. are made for every known car.

Trade Mailing Lists

Are revised only when the publishers can afford to check them.

Trade changes exceed 30 per cent. annually, or one name in three.

The minimum cost of checking and verifying a 40,000 name list would reach \$25,000 a year with a system and organization insuring accuracy.

If not revised the loss for postage and printed matter would exceed \$100 after 30 days; after three months the loss would exceed \$500 a month; the loss would correspondingly increase with each succeeding month.

Full correction can only be made by reaching every name with a first class letter and a printed postal card for return. Printing, folding, inserting, sealing, addressing and mailing, and checking the replies of a 40,000 name list would cost more than \$2000 a month. Besides there is the expense of obtaining names to replace those eliminated. New names are absolutely necessary to prevent shrinkage. To be of value these must be confirmed.

Under the most favorable conditions a full trade mailing list will cost for maintenance in any office, not including printing, postage or losses, but simply addressing and making known changes, \$200 or more a month.

The ACCESSORY and GARAGE JOURNAL mailing list is NOT claimed to be the largest that exists, but it is the most accurate and complete of the industry that can be compiled. Its accuracy and productiveness makes its value to us, and this quality insures to you the greatest service that care and supervision can produce.

is found only in a straight, distilled, unmixed oil. It is that quality which enables it to stand up under great cylinder heat without being "shot to pieces."

Polarine

was chosen to lubricate this car on its trip through the rocky, cylinder-heating grades of the Grand Canyon — because it had stability.

Polarine is not affected by heat or cold, it is non-carbonizing.

It is the oil for your trip.

For sale at all good garages; but be sure you get Polarine. If in doubt send us a sample of the oil for analysis.

How You Can Help

THE LINCOLN HIGHWAY

"A continuous, connecting, improved highway from the Atlantic to the Pacific."

Do you want to be one of that great army of progressive patriots who are helping to build a greater, more beautiful and more prosperous America?

Do you want to join with a million others, in the pushing through of an unselfish work which means more business, more pleasure and more advantages to all?

Do you want to help in the building of an eternal monument to the greatest name in the history of our country, to the greatest man the nineteenth century produced—Abraham Lincoln?

Do you wish to aid in the completion of the most practical enterprise ever undertaken by the American people? A 3400-mile link connecting the two oceans, to be used by, and directly profiting sixty millions of our population?

If you do, join the Lincoln Highway Association.

It's a great organization—a grand work to feel in sympathy with. Costs but \$5.00, payable once. The price of one good dinner, of one ten-cent cigar a week for a year, makes you a contributor and places your name on that vast list of patriots which generations to come will have cause to bless.

Get out your check book now. Here's a chance for you to build a portion of a lasting monument, the longest improved road in the world.

We have a pair of Lincoln Highway pennants, like the illustration, for your car. They will come to you for a dollar, prepaid.

A big map of the United States, showing the route of the Lincoln Way, is a fine thing to have on the wall of your office. It's backed with cloth, printed in three colors and costs \$2.00.

All the real Lincoln Highway boosters are wearing a little red, white and blue lapel button—they're twenty-five cents. Wear one.

Send the five to
The Lincoln Highway Association
 Dime Bank Building DETROIT, MICHIGAN

THE LINCOLN HIGHWAY ASSOCIATION, DETROIT, MICHIGAN.

Gentlemen:

I regard it as a privilege to be one of the many who will make THE LINCOLN HIGHWAY possible, and am accordingly sending along my check for Five Dollars as my subscription to this glorious cause.

Pierce-Arrow

The Durability of Perfect Balance

Pierce-Arrow Automobiles represent the highest average of desirable motor car qualities yet attained. A Pierce-Arrow car is a safe car and it is fast; it is a splendid hill climber; it is a strong car and it is light; it is most economical in its use of oil; it wastes no gasoline. No one desirable quality has been sacrificed to another. A balance of all desirable qualities has resulted in a splendidly practical whole.

Strength is placed first because it means steadfastness, and that means safety—which is paramount. Comfort is an essential factor because without it the pleasure is taken out of a pleasure car. Beauty has been considered as a vital attribute—but the beauty of liteness, of grace.

The result is a well-balanced, all-around car into which so much vitality has been built originally that we have yet to see the Pierce-Arrow which, after years of service, has not retained the enduring vigor that can come only from materials of excellence, wisely chosen and intelligently combined.

Pierce-Arrow cars are built in three chassis sizes, 38, 48 and 66 horsepower. These chassis are equipped with many types of open and enclosed bodies, including a runabout with interchangeable Victoria and coupe top.

THE PIERCE-ARROW MOTOR CAR COMPANY

BUFFALO

NEW YORK

Wanted!

A representative in every section of New England, New York and New Jersey, inside the next ten days. To the right man or firm we offer an extraordinary business opportunity.

THE DETROITER CAR is too well known to need description here. It leads the \$1,000 class. A safe car. A strong car. A fuel-saving car. A powerful car that will take any grade where its wheels can find traction. The only car of its class with full floating rear axle, ball bearings throughout, 32 h. p. motor and platform springs. Made by a firm that never borrowed a penny but has won conspicuous success through giving quality to the car and co-operation to its dealers.

Until this year practically every Detraiter that could be built was taken by western dealers because of the ability of the car to negotiate the rough western roads and hills. Now—this season—the Detraiter is coming into the East and coming strong. Success is assured.

A Complete Line - \$850 to \$1050

Stream Line or Torpedo Body in wide variety of equipment
Eastern territory is now being allotted. We want one of the best dealers in every eastern county within the next ten days. Address your communications to

Fuel and Repairs

You can lower these expenses

IN three years' time supplies and repairs occasionally cost as much as the original price of a car.

Careless lubrication is responsible for most of this expense.

A canvass among New York repair shops showed that about one-half of the automobile engine troubles are caused by incorrect lubrication.

There are two things that must always be considered in an oil. One is its quality. The other is its fitness for your motor.

Low-quality oil in time may bring practically every trouble a motor can face.

Oil of a *body* which is incorrect for your motor brings many penalties—heating and seizing of bearings, worn wrist pins, poor compression, breaking of parts, excess carbon deposit smoking or overheating of engine and many other troubles.

Aside from repair troubles you must face a plain fact:

The more power you waste the more fuel you must consume.

The various grades of Gargoyle Mobiloils, purified to remove free carbon, are:

Gargoyle Mobiloil "A"
Gargoyle Mobiloil "B"
Gargoyle Mobiloil "E"
Gargoyle Mobiloil "Arctic"

Mobiloils

A grade for each type of motor

VACUUM OIL COMPANY, Rochester, N. Y., U. S. A.

Specialists in the manufacture of high-grade lubricants for every class of machinery. Obtainable everywhere in the world.

DETROIT 321 Free Press Bldg. BOSTON 49 Federal St. NEW YORK 61 Broadway CHICAGO Fisher Building 4th & Chestnut Sts. PHILADELPHIA Indiana Pythian Bldg. INDIANAPOLIS Plymouth Bldg. MINNEAPOLIS Fulton Bldg. PITTSBURGH

You cannot get perfect lubrication unless the *quality* is right, and the *body* of your oil suits—

- | | |
|---|--------------------------------------|
| (1) Your type of lubrication system. | (4) Your bore and stroke. |
| (2) Your piston clearance. | (5) Your engine speed. |
| (3) Your bearing design and adjustment. | (6) The size and location of valves. |
| | (7) Your cooling system. |

Gargoyle Mobiloils are sold by a *Chart* which specifies the correct grade for each car.

They are backed by almost 50 years' experience which has won for us the world-leadership in scientific lubrication.

If you do not at present use the grade of Gargoyle Mobiloils specified for your car, you may feel almost certain that your bills for fuel and repairs are higher than they should be.

It is safest to buy in original barrels, half-barrels and sealed five and one-gallon cans. See that the red Gargoyle, our mark of manufacture, is on the container.

On request we will mail a pamphlet on the Construction, Operation and Lubrication of Automobile Engines. It describes in detail the common engine troubles and gives their causes and remedies.

They can be secured from reliable garages, automobile supply houses, hardware stores, and others who supply lubricants.

For information, kindly address any inquiry to our nearest office.

ONE manufacturer advertises "Think of it—a 35 horsepower car for only \$1350."

Wonderful!

However, that's pretty good advice. Thinking of it will do you no harm. In fact, the more you "think of it" the more you are brought to realize how absurd the statement is.

Don't permit yourself to be influenced by false enthusiasm.

Do you know that the Overland has a 35 horsepower motor?

And the Overland costs only \$950.

That's something real to think about!

No-Rim-Cut Tires

4 For the Price 3 Some Ask for 3

Goodyear No-Rim-Cut tires dropped 28 per cent. last year. Now these tires—once the high-priced tires—undersell 16 other makes.

Some makes sell nearly one-half higher. A number of makers charge for three tires about what we charge for four.

It's a rather queer situation. Goodyear tires hold top place in Tiredom. They have more prestige, more users than any other tire. They have four great features found in no rival make.

Yet 16 makes, by their extra price, assume an extra quality—a better tire than Goodyears.

There Is No Such Tire

There is no better tire than Goodyears. That is self-evident. A better tire would out-sell Goodyears. Men would quickly find it out.

Higher prices mean smaller output, ancient methods or equipment, or a larger profit. They mean that Goodyear prices dropped so fast and far that others could not follow.

Our multiplied output, our new equipment, our efficient methods did it. In no other factory could equal tires be built at the Goodyear cost. And we last year pared our

profits down to 6 1-2 per cent. Those are the reasons—and the only reasons—for those many higher prices.

Exclusive Features

These four features can be found in Goodyear tires alone. They have won hundreds of thousands of users—saved millions of dollars in upkeep. And not an extra-price tire offers one of them.

Our No-Rim-Cut feature which completely ends rim-cutting in the only faultless way.

Our "On-Air" cure, which saves the countless blow-outs due to wrinkled fabric. This one extra process adds to our tire cost \$1,500 daily.

Our rubber rivets—hundreds of which are formed in each tire to combat tread separation.

All-Weather treads—our tough, double-thick anti-skid. So flat and smooth that it runs like a plain tread, but it grasps wet roads with deep, sharp, resistless grips.

Don't pay more for tires which lack these features. Almost any dealer, if you ask him, will give you Goodyear tires.

For Our "100 Million" Nation

A growth of 7,000,000 in four years has placed the United States in a position where it "looms as the true colossus of the modern world".

In colossal achievements, it has surpassed the works of antiquity. The airy Gothic Spires of the Woolworth Building, the shining tip of the Tower, stand as eloquent attestations of this American progress.

It has remained for the United States to carry to successful termination, that gigantic project—the Panama Canal.

In constructive work of all kinds the American Nation has taken the lead, holding her Light of Liberty and Peace high above sordid jealousies and selfish desires, setting for the whole world a worthy and well meaning example of true Brotherhood and Co-operation. Justly we may be proud that we are Americans.

For another great thing is to be done—there is to be a true "Uniting of the Union." A great shining band of Brotherhood is to be stretched across the continent, from coast to

coast, state to state, city to city, linking the hearts of all true Americans still closer together.

The Lincoln Highway—continuous, connecting, improved—a road of beauty and comfort—*Your Way and My Way.*

A splendid national monument dedicated to the great citizen of the Republic, who stands as exponent of fine courage, lofty aspiration, and vigorous, masterful American genius. Lincoln could have no more appropriate—no more enduring—tribute.

You can share—you can help, in the building of this glorious memorial.

Do it—send five dollars to—

Send an additional dollar and get a pair of Lincoln Highway pennants for your car. We also have some fine big wall maps in three colors, which show the route of the Highway, a great thing for your office, for two dollars

Polarine

is the cheapest oil in the long run. It stands up under cylinder heat. You don't have to drain it out of the crank case because it's shot to pieces and too thin to lubricate.

Polarine was used as the oil for this car on its hard trip through the Grand Canyon; it's the oil for your trip—the standard oil for all motors.

A GOOD oil may not be the RIGHT oil for YOUR car

There are nine distinct types of lubricating systems in general use. No one oil, however high its quality, is suitable for all of them.

An oil that does not suit the particular lubricating system of your car will result in engine trouble as surely as though it were the poorest oil on the market.

Learn which lubricating system your engine has and use the grade of Veedol that is best for it

The VEEDOL LUBRICATION CHART will show you exactly which grade of Veedol is best suited for your car. It was prepared after a study of all brands of automobile oils on the market, and scientific research into the requirements of the motor engines in the various American and Foreign automobiles.

The types of lubricating systems employed in internal combustion engines are as follows:

1. Full Splash.
2. Splash with Circulating Pump.
3. Pump Over and Splash.
4. Force Feed and Splash.
5. Pump Over.
6. Separate Force Feed.
7. Force Feed.
8. Full Force Feed.
9. Knight Slide Valve Motor.

Get a copy of the VEEDOL LUBRICATION CHART from your nearest dealer or write us for it. The use of the grade of Veedol recommended for your car will save you money in both repair bills and gasoline consumed.

PUBLISHER'S AND READER'S PAGE.

Each Issue of The Automobile Journal is a little bit better than the one which preceded it. This is an owner's motoring magazine, and as such it aims to present that which will not only meet with the approval of motor car users, but afford them every opportunity for becoming intimately acquainted with the products of the industry. Special attention is paid to needs of the prospective owner and the novice, as well as the man who desires to obtain the fullest measure of satisfaction, economy and efficiency from his machine.

The Departments devoted to suggestions for new owners and the timely articles dealing with the matters of care and maintenance, with particular application to the light automobile, are intensely practical. If you have not been following this feature closely, now is the time to begin. The Automobile Journal wants to serve you in the fullest measure possible. The object is to present these discussions in simple, non-technical language, but if anything remains that is not entirely clear, you are invited to make the freest use of the correspondence columns.

July 10 is the date of issue for the Eighth Annual Touring Number of The Automobile Journal. Reference already has been made to this special number on this page several times. Hundreds of tours, illustrated with hundreds

of new photographic reproductions of scenes of interest and beauty, each tour delineated on a map that can easily be followed in the car, and every itinerary completely routed in both directions. The data cover every section of the United States and Canada. The information presented could not be secured in any other form for less than 100 times the price.

Order Now—Hundreds of motorists were unable to secure a copy last year, although more than 25,000 were printed. Orders now on file will make it necessary to print an edition of not less than 30,000 this year. Your regular dealer will see that you are supplied, or

you may order direct. The price will remain the same—10 cents.

Be Sure to mention The Automobile Journal when writing to advertisers.

The Gliding Stop

"Safe in the Grip of Multibestos"

MULTIBESTOS controls a car with the power and precision of an air brake. Never a jolt or jar but always a smooth, gliding stop that insures both comfort and safety.

Experience has proved that the greatest safety device is an efficient brake and that no brake can be called efficient if the brake lining is not firm, strong and reliable.

The enduring efficiency of MULTIBESTOS is due to a firm, close weave of the purest of long fibre asbestos and brass wire. Its powerful grip and flexible action make it in every way the right brake lining and the greatest of all safety devices.

24.4 Miles per Gallon by a Six

A new high record for economy and wide range of efficiency has just been established by the Rayfield Carburetor, model G 3, attached to a stock Chandler six.

The test, officially conducted by F. E. Edwards, chairman of the Technical Committee of the Chicago Automobile Club, was made with all carburetor adjustments, including that on the dash, soldered fast. It covered four separate performances calling for very different qualities in the carburetor action, and not only did the Rayfield Carburetor prove wonderfully economical but, without change of adjustment, it showed itself also powerful, speedy, and very flexible.

What the Rayfield did on the Chandler Six without change of adjustment

1. Ran 24.4 miles on one gallon of gasoline.
2. Showed speed of over 45 miles per hour.
3. Climbed Chicago's famous Hubbard's Hill, from a standing start, on high and reached a speed of 20 miles per hour at the top.
4. Throttled down on high speed so low that for a stretch of several hundred feet the speedometer did not register.

Note: Car was a stock car in every particular, not especially prepared for the test. It carried full equipment, was occupied by four passengers and weighed 3700 with load. Tires 34 x 4. Temperature 52° at start, 56° at finish, actual specific gravity of fuel 60°.

If you want perfect carburetion you must use the Rayfield

KANSAS CITY CLUB WELCOMES TOURISTS.

Facilities of Largest Garage Outside of Boston, New York and Philadelphia Placed at Their Disposal on Terms Enjoyed by Resident Members.

Motorists contem-
district of which Kan-
will be interested in
planned for them by
of Kansas City. The
officially herein by E.
president of the or-

THE Automobile Club of Kansas City was formed under laws of Missouri, Dec. 7, 1903, with nine members. In 1907, W. W. Cowen of the Kansas City Board of Trade was elected president and W. P. M. Stevens, secretary. Under this administration the membership increased very rapidly, and the following year the club purchased 40 acres of land on the Grandview rock road, about 10 miles out of the city. This property was improved and was paid for in full out of the pro-

ganization.

ceeds of a race meeting, in which many prominent drivers took part. It cost the club \$8000, is now worth \$20,000, and was very popular among the members until early in 1913, when the buildings were burned.

In 1912, H. D. Train was elected president, serving two years, and during his administration the membership was increased to 800. In the spring of 1913, a committee consisting of E. W. Shannon, H. G. Blakeley and W. G. Whit-

Secretary's Private Office: Right to Left, President W. S. Webb, Vice President E. W. Shannon, Secretary W. P. M. Stevens.

comb was appointed to secure garage accommodations in the downtown section. This movement became so popular that a contract was made with Dr. Minor for the erection of a four-story building, with basement, at 1020 Oak street. This structure was completed and occupied April 1, 1914.

Description of Building.

The garage is of fireproof construction, of brick and concrete, on a lot 49.5 by 126 feet. The floors are entirely of concrete with reinforced concrete girders, and it is maintained that it is the only garage of its size without posts.

Two entrances are provided, one from Oak street and the other from an alley at the rear. Cars are stored in the basement and on all the floors, electric elevators communicating with each. Accommodations are afforded for about 250 machines. The wash stand is located in the basement, and there is a 600-gallon gasoline tank under ground in the alley. The building is heated by steam, supplied from the city heating plant, and lighting is by electricity.

As the cars enter the building they are checked by an attendant, and placed either by the member or an assistant, as he desires. No member is given preference of position on the first floor, or on any other unless he takes storage by the month. Back of the checker's station is a stairway leading to the second floor, on which are located the secretary's private office, the assembly room for the club, a reception room for women and a wash room for men.

The garage is one of the best equipped and most convenient in the country. The writer has visited practically all the garages in Illinois, Indiana, Ohio, New York and New England, and the only ones which equal it are found in Boston, Philadelphia and New York City. The building and grounds are valued at \$90,000, and the club pays a rental of four per cent. on the investment, or \$375 a month. Dr. Minor is a very enthusiastic member, and the club was fortunate in securing such good terms.

Charges for Members.

The charges are graded according to service. For each storage limited to 12 hours, the charge is 25 cents, or coupon books valued at \$5 may be purchased for \$4.50. Day storage by the month costs \$5, while storage day and night may be had for \$10. Storage for the entire year, including all membership dues, may be had for \$60. The yearly dues are \$12 and the admission fee is fixed at \$10. For washing and polishing, the charge is \$1.

While the garage service is intended primarily for members only, the directors have de-

Assembly Room of the Automobile Club of Kansas, with the Three Officers Shown in the Above Picture.

Second Floor of the Garage, Showing the Electric Elevator at the Rear—Note Entire Absence of Posts.

cided that use of the garage shall be extended also to all tourists through Kansas City, at the same rates as those charged to members, so that a tourist can put up his machine over night at the best garage west of Boston for the sum of 25 cents, and can obtain gasoline and oil at actual cost to the club. This is rather in contrast to the plan in vogue in many eastern garages, where the lowest price is \$1 a night for storage, and the highest price that can be charged for supplies. At present the Automobile Club of Kansas City is charging 12 cents a gallon for gasoline.

Trails Leading to City.

In addition, the good roads committee and touring bureau supply free information to all motorists. There are many routes through Kansas City, and throughout Missouri and Kansas good trails lead north, south, east and west. Among these latter may be mentioned the Canada, Kansas City and Gulf highway, starting from Winnipeg and leading through St. Paul, Minn.; Cedar Rapids, Ia.; Powersville, Chillicothe, Excelsior Springs and Kansas City, Mo., to Olathe and Fort Scott, Kan., and Joplin, Mo., and on to the Gulf. This highway is now being marked with 18-inch white bands around the telephone poles. Connection therewith may be made at Cedar Rapids from Chicago.

Another trail now being marked is from Utah to Indianapolis, through Colby, Manhattan, Lawrence, Kan., into Kansas City, and through Higginsville, Glasgow, Louisiana, Mo., into Pittsfield, Ill., and thence to Springfield, Decatur and Chrisman and on to Indianapolis. The poles on this route are marked

with an orange band 18 inches wide, surmounted by a black stripe six inches wide. This is known as the Midland trail.

Then there is the Old trail, marked red, white and blue, from the Atlantic to the Pacific, leading through Colorado and Kansas, Kansas City, Lexington, Marshall, Boonville and St. Louis, Mo., and on East through Illinois, Indiana, West Virginia, Pennsylvania and Maryland. Others might be mentioned, including the Sunset trail from Omaha, the Interstate trail from Des Moines, the White way from Kansas, all of which lead to Kansas City and all of which are marked.

Signs Being Erected.

To all tourists from every direction, the Automobile Club of Kansas City extends an invitation to make use of its garage and club accommodations. Signs have been made calling attention to this invitation, and soon will be erected, on all trails 100 miles in every direction from Kansas City.

A word might be added concerning the other activities of the club, these including the erection

First Floor of the Garage, with Checker's Station at the Left of the Entrance from Oak Street.

of a \$10,000 clubhouse on the 40-acre tract, to replace the structure burned last year. In addition, it is hoped that accessories, tires, tubes and insurance may be secured for members at reduced prices, and that cafe privileges may be established in the down-town clubrooms.

The officers elected in February are: President, W. S. Webb; first vice president, E. W.

Shannon; second vice president, A. D. Cottingham; secretary, W. P. M. Stevens; treasurer, Bird H. McGarvey; directors, W. C. Whitcomb, D. A. Morr, A. E. Hutchings, Frank E. Lott, E. F. Webster and Frank P. Ewins. The present membership is 900, and the officers hope to increase this to 2000 before the end of the year, and the chances of success appear very good.

ENGINEERS' MIDSUMMER MEETING PLANS.

MEMBERS of the Society of Automobile Engineers in all parts of the country are laying plans to be present at the annual midsummer meeting, which will be held this year at Cape May, N. J., June 23-27. While considerable time will be spent in professional sessions, at which reports of committees will be presented, discussions will be had on pertinent subjects and business will be transacted, the general committee of arrangements, Arthur B. Cumner, chairman, has planned numerous special events of a social nature, so that the outing will combine business and pleasure.

The programme follows:

Tuesday, June 23—Standards committee meeting at 2 in the afternoon; meeting of the board of governors of sections at 8 in the evening.

Wednesday Afternoon, June 24—Business session at 2. Address by President Henry M. Leland, Detroit, followed by report of Treasurer Hermann F. Cuntz of New York City. Election of new members, discussion on proposed constitutional amendment and introduction of new business.

Professional Session—Reports of committees. Research division, David L. Gallup, chairman; Iron and steel, Henry Souther, chairman; miscellaneous, John G. Utz, chairman.

Thursday Morning, June 25—Professional session at 9:30. Report of pleasure car wheels division, Henry Souther, chairman; "Tolerance Specified in Connection with British Standards of Rims and Pneumatic Tires", E. R. Hall; "Possibility and Difficulties of Formulating Acceptable Recommendations for One Standard Felloe Band for Wheels to Be Equipped with Pneumatic Tires", C. C. Carlton; "A General Summary of the Truck Tire Situation", J. E. Hale; report of springs division, Harold L. Pope, chairman; "Ignition and Starting Devices", A. D. Libby; "Electric Transmission for Motor Cars", J. B. Entz.

Thursday Afternoon, June 25—Professional session at 2. "The Ideal Car", discussion introduced by C. E. Davis; "Possible Weight Reduction of Cars", A. P. Brush; "Necessary Elements of Design for a Successful High Speed Motor", D. McCall White; "Motor Capacity for Motor Vehicles", C. T. Myers; report of electrical equipment division, A. L. Riker, chairman; report of electric vehicle division, A. J. Slade, chairman; report of broaches division, C. W. Spicer, chairman.

Friday Morning, June 26—Professional session at 9:30. "Tap Drill Sizes and Causes of Stripped Threads", H. E. Harris; report of motor testing division, J. O. Heinze, chairman; report of ball and roller bearings division, Howard Marmon, chairman; "A Proper Basis for Road Vehicle Taxation", C. O. Egerton and S. I. Fekete; "Proper Characteristics for Automobile Engine Oils", Prof. David L. Gallup.

It will be noted that sufficient time has been left for the social features. A banquet will be

held the evening of June 25, at which members of the society and the women of the party will be the guests of the hotel management. Wednesday evening there will be amateur theatricals, in which members of the various sections will take part. A baseball game has been arranged for Friday afternoon, and other games and tournaments are to be held Saturday.

Particular reference is made in the advance announcement to the discussion on the ideal car. It is generally conceded that the design of the average automobile would be materially different from what it is were the engineer unhampered by the dictates of the manufacturer, but exactly what a machine would be like were it based entirely on engineering considerations is to be disclosed at this meeting.

In preparation for this discussion, a number of consulting engineers and other members of the society, who are not actively engaged as designers, have been asked to give their views on this subject. In this way it is believed that the influence of commercialism will be entirely eliminated for the time being, and it is expected that ideas will be brought to light which will be reflected in the design of the future car.

Another matter that will come up for discussion is that of securing better identification for cars. Owing to the variety of shapes and sizes of license tags prescribed by the laws of the several states, as well as confusions in the manner in which these shall be displayed, manufacturers have thus far been unable to arrive at an entirely satisfactory method of mounting the plate. It is believed that owners would welcome some uniformity on this matter, and the society will endeavor to arrive at some method of securing uniform legislation on the subject.

Another feature of the meeting will be an illustrated lecture, with moving pictures, calling attention to the forthcoming European trip of the society in October and November. Opportunity also will be had to reserve passage.

SIX STUDEBAKER SIXES IN SHANGHAI.

THE rapidity with which China is receding from its century-old habits, and taking on modern clothes, has often been pronounced one of the 20th century marvels. In no way has this progress been proven more forcibly than in the part Chinese women are taking in affairs, social and political.

A recent transaction in Shanghai bears out the above in every particular. During the past winter the widow of Soong King Dong, who, previous to his death, was compradore of the Russo-Chinese bank at Shanghai, and one of the city's wealthiest citizens, decided that, with her family, she would enjoy some of the pleasures pursued by her American sisters. So she purchased a Studebaker six from Hubert S. Honigsberg, who represents the Studebaker Corpora-

tion from west to east in a 40 horsepower KisselKar, made by the Kissel Motor Car Company, Hartford, Wis. They expect to reach New York City early in July.

Before leaving the Pacific Coast, Mr. and Mrs. Morris drove their KisselKar to the Mexican border, and, during the return to San Francisco, had a very interesting adventure. Near San Lucas, Cal., they lost the main road and decided to cross the Salinas river. There being no bridge at this point, and having been warned not to attempt to make the ford without the aid of horses, they secured the service of a farmer and two teams. While they were in the middle of the stream the towing chain broke and left them stranded with the water up to the frame of the car. Mr. Morris, being afraid that the machine

Mrs. Soong King Dong and Her Family in Six Studebaker Sixes at Fuh Tan University, Shanghai, China—Statue of Li Hung Chang in the Background.

tion of Detroit in that section of the Orient.

It happens that the four Soong sons and one daughter are married and each has a house full of little ones who are just as modern in their desires as the older folk. Each son and daughter prevailed upon the mother to buy them a Studebaker, and the accompanying illustration shows the six Studebaker sixes immediately after the five new ones were landed from the steamship Empress of Asia, at the grounds of Fuh Tan University.

TRANSCONTINENTAL JOURNEY.

Weed Tire Chain Representative Is Utilizing a 40 Horsepower KisselKar.

W. T. Morris, representing the Weed Chain Tire Grip Company, Bridgeport, Conn., accompanied by Mrs. Morris, is crossing the conti-

would settle in the soft sand, turned on the ignition switch, pressed the starter button, and to his surprise the motor started, and in a few moments had pulled out of the river under its own power. The farmer declared it was the most wonderful demonstration he had ever seen with a gasoline motor.

Leaving San Francisco, the journey was continued up the Coast through Oregon and Washington to Seattle. From the latter city they will take the trail through Spokane and into Montana, one of the most difficult passes in the Rocky mountains. Thence they will go down through Wyoming to Denver, from which point they will pursue an easterly course, crossing the Mississippi river at Clinton, Ia., and on to Chicago. From Chicago the exact route has not been determined. The trip is being undertaken for pleasure and this will be taken into consideration at all times.

THOMAS IN DELAGE TAKES 500-MILE RACE.

Wins \$35,000 in Cash and Trophies and Creates New World's Records---French Machines Capture First Four Places---Stutz First American Car to Finish.

RENE Thomas of France, driving a Delage car, won the fourth annual international sweepstakes 500-mile race on the Indianapolis speedway, Memorial Day, and with it \$21,750 in cash and trophies of sufficient value to make his total winning for the day \$35,000. His time was 6:03:45.99, and the average speed of 82.47 miles an hour is a new world's record for the distance. Thomas also established new records for all distances from 300 miles.

To Arthur Duray of Paris, France, a Belgian

born in New York City, goes the honor of taking second place with the little 183-inch Peugeot, the smallest car in the race. His time was 6:10:24.49, and his average speed 80.99 miles an hour. His share of the prize money was \$10,500 in cash and sufficient trophies to bring the total of \$14,500. He secured new records for 100 and 200 miles.

The rivalry between the Peugeot and Delage teams was particularly strong. A second Delage, driven by Alfred Guyot, who drove an English

RESULTS IN THE FOURTH 500-MILE RACE				
No.	Car and Driver	Time	M. P. H.	Prizes

25	Maxwell, Carlson	7:02:42.60	70.98	1,500
42	Duesenberg, Rickenbacher	7:03:34.59	70.83	1,400

Competing Cars Lined Up for the Grand Parade Around the Course at the Start of the Fourth 500-Mile Race.

Sunbeam to fourth place last year, finished third, while Jules Goux in a second Peugeot, the man who won last year's 500-mile event, finished fourth.

The first American car to finish was Barney Oldfield's Stutz, in fifth place. Joseph Chris-

tiaens of Belgium in an Excelsior, made in that country, was sixth, and Harry Grant of Boston, in an English Sunbeam, was seventh. Three American cars, Charles Keene's Beaver Bullet, William Carlson's Maxwell and E. V. Rickenbacher's Duesenberg, took the last three prizes. Three other cars, Ralph Mulford's German Mercedes, Willie Haupt's Duesenberg and William Knipper's Keeton, the last two American made machines, also finished, but not in the money.

Analysis of Results.

The complete story of the prize winning is told in tabular form at the beginning of this article. In connection therewith attention is drawn to the table at the bottom of this page. Comparison of the two tables will show that the first six cars to finish exceeded the speed of the winner of last year's event, and that the first four exceeded the record established by Joseph Dawson in a National in 1912. Eight of the 10 prize winners returned in less time than it took Ray Harroun to win the first 500-mile race with a Marmon in 1911.

It is interesting also to note that France took cash prizes and trophies valued at \$58,525; America, \$7500; Belgium, \$2200, and England, \$1800.

Rene Thomas and the Delage 16, Winning Combination in the Fourth International Sweepstakes Event.

Of course, while the English car won the \$1800, the sum really ought to be added to that secured by America since the machine is owned by the driver, Harry Grant, who is very much an American.

Out of the field of 45 entrants, all but two, the Tatter, and one of the Maxwells, appeared for the elimination trials. Thirty-two qualified. Ralph DePalma's Mercedes, with the six-cylinder aeroplane engine, failed to make the required 75 miles an hour on the first two trials, but qualified on the third. DePalma decided, however, that the engine was out of balance and withdrew before the start. Edwin Pullen also decided to withdraw his Mercer. Thus neither the winner of this year's Vanderbilt Cup race or of the Grand Prize took part in the event. Thirty cars started, and, as indicated above, 13 finished.

Story of the Race.

Following the practise inaugurated at the first 500-mile race in 1911, Carl Fisher, president of the speedway association, led the parade once around the course, before Starter Thomas Hay of Chicago fired the opening gun. Seven hours and 36 minutes later the last car crossed the finish line. Eleven seconds less than one hour separated the 10th prize winner from the first. Without doubt it was the greatest automobile race ever run, and this record will be one hard to beat.

Howard Wilcox and his Gray Fox was the first to cross the tape on the first lap. This position went to Christiaens and his Excelsior on the

TIME AND SPEED OF PRIZE WINNERS IN THE FIRST THREE 500-MILE RACES.

Thomas Crossing the Finish Line, Winner of \$35,000 in Cash and Trophies.

second, who maintained his lead until the fifth round, when it was found that Goux, last year's winner, had passed him, but this condition prevailed for only one lap. Bragg in a Mercer was now second and Thomas' Delage was in third place.

The score sheet shows that Oldfield in the Stutz was leading at 20 miles. Haupt in a Duesenberg was second, Christiaens third, Bragg fourth and Thomas fifth. There were 31 cars in the race at this point, Brock's Ray having been eliminated at 10 miles. Christiaens regained the lead in the 11th round and retained it through the 40-mile mark to the 17th lap, when Thomas supplanted him.

At 60 miles Thomas was but three seconds ahead of Christiaens, while Bragg was two seconds behind the latter.

At 75 miles Thomas was still leading, with

took the Remy trophy and grand brassard for completing 200 miles in the lead, while Thomas was in second place and Wishart in a Mercer third. The number of cars running had been cut

Duray and the Second Place Peugeot, the Smallest Machine in the Big Race.

to 20. The most serious accident of the race took place when Gilhooley lost a tire on his 41st lap, and collided with Dawson's Marmon. Dawson and his mechanic, Vare Barnes, were severely injured and taken to a hospital.

Duray held the lead until 260 miles had been reached, when Wishart, who had been in second place, passed him. Boillot went into second place, while Duray dropped to third. At 300 miles Thomas again appeared in first place, taking the Prest-O-Lite trophy. Wishart was second and Duray still third. Three more cars had been eliminated during this 100-mile period.

Wishart went out at 305 miles. Thomas dropped to sec-

Barney Oldfield and Stutz 3, First American Car to Complete Long Grind.

ond place at 340 miles, when his teammate, Boillot, winner of last year's international Grand Prix and Coupe de L'Auto races in France, took the lead for a short time only. Boillot resumed third place at 360 miles and went out at 367.5. Thomas returned to the lead at 360, and retained it to the end. At 400 miles he took the Wheeler & Schebler trophy, and at this point the relative positions of the 13 cars remaining in the field was practically the same as at the end, although there was still some question as to the final arrangement of those running below first, second and third.

Work at the Pits.

Unusual interest centres around the work at the pits, because of the efficiency prize offered by the Waltham Watch Company for this race. It is pretty generally conceded that a contest may be won or lost at the pits, and for this reason the possibility of adding another \$500 to the prize money was a splendid inducement. However, its value would have been still further enhanced had the award not been limited to the first three cars to finish. Barney Oldfield's Stutz would have won this prize had it not been for this qualification, and thus \$500 more would have been saved to America. As matters stood, Thomas' Delage was the fortunate car.

It has been the proud boast of the Delage team that never in the racing history of that

Charles Keene and His Special Beaver Bullet, Second American Car to Finish.

factory has a hood been lifted or a tool used between the start and finish. This record was again maintained in this event. Duray's little Peugeot also secured this honor, but Goux was compelled to put a new bolt in the front spring hanger of his Peugeot.

But foreign machines are not the only ones that can lay claim to such freedom from trouble. The first Stutz ever made took part in the 500-mile race of 1911, and was the only machine in that event to complete the entire distance without once lifting the hood. Cars of this make have repeated this performance time and time again, and Barney Oldfield's Stutz was the only American car in this event to complete the journey under such circumstances.

How Time Was Lost.

Oldfield's Stutz stopped but three times and lost only 3:56 at the pits. The first stop was at

The 30 Drivers and Their Mechanicians as They Faced the Camera Before Starting on Their 500-Mile Journey.

17	Burman, Burman	15:26	35:30	50:09	64:41	79:29	out at 115 miles.							
24	Stutz, Anderson	14:42	29:19	41:58	57:27	76:56	out at 102.5 miles.							
49	Isotta, Gilhooly	15:38	30:28	43:21	60:49	79:47	out at 102.5 miles.							
8	Maxwell, Tetzlaff	19:33	49:58	68:48	89:48	out at 92.5 miles.								
12	Sunbeam, Chassagne	15:25	30:03	out at 47.5 mile										
48	Ray, Brock	out at 10 miles.											

120 miles, for a right rear tire, gasoline and oil. It stopped a second time 10 minutes later for a right front tire, and took on more gasoline and oil. Gilbert Anderson then took the wheel, and was replaced by Oldfield after the 225-mile mark, when a right rear tire was placed, and more fuel and oil taken on.

Stops Made by Thomas.

Thomas really took second place with three stops, losing 4:55. His first stop was at 140 miles, when he changed both rear tires. He stopped again at 215 miles and changed the left rear tire. At 350 miles he stopped for water, gasoline and oil, and changed both rear shoes.

Duray's Peugeot was in third place in this

respect. He stopped but twice, once at 290 miles, when he changed two tires and filled his tanks, and again at 376 miles to change three tires. His lost time amounted to 5:03.

Christiaens also stopped twice, once at 240 miles for three tires, gasoline and oil, and again at 360 miles, apparently for a short rest, although he took on gasoline. He lost 6:17.

The other drivers who finished made the following stops and losses at pits, in the order given: Grant, five, 9:27; Guyot, three, 9:38; Goux, 10, 12:23; Carlson, 10, 18:13; Keene, 12, 23:28; Mulford, seven, 27:50; Rickenbacker, nine, 36:00; Knipper, 13, 42:27; Haupt, 15, 42:54.

As was true of the 1913 race, tire changes

193:56	210:26	out at 290 miles.											

played a prominent part in the final result. The day was extremely hot. The race was hardly under way when Friedrich changed the first shoe on the fourth lap. It is estimated that over \$14,000 worth of tires was destroyed during the day, 138 casings having been changed during the progress of the event.

The Delage driven by Guyot had the best record with respect to tires, only two having been replaced. Oldfield's Stutz and Christiaens' Excelsior were tied for second place with three each. Thomas made five changes and he declares that the speed record set up by him will not be exceeded for some time because tires cannot withstand a faster pace.

Maxwell Burned Kerosene.

In at least one respect the feature of the race was the performance of the Maxwell 25. This machine was specially designed for the Maxwell Motor Company, Detroit, by Ray Harroun, who won the first 500-mile race and who has another claim to fame in the invention of the Harroun carburetor for using kerosene. While the company had made public some of the constructional details, the fact that this machine was to utilize kerosene was kept as a guarded secret.

There is little doubt that this is the first time that a kerosene burning car has competed in a speed contest, and certainly, it is the first time that such a car has covered 500 miles under those circumstances. It is stated that the only fuel carried on the Maxwell aside from the kerosene was a half-pint priming can, which was used in

starting. Less than 30 gallons of the heavier fuel were consumed, this being of 43.3 degrees Baume gravity, selling at about six cents a gallon. Thus the expense for fuel used on the Maxwell 25 was about \$1.80. The only trouble experienced, aside from tire changes, was one blown-out spark plug.

When Harroun was commissioned to design the three cars, two of which qualified for the race and the third could not be gotten ready in time, President Flanders of the Maxwell company is said to have guaranteed a bonus of \$10,000 pro-

William Carlson Crossing the Finish Line with the Maxwell 25, the First Kerosene Burning Car to Compete in Any Race.

viding the machine should be able to make one lap of the Indianapolis course in less than 1:37. Immediately after the conclusion of the race a check for the above amount is understood to have been forwarded to Indianapolis.

The story of the race is set forth in full in an accompanying score sheet, giving the elapsed time at 20-mile periods. This score sheet is unofficial and may be revised slightly when the records are confirmed by the contest board of the

American Automobile Association. The arrangement is such that the car in first position at the various stages is denoted by bold faced figures.

How Cars Were Equipped.

Another table sets forth the equipment used on the machines finishing the race. It may be added that Thomas' winnings are made up as follows: Speedway prize, \$20,000; using Bosch magneto, \$500; Truffault-Hartford shock absorbers, \$250; Rudge-Whitworth wire wheels, \$500; creating a new world's record for 500 miles with Bosch magneto, \$500; Prest-O-Lite trophy at 300 miles, \$2750; Wheeler & Schebler trophy at 400 miles, \$10,000; Waltham efficiency prize for least time at pits among the three place cars, \$500.

Duray won the speedway prize of \$10,000, \$100 for using Bosch plugs, \$150 for Truffault-Hartford shock absorbers, \$250 for Rudge-Whitworth wire wheels, G & J trophy at 100 miles, valued at \$1500, and Remy trophy and grand brassard at 200 miles, valued at \$2500.

Guyot's \$5525 is made up as follows: Speedway prize, \$5000; using Bosch magneto, \$200; Bosch plugs, \$100; Truffault-Hartford shock absorbers, \$100; Rudge-Whitworth wire wheels, \$150. The other prizes won were those offered by the speedway management only.

MANY HUPMOBILES PRESENT.

At Least One from Each State Parked at the Speedway During the 500 Mile Race.

Thomas Hay of Chicago, who acted as starter for the international sweepstakes 500-mile race at Indianapolis, Memorial Day, is the Hupmobile distributor in his home city. When he was not busy with the contest he took advantage of the opportunity to become acquainted with some of the Hupmobile owners present, and he was very much surprised to find that there was at least one from each state in the Union parked at the speedway during the progress of the race.

He was particularly interested to note the number of tourists who visited Indianapolis from all sections of the country, and when he saw a Hupmobile enter the western gate to the speedway bearing a California number on the radiator, he took pains to learn the owner's name. He found that it was E. S. Gartland, a young rancher of Burdego Canyon, who had driven all the way from California to witness the contest.

Concerning the race itself, Mr. Hay says:

The contest from start to finish was the keenest I ever witnessed, and I am proud of the fact that I had

the honor of firing the starting gun. It will go down in motor history as the greatest automobile contest of all times.

The amount of interest shown by spectators all during the race was extraordinary. You know six or seven hours of continual watching a mile-a-minute grind gets tiresome, but the fact that the speed kings were so evenly matched made the race an interesting contest at all times.

BIG SILVERWARE DISPLAY.

Stutz Exhibition Attracts Unusual Attention During Indianapolis Race.

Selecting the international sweepstakes 500-mile race date as a most appropriate time in which to call direct attention to the creditable work of Stutz cars in the racing field, the Stutz Motor Car Company, Indianapolis, Ind., gathered in all of its racing trophies, which have been on display by its agencies throughout the country, the result being a handsome and costly exhibition of silverware at the Stutz factory.

These trophies were won in a sensational campaign covering three years, and represented victories on road, track and hill in all sections of the country. A remarkable record was established during 1913, when Earl Cooper won six out of seven events in which he was entered, earning the title of road racing champion. And it may be added that Gilbert Anderson's winning of the Elgin National trophy in August made seven consecutive long distance victories for the year.

THE NATIONAL'S RECORD.

Europe's Best Speed Creations Needed to Lower That Made in 500-Mile Race.

According to George M. Dickson, general manager of the National Motor Vehicle Company, Indianapolis, Ind., only one American automobile manufacturer has grounds for rejoicing over the results of this year's 500-mile race. He bases this suggestion on the fact that none of the American cars entered for the event were able to exceed the record for the race set by the National winner in 1912. He says:

We firmly expected our record to fall this year. It was made back in 1912, and withstood the attacks of both foreign and American cars in 1913. We have not raced since 1912, and feel proud that our record was such an internationally cherished honor that the fastest cars of Europe tried repeatedly to break it.

We also are proud that the National's record still stands as the fastest for all American made cars. I believe I can be forgiven in our pride in the fact that the National was made almost entirely of stock parts; was built right in Indianapolis after the same National methods that turn out the cars for the public, while it required special speed creations from Europe to break the record set up by it at that time.

COLE LITTLE SIX MAKES ITS DEBUT.

EVERY year, on the evening preceding the 500-mile race in Indianapolis, J. J. Cole, president of the Cole Motor Car Company in that city, is host at a dinner to which newspapermen, trade publication and magazine representatives are invited. This is one of the features of Speedway week, as the period is termed in Indianapolis, since it affords a splendid opportunity for busy men to get together, renew friendships and make new acquaintances, which would be impossible on the day of the race.

This year, Wilbur D. Nesbit of Chicago was toastmaster, and the accompanying photographic reproduction gives some idea of the esteem in which President Cole is held by the men who gather in Indianapolis to "cover" the big event. Among those whom Mr. Cole asked to meet the guests were: R. J. Firestone, head of the Firestone Tire & Rubber Company, Akron, O.; W. J. Mayo, president of the Mayo Radiator Company, New Haven, Conn.; Alvin F. Knoblock, head of the Northway Motor & Manufacturing Company, Detroit; E. C. Tibbetts, advertising manager of the B. F. Goodrich Company, Akron, O.; E. A. Walton, advertising manager of the Timken Detroit Axle Company, Detroit, and E. S. Babcock, advertising manager of the Firestone Tire & Rubber Company, Akron, O.

At the conclusion of the banquet, and as a part of the postprandial exercises, the guests were invited to inspect the full 1915 Cole line in the new Cole plant. This line comprises a four-cylinder car, a little six and a big six.

The fact that a little six had been added was not exactly a surprise, since it was known that as long ago as March, 1913, President Cole had shown his representatives such a model at a distributor's conference held at the factory. At the time, he advised against placing it on the market, as it was not thought quite up to the Cole standards. Therefore, this was its debut, so to speak, and it was on view to the public during the remainder of the week.

It is stated that the little six already has two records to its credit. Chief Engineer Charles Crawford says he has made it cover the 2.5 miles

of the speedway, with top and windshield up, at better than 60 miles an hour, and it also set up a new cross country mark between Indianapolis and Detroit. One hundred and forty-nine of these models were sold during Speedway week, 24 being driven home overland. In addition, there were 112 four-cylinder models sold, 64 being driven home, and 58 orders for the big six, of which 19 went overland.

The new line is completely standardized, each model having the Northway motor with three point suspension, Timken axles and bearings, Mayo radiator, Spicer universal joints, Gemmer steering gear, Hydraulic pressed steel frame, Detroit Steel Product Company's springs, Rich

President J. J. Cole's Guests at the Banquet Given in Indianapolis the Evening Previous to the 500-Mile Race.

tungsten steel valves, Stromberg carburetor, Delco electric lighting, starting and ignition system, Janney, Steinmetz tanks, Firestone tires and demountable rims and Cole Stewart-Warner gravity gasoline control.

The four-cylinder Cole has wheelbase of 118 inches; the little six, 120 inches, and the big six, 136. The body designs are all with the streamline effect, with deep, comfortable upholstery. The latest style Pantasote top and ventilating windshield are included in the equipment. The color scheme is a rich, dark Brewster green.

The marriage of Spencer E. Wishart, a member of the Mercer racing team, and Miss Louise McGowan, second daughter of the late Hugh J. McGowan of Indianapolis, will take place June 23. They will spend their honeymoon abroad.

PARTIN-PALMER CAR IS SUCCESSFUL.

LESS than two years ago a group of men composing the Partin-Palmer organization got together with what they believed was a big idea and the capital, brains and determination to carry this idea to completion. The men were G. H. Partin, J. B. Blackman and H. E. Graper. The idea was to build a six-passenger, 38 horsepower car embodying all the newest and most desirable features in machines that were selling around \$1200 to \$1500, but the price was to be much less than that figure. The result was the Partin Manufacturing Company, Detroit and Chicago, maker of the Partin-Palmer car.

Joseph M. Kraus, Advertising Manager,
Partin Manufacturing Company.

Every man in the Partin-Palmer organization is held to be a picked man—a specialist in his line. The intention of the officials is that he shall realize his responsibility and know that he must keep his department upon an equal working efficiency basis with every other department. The object is that not only the

advertising has been confined to trade publications, and Mr. Darnall attributes his success to three things—the quality and value of the car, the unique selling methods and the trade paper advertising.

Partin-Palmer distributors are located at Berlin, Germany; Odessa, Russia; Ashburton, New Zealand; Yucatan, Mexico; Mahuo, Sweden; Sura, Fiji Islands; Milan, Italy; Havana, Cuba; Cape Town, South Africa, and Sidney, Australia. The above are confined to those controlling large territories in foreign countries, and do not include any of the several hundred dealers handling local territory throughout the United States and Canada.

It is explained that it was the plan of the Partin-Palmer organization to put the greatest actual value into the car and place as many machines as possible for demonstrating purposes all over the world with an idea of permitting these to accomplish their own results on their own merits before entering an extensive advertising campaign. This part of the plan having been carried out, and the dealers being in a position to take care of business, it is now deemed the proper time to put the second portion of the proposition into effect.

This campaign is to be most extensive, with a view to making the Partin-Palmer car and the organization back of it known to every motorist and prospective motorist in the civilized world. Following the practise of securing men who are recognized as specialists, Joseph M. Kraus has been selected to handle this campaign. He has had a very broad advertising experience, having sold space, written copy and made a thorough study of the proposition from all aspects.

SELLING STUTZ CARS.

Announcement is made by the Stutz Motor Car Company, Indianapolis, Ind., of the appointment of Harry W. Anderson, for 3.5 years with the American Motors Company, as assistant to Sales Manager W. D. Myers. His work will be devoted largely to placing agencies for Stutz machines in the South.

Mr. Anderson is well known to the trade in the South, having done considerable work in that territory. He will shortly begin a campaign of six months' duration, which will take him into every corner of that section.

The Partin-Palmer 38 was designed by Randall A. Palmer, an engineer with many years' experience in the industry. The motor is the product of the genius of A. C. Mason, well known as a designer of Buick engines. These examples are held to be typical of the other components of the chassis.

The sales department is in charge of C. C. Darnall, who has some very radical ideas regarding selling that appear to have been a decided success. Attention is drawn by the company to the statement that he has taken a new product, unknown even to dealers, and gained a world wide distribution within a year. Most of the

MANUFACTURING ZENITH CARBURETORS.

How Components Requiring Tools as Accurate As Those Used by Watchmaker Are Made and Tested--Simplicity and Efficiency of Zenith Due to Nozzle.

ZENITH carburetors, well and favorably known abroad, where they have received the indorsement of a large number of manufacturers of high grade machines, are now being produced in constantly increasing numbers for the American trade in the Detroit plant of the Zenith Carburetor Company, a building of steel, concrete and glass, splendidly equipped for the accurate work and tests required in high grade carburetor practise.

Although several hundred carburetors are completed and tested during the working days of the week, accuracy is not sacrificed for quantity, and each component undergoes the most rigid inspection in the various processes of manufacture. Even the raw material utilized must conform to the specifications of the engineering department, and exhaustive tests are made of each part before it reaches the final assembly. Certain components require tools as accurate as those utilized by the watchmaker. The hole in

the nozzle, for instance, must be made by a drill as accurate as human ingenuity can devise.

The accompanying illustrations depict some of the more interesting steps in the manufacture of the Zenith carburetor, that at Fig. 1 showing how the float chamber is tested. It is very important that the float and float chamber be tested under working conditions. Each spun brass float is plunged into hot water, which expands the air within, and any leaks are noted by the bubbles given off. After the floats are assembled in the float chambers they are placed in a testing rack as shown and a gasoline gauge is temporarily attached to each instrument to indicate level of the fluid. The float should occupy a certain position with respect to this level and the performance of each carburetor is carefully noted and corrected in this way. The gasoline is carried in a tank about six feet above the testing bench.

A ball gauge is utilized in the inspection of

Illustrating Some of the More Interesting Processes in the Manufacture of Zenith Carburetors: 1, Testing the Float Level; 2, Drilling the Spraying Nozzle, Requiring Great Accuracy; 3, Testing the Nozzles; 4, Special Jewellers' Lathes Utilized for Machining Needle Valves; 5, Partial View of the Assembly Department.

the air nozzle in the venturi tube, as accuracy is important. A long row of nozzles is placed on a bench as shown at Fig. 10. The "go" end of the

Fig. 6—Model L Zenith Carburetor.

gauge must clip through the nozzle, while the "no go" must not. The "go" end measures .7851 inch, while the "no go" end is .7898 inch. Thus there can be a variation of plus or minus about two thousandths. A ring gauge must readily slip over the outside of the nozzle without any play.

In the drilling of the spraying nozzles great care must be taken to have them absolutely correct and uniform in size. Two jewellers' lathes are utilized for this purpose, the one at the right in the illustration at Fig. 2 serving to centre the nozzle, while the small drill at the left is used to complete the operation. Many accurate operations similar to this will give the reader some idea of the skilled workmanship employed in the making of the Zenith.

Although the holes are drilled with the greatest of care, yet they sometimes vary slightly, and an infallible method is employed in determining whether or not the variation is within permissible limits. This is by means of a flow of water through the nozzle at a given pressure and time. This is testing the nozzle under conditions similar to actual operation, and a stop watch is employed when noting the level of the water in a graduated measuring tube. The variation permitted is very slight. A workman testing the nozzle holes is shown at Fig. 3.

Fig. 4 shows part of the equipment utilized for the careful machining of the needle valves which control the flow of gasoline from the float chamber. The drilling is performed by special jewellers' lathes. Multiple spindle drills are used

for drilling all of the holes in the barrel or air passage of the carburetor. The part is placed in the jig, when then accurately locates the drill points for all 12 holes to be drilled. There are almost as many sizes of drills as there are holes, and they are so arranged that the drilling of all holes with one side of the jig in position can be done in one operation, the other drills not interfering.

The main jets are drilled at the rate of two a minute. They come to the lathe man from the automatic machine which finishes the outside, but the inside must next be drilled. Fig. 5 depicts a section of the assembly department, showing a line-up of partially finished carburetors ready for the fitting of the floats, etc. Each assembler has a vise to hold the instruments in the making and the parts ready for fitting are contained in steel trays before him. The same careful attention characteristic in the production of Zenith carburetors is observed in packing them for shipment, a special box having rubber strips to hold them securely being used.

The simplicity and efficiency of the Zenith carburetor is due to the compound nozzle. There are no moving parts except the float and the butterfly valve, and there is but one adjustment, that regulating the quality of the mixture for low speed. The setting of the Zenith carburetor is the selection of the proper size of choke or venturi tube, and gasoline jets and secondary well. As these are determined at the fac-

Fig. 7—Cross Sectional View of Zenith Carburetor—The Principal Parts Are: G, Main Jet; I, Compensator; X, Choke Tube; P, Secondary Well; O, Slow Speed Screw; T, Butterfly Valve; J, Priming Tube; U, Passage for Priming Fuel; F, Float; G I, Needle Valve; B, Valve Lever Weight; T I, Control Lever; J, I, K, Constant Flow Device; H, Nozzle.

tory the carburetor requires no attention after installation, and it is stated that it is as efficient in high altitudes as in low, a statement that is

borne out by the performance of Garros in an aeroplane, who attained an altitude of nearly three miles with a Zenith equipped motor.

The success of the Zenith is due to the constant flow or open well device utilized, a discovery of Baverey, the inventor of the Zenith, which is held to overcome such increase in the fuel emergence from the jet as would tend to make too rich a mixture when the piston speed increases. In other words, the mixture is practically constant.

The operation of the Zenith will be best understood by reference to the illustrations at Figs. 8 and 9. The former is a simple type of carburetor or mixing valve, having a single jet placed in the path of the incoming air, with fuel supplied from the usual float chamber. As the speed of the motor increases, so does the air, but the emergence of gasoline from the jet is augmented, resulting in a mixture which grows richer and richer. The mixture is practically constant only between narrow limits and at very high speed.

Fig. 8—Simple Type of Carburetor.

gravity only through the compensating jet I, and is not affected by the suction, as the well is open to atmospheric pressure. The flow of the fluid is, therefore, constant at all motor speeds, causing the mixture to become poorer and poorer. It will be seen that this type produces the opposite effect from the first.

By combining the two types Baverey secured the mixture balance desired, by the compound nozzle previously referred to. Fig. 9 B shows the direct suction or richer type leading through the pipe E and the nozzle G, while the constant flow device is depicted at J, I, K and nozzle H. One counteracts the defects of the other, providing a constant ratio of aid and fuel at all speeds.

In addition a priming tube J is incorporated, it extending into the secondary well P and opening at the point U of the butterfly valve as shown at Fig. 7, which depicts cross sections of the Zenith carburetor. With the butterfly valve partial-

ly open a powerful suction is exerted, providing the required rich mixture for starting a cold motor, as well as a positively measured flow of fuel

Fig. 9—Illustrating Principle of Compound Nozzle: A, Baverey Constant Flow Device; B, How Zenith Obtains Constant Ratio of Air and Fuel.

at low motor speeds when idling, for example.

The priming tube J, soldered into a brass holder G, is inserted from below, while a fibre washer on top of this holder insures tightness. The assembly is secured by screwing in the secondary well P. The lower portion of the holder or priming plug is turned down and slotted to allow air to enter through a lateral hole in the slow speed screw seat N, from which it flows around the lower part of the priming plug and into the secondary well. The secondary well P is drilled for gasoline and the supply of air can be regulated by the screw O.

The choke tube or air nozzle is held in place by a screw, and can be changed easily when the butterfly throttle has been removed. Its object is to obtain a correct gas velocity around the jets. The main jet is displaced after removing the lower plug. This jet is of the ordinary type and has a predominating influence at high speeds. The compensating jet corrects the action of the main

Fig. 10—The Air Nozzle in Venturi Tube Is Tested by a Ball Gauge and the Variation of Plus or Minus Is About Two Thousandths.

jet and comes into action at low speeds, as when climbing a hill. The opening of the throttle is regulated in the usual manner by a screw V, and

the position of the screw O regulates the mixture at low speed. Screwing it in enriches the mixture, and vice versa provides a leaner mixture. It will be seen that the carburetor can be readily taken apart and cleaned without changing its setting, which is determined at the factory. This applies, of course, to motors on which model the experimental determination has been secured.

The Zenith carburetor is made in five sizes, models L 4 to 8 inclusive, and with diameters

from one inch to two. A combined strangler and temperature regulator is manufactured, which is easily attached, and has a connection for the use of hot air. The company makes a carburetor for service with motors cast en bloc, and where the intake pipe is eliminated. The design differs from the standard type in the use of a horizontal mixing chamber instead of vertical and in the alteration of the low speed arrangement to suit the new condition.

SAXON TO CHRISTEN LINCOLN HIGHWAY.

ONE of the smallest cars in the industry will christen the Lincoln highway. That is to say, a Saxon car, made by the Saxon Motor Company, Detroit, and driven by M. J. Croker and Fred Wilkins, will be the first machine to cross the continent from New York City to San Francisco over this route. Officials of the Lincoln Highway Association are co-operating with the maker, and fitting receptions will be planned throughout the states crossed.

After dipping its rear wheels in the Atlantic ocean at Coney Island, June 4, the little machine

City to Philadelphia, Pittsburg, Fort Wayne, South Bend, Chicago, Cedar Rapids, Omaha, Denver, Salt Lake City, Reno, Carson City, Sacramento and San Francisco.

TRANSCONTINENTAL EMPIRE.

Famous Car Returns to Indianapolis for the International Sweepstakes Race.

With a record of 19,000 miles to its credit, Empire car No. 19, which had the distinction of being the smallest machine to participate in the Indiana-Pacific tour of last July, returned to the factory of the Empire Automobile Company, Indianapolis, Ind., just previous to 500-mile race. It occupied a prominent place in the local show-rooms of the company and was viewed by thousands during the week of the big contest.

After Joseph Moore had taken the little machine across the country, it was placed at the disposal of Pacific Coast Empire distributors as a show car, and it has been constantly on the go, adding thousands of California, Washington and Ore-

gon miles to its credit, its itinerary taking in all sections of these Coast states. Mechanically, and in outward appearance, the machine is still in splendid condition.

The annual outing of the Bay State Automobile Association, Boston, Mass., will be held June 16-17 at Rye Beach, N. H. The members and their friends will drive over the road, and a special programme of sports, etc., has been arranged.

Transcontinental Saxon Dipping Its Rear Wheels in the Atlantic Ocean Before Starting to Christen the Lincoln Highway from New York City to San Francisco.

set out on its long journey, carrying a canteen of salt water from that point to be dumped into the Pacific at the Golden Gate. It is proposed to make the trip at an average speed of 20 miles an hour. The distance is 3389 miles, and it is expected that a daily average of 125 miles will be made. Thus it may be assumed that the car will reach its destination in time to celebrate the Glorious Fourth.

The Lincoln highway leads from New York

GENERAL NEWS OF THE INDUSTRY.

General Manager Reeves Finds Manufacturers Are Having the Best Year of Their History--Changes in Personnel, New Concerns and Building Plans.

UPON his return to the New York City headquarters of the National Automobile Chamber of Commerce, from a business trip throughout Michigan and Indiana, on which he visited no less than 74 motor car factories, General Manager Alfred Reeves says that with the improvement of weather conditions the manufacturers of the industry are enjoying the best spring business in their history. That the predicted shortage of cars will soon be an established fact is borne out by his statement that most makers will complete their shipments of 1914 models by July 1 and that several concerns are even now out of cars.

March and April were record months in production and shipments. With the splendid driving weather of the past few weeks dealers have been busy getting the new machines into the hands of purchasers. The result has been numerous reorders, a condition that has been very much more prevalent this year than at any time in the past, according to Mr. Reeves.

TAKES OVER R. & L. STOCK.

Willys-Overland Company Acquires Entire Control of Selling Concern.

Last November, the Willys-Overland Company, Toledo, O., purchased an interest in the R. & L. Company, New York, although the control remained with J. T. Ranier and Paul Lineberger. It has now acquired the remaining shares and the two men named have retired as directors. It is understood that in the future the R. & L. Company will act as a service and operating company exclusively, conducting the service buildings in New York, Newark and Brooklyn. It is not stated what effect this will have on the branch house in Boston.

Ranier and Lineberger have formed a copartnership and will have the sole selling rights for Garford and Willys commercial vehicles in the same territory as before. The entire sales organization has been taken over by them. E. A. Williams, formerly president of the Gramm Motor Truck Company, Lima, O., becomes president of the R. & L. Company. C. T. Silver, New York

City distributor for Overland cars, made by the Willys-Overland Company, has taken on the Willys-Knight line.

IS GENERAL SALES MANAGER.

Alfred J. Pitts Will Direct the Distribution of Wagenhals Delivery Wagons.

Alfred J. Pitts, a well known Detroit newspaper man, has become directly connected with the automobile industry in accepting the appointment as general

sales manager of the Wagenhals Motor Car Company of that city, maker of Wagenhals delivery wagons. He has had extensive experience with automobiles, having "covered" the various motor car and motor truck concerns in Detroit for a number of years, and, in assuming his new position, he is thoroughly conversant with the history of the Wagenhals product.

The company produces a three-wheel machine which has found its way into every state of the Union and into a number of foreign countries.

Alfred J. Pitts, Sales Manager, Wagenhals Motor Car Company.

NOT SERIOUSLY DAMAGED.

Fire in Apple Electric Company's Plant Does Not Interfere with Shipments.

Early reports concerning the fire which visited the plant of the Apple Electric Company in

Dayton, O., last month, appear to have been somewhat exaggerated, in view of the fact that shipments were resumed as usual May 28. It is added that the damage was so slight as not to interfere with production.

JOINS WESTCOTT COMPANY.

A. L. Bennett, Formerly with Abbott-Detroit Line, Becomes District Manager.

A. L. Bennett, well known to the dealers in most of the cities of the East, and for the past four years eastern district sales manager for the Abbott Motor Company, Detroit, will henceforth supervise the same territory for the Westcott Motor Car Company, Richmond, Ind., with

which concern he formerly was connected. He will make his headquarters with the new Metropolitan distributor for Westcott cars, C. B. Derby & Co., 1862 Broadway, New York City.

Mr. Bennett has been connected with the industry since 1901, when he began to sell De Dietrich cars in Boston. After

A. L. Bennett, Eastern District Manager, Westcott Motor Car Company.

selling 25 of these to New Englanders at \$10,000 each, he handled the Mors line, another foreign machine, in New York City for two years. He next took up the sale of Chalmers cars, and later went with the Cole Motor Car Company, first as eastern district manager and then in the same capacity in the Middle West. After that he was with the Westcott.

TO HAVE NEW HOME.

Maker of Carter Carburetor Purchased Factory Building in St. Louis.

The Carter Carburetor Company, St. Louis, Mo., the present factory of which is located at

912-914 North Market street, has purchased the large modern plant on Spring avenue, between St. Louis and Dodier avenues, formerly occupied by the Carruthers-Jones Shoe Company. The main structure is of brick, three stories, 125 by 50 feet, and another building, 40 by 90 feet, will be put up at once.

The Carter company expects to remove to its new plant July 1. It may be added in this connection that, since the H. W. Johns-Manville Company, New York City, took over the sale of the entire production of Carter carburetors made by this concern, it has been impossible for it to keep abreast of the orders without acquiring better manufacturing facilities. It is expected that it will be possible to treble its daily output.

WILL CONDUCT TESTS.

Robert G. Pilkington Becomes Resident Engineer of American Efficiency Survey.

Announcement was made in the last issue of The Automobile Journal of the organization of the American Efficiency Survey of Motor Car Units, full details of which are promised in the near future. Now comes the information that Robert G. Pilkington, one of the pioneers of the industry, having been connected with experimental work in St. Louis in 1899, has been appointed resident engineer in charge of the tests of that organization at the Purdue University in Lafayette, Ind.

It is stated that these tests cover the working efficiency of each and every make of the various units entering into the construction of a motor car, and are to be of the most thorough and unusual type. A large amount of special apparatus designed by the members of the board of technical detail is being prepared and installed in the laboratories, one of which is a special type Diehl dynamometer. By the use of this machine, motors, carburetors, transmissions, axles, universals, etc., will be put to the most rigid examination.

It is understood that this organization will undertake to test motor car units, and place its seal of approval on such work as is submitted to it, that the general public may be assured that it is purchasing goods of the proper quality. The engineers selected are not to be connected with the industry at present, but it would appear that choice was to be made of men who are well acquainted with automobile design and construction, judging from the selection of Mr. Pilkington for the position referred to.

CONTRACTS FOR BODIES.**Budd Company Will Furnish 10,000 for New Car to Be Produced by Dodge Bros.**

The contract, under which Dodge Bros., of Detroit, has been supplying motors and transmissions to the Ford Motor Company, expired June 1, and immediately thereafter comes the information that Dodge Bros. has contracted with the Edward G. Budd Manufacturing Company, Kensington, Philadelphia, Penn., for 10,000 metal bodies, deliveries on which shall commence Sept. 1. The entire lot must be ready for delivery not later than March 1.

While it has been known for some time that Dodge Bros. was to engage in the production of cars, it was not until quite recently that information began to be made public that the machine was to compete in price with that made by the Ford company. In view of the details of the Budd contract, mentioned above, it would appear that the new machine would be ready for the market about Sept. 1.

REO CUTS BIG MELON.**Directors Declare a Stock Dividend of 50 Per Cent., Which Means \$1,000,000.**

The directors of the Reo Motor Car Company, Lansing, Mich., maker of Reo cars, have declared a stock dividend of 50 per cent., payable June 1, to stockholders of record May 28. Since the capital stock of the company is now \$2,000,000, par value \$10, this means that \$1,000,000 in new stock will be issued.

The earnings of the Reo company for the past year have been the largest in its history, it being understood that they exceeded 50 per cent. Reo stock has been increasing in value on the Exchange for several months, and during the last week in May it was quoted at \$27 a share.

PALMER & SINGER ASSETS.**Understood That Purchaser Will Market Small Car Bearing the Old Name.**

The machinery and most of the stock and parts of the Palmer & Singer Manufacturing Company, Long Island City, were purchased at the bankruptcy sale, May 25, by William Wooster of the Auto Surplus Stock Syndicate, New York City. The entire assets of the company brought between \$14,000 and \$15,000, and the

portion purchased by Mr. Wooster went for \$10,101.

It is understood that plans are under way for the production of a small car, to sell around \$450, which will bear the Palmer-Singer name, this right having been included in the assets bought by the syndicate. If possible, this car will be built in the factory at Long Island City, which was operated by the old company under lease from Chauncey Marshall.

TO MAKE HYDRAULIC TRANSMISSION.**Company Organized for This Purpose in Wisconsin Now Ready for Business.**

The Beijer Hydraulic Transmission Company, organized several months ago in Stevens Point, Wis., is understood to be ready to produce hydraulic transmissions for passenger cars and trucks, invented by Arthur A. Beijer. The officers of the company are: President, N. A. Week; vice president, James Mainland; secretary and treasurer, C. S. Orthman; superintendent and manager, A. A. Beijer.

The transmission is said to consist of a rotating cylinder pump in the flywheel of the engine and an hydraulic motor built on each of the four wheels of the vehicle. The pump and the four motors are connected by means of a series of pipes, through which oil is pumped to operate the motors, and thus the wheels. Speeds are governed by lengthening or shortening the stroke of the pump. To obtain the reverse speed the oil is pumped through the pipes in the reverse direction. It is claimed that the Beijer transmission eliminates all gears, clutches, brakes, universal joints, differential and many other complications present in the ordinary type of vehicle.

ERECTING NEW FACTORY.**Holtzer-Cabot Company to Consolidate Its Departments at Roxbury Plant.**

Ground has been broken for the erection of a new factory of the Holtzer-Cabot Electric Company, Brookline, Mass., and Chicago, Ill., on Armory street, Roxbury, Mass. It will be six stories high, with an ell of the same height, and will be of modern construction and equipment throughout. It is expected that it will be ready for occupancy early in 1915.

The Holtzer-Cabot company began business in Brookline, Mass., in 1875, specializing in electrical equipment. At that time the electrical in-

dustry was in its infancy, but the growth of the business was rapid, and when the automobile began to make itself felt in industrial fields this concern became one of the pioneers in motor car equipment. Its line includes carburetors, ignition devices, lighting systems, horns, etc. The new factory is being erected because the growth of the business during the past year has made it advisable to concentrate the various departments under one roof.

ABSORBS KINSEY COMPANY.

Willys-Overland Company Takes Over the Plant and Official Force.

The Willys-Overland Company, Toledo, O., which was heavily interested in the Kinsey Manufacturing Company of that city, has absorbed the latter concern, and it will be operated in the future as a department of the former. The Kinsey company was capitalized for \$100,000, and its officers were: President, Isaac Kinsey; vice president, John N. Willys; secretary, Homer V. Hawk; treasurer, Walter Stewart. It was engaged in the production of automobile parts of various kinds. Under the new plan the officers will become a part of the official staff of the Willys-Overland Company.

It will prove of interest, in this connection, to note that, according to current reports, based on 10 months' record, the net profits of the Willys-Overland Company for the fiscal year will reach \$6,000,000, equal to about 30 per cent. on the \$20,000,000 common stock. It is expected that a total of 45,000 Overland cars will be sold as against 31,000 in 1913.

JOINS SIGNAL TRUCK FORCES.

Howard Wilcox Acquires Interest and Will Direct the Sales Department.

Announcement is made by the Signal Motor Truck Company, Detroit, that Howard Wilcox, for 13 years connected with the industry in various capacities, has acquired an interest in that concern and will act as consulting engineer and director of sales. He has had wide experience in the truck field and his many friends will be glad to learn of his new venture.

Mr. Wilcox formerly was connected with the manufacture and distribution of Reliance trucks, and later with the General Motors Truck Company, when that concern took over the Reliance Motor Truck Company. He also is understood

to have had a large part in developing several features of the Kelly line. He designed the Standard three-ton truck and helped to organize that company, and was for a time consulting engineer for the Federal Motor Truck Company.

GETS FOREIGN CONTRACT.

Continental Motors Will Be Used by British Manufacturer in New Car.

Because of the strong feeling with respect to goods which are British made, it is of unusual interest to note that the Continental Motor Manufacturing Company, Detroit, has secured an order for 5000 motors to be used by W. R. Morris of the W. R. M. Motors, Ltd., of Oxford, England, in the production of a new machine which that concern will place in the British market. The motor which will be used is known as the Continental model U, with bore of 2.75 inches and stroke of four.

While Morris is British born and bred, he is a man of unusual courage, it would appear, since he is willing to defy British traditions in contracting for nearly \$1,000,000 worth of material. It is stated that the company expects to produce about 100 cars a week, which may be regarded as another innovation in British motor car manufacturing circles.

TO MAKE ELECTRIC STARTERS.

New Concern, Organized in Detroit, Absorbs Disco Company of That City.

The American Electric Starter Company has been organized in Detroit, with capital of \$250,000. It is understood that the moving spirit is Mansell Hackett, head of the Disco Company, which has been absorbed by the new concern. The other incorporators are T. G. Murton, N. M. Guy and J. E. Olsen.

As the name would imply, the company will engage in the production of electric motor starters, and it is stated that the design will comprise a single unit machine, having ignition, starting and lighting functions. Joseph Lamb is said to be the inventor.

A recent dispatch from Detroit contains the information that contracts already have been consummated with the maker of the Krit, Paige, Brockville-Atlas, the last named being a Canadian concern, and some others. It is added that special types will be produced for Packard cars.

NEW ACCESSORIES FOR THE MOTORIST.

THE CABLEPHONE.

A Mechanically Operated Horn Actuated by a Cable.

The Automobile Supply Manufacturing Company, 220 Taaffe place, Brooklyn, N. Y., maker of horns, announces a new design, which differs materially from conventional practice. It is a manually operated horn, but instead of being actuated by moving a lever, the signal is obtained by means of a cable. The Cablephone, as it is termed, is located at the side of the dash, and leading from it to the steering wheel or other convenient location, is a cable. A slight pull on the cable operates the horn, which is of the mechanical type. The design is moderately priced, comes complete with all necessary fittings and is guaranteed for three years.

nounces a new design, which differs materially from conventional practice. It is a manually operated horn, but instead of being actuated by moving a lever, the signal is obtained by means of a cable. The Cablephone, as it is termed, is located at the side of the dash, and leading from it to the steering wheel or other convenient location, is a cable. A slight pull on the cable operates the horn, which is of the mechanical type. The design is moderately priced, comes complete with all necessary fittings and is guaranteed for three years.

FORD SHOCK ABSORBERS.

Connecticut Design, Same as Utilized on Large Machines.

The Connecticut Shock Absorber Company, Meriden, Conn., maker of the shock absorber of that name, is manufacturing a special design for the model T Ford automobile. The same principle as that used with the absorbers made for large machines is employed and the workmanship and material are in keeping with the high grade established by this concern.

Three absorbers are utilized with the Ford car, one in front and two at the rear. The method of mounting the front member is shown in the accompanying illustration, and it will be noted that the design makes for easy attachment, being secured as it is, to the axle and cross frame member. The rear members are fitted by means of a bracket bolted to the outside of the frame and an axle clamp to the axle housing. The clamp is prevented from moving by the use of a V shaped bar.

In the Connecticut design, one arm is integral with the case containing a

triangular set of springs, and the other is attached to a three-faced cam which turns between the springs. The absorbers are set so that the springs are slightly deflected, permitting unrestricted motion of the cam in one direction, but checking the movement in the other. It is this principle that allows the car springs to perform their function of compensating for inequalities of the road, while all reaction is checked.

PRICE CUT-OUT SWITCH.

Automatically Cuts Out Horn and Electric Lighting.

John R. Price & Co., Basic City, Va., has brought out an ingenious device for preventing the operation of the electric horn or lighting system when the motor is not running, thereby locking these members against tampering. The Price automatic cut-out switch, as it is named, utilizes the pressure or suction of the intake manifold or pipe to actuate it.

A sectional view of the device is shown in an accompanying illustration with the various components lettered. It is a simple electric switch,

comprising a strip or blade of special electrical copper D, which is normally out of contact with the contact piece E and terminal.

The spring is enclosed in a cylindrical chamber or fibre case A, which also contains a flexible leather diaphragm B, backed by a water proof oilcloth C. A protecting strip F is also utilized. The switch side of the chamber is connected by a small copper tubing G to the intake manifold, and the opposite side is provided with a vent H.

It is stated that a very slight suction, about two ounces to the square inch, will cause the circuit to close through the spring member making contact with the terminal contact. It is claimed that the action of the device is not affected by vibration, and that, as the circuit will be opened when the suction ceases, waste of current is prevented when the motor is stopped and when the driver forgets to turn off the lights. The Price device weighs but three ounces, is 2.25 inches square and is sold with a one-year guarantee.

The editor wishes to acknowledge the receipt of several cuts for use in this department. Some were too large, being in excess of 2.0625 inches, the width of the column utilized. As previously stated photographs or half tones are preferred. Cuts will be returned after use, if so desired.

GARDNER ENGINE BASE.

For Ford Cars and Replaces Conventional Member.

The Gardner Engine Starter Company, 1455 Michigan avenue, Chicago, is manufacturing the Gardner auxil-

lary engine base designed for the model T Ford motor. One of the qualities emphasized is that it makes possible engine repairs without removing power plant from the chassis. The device is machined to fit accurately and as a further precaution against oil leakage is equipped with cork gaskets.

The maker states that new rings can be installed and the cylinders inspected with the Gardner base, and that connecting rods, etc., may be reached easily and adjusted in considerably less time than ordinarily.

NIGHT AND DAY GOGGLE.

Includes Lense for Eliminating Glare of Headlights.

T. A. Wilson & Co., Inc., Reading, Penn., has brought out a new automobile goggle which presents practical features, in that its construction provides for eliminating the blinding effect created by powerful electric headlights. It is called the Night and Day goggle, and comprises all the desirable features of the ordinary goggle and, in addition, has an extra segment in the top of each lense. The small and lower section is of light amber, and the vision through this portion is for ordinary driving. The top lense is of dark amber, and is made smaller than the other member.

When the driver is confronted by dazzling headlights at night he simply tips his head to bring the vision through the dark segment, which so reduces the glare that the approaching machine and roadway can be seen with perfect clearness. A feature of the design is the use of a soft silk bridge band, adjustable to the face.

FORD ELECTRIC HEADLIGHTS.

A. H. Kling Company Marketing New and Practical Design.

The A. H. Kling Company, Detroit, distributor of accessories for the model T Ford car, is marketing a

special design of electric headlight for this machine. The feature of the design emphasized is that the bulbs may be removed and new ones inserted without disturbing the reflector proper, as will be noted by the accompanying illustration, which depicts the attachments displaced from the lamp. This arrangement enables securely mounting the reflector.

Another feature of the equipment is the use of a quick make and break, flush type of switch, and it is held that it is positive in its action. The wiring connections are made on the hood side of the dash, and the leads and connections are high grade in every particular.

NEW-LITE LIGHTING DYNAMO.

Designed for Ford and Other Small Automobiles.

The New-Lite Manufacturing Company, Newton, Ia., is marketing a complete electric lighting system for small cars such as the Ford, Metz, etc. The system includes a belt driven generator, storage battery, headlights and tail lamp, dash switch, wires, connectors, etc. The outfit comes ready for installation.

Drive is taken from the usual fan pulley, one belt being utilized for the fan and the generator. The dynamo operates at six volts and is provided with an automatic cut-out. Provision is made for carrying the battery on the running board, a steel box with lock being included in the equipment. The lamps are finished in black and nickel, the headlights being eight inches in diameter and equipped with 15 candlepower mazda bulbs. The tail lamp is of two candlepower. Bullet side lamps are supplied at a slight extra cost. It is

stated that the system may be installed on a Ford car in two hours, the generator being mounted on the left hand side of the motor by means of a plate bolted to the cylinder head.

The generator is very compact, and throughout the best of material and workmanship has been incorporated. Its output is stated to be sufficient to supply all requirements, and the bracket utilized for mounting the generator is well designed. Complete details of the system will be supplied upon request.

LEGALITE REFLECTOR.

Eliminates Glare of Headlights by Novel Construction.

The Legalite Reflector Company, 1503 Bryant avenue, Bronx, New York City, has brought out a novel device for eliminating the glare of headlights. As will be noted by the cut-away illustration presented herewith, an auxiliary reflector is utilized, and this is positioned at a downward angle.

This projects the rays in such manner that the top of the beam is parallel with the ground, while the bottom of the beam strikes the ground close to the car. The small or auxiliary reflector is constructed to snap

on over the Ediswan socket that ordinarily is fitted to electric headlights, when the bulb may be put back in place.

The maker states that the device may be slipped on or off easily, and that after being fitted it cannot work loose or change its position. It comes in sets of two and is inexpensive.

With electrifying the gasoline car the motorist is provided with a number of devices making for comfort and convenience, to say nothing of equipment that saves considerable time. Particular reference is made to the inspection or trouble lamp. Formerly these units were such that when their use was desired it was necessary to attach terminals.

Today inspection lamps may be purchased having means for plugging in to convenient place on the dash, etc., as the maker of the car provides such connections. Some designs are equipped with a self-winding reel, eliminating the work of winding up the cord after the work is completed. An ingenious trouble lamp is that provided with a magnet, making it possible to attach it to any metal portion of the car, a construction which is decidedly convenient.

LITTLE GIANT TROUBLE LAMP.

A Combination Unit Including Magnetic Lifting Device.

The Harding Specialties Company, 755 Boylston street, Boston, and 1339 Michigan avenue, Chicago, maker of

the Boston tail light detector, is marketing the Little Giant magnetic trouble lamp.

It is a combination device, providing as it does an inspection or trouble lamp and a magnetic lifter. It will stick to metal, and the accompanying illustration depicts the device attached to the mudguard of a car, supplying the operator with light for making a change of a casing, for example.

One of the qualities of the device is that nuts, bolts, etc., dropped in places not easily accessible by the hands or tools, can be recovered easily, as the pull of the magnet is sufficient to lift ordinary tools. The Little Giant magnetic trouble lamp is inexpensive, and as above stated, can be made to serve a number of useful purposes.

PEERLESS FUEL SAVER.

Introduces Heat into Intake Pipe Above the Carburetor.

The Peerless automatic gasoline saver is manufactured by the Peerless Motor Specialty Co., Inc., 1779 Broadway, New York City, for which the Harding Specialties Company, Inc., 755 Boylston street, Boston, is sole distributor. It is held to save from 25 to 40 per cent. of fuel, increase the efficiency of the motor, reduce carbonization to minimum and assist in starting.

The design differs from the usual application of heated air, in that the heat of the exhaust is utilized above the carburetor. A flexible metal tubing is connected with the saver, which is tapped into the intake manifold as shown. The hot air is injected and controlled automatically, and is supplied according to the demands of the motor. The heat thus introduced vaporizes any particles of fuel existing in the mixture.

AMERICAN FIBRE CLEATS.

Made in Shades and Used to Secure Wiring on the Car.

The American Vulcanized Fibre Company, Wilmington, Del., manufacturer of hard and flexible vulcan-

ized fibre, kartavert and laminar fibre, is producing a large variety of vulcanized fibre cleats, some of which are shown in the accompanying illustration. These comprise a design having a single groove for twin or parallel wires, one for corners, for triple wiring, etc.

The company produces cleats which are not only compact and neat in appearance, but in shades to make them inconspicuous in places where appearance is considered. They are strong and durable and make an excellent substitute for wood and porcelain members. The value of fibre as a non-conductor of electricity is well known. The high-tension wire cleat shown in the centre of the illustration is designed especially for motors. The American Vulcanized Fibre Company also manufactures gears, etc.

AUTO-VALVE FUEL SAVER.

Extra Air Supplied Is Controlled by an Automatic Valve.

The Auto-Valve gasoline saver, manufactured by the Crary Company, 652 Woodward avenue, Detroit, is a simple device comprising two parts, a control lever mounted on the driver's side of the dash, which opens and closes an automatic air valve under the hood, and a connection to the intake manifold just above the carburetor. The function of the device is to admit extra air into the intake pipe, making for a homogeneous mixture, as well as to economize on fuel, etc.

The dash lever is operated after the motor becomes warm, permitting the piston to draw in extra air, thereby reducing the amount of fuel emerging from the jet of the carburetor by lessening the suction. It is pointed out that the stream of air encountering the mixture breaks it

up, and that more energy is obtained from the explosion.

After turning on the air by the dash lever the automatic valve controls the supply of air, this being according to the speed of the motor. A priming cup is included in the equipment, located near the intake manifold, and it may also be utilized for introducing kerosene into the cylinders.

STRYKER STARTER FITTING.

Provides Means for Introducing Fluids into Cylinder.

C. W. Stryker, 240 Shonnard street, Syracuse, N. Y., is manufacturing the Stryker starter fitting, which is designed for the model T Ford and other makes of motors in which provision has not been made for the fitting of petcocks or means for introducing gas or fluids as is necessary with some forms of motor starters.

The Stryker device is constructed much in the same manner as the shell of a spark plug, but differs in that it is made much thicker at one side, this section being indicated at B in the illustration. The lower part C is threaded and this is screwed into the cylinder, replacing the usual spark plug, which is threaded into the opening at A. The member B is also

threaded and into this is screwed the starter connection or a petcock for priming purposes.

FUEL ECONOMIZERS.

During the past year there have been placed upon the market a large number of fuel economizers, and sometimes these devices include a priming attachment. There is no doubt that these fuel savers, as they are often called, are productive of the results claimed for them when installed properly and used intelligently.

The majority provide for introducing air into the intake pipe above the carburetor, thereby assisting in carburetion, as well as breaking up any particles of fuel not completely vaporized by the usual carbureting means. Others utilize the heat of the exhaust to attain the same end. It is obvious that where the design of the carburetor is such that the proper mixture is not obtained, at medium and high speeds, for example, control of the air is a decided advantage.

The priming attachments above referred to will appeal particularly to those owners whose cars are not equipped with petcocks.

STEVENS PRESSURE GAUGE.

Indicator Remains Set After Pressure Is Registered.

Too much emphasis cannot be laid upon the importance of keeping the tires inflated to the pressure recom-

mended by the maker and for the particular size casing employed. Over-inflation is held to be as bad as under, and the best method of determining the pressure is to utilize a gauge, which is not expensive.

The Stevens Manufacturing & Supply Company, Fisher building, Chicago, is marketing the Stevens auto tire pressure gauge, which is provided with special connections to fit any tire check valve marketed, and is guaranteed to register with perfect accuracy. The indicator remains set after the pressure is registered, enabling removal of the gauge and its reading at leisure. All gauges are tested before leaving the factory and an adjusting device is incorporated for correcting any lost tension in the spring occurring after considerable service.

WILLIAMS FORD WRENCH SET.

Fits All Nuts and Bolts, Including Cylinder Head Members.

J. H. Williams & Co., Brooklyn, N. Y., maker of drop forgings, has brought out a wrench set for the model T Ford car, and one of the qualities of the outfit is that all wrenches are accurately milled. The wrenches in this selection have been thoroughly tried out and are drop forgings, case hardened.

They will provide adjustment for a large number of bolts and screws, including the cylinder head members. They will fit U. S., S. A. E. and A. L. A. M. standard nuts and cap screws, the opening varying from .25 to .5625-inch.

The maker states that the wrenches will permit of removing and replacing nuts and bolts not accessible with the usual tools.

SPARK PLUG GAPS AND MOTOR EFFICIENCY.

THERE was a time when the motorist was obliged to pay more or less attention to the ignition of his car. That was in the days of the

Fig. 1—Using Splitdorf Magneto Gauge to Set Plug Gap.

battery, coil and timer system. Batteries would deteriorate, coils required adjusting and points had to be kept clean and true. and commutators and distributors had to be cleaned, oiled and adjusted. While the old systems had their disadvantages, requiring as they did periodic attention, they taught the motorist the importance of maintaining the correct spark plug gap, a factor much neglected in these days of magneto ignition, and one that the writer holds is of much importance.

This contention is borne out in the instructions given by magneto manufacturers for the proper maintenance of their equipment, and a careful perusal of any maker's instruction book will result in finding a paragraph dealing with the spark plug gap. The Splitdorf Electrical Company, for example, states that the best results are obtained with its equipment when the gap is .03125 inch. The Eisemann Magneto Company, and the Bosch Magneto Company, recommend a gap of .015625 inch. The Remy Electric Company states that different motors require varying gaps and that about .025 or .030 inch is best for the average engine, but if it misses at low speeds when running idle or pulling heavy, particularly at slow speed, the gaps should be decreased.

The last named conditions are frequently encountered and generally prevail when the plugs have seen considerable service. Much depends, of course, upon the plug utilized; that is, the material employed for the sparking points. The general tendency is to utilize a metal that will resist the burning effect of the high-tension current, as well as to make the points larger. With plugs having points constructed of soft material it is obvious that in time the gap will be augmented.

When it is considered that several thousand volts in excess of the voltage produced by the

battery or magneto are required to overcome the resistance at the gap of the spark plug, the importance of maintaining the proper space will be readily understood. The actual voltage needed is shown in the chart at Fig. 2, the diagram depicting the electromotive force required to bridge a .02-inch gap with various compressions. The compression of the motor is a factor, and it is a well known fact that a spark that appears good in the open air may not be sufficiently strong to ignite the mixture when under compression. Referring to the chart, it will be noted that over 12,000 volts are required to overcome the resistance above referred to.

Setting the spark plug gap by guess work is not to be commended, nor is the use of a 10-cent piece reliable, as the thickness of the coin varies according to wear. A gauge is to be preferred, as it is accurate, and every owner of a machine fitted with a magneto should make it a rule to utilize the gauge supplied with it for setting the points. That made by the Splitdorf Electrical Company and the method of its use is shown at Fig. 1. These gauges are utilized to set the contact points of the Splitdorf magneto, which require a break of .03125 inch, the correct distance for the gap of the spark plug with many ignition systems. The gauge is not expensive and is accurate.

In setting the points it is well to examine the negative member or electrode integral with the shell, for it may be so burned that a recess is formed. When such is the case the point

Fig. 2—Curve Showing Voltage Required for High-Tension Current to Bridge a .02-Inch Gap with Various Compressions.

should be filed until the surface is true, otherwise the gap will be .03125 inch, plus the depth of the recess.

TEXAS CYCLECAR HAS NOVEL FEATURES.

IT IS not exactly clear just what connection the Wichita Falls Motor Company has with the cyclecar produced in its factory by Enio Salminen, an employee of that concern. The company was organized some two years ago for the purpose of manufacturing Wichita Falls motor trucks, a line which has met with decided success in the Southwest. In the letter accompanying the photograph, which is reproduced herewith, Walter H. Ilg, sales manager of the concern, states that it has nothing whatever to do with the two cyclecars which have been made by its employees, T. T. Lane and Enio Salminen. However, the description presented is that supplied by Mr. Ilg.

It will be understood that the illustration is that of the machine produced by Mr. Salminen. It has wheelbase of 105 inches and tread of 36. Its weight is 550 pounds. The two passengers are seated tandem, with the driver in front. The motor is a nine horsepower, twin-cylinder, air-cooled De Luxe, evidently of the true cyclecar type. The planetary transmission is mounted on the jackshaft, drive from the motor being by chain from a small sprocket on the flywheel to a larger member on the jackshaft. Final drive is by 28-degree V belts to the 16-inch grooved drums on the rear wheels.

Special reference is made to the steering arrangement. Both axles are tubular, that at the front being pivoted in the centre and resting on a heavy coil spring both top and bottom, from which point the body is suspended, as indicated in the illustration. It is maintained that this construction permits the axle to turn through an angle of 45 degrees before the body assumes a different position, and that the springs employed take up the vibration and inequalities of the road.

The steering is accomplished by means of a drum at the forward end of the steering post, over which a cable is wound and passes through pulleys at a right angle to the front axle, to which it is fastened at each side. This steering operates the entire front axle, no steering knuckles being employed. It should be explained, as well, that the hand wheel describes a semi-

circle only, a radical departure from conventional practise. The evident reason for this lies in the desire to provide ample leg room, necessary because of the low angle of the steering column.

It will be noted that the body, which is of steel over a wooden frame, is suspended at three points—on the coil spring arrangement in front, and two cantilever type springs at the rear, these latter being supported at the front end on spring shackles. Ball bearings are used in the jackshaft and in the wire wheels. The tires are 28 by three inches. A 3.5-gallon fuel tank is located at the cowl dash, and in the beetle back compartment back of the rear seat are carried the Prest-O-Lite tank and the tool kit. The equipment also includes a single acetylene headlight, etc.

Texas' First Cyclecar, Produced by Enio Salminen of Wichita Falls.

This first car has been in daily operation since Thanksgiving Day, and is said to have proven very efficient and satisfactory over the rough roads in that section. It is added that it has attained a speed of 55 miles an hour and shown a fuel consumption of 45 miles to the gallon.

BILLIKEN GROWS UP.

It is understood that \$25,000 has been subscribed by residents of DePere, Wis., to secure the Milwaukee Cycle Car Company for that city. The concern has been producing the Billiken cyclecar, designed by Stanley S. Eigel, but it is stated that the plans will be changed so that the future product will be a standard motor car, although it is expected that the construction will be simplified in every respect. DePere capitalists are said to be very much interested in the project, and expect good returns on the investment.

TRANS-ANDEAN MOTOR TRANSPORTATION.

Chilean and Argentine Governments Expected to Subsidize Plan Developed as Result of Buick's Recent Successful Journey from Coast to Coast.

COMING so soon after the completion of the first transcontinental automobile journey across South America, made by Johnson Martin in a Buick machine, a detailed description of which appeared in the issue of *The Automobile Journal* for May 10, the news that the Chilean and Argentine governments are considering the advisability of establishing a regular line of motor transports through the Uspallata pass in the Andes from Los Andes, Chile, to Mendoza, Argentina, is of particular interest to American motorists and to the industry in this country. The scheme was projected by Wiedgan & Cia. of Valparaíso.

It will be remembered that Martin's account of his trip indicated that considerable work will need to be done on the Argentine end of the route, while the road between Los Andes and La Cumbre (the summit) is fairly good. It is believed that, even with good roads entirely through the pass, it would prove practicable to attempt transportation only between October and March or April. (In this connection, it is well to remember that the seasons in South America are directly opposite to those in North America, so that the period mentioned would include the summer months.)

The plan is to establish a syndicate under government subvention to build and maintain the roads, and carry on the transportation of passengers and freight. It is understood that Wiedgan & Cia. would undertake the formation of this syndicate under a government guarantee on a capital of 750,000 pesos (Chilean gold), or about \$273,750 in American money. This concern estimates that 60,000 pesos (\$21,900) will be required to place the Argentine portion of the road in condition for motor traffic. The distance between Los Angeles and Mendoza is 148 miles.

The Chilean government already owns the Trans-Andean Railway, which is administered by the Buenos Aires & Pacific Company, in connection with the Argentine Trans-Andean Railway. Inasmuch as the proposed motor transportation line would act to reduce the freight and passenger tariffs, all three of these companies are interested in the project. Negotiations already have been under way looking toward a reduction of

freight tariff on the railroad from 15 to 20 per cent., and the Buenos Aires & Pacific Company has suggested that 40 per cent. of this reduction be borne by the Chilean company and 60 by the Argentine company.

The Mendoza provincial government has been asked for a subsidy to build the portion of the road between the city of Mendoza and La Cumbre, since it is maintained that this province will benefit most largely by the motor transportation plan. The entire project has been laid before the national congresses of Chile and Argentina, and it is expected that it will meet with speedy indorsement.

In case this should prove true, and the syndicate is granted the subsidies for which it asks, there will be a market for a number of motor vehicles. It is proposed to utilize motor 'buses capable of carrying 12 or more passengers, and trucks with capacity for 17,600 pounds of freight. Because of the successful trip of the Buick, an American automobile, it is expected that American manufacturers will receive the first opportunity for supplying the necessary vehicles.

WHITE 'BUSES IN URUGUAY.

Three Machines Have Been Operating for Entire Year with Splendid Success.

In connection with the proposed scheme for motor transportation over the Andes, it is of interest to note that the Albatros Autobus Company of Montevideo, Uruguay, has been operating three White 'buses between that city and Pando, a distance of 35 kilometers (21.73 miles) since June 1, 1913, with splendid success. The company has a garage at 18 de Julio and Andes, Montevideo, which is the starting point, and another in Pando, each having facilities for caring for three machines. However, the schedule is so arranged that there are never more than two 'buses at either end of the line.

The road over which the run is made consists of about four kilometers of asphalt, four of stone pavement, and the remainder of fairly good macadam. The scheduled time for the run is 1:30:00, and four trips are made each way daily.

between 7 in the morning and 6:30 in the afternoon. On Sundays and holidays, two extra trips are made. The run is divided into four sections, and the fare is 30 cents for one section, 40 for two, 50 for three and 60 for the four. None of the machines has ever missed a trip.

DELIVERS ROYALTY'S ORDERS.

Willys Utility Wagon in the Service of Baker at Heidelberg, Germany.

"Made in Germany" has almost the same weight with Germans as "Made in Great Britain" has with British subjects. Moreover, there has been decided opposition on the part of German automobile manufacturers to the so-called American invasion. In fact, it was within the year that United States consuls stationed in the German empire felt constrained to make complaint concerning the character of advertising that was appearing in trade papers in that country.

In view of this situation, it is of particular interest that Emil Roesler, a baker and confectioner in Heidelberg, the seat of the great university and one of the numerous palaces of the Emperor, has purchased and placed in service a Willys Utility wagon, made by the Willys-Overland Company, Toledo, O. The fact that this is an American made machine does not appear, thus far, to have worked any hardship upon his business, since the car regularly calls upon several members of the royal family.

NEW BODY MATERIAL.

French Coach Makers Find Fibromonolith Has Desirable Qualities.

As is true of all foreign countries, the French chassis maker does not produce the automobile body, except in a comparatively few cases. This

work usually is done by a separate branch of the industry, which is continuously striving for something new. Among the latest announcements of the French coach maker is the body made of fibromonolith.

This new material is a cement containing powdered wood, and is said to be unusually hard and tough. In use, strips of split cane are attached to the wood side frame members of the body, and panels of wire cloth are nailed to these. The cloth is given whatever curve is desired by hammering, and then the fibromonolith is applied in a wet paste with a trowel. The material enters the mesh and comes in contact with the split cane and wood frame to which it adheres quickly.

After it has dried and set, it can be smoothed on the outside by planing and sandpapering.

Willys Utility Delivery Wagon Used by Emil Roesler, Baker and Confectioner, of Heidelberg, Germany, to Serve Royalty and Other Patrons.

Thereafter it may be simply varnished, in which case it shows a leathery grain, characteristic of the substance and held to be entirely satisfactory. It may be treated as wood, however, and painted and varnished in the same way. Or coloring matter may be mixed with the paste in advance, if desired.

Among the advantages claimed for the substance are: That it is incombustible and insensible to the action of water, heat or cold; that it is non-vibratory and therefore silent; that a body formed in this manner has no joints and moldings, may be shaped in the coating substance wherever desired and so as to be integral with the structure, and that repairs may be made as readily as placing patches on a plastered wall.

TESTING FUEL LEVEL OF CARBURETOR.

ATENTION to apparently minor details makes for economy in the upkeep of a motor car and manufacturers now supply instructions for caring for components that formerly were considered unimportant. For example, the Cadillac Motor Car Company in its instruction book calls the attention of the owner to the need of testing the fuel level in the carburetor and the tension of the air valve spring. Reference is made

Fig. 1—Testing Air Valve Spring of Carburetor.

to this particular type to indicate the need of occasionally inspecting the components of the carburetor, for the lack of flexibility and power may be due to normal wear.

After a carburetor has been in service for some time there may be a slight amount of wear at the point of the needle valve and its seat, as the valve is subjected to considerable work, controlling as it does the supply of fuel to the float chamber. If worn the level of the gasoline will be higher than intended by the maker, and if this condition exists it should be corrected.

With the Cadillac carburetor the level of the fuel is tested by removing the bowl or float chamber from the carburetor, removing the spraying nozzle, and attaching the bowl to the fuel supply pipe. When the chamber is held in a perfectly level position the distance from the top of the bowl to the gasoline should be from .65625 to .71875 inch. If less than the first named distance correction may be made by bending down slightly the arm A, shown in Fig. 2. If the float has to be removed, shellac the screw at B to prevent its working loose.

With many carburetors an auxiliary air valve is utilized and this should open as the motor begins to speed up. It is utilized to compensate for the extra amount of fuel which emerges from the jet when the throttle is opened and the suc-

tion consequently is increased. Springs that have seen considerable service may lose their tension and with some makes it is better to replace with new than attempt to remedy the faults of the old one.

The suggestion made for testing the air valve spring of the Cadillac carburetor shown at Fig. 1 is as follows: Remove the small cover over the air valve by displacing the two small screws retaining it to the body of the carburetor. Next take out the small cotter pin near the top of the air valve stem and remove the latter complete with springs from the adjusting nut. Hold the air valve as indicated in the sketch. The distance from the leather face of the air valve to the under side of the collar on the air valve stem as shown should be 1.3125 inch. If more than this new springs should be substituted.

Relative to the position of the float, it is possible that too low a level of the fuel is due to the float being heavy. This condition is generally due to the cork absorbing a certain amount of the fuel. Before bending the arm to which it is attached, remove the float and dry it thoroughly, then give it one or more coats of shellac. If, after replacement, the level is not in accordance with that prescribed by the maker, bend the arm carefully. Some types of carburetors provide for adjusting the float.

Those motorists who adjusted their carburetors for easy starting in cold weather should cut down the fuel supply, as the relative flow of the gasoline is considerably faster in warm weather than in cold. In adjusting the carburetor it

Fig. 2—In Testing Level of Fuel in Float Chamber of Cadillac Carburetor the Spraying Nozzle Is Removed.

should be borne in mind that warm weather has the effect of not enough air, directly the reverse of conditions existing in cold weather.

DETAILS OF THE CLEVELAND CYCLECAR.

AFTER several months of experimentation, the Cleveland Cyclecar Company, Cleveland, O., recently announced a roadster model of the true cyclecar type. It is understood that this machine presents English lines, the designer, Robert Clark, having formerly been employed as an engineer with the Daimler Motor Car Company and the Humber Motor Car Company, Ltd., both of England. During his stay with the latter concern he was actively connected with the design and production of the Humberette.

Before going abroad Mr. Clark was employed as machine shop superintendent for the Columbia Motor Car Company, Hartford, Conn., and later as chief inspector for the F. B. Stearns Company, Cleveland. Associated with him in this latest enterprise are W. E. Burnes, formerly with the Royal Motor Car Company and later with the Stearns, and W. H. Noyes, who also was with the Stearns, but before that with the Garford company.

The Cleveland cyclecar has a four-cylinder, water-cooled motor of the L head type, rated by the maker at 10-16 horsepower. The bore is 2.25 inches and the stroke four, giving a piston displacement of 63.6 cubic inches. Cooling is by thermo-syphon, lubrication by constant level circulating splash, ignition by magneto and the carburetor is a Mayer.

Fourteen-inch friction discs give variable speeds, these being governed by hand lever, while a foot control releases the discs. Final drive is by V belts. Brakes are internal expanding on six-inch drums, operated by ratchet foot control. Springs are semi-elliptic in front and quarter-elliptic in the rear. Ball bearing wire wheels are employed, these being fitted with 28 by three-inch tires.

The body is of metal, seating the driver at the left, and is with baggage space in the rear. The wheelbase is 96 inches and the tread 36. The weight is not given. The equipment includes a top, windshield, horn and tool kit.

As stated above, several months have been devoted to experimentation, and the officials of the company believe they have a thoroughly practical machine. The tests are said to have

demonstrated that it is capable of speeds up to 50 miles an hour.

UNIVERSAL LIGHT CAR.

New Machine Announced by Pennsylvania Concern Capitalized for \$1,000,000.

The Universal Motor Company has been incorporated in Washington, Penn., with authorized capital of \$1,000,000, for the production of the Universal light car. The officers of the concern are: President, R. M. Paxton; vice president, J. H. Donnan; treasurer, J. B. Allison; directors, A. M. Linn, J. H. Donnan, A. C. Warne, J. D. Bigger, C. S. Caldwell, R. M. Paxton and J. I. Brownson.

Cleveland Cyclecar Is Held to Be Designed Along English Lines.

The machine is properly termed a light car, under the rules of the Cyclecar Manufacturers' National Association, being equipped with a four-cylinder, water-cooled motor of the block type, with bore of 2.81 inches and stroke of four, giving a piston displacement of 99.67 cubic inches. This is rated at 18 horsepower. Lubrication is by constant level splash, maintained by plunger pump. Ignition is by Splitdorf magneto.

The three-speed transmission is mounted as a unit with the motor and the cone clutch. Springs are semi-elliptic in front and three-quarter elliptic in the rear. The rear axle is semi-floating. Wheels are of wire, with 28 by three-inch tires.

The equipment is most complete, including a top, curtains, ventilating windshield, electric lights and starter, electric horn, generator, storage battery, pump, jack and full set of tools. The two passengers are seated side by side, with the driver at the left. The wheelbase is 96 inches.

CORRESPONDENCE WITH THE READER.

Marsh Rims—New Reader, Germantown, Penn.

In a recent argument between two old time motorists I heard reference made to the Goodrich and Marsh rims, one holding that the former was much easier and quicker to change than the latter. Being interested in such matters, would be pleased to have your opinion, also a description of the two types.

The types of rims referred to were largely utilized previous to the adoption of the universal

Fig. 1—Sectional View of Marsh Rim.

type and both possessed merits. The Marsh rim shown at Fig. 1 comprised three removable rings, two of which were utilized to retain the casing, and the third as a locking member. The last named was split and was held in place by a wedge shaped piece which was slipped over a threaded bolt integral with the felloe. This wedge served to prevent the split ring from contracting and from leaving the felloe. The wedge was locked in place by an acorn shaped nut.

To remove the rim this nut was displaced and the small ring sprung out. Then the ring next to the casing was displaced, which permitted the tire to be slipped off. To replace, this order was reversed. With the Marsh rim it was essential to keep the ring next to the casing free from rust, else it had a tendency to freeze to the rim proper.

The Goodrich rim is shown at Fig. 2, the sketch being made by the writer from memory, and while the details may vary slightly, the illustration will serve to explain its operation. The design consisted of a rim having a detachable split ring, which is shown in its normal position at A. To remove and replace it a special tool was employed, one end having a screw driver point, while the other carried a stud. Pivottally mounted on the same end was an arm carrying a stud.

To take off the rim the point of the tool was inserted in the slot and the rim forced inward, then upward to disengage the locking device. The last named member and the recess into which it was fitted are depicted at B and C respectively.

After mastering the construction it was a simple matter to replace the ring correctly. Some owners employed a hammer and a punch, but the writer, who has had considerable experience with the design, has made changes very quickly with the tool referred to. If the valve was

pushed well up the locking section of the split ring would go into place easily by inserting the studs of the tool in the holes shown in the ring at A, and giving the tool a quick pull or push, according to the manner the tool was held. This drew the free end of the ring toward the other section, which was prevented from slipping by a stud fitting into the hole shown at C.

It is a matter of individual opinion as to which was the better rim. The writer has made a number of changes with both types and found that a quicker and easier replacement could be made with the Goodrich. Some motorists, however, pinned their faith to the Marsh.

Ball Checks—Reader, Ashaway, R. I.

Some time ago you printed in the notes for owners an account of how to fit a priming device to a Ford car, and stated that it could be used to admit extra air into the intake pipe as well. I have mislaid the copy of the book and wish to fit the device to my car. I remember the plan, but am not sure whether it was necessary to use a ball check. A friend of mine says it will be needed. Please advise me.

The article referred to dealt with a dash priming device comprising a petcock and copper tubing. The intake manifold above the carburetor was tapped to take a nipple to which the tube was fitted. The construction permitted of placing a small amount of gasoline in the petcock, thereby wetting the walls of the intake manifold and providing a rich mixture for starting.

By opening the petcock slightly, or to its maximum, extra air is introduced, an advantage

Fig. 2—Goodrich Quick Detachable Rim: A, the Split Ring in Place; B, Locking End of Ring; C, Showing Recess into Which B Was Inserted by Special Tool.

if the mixture is slightly rich and when the carburetor does not supply sufficient air at high speeds.

A ball check is not necessary; in fact, it would serve no purpose, as there is no back pressure in the intake pipe unless the motor backfires. Ball checks are utilized to control the flow of liquids or air. In other words, the liquid can move only in a predetermined direction.

Decarbonizing Outfit—Information, New York City.

I read in a motoring publication an account of how to construct an oxygen outfit for removing carbon from the cylinders. No doubt your mechanical writer is familiar with the outfit referred to and I would like to be advised if it is practical to make the equipment.

The writer has investigated the equipment referred to, but is of the opinion that it would be more satisfactory to purchase an outfit constructed by a manufacturer who is familiar with the requirements. Decarbonizing outfits are not expensive.

Missing at Low Speeds—Ford, Leland, Ill.

Can you diagnose my trouble with my Ford motor? It skips slightly when it is idling and at low speeds. The valves have just been ground and the clearance between the pushrods and valve stems is right. It isn't the carburetor, as I have tried various adjustments. The valves seat correctly. All wires and connections are good and the engine runs all right at high speeds. I run on the magneto.

The faulty operation of the motor is doubtless due to the plugs. It is possible that one of them leaks; that is, the high-tension current takes some path other than across the gap. It is more likely that the gaps are not correct; that one plug may have too large a gap. If such be the case the spark will be weak at low motor speeds, as the output of the flywheel magneto varies according to the revolutions of the crankshaft.

The writer recalls an instance of missing on a Ford motor which was traced to incorrect spark plug gaps. Set each gap to exactly the same distance, .03125-inch, and use a gauge. Elsewhere in this issue will be found an article dealing with the proper method of adjusting spark plug gaps and testing for ignition troubles.

Briggs Magneto—E. G. W., Boston.

Is the magneto used on Crow Elk-Hart model C motor a high-tension instrument? What is the firing order of the motor? Can you supply me with the wiring plan of the ignition system?

The Briggs magneto is fitted to the motor referred to and is not a true high-tension instrument, as its armature carries but one winding, a primary or coarse wire, and consequently the current produced is low-tension. Like all single-wound magnetos the desired high-tension current is obtained by the use of a transformer or induction coil, which builds up the primary current. The coil has a primary and secondary winding,

is located on the dash, and increases the voltage sufficiently to permit the current to jump the gap at the spark plug.

The wiring plan employed is shown at Fig. 3, and it will be noted that the system is a dual one in that batteries may be utilized for starting or as an auxiliary. When cells are utilized their current is interrupted or broken, and the break timed by the breaker mechanism of the instrument. The low-tension current is then transformed into a high-tension by the coil, then led back to the magneto and distributed to the spark plugs by a distributor. The cable carrying the transformed current will be noted in the centre of the spark plug leads. As the connections of the breaker box are numbered to correspond with those of the coil, it should be a simple matter to rewire the system, if necessary.

The Crow Motor Car Company, Elkhart, Ind.,

Fig. 3—Wiring Plan of Briggs Magneto Utilized on Four-Cylinder Crow Elk-Hart Cars.

makes several model C motors and their firing orders are as follows: Models C-1-2-3-4-D-T-5, 1-3-4-2; C-8-7-9-P, 1-2-4-3; C-6-1-6, 1-4-2-6-3-5.

Iridium—A. E. T., Brockton, Mass.

I note that some makers of ignition devices state they use iridium points, and others, platinum. What is the difference between these metals and their value in ignition apparatus?

Iridium is not only a rare metal, but its hardness is held to be about equal to that of a ruby. In the cold it is quite brittle, but at a white heat it is somewhat malleable. It is one of the heaviest of metals, having a specific gravity of 22.38. It is extremely infusible and almost absolutely inoxidizable.

Platinum is a whitish steel gray metal, malleable, very ductile, and as unalterable by ordinary agencies as gold. When fused and re-

fined it is as soft as copper. It has a specific gravity of 21.15. It is fusible only by the oxy-hydrogen blowpipe or in strong electric currents. When combined with iridium it forms an alloy of great hardness.

Both platinum and iridium, and in combination, are used for contact points in induction coils, magnetos and electrical devices subject to considerable voltage, to prevent fusing, etc.

Clogged Water Jackets—Constant Reader, Bath, Me.

Can you help me out of my trouble? It has nothing to do with automobiles, but I thought your mechanical man would suggest something, as it has to do with a gasoline engine. I have an old style one-cylinder, two-cycle Lathrop marine engine and the water jackets are badly clogged. The cylinder head plate is removable, but the jackets can't be got at except through a small opening on the side of the cylinder, the inlet and outlet of the water connections. Have tried all kinds of stunts, even acid, but cannot get but a tiny hole through. Any advice will be appreciated.

The engine referred to is one of the early types, with which the writer is familiar. The deposits can be removed, and the best method is to disassemble the engine and take the cylinder proper to some machine shop where a power drill can be utilized.

Remove the top plate and drill .375-inch holes between the studs securing the plates, making sure that the cylinder is held exactly vertical during the drilling. A careful machinist should be able to do this work without any trouble. The drill should be run through the metal and until it strikes the water jacket space.

Next take a long drill or auger and cut the deposits, removing the loose material as the work progresses. By working the drill at an angle, the greater part of the deposits may be removed. By using water under considerable pressure, the jackets may be cleaned sufficiently to provide for a good circulation of water.

The holes in the cylinder head can be plugged up by cutting a standard thread with a tap and fitting bolts, cutting the latter flush with the surface. As a gasket is utilized with the cylinder plate, no trouble should be experienced with leakage of the water. The writer can vouch for this method, having seen the work performed by a marine engine expert, and the motor has been in service over two years since the repair was effected.

Diametrically Opposed—F. E. K., La Crosse, Wis.

As a new subscriber to your magazine would like you to explain what is meant by "diametrically opposed". I note it is used in some of your articles on mechanical subjects.

By diametrically opposed is meant directly opposite. For example: If a line be drawn

through a circle the point where the line is completed would be diametrically opposite that where it began.

PRIZE WINNING ESSAY.

Miss Amy Coon of Scammon, Kan., Will Go to Road Congress in Atlanta.

In a contest in which nearly 5000 school children all over the United States participated, two girls and a boy, all aged 14, have been awarded prizes by Logan Waller Page, director of the office of public roads, for writing the best essays on the repair and maintenance of dirt roads. First prize, a gold medal, went to Miss Amy Coon, Scammon, Kan., a pupil in the Skidmore school; second, to Miss Lucille Huff, Willowdale Farm, Arlington, Ore., and third, Melvin Paulson, Blooming Prairie, Minn. Honorable mention was received by: Robert Barrow, 14, Mansfield Centre, Conn.; George H. Rombough, 11, Woodside, Idaho; Maurine Atkinson, 15, Independence, Mo., and Francis Cochran, 14, Wellman, Ia.

Because of the general excellence of her essay, Miss Coon has been selected by the American Highway Association as the recipient of unusual honors, in addition to her gold medal prize. The organization will pay all her expenses to the annual road congress in Atlanta, Ga., in November, where she will read her essay to the engineers and other delegates attending the congress.

Miss Coon says that the chief reason why earth roads have received no attention and little improvement in the last 40 years is because they have not had sufficient place in the public mind. She adds:

People seldom give the improvement of roads any thought beyond paying their taxes or working them, and sometimes getting out of it altogether. They then find fault with the road overseer. Straight roads are desirable, but in hilly countries it is often necessary to make a winding road in order to have a level grade.

After the road is properly located, the next thing to be thought of is the drainage. A poorly drained road is very undesirable, when, after a rain or snow, the horses' feet and wagon wheels cut it up, it becomes impassable with mud, and then a freeze comes which leaves the road in a worse state than before. When water is allowed to course down the middle of the road it washes out gutters and ruts that are quickly enlarged by the wagon wheels. This can easily be overcome by proper drainage.

Chief McIlhargey of the fire department in Hibbing, Minn., reports that the cost of maintaining and operating the KisselKar combination hose and chemical wagon in service in that city was exactly \$23.16 for the first three months, a saving of more than \$23 a month over horses.

FLAGLER NOW IN LIGHT CAR DIVISION.

ALTHOUGH originally announced from Chicago, the factory of the Flagler Cyclecar Company has been located in Cheboygan, Mich. And it may be added that the design of the product has been changed very materially, eliminating the air-cooled motor, friction transmission and belt drive, and placing the machine in the light car division of the cyclecar class. The body design also has been changed, although it still seats the two passengers side by side. The driver is at the left. The wheelbase is 94 inches and the tread 42.

The new motor is a four-cylinder, four-cycle, water-cooled unit, with bore of 2.75 inches and stroke of four, giving a piston displacement of 95.03 cubic inches. The transmission is a standard gear type, affording two forward speeds and reverse. Drive is by shaft. The service brakes are internal expanding on the rear wheel drums, while the emergency member operates on the transmission reverse.

The frame is of pressed steel channel section, and the body is of sheet metal. This is suspended by semi-elliptic springs in front and full elliptic in the rear. Wheels are of wire, with ball bearing hubs, and carry 28 by 2.75-inch tires. A five-gallon gasoline tank is located under the hood, and the lubrication is by plunger pump.

According to the announcement of W. C. Lumb, general sales manager, the new factory is ready to produce in quantity and the company is in a position to make deliveries. The officers of the concern are: President, Elias S. Flager; vice president, Dr. Arthur M. Gerow; secretary and treasurer, Warde L. Hagadorn.

THE LULU SPEEDSTER.

Product of the Kearns Motor Truck Company Is in the Light Car Division.

Several motor truck manufacturers throughout the country have been turning their attention to the cyclecar field, and among the latest to make an announcement of that nature is the Kearns Motor Truck Company, Inc., Beavertown, Penn. This concern has been engaged in

the production of commercial vehicles for some years. It is stated that the new machine, which is termed the Lulu small car, although its piston displacement and weight would place it in the light car division of the cyclecar class, bears the same guarantee against defective workmanship and material as the Kearns trucks.

The Lulu is a roadster type vehicle, with wheelbase of 90 inches and tread of 44. The weight is 850 pounds. The four-cylinder, water-cooled motor is of the L head type, with cylinders cast en bloc, and with bore of 2.75 inches and stroke of four, giving a piston displacement of 95.03 cubic inches. This is mounted as a unit with the selective sliding gear transmission, affording three speeds forward and reverse. The clutch is a leather faced cone. Cooling is by

Latest Model of Flagler Cyclecar Is in the Light Car Division.

thermo-syphon and lubrication by constant level splash, maintained by plunger pump. Ignition is by high-tension magneto.

The frame is of steel, channel section, and the body is suspended on semi-elliptic springs, front and rear. Brakes are expanding, on the rear axle, which is of the live type, with a differential in each wheel. The front axle is tubular, and fitted with ball bearings. Wheels are of wire, carrying 28 by three-inch tires.

Seating is with the driver at the left, the control levers being in the centre. The equipment includes a windshield, two gas lamps in front, one oil lamp in the rear, gas tank, bulb horn, etc., while a top and speedometer are listed as extras. The maker also will furnish an electric starter and electric lights on special order.

The race meet of the New Jersey Cyclecar Club, scheduled for Memorial Day, has been postponed to June 13.

EIGHT MILLIONS A YEAR.

Motorists are most interested in highways during the active touring and driving season of the year, and, unfortunately, the interest thus created often is permitted to lapse at the period when legislative authorities are in a position to make appropriations for such work. That automobile owners are warranted in giving careful study to methods and applications of funds is clearly demonstrated by the fact that they are called upon to provide some \$8,000,000 annually, largely for road construction and maintenance.

Much of the preliminary work has been accomplished. Interests which were inclined to look with disfavor upon improved highways in the early days of the industry, are now actively supporting the good roads movement. What is needed at present, is that motorists and others should give greater attention to methods, despite the fact that this is a field properly assigned to the engineer.

There is little disposition to dispute the proposition that politics play an important part in the handling of road funds in America. A body of citizens which contributes \$8,000,000 a year

for this purpose has interests which cannot be overlooked. Engineers may be willing and anxious to provide that which is desired, but public opinion must be aroused to a point where civic need overcomes political expediency.

MASSACHUSETTS' GARAGE LAW.

Organized motorists need the assistance of the manufacturer and the trade in watching legislative action. The responsibility is two-fold, as is clearly demonstrated by the new garage law recently enacted by the Massachusetts legislature. Within the past year, particularly, there has been a very evident tendency toward regulation of the automobile industry, as well as the use of the cars themselves.

"Safety First" is an excellent slogan, and motorists and those connected with the industry may be expected to use every legitimate effort to make this slogan effective. It is often demonstrated, however, that sufficient attempt is not always made to study proposed legislation before it is enacted into statute. This applies to laws affecting other industries than this.

While it may be too early to make definite conclusion as to the working of the new Massachusetts law, it would appear from the first study of its provisions that it could not help but work a hardship upon the automobile business. Already it has caused unlimited criticism, even among those upon whom its enforcement devolves. Had those, whose business this statute presumes to regulate, been invited to co-operate with the legislators in framing the bill, it is probable that many of its objectionable features would have been eliminated without in any way impairing its value in the interests of safety.

SOUTH AMERICAN MARKET.

The importance of the South American field cannot be overlooked by the manufacturers of the industry. The quick response of business men and government officials in Chile and Argentina, to the possibilities demonstrated by the recent successful trans-Andean trip of an American car, may be taken as evidence of the enterprise to be expected of these people. The market would appear to be one that ought to receive careful consideration at the hands of motor truck makers in particular.

REGISTRATION FEES TOTAL \$8,000,000.

What the Motorists of the Several States Paid for Operating Cars in 1913, and How the Money Is Apportioned to Roads, General Fund and Schools.

HOW much money do the motorists of the United States contribute for improved roads? This is a question that has interest for every automobile owner and user, since there has long been a disposition on the part of legislators to increase registration fees upon the slightest provocation—or in the entire absence of justification. And in considering the situation, it is well to keep in mind that horse drawn vehicles are not called upon to bear their proportion of the alleged damage to highways.

In order to secure absolutely reliable data as to the amount of money collected from the motorists in the several states during 1913, The Automobile Journal recently addressed inquiry to the official to whom such payments

are made in each of the commonwealths, with the exception of Florida, Georgia, Louisiana, Mississippi, South Carolina and Texas. The result of this inquiry is presented herewith in tabulated form, except that it should be stated that in a few instances no returns were received, in which case the best possible estimate has been made, this being based upon reports from state highway officials to the American Highway Association. It is evident, also, that some of the reports from the state officials made direct to The Automobile Journal are estimates, and this can be held to apply generally where round numbers are given.

No returns are presented from Florida, South Carolina and Texas, because registration is by counties. Georgia and Louisiana had no regis-

tration law in 1913, although Georgia has one now, and in Louisiana a bill providing for such registration is pending before the present session of the legislature. Mississippi's registration law was declared unconstitutional by the supreme court. This also applies to Michigan and Ohio, but in these states the new law was not expected to take effect until Jan. 1, 1914.

The tabulation shows that motorists contributed \$8,032,190.02. But not all of this money

was applied to the construction and maintenance of highways—improved or otherwise. In some states automobile fees are turned over to the general fund, and in others they are available for school purposes, while a few divide the money thus collected between high-

A Little Better Than 10 Per Cent. of the 2,235,854 Miles of Road in the United States Is Improved, and Motorists Contributed \$8,032,190.02 for Using These Highways Last Year.

ways and the general fund. A careful computation, on this basis, indicates that 91.2 per cent. of the \$8,000,000, in round numbers, was available for roads; 8.6 per cent. went to the general fund and .2 of one per cent. was utilized for schools.

In order to understand this view of the situation it will prove of interest to study a digest of the motoring laws for the several states, as affecting the distribution of registration fees, which is presented below:

Alabama—Not applied to roads. Forty per cent. of the gross revenue derived from owners residing in incorporated cities and towns is returned to such cities and towns, and 40 per cent. derived from owners in counties, not residing in cities and towns, is returned to the county of their residence.

Arizona—Credited to the state road tax fund.

Arkansas—Equally divided between the state and the county in which the revenue is collected. State portion credited to the state highway improvement fund. County

portion paid into the general school fund.

California—Half of net revenue credited to road fund in county in which it is collected. Half to state treasury for maintenance of state roads.

Colorado—Equally divided between state and county in which it is collected. State portion credited to state road fund to be expended in improving and maintaining state roads. County portion credited to county road fund.

Connecticut—Placed to credit of state highway fund

Illinois—State road fund, expended only in permanent roads.

Indiana—Road fund, apportioned to several counties on Jan. 1 and July 1 of each year.

Iowa—Eighty-five per cent. apportioned to the several counties to be expended only for crowning, draining, dragging, gravelling or macadamizing roads outside of incorporated cities and towns.

Kansas—County treasury, where collected. Maintenance of public roads.

Kentucky—State treasury. State road fund.

Louisiana—No registration. Bill pending.

Maine—State treasury, for repair, maintenance and construction of state highways.

Maryland—One-fifth to Baltimore for use on its roads and streets. Remainder for oiling, repair and maintenance of modern state and county roads.

Massachusetts—State highway commission. Not exceeding 20 per cent. for repairs, improvement and construction of local roads used as through routes.

Michigan—State treasury. Expended under direction of state highway department.

Minnesota—Not applied to roads. General fund.

Mississippi—No registration.

Missouri—State good roads funds. Specific appropriation necessary by legislature.

Montana—State highway fund. Constructing state roads and for apportionment to several counties.

Nebraska—Road funds of county in which collected.

Nevada—Apportioned to several counties for construction of county roads under joint supervision of county commissioners and state engineer.

New Hampshire—Maintenance of highways in accordance with state highway laws. Thirty-five per cent. may be expended in the maintenance of roads in cities, towns and places where roads are not ordinarily maintained with the assistance of the state.

New Jersey—Repairing the more important improved roads.

New Mexico—State highway fund. Expended on public highways, preference being given to automobile routes.

New York—Maintenance and repair of improved roads.

North Carolina—Eighty per cent. to county from which collected, to be expended only on public roads of said county.

North Dakota—Returned to county from which collected for repair and maintenance of main travelled roads of county. No part may be expended within the limits of an incorporated town or city, or within any township that does not levy a road tax of at least six mills on the dollar.

Ohio—One-third for repair, maintenance, protection, policing and patrolling of public roads. Two-thirds to general fund.

Oklahoma—To create a fund for the maintenance of the state highway department.

TABULATED ROAD STATISTICS FOR 1913.

State	Total Mileage	Improved Mileage	No. Cars Registered	Collected in Auto- mobile Fees	Road Ex- penditures in 1913
Alabama	49,639	5,491	6,150	\$85,000.00	\$2,164,000
Arizona	5,987	434	3,583	8,110.50	610,355
Arkansas	36,445	1,045	3,000	25,000.00	1,586,050
California	48,069	8,788	60,000	350,000.00	8,260,611
Colorado	30,421	1,600	15,993	60,883.00	1,917,690
Connecticut	12,583	3,100	26,560	326,796.52	3,100,000
Delaware	3,000	220	2,450	24,735.00	349,000
Florida	17,954	2,175	.	.	1,500,000
Georgia	83,986	22,043	.	.	2,750,000
Idaho	18,403	511	2,344	37,213.00	1,015,000
Illinois	94,141	8,914	106,839	500,000.00	7,100,000
Indiana	63,370	26,831	51,100	143,000.00	8,887,553
Iowa	102,427	2,505	78,389	802,000.00	7,300,000
Kansas	98,302	374	47,500	200,000.00	4,984,000
Kentucky	53,744	10,115	7,210	50,275.00	2,025,000

*Florida, South Carolina and Texas have county registration and figures are not available. Georgia and Louisiana had no registration law in 1913. Mississippi's registration law was declared unconstitutional by the supreme court.

to be expended in maintenance of state highways.

Delaware—Credited to general fund of the state treasury.

Florida—County registration. Credited to county road and bridge fund.

Georgia—Credited to state road fund, apportioned to several counties in proportion to the number of miles of rural mail routes.

Idaho—State highway fund, expended under the direction of state highway engineer. Seventy per cent. of fees collected from the residents of any county which has issued road bonds shall be returned to such county for the payment of interest on the bonds.

Oregon—Returned to county treasurer for general road fund.

Pennsylvania—State treasury, for assisting in the construction, maintenance and improvement and repair of state highways and state aid highways.

Rhode Island—Repair and maintenance of state roads.

South Carolina—County registration. No provision.

South Dakota—Eighty-seven and one-half per cent. retained by county treasurer, to be used only in grading, crowning, draining, dragging, gravelling and macadamizing public highways of the county.

Tennessee—Perpetual registration. No provision.

Texas—County registration. Perpetual. No provision.

Utah—Credited to state road fund.

Vermont—Repair and maintenance of main thoroughfares and state roads.

Virginia—Special fund. Permanent improvement of main highways of state.

Washington—No special provision.

West Virginia—General fund not roads.

Wisconsin—Three-fourths returned to county where collected, for repairing highways outside of incorporated towns and cities. Remainder to state highway fund.

Wyoming—Four-fifths returned to county where collected. Special fund. Temporary improvement of county roads.

The accompanying table also sets forth the total mileage of roads in each state and the amount of improved highways, according to the latest information available from the United States office of public roads. From this it will be seen that but little more than 10 per cent. of the highways of the country have been improved. Some states are well represented on this list, but others appear to have made little headway in highway improvement, this applying particularly to those of the West and Northwest.

It is somewhat difficult to obtain thoroughly reliable figures as to the amount expended by each state in any given year. The figures presented in the last column of the table are those supplied by the year book of the American Highway Association, and purport to give information as to the amounts expended in 1913, although in some instances these are estimates only. In others the figures are calculated as nearly as possible from an appropriation made to cover two years, as 1912-13 or 1913-14, for example. The fiscal year in some states begins on July 1, or at some other period well removed from the beginning of the calendar year. Thus it will be seen that it is practically impossible to secure an authoritative statement on this point. The figures presented undoubtedly are as nearly correct as it is possible to make them, and probably do not vary materially from the exact total—allowing for discrepancies here and there, either way.

The column devoted to the number of cars registered in the several states is open to the same explanation as was made regarding the amounts collected from motorists. The Automobile Journal has sought to secure the exact figures from those with whom registration is made. In some few instances replies were not received,

and the figures given are the best estimates obtainable.

It would appear, therefore, that there are some 1,250,000 motor vehicles of all classes, passenger cars, commercial vehicles and motorcycles, in use in the United States at present. This figure is by no means exact, since, in the case of Tennessee and some other states, registration is perpetual, and the number of cars credited in the table is that of the machines registered during 1913, on which fees were collected that year. And, of course, there are a large number of machines owned and in use in the states from which no registration figures are given. In computing the total, however, it is necessary to take into account the fact that many registrations are duplications, as, for instance, cars of persons living near the state border, which are registered in two

How the \$8,032,190.02 Contributed by Motorists in Registration Fees Was Distributed.

or more states, etc. It seems entirely probable that the registrations that are missing might be offset—perhaps more than offset—by these duplications, so that the grand total cannot be far from that shown in the accompanying table presented herewith.

While lack of space does not permit of making even a few of the interesting deductions possible by more extended study of the tabulations, those who are mathematically inclined will find plenty of opportunity to exercise their talents. The Automobile Journal offers the table as the most complete that has ever been compiled and as presenting information, in concise form, which should prove of unusual interest to the motorist, whenever his state legislature contemplates raising the registration fee.

EISEMANN MAGNETO ATTACHMENT FOR FORD.

IN KEEPING with its policy not to market a new product until it has been thoroughly tested in practise, the Eisemann Magneto Company, Brooklyn, N. Y., has withheld details of its magneto attachment for the model T Ford motor until recently. In designing the equipment the company gave careful consideration to the

Fig. 1—Switch Used with Eisemann Ignition System for Ford.

method of drive and lubrication, important factors with this high speed motor. Quietness of operation and accessibility, as well as ease of installation, are features.

The simplicity of the equipment will be noted by reference to Fig. 2, and each detail has been worked out very carefully. For example, the trouble generally experienced in removing a gear from a conical shaft without the aid of a special tool, is eliminated in the Eisemann design by a simple device in which the removal of the nut retaining the gear in place automatically pulls off the gear. Another feature, one that will appeal particularly to those not familiar with timing a magneto, is the use of marked gears and an indicating window on the instrument. There is no reason why the most inexperienced should not be able to correctly install the equipment, as the instructions are easily followed.

The attachment is an aluminum casting, it serving a double purpose, in that it provides a bracket for mounting the magneto, also a housing for the driving gears. The structure provides a rigid, well ribbed mounting, and as all bolt and screw holes are accurately machined, it is simply a case of utilizing the parts supplied.

The gear housing, which is integral with the bracket, has two removal covers, these permitting of the fitting of the large camshaft gear and armature gear. The entire construction is proof against leakage of lubricant, special gaskets being utilized.

For driving the magneto, two bronze gears are employed. The larger one is securely fastened to the camshaft by means of a spacing ring,

dowel pin, lock washer and a nut. The dowel pin is extra heavy and, passing through the gear directly into the shaft, assures a positive and reliable drive. The magneto pinion is retained by a Woodruff key, lock washer and nut, and the magneto is secured to the bracket by dowel pins and straps. Control of the movement of the breaker box of the magneto, providing variable ignition, is by means of a shaft passing through a solid bearing in the support, and a lever and link. This linkage is connected to the Ford ball joint at the base of the steering column by a second lever and rod. The movement provided is sufficient to permit the timing lever of the magneto to be advanced to its maximum without the spark lever travelling over the entire length of the quadrant.

Reference has been made to the easy timing feature. The Ford crankshaft and camshaft gears are marked and, with these marks registering, the camshaft gear is removed and replaced by the marked new gear. With the magneto on its base, its armature is turned until the figure 1 appears in the indicating window. The magneto pinion is then slid on and so meshed with the camshaft gear that the marks coincide. As the new camshaft gear is retained by a dowel, it is a simple matter to install it correctly.

Careful attention has been paid to supporting

Fig. 2—Showing the Eisemann Magneto Attachment for Ford Motors Installed—A Quiet Gear Drive, Well Lubricated, Is Among Its Practical Features.

the high-tension wires leading from the distributor of the magneto to the spark plugs, a solid bracket being utilized. It is secured to the two

middle bolts of the stirrup holding the intake and exhaust manifolds.

As the Eisemann system eliminates the coil, the space on the dash is neatly covered by an enamelled steel plate, as indicated at Fig. 1. This plate carries the Eisemann switch, a simple and efficient construction, one permitting of securely locking the car, as its key is removable. Moving the key to the side of the switch marked "M" permits the high-tension current of the magneto to pass to the plugs. To cut off the current supply, the key is pushed in and moved to the "Off" position. As with all true high-tension magnetos, the motor is stopped by grounding the primary current, and with the Eisemann Ford installation a wire is carried from the breaker box to the switch, thence to a cylinder head bolt, the arrangement being clearly depicted at Fig. 2. The simplicity of the wiring plan is obvious.

The magneto supplied is the well known EM type, a true high-tension magneto, which provides a very hot spark at very low motor speeds, and it is stated that the Ford motor car be started easily on a quarter turn. For those owners desiring to start the motor on the spark, the Eisemann Magneto Company supplies the dual ignition system, type EB. This includes a flush type dash coil, having a starting button, which, when pressed, produces a shower of sparks in the cylinder on compression. This system lists for \$5 extra.

The advantages of a true high-tension magneto over the usual Ford ignition system are many, and were described in the issue of *The Automobile Journal* for May 25, 1913. The writer accompanied the owner of the car referred to in that article, in its trials, and ease of starting, quick response to the throttle, increase of power and a cool motor were among the noticeable features. The increase of speed was over 20 per cent.

The Eisemann Magneto Company is issuing a neat booklet, which describes and illustrates in detail the magneto attachment for Ford motors.

INSPECT WHITE FACTORY.

Seventeen Selling Agents in New England Visit the Plant in Cleveland, O.

Seventeen selling agents for the White line of passenger cars and trucks, made by the White Company, Cleveland, O., visited the factory last month as guests of J. S. Hathaway, manager of the New England branch in Boston. At the

plant full opportunity was given to study the details of manufacture, the men being under the special charge of Walter C. White, vice president and general manager. Those in the party were:

C. A. Gilmore, H. M. Gordon and William T. Barry, Boston; H. A. Peck, Taunton, Mass.; W. A. Speare, Manchester, N. H.; H. I. Cashman, Worcester, Mass.; Ernest Place, Fall River, Mass.; H. F. Vesper, Rockland, Me.; R. S. Bridge, Pittsfield, Mass.; J. S. Coy and R. W. Tanner, New Bedford, Mass.; E. C. Hall, Brockton, Mass.; J. W. Norcross, Marshall Scott and H. W. Hooker, Springfield, Mass.; A. C. White, Jr., Bridgewater, Mass., and E. A. Sontag, Providence, R. I.

COL. POPE AGAIN HONORED.

Well Known Automobile Man Heads National Association of Manufacturers.

The importance of the automobile industry again received encouraging recognition at the annual meeting of the National Association of Manufacturers held in New York City, May 21, when Col. George Pope of Hartford, now receiver for the Pope Manufacturing Company of that city, was re-elected as president. The other officers are: Treasurer, A. B. See; secretary, George S. Boudinot; general manager, J. Philip Bird, all being re-elected.

It will be understood that this organization has no connection with the automobile industry, as such, being a national body of manufacturers producing all lines of goods. Col. Pope has been prominently identified with the manufacture of motor cars for many years, and has held numerous offices in the organizations of this industry. He was selected to head the National Association of Manufacturers last year, and his re-election at this time is worthy of special mention.

G. H. Townsend, 2nd., president, and H. H. Boyce, secretary, of the Motometer Company, New York City, attended the Indianapolis race in the interests of their product.

Col. George Pope, Re-Elected President of the National Association of Manufacturers.

PROTECTING TRUCK COOLING SYSTEM.

THE system for cooling the motor of a power wagon is usually much larger than for a passenger car, because of the slow speed of operation and the lessened circulation of air. The possibility of damage is materially increased and designers have directed much attention to the protection of radiators. Two examples of tubular construction of recent design may be noted in the sketches of the Chase and GMC machines shown herewith.

The radiators used for the two and three-ton, water-cooled Chase models are of the vertical round finned tube construction, with the header in a casting with wide fins. In this the tubes are soldered. One or a number of the tubes could be damaged, and with these removed the tank could be plugged and the machine used. Repairing is a simple matter of soldering. These radiators are supported by lugs installed between helical springs in a housing bolted to the chassis frames, and are not affected by chassis distortion.

The GMC radiator is a different form, but the principle is much the same, the header, base and side columns being one assembly, and into this frame is set a flat tube centre section with the tubing horizontal. The frame can be taken apart, the castings being bolted together, for cleaning, and a spare centre section can be installed with comparative ease. The radiator is installed within the frame, and the side frame members are extended forward, while the front cross member is the full width of the truck body, so that the radiator is unusually well protected. This construction is employed on both the 2500

and 4000-pound machines, made by this concern.

The Atterbury chassis are fitted with honeycomb radiators that have very rigidly constructed frames, and these are mounted on two sets of helical springs that are carried on the frame front cross member. Two heavy bronze bushings are fitted in the frame member, and in these are sockets into which helical springs are seated. From the bottom of the radiator base two bolts project vertically, and these are carried through the springs and holes in the bushings. Below the frame two shorter springs are seated against the web, clamped by collars secured by nuts on the bolt ends.

The radiators of the Velie three-ton trucks are a honeycomb type, and are installed in a frame in which they are supported on springs, this minimizing any influence from chassis distortion, but protection is afforded by the curved front cross member of the frame, which is carried on extensions of the side members. As an additional protection a heavy wire screen is mounted in the frame, of the same form as the radiator, and this frame is supported by bolts through a base flange and by a heavy bracket extending from each of the lamp brackets. The screen insures abundant circulation of air and prevents anything contacting with the radiator.

F. W. A. Vesper, assistant general sales manager of the Buick Motor Company, Flint, Mich., has purchased the company's branch house property and business at St. Louis, which he will operate as the Vesper-Buick Company.

Some Examples of Radiator Construction: Sectional Vertical Tube Model on Chase, New Type Installation on GMC, Spring Supported Design on Atterbury and Screen Protector on Velie.

DUMPING BODY FOR HANDLING ASPHALT.

ONE of the problems which contractors for street construction are called upon to face is that of having asphalt intended for application on a paving job at the right condition when it is delivered for work. Asphalt as a material may be received in drums or barrels, or other containers, but when applied it must be mixed with sand and gravel to give it sufficient body, so that it will not soften and be cut by the wheels of traffic. This means that it must be prepared by heating and mixing, and this can only be done where the facilities are adequate for the purpose. Thus, with rare exceptions, conditions do not warrant the establishment of a temporary plant.

If permitted to cool, the mixture cannot be worked, and when solidified, it must be broken and heated, necessitating expensive work. It can only be applied to dry surfaces, and usually it is spread by rakes and then rolled to a uniform thickness. Generally the contractor prepares the mixture at a permanent plant and depends upon some method of carrying it heated to the job. If the haul is long there is probability of cooling, and in any event it is difficult to handle because of adhesion to the vehicle in which it is transported.

Handling asphalt by motor trucks requires a body that can be elevated to such a degree that the load can be dumped by gravity. Quick handling is the solution of the work. To meet these requirements, the Brooklyn Alcatraz Asphalt Company, Brooklyn, N. Y., recently purchased nine five-ton White trucks, made by the White Company, Cleveland, O., these being fitted with steel bodies and power hoists by which the highest elevation can be reached in 30 seconds.

This is held to be the largest number of motor trucks operated by a concern handling asphalt anywhere in America and possibly in the world. The machines have been in service in New York City for some little time, and are giving the high-

est degree of satisfaction in every respect. It may be added that a number of other similar trucks made by this concern have been sold for such work in the Middle West during the past few months.

PEERLESS FOR ARMY WORK.

Machine Recently Shipped to Texas Replaces Mules in Field Service.

S. M. Williams, southern sales representative of the Peerless Motor Car Company, Cleveland, O., reports that the Peerless truck recently shipped from the factory to Beeville, Tex., has entered the service of the United States army.

White Five-Ton Truck Chassis Fitted with Special Power Dumping Body, One of a Fleet of Nine Purchased by the Brooklyn, N. Y., Alcatraz Asphalt Company.

Its first work was that of proceeding to Houston, 250 miles from Beeville, there to assist in the movement of the troops to Texas City.

The machine left Beeville Tuesday morning, running over roads, a large portion of which had previously been regarded as impassable for motor trucks because of mud, sand and general adverse conditions. After 35 hours of continuous running, except for stops to take on gasoline and permit the crew to eat, the machine arrived in Houston Wednesday afternoon.

On the journey from Houston to Texas City the load consisted of army supplies, and in addition, the truck hauled a loaded trailer. Much the same road conditions prevailed, but in spite of these the journey was accomplished without difficulty and the truck was thereupon accepted by the government.

OIL PRODUCTION AND GASOLINE PRICES.

WITHIN the past six months, in addition to the reduction in pipe line dividends, several other companies in the Standard Oil group have reduced, and in some cases omitted, their extra dividends. Last month the New York Transit Company declared an \$8 dividend in place of the \$10 dividend which has been declared regularly every three months since the beginning of 1912. This situation, taken in connection with the price of crude oil at the wells, which has dropped materially during the last six weeks, is of interest to the automobile industry, as having a bearing on the price of gasoline and other refinery products. So far as can be learned, the present price of gasoline in tank wagon lots is pretty general at 15 cents, although so-called 60 test gasoline has been sold recently in some portions of the Middle West at 12.5 cents.

Illinois, West Virginia, Pennsylvania, Kentucky, Indiana, Ohio and New York, was 50,200,000, a decrease of almost 10,000,000 barrels.

The United States is at present producing almost two-thirds of the world's oil output, while Russia is second with 18 per cent. California produced nearly 25 per cent. of the world's output for 1913. Russia's maximum was reached in 1910, with 70,336,574 barrels. Much interest is now centred in the exploitation of South American fields, particular attention being directed toward the development of this territory in contemplation of the opening of the Panama canal. Thus far Peru is the only large oil producing country, although considerable development work was done in Venezuela last year.

Since the beginning of the year great interest has centred in the Mid-Continent field in the

United States, and it may be stated that the first break in the present fall of prices occurred in Kansas-Oklahoma. The Oil City Derrick is authority for the statement that the Cushing district is now the largest high grade oil producing field in the world. A recent dispatch from Tulsa, Okla., states that Cushing is now producing at the rate of 98,000 barrels a day from 78 wells.

Six months ago, it is stated,

this district was considered a dead one. The discovery of the prolific Bartlesville sand created unusual excitement, and it is added that this district is 10 miles in length by five wide and embraces practically 30,000 acres of land. Wells now being drilled are expected to increase the present production by 40,000 or 50,000 barrels a day. This should make the annual production something like 50,000,000 barrels. But it is maintained that the district has only been "pin pricked", as it were.

Thus far, the situation does not appear to have affected the price of gasoline very materially. The reason given for the reduction of dividends in the Standard Oil groups is the diminished consumption of petroleum.

Nelson B. Hazeltine, formerly Philadelphia sales manager for the Adams-Bagnall Electric Company, has joined the sales organization of the Electric Storage Battery Company at 100 Broadway, New York City.

TABLE OF WORLD'S OIL PRODUCTION.

Country	1913	1912	1911	1908
United States	242,000,000	222,113,218	220,440,291	178,527,355
Russia	66,500,000	68,019,208	66,183,691	62,186,447
Mexico	26,000,000	16,558,215	14,051,643	3,481,410
Roumania	13,500,000	12,991,913	11,107,450	8,252,157
Dutch East Indies	11,000,000	10,845,624	12,172,949	10,283,357
Galleia	7,800,000	8,535,174	10,519,270	12,612,295
India	7,200,000	7,116,672	6,451,203	5,047,038
Japan	1,800,000	1,671,405	1,658,803	2,070,145
Others	2,500,000	2,331,043	1,934,079	1,620,133
Totals	378,300,000	351,178,236	345,512,185	285,089,615

Stimulated by higher prices, due to a heavily increased demand, the world's production of petroleum attained a new high record in 1913. Taking what are generally considered the most reliable estimates for foreign countries, together with the preliminary figures for the United States, the total output of the world last year was something like 378,000,000 barrels of 42 gallons each, as compared with the Geological Survey's figures of 351,178,236 barrels as the actual production in 1912. In seven years there has been an increase of over 80 per cent. The accompanying table gives the estimated production for 1913, compared with the actual figures for the other years listed.

According to the Wall Street Journal, California supplied most of the increase in the United States, its output for 1913 being approximately 98,000,000 barrels. The Mid-Continent field (Kansas-Oklahoma) was second in increase, with 64,500,000. The production in the Appalachian and Lima-Indiana fields, which include Il-

ZEISS HEADLIGHTS ELIMINATE GLARE.

THE problem of eliminating the glare of motor car headlights is being given consideration abroad and an ingenious method of accom-

Two Diagrams Showing the Effect of the Zeiss Auxiliary Reflector in Its Two Alternative Positions.

plishing this end is noted in the Zeiss headlights, made by Carl Zeiss, Ltd., London, England, a well known English lamp maker. The anti-dazzling feature is incorporated in both acetylene and electric units.

Two reflectors are utilized in the acetylene unit, the main being a spheroid glass mirror silvered on the reverse side and having a very large aperture. The second or auxiliary reflector is also a spherical glass mirror silvered at its back, but it is so arranged as to form in the plane of the flame and in front of it, an inverted image of similar size. Although a small portion of the light emanating from the main reflector is intercepted by the auxiliary member, it is stated that it is a negative factor, as the auxiliary acts as an intensifier.

The auxiliary reflector is so arranged that it can be turned round, it being actuated by a Bowden cable. When its position is reversed it cuts out the back rays of the main reflector, providing a wide diffusing and non-glaring beam.

The electric lamps are similar in design, except that in place of the burner a partially silvered bulb is utilized, this silvered portion acting as the auxiliary reflector. Around the inside of the rim of the lamp is a white reflecting shade, which is employed to obtain a uniform illumination directly in front of the car.

The front glass employed differs from that used with the acetylene unit in that it is fluted, it providing an additional side light at an angle of about 45 degrees for negotiating curves. The revolving bulb holder is actuated by the Bowden cable referred to, enabling the driver to cut out the dazzling rays as desired.

It is stated that the electric unit provides a very clear light, and that the rays are free from the rings, also that the use of the auxiliary reflector referred to, enables pedestrians and other users of the highway to approach the car without being blinded, as all upward rays are eliminated.

CLEANING THE MOTOR.

Motors that have seen considerable service are apt to be more or less covered with lubricant as the oil works out between the pushrods and their guides. The lubricant attracts more or less road dust, which is a rapid cutting abrasive. It is an excellent plan to go over the power plant and remove all traces of oil, as this will not only prevent undue wear of the exposed working parts, but will save the clothing when an adjustment must be made on the road.

CULMER OIL GAUGE.

The Culmer Engineering Company, 6 Church street, New York City, is marketing an oil gauge for the model T Ford motor, which enables the driver to note the supply on hand without leaving the seat. It is of the dashboard type and the amount of lubricant is indicated by a moving member in an indicating tube, this being graduated to make for easy reading. The gauge is constructed of heavy brass and the glass indicator tube is of extra heavy stock. The gauge proper is provided with a large float and it is stated that it will not stick or bind, and that the device will register accurately. The accompanying illustration shows complete construction, also connection between the gauge and the crankcase of the motor. The equipment is moderately priced.

Culmer Ford Oil Gauge.

MODERN LEGISLATIVE TENDENCIES.

IN VIEW of the fact that some 160 bills affecting motorists and motoring were introduced in the legislatures of the 10 states which held sessions this year, it may be contended that there is little occasion for suggesting anything new along this line. In the light of past experience, it would seem that the first thing a legislator-elect considers is the possibility of introducing some new bill regulating the use of automobiles.

That a larger percentage of these measures are not enacted into law is due to the activity of organized motorists, and during recent years these have been assisted very materially by organizations of manufacturers and dealers. There are many subjects upon which legislation is proposed, and often there is room for genuine differ-

Cartoon Reproduced from L'Auto of Paris, France, Showing Artist's Conception of Legislative Tendency.

ence of opinion, but the field has offered, and continues to offer, unlimited opportunity for the practical joker.

Herewith is presented a cartoon reproduced from L'Auto of Paris, which might well have been suggested as a result of reading over a list of the 160 bills mentioned above. The artist has depicted a motorist self-convicted of exceeding the speed limit, his machine being plentifully supplied with automatic devices. Besides being threatened with a revolver, warned by a gendarme mascot and notified by a clanging bell, his tires are punctured, his name and address are being circulated by means of identifying cards and a huge speed indicator shows the actual speed he has attained. That this is not much overdrawn is evident, when it is remembered that one of the New Jersey solons introduced a

bill providing for the automatic distribution of 72 metal tags bearing the license number of the machine under somewhat similar conditions.

ONE RIDDLE IS SOLVED.

Massachusetts Legislature Tells When a Motorcycle Is an Automobile.

Under the title, "An Act Relative to the Operation of Motorcycles", the Massachusetts legislature has successfully solved a riddle which has been worrying the state highway commission and motorcyclists in that commonwealth ever since the sidecar became popular. For the benefit of those who may desire to know when a motorcycle becomes an automobile, attention may be directed to the reading of the new statute:

Section 1—Motorcycles shall, on and after the first day of January, in the year 1915, carry two number plates, displayed and illuminated substantially in the same manner in which other motor vehicles are required by law to display and illuminate them. The number plates shall be furnished by the Massachusetts highway commission, and shall be of such size, shape and color, with such letters and figures thereon, as said commission may from time to time determine. No seal shall thereafter be furnished or used.

Section 2—A motorcycle with a sidecar attachment may be operated provided that the owner has registered it as an automobile, pays the necessary fee for such registration, and displays the number plates above provided for in the manner hereinbefore set forth.

Section 3—The owner of any motorcycle, already registered as a motorcycle, who has paid the necessary fee, may, upon proper application, have it registered as an automobile by paying the additional fee necessary to make up the total sum of money required for the registration of an automobile of like horsepower, and may thereafter operate it either with or without the sidecar attachment, using the same plates.

Section 4—All acts and parts of acts inconsistent herewith are hereby repealed.

Section 5—This act shall take effect on the first day of January, in the year 1915.

NEWS NOTES FROM ABROAD.

Consul-General Ernest L. Harris of Stockholm, Sweden, reports that there is a wide market for American automobile tires in that country, providing the manufacturer is willing to make the exact size required by the Swedish buyer, which is usually 32 by 4.5 inches. The bulk of the business is now going to England and Germany. The makers of the latter country, in particular, are willing to get their money in Stockholm and give three months' credit. There is but one tire factory in Sweden, and this is quite unable to supply the home demand.

Three American makes of cars were on display at the 11th annual international exhibition of automobiles and automobile accessories held recently at Prague, Bohemia, these being the Studebaker, Ford and Hupmobile. Display space cost about \$25 for each car for the week, and about 200 machines were shown.

NOVEL THERMO-ELECTRIC INDICATOR.

A DEVICE for notifying the operator of a gasoline vehicle when the supply of cooling fluid requires replenishing and indicating an

Fig. 1—Thermo-Electric Indicator for Notifying Driver of Abnormal Rise of Temperature of Water (Upper View) and When Radiator Needs Replenishing (Lower View).

abnormal rise in its temperature has been brought out by an English engineer. It differs from those marketed in this country in that electricity is utilized to light a dash lamp, the circuit being closed by the expansion of mercury. The device is manufactured in two styles, which, although very similar in construction, perform two different functions. One indicates to the driver when the temperature of the cooling water has risen to an abnormal degree, while the other informs him when the radiator requires water.

A sectional drawing of the thermo-electric indicator, as it is called, is shown at Fig. 2, and in this instance it is indicated applied to a radiator. The fitting consists of a brass body A having a screw flange by which it is attached to the radiator tank, and a brass tube B which projects into the water space. This tube supports a thermometer C, into the bulb of which is fused a platinum wire, making contact with the brass tube C. A platinum wire is also fused into the other end of the thermometer tube, and is connected to a terminal D carried in a vulcanite packing E. A rubber washer G, compressed by means of a washer and nut H, prevents leakage. The electrical circuit includes a battery K, switch L and small red lamp M, the last named fitted to the dash.

When the radiator is full or the level of the water is above the instrument, the temperature

is not sufficient to cause the mercury in the bulb of the thermometer to expand enough to make contact with the platinum at the other end of the tube, but as soon as the fluid falls below the tube B, the temperature of the steam generated causes the mercury to expand sufficiently to complete the circuit, and the dash bulb is lighted.

The other instrument is similar, except that instead of being provided with a flange it is intended to be screwed into any convenient point in the cylinder cooling system. When thus used a lower temperature completes the circuit than in the radiator device. In installing it the normal temperature of the water is first ascertained, and a thermometer utilized which will complete the circuit when a rise of 10 per cent. is experienced. If both instruments are used, different colored lamps are employed, or one can be substituted by a buzzer, which would be more effective in attracting the attention of the driver.

An interesting comparative test demonstrating the hill climbing ability of a duplex drive, model 48 Detroit electric, made by the Anderson Electric Car Company, Detroit, and equipped with Edison batteries, took place recently at Orange, N. J. The machine carried five passengers up Eagle Rock hill, having a grade of 25 per cent. and being one mile long, while the competing car, of another make, carrying two passen-

Fig. 2—Sectional View of Thermo-Electric Indicator Installed on Radiator.

gers, failed about half way up the hill. The Detroit made the hill at a speed of eight miles an hour, and without difficulty.

BOTTLER'S DOUBLE-DECKED WAGON.

IN ORDER that the motor truck owner may secure the widest measure of service from his vehicle, it often becomes necessary to provide a special body installation. Manufacturers of commercial vehicles realize the importance of such equipment, and, so far as is practicable, endeavor to produce that which will meet the needs of the purchaser. An example of special body design is shown herewith, this being the work of the Palmer-Moore Company, Syracuse, N. Y., maker of Palmer-Moore delivery wagons.

The machine was purchased by the Zenith City Bottling Works, Duluth, Minn., and is rated at 1600 pounds capacity. The use to which it is being put is that of delivering bottles carried in

can be carried so placed that changing is unnecessary. In the event of storm the body and load may be covered by a tarpaulin, which gives every protection needed.

OPEN ARMY TRUCK BIDS.

Manufacturers of the Industry Ready to Make Early Delivery to Government.

It was demonstrated by the bids opened by the depot quartermaster in Washington, D. C., May 25, that the manufacturers of the industry are prepared to supply the War Department with motor trucks on comparatively short notice.

Seventeen chassis are desired by the government, and bids also were opened at El Paso, Tex.; Fort Sam Houston, Tex.; Chicago and St. Louis. The Washington bids were as follows:

Thomas B. Jeffery Company, Kenosha, Wis.; \$2300 each, delivered in 40 days in Kenosha.

Velle Motor Vehicle Company, Moline, Ill.; \$2022, delivered in Moline; \$2074, delivered in New York City; \$2112, El Paso; all deliveries within 44 days.

Federal Sales & Service Company,

Washington, D. C.; \$2200, delivered in 60 days at Detroit.

Bessemer Motor Truck Company, Grove City, Penn.; \$2265, delivered in New York City; \$2290, delivered at El Paso; deliveries in 90 days.

Driggs-Seabury Ordnance Corporation, Sharon, Penn.; \$2440, delivery at Washington or New York City; four within three weeks and four a week thereafter.

Lord Baltimore Truck Company, Washington, D. C.; \$2500, delivered in 90 days at Washington.

Kelly-Springfield Motor Truck Company, Springfield, O.; \$2400, delivery at Springfield; four in seven days, eight in 14 days, five in 21 days.

Double-Decked Platform Fitted to a Palmer-Moore Delivery Wagon for the Service of the Zenith City Bottling Works, Duluth, Minn.

crates or racks. It might be contended that these could be stacked, but the experience of the company indicated that this was not desirable for several reasons, and particularly because of the loss of time in continually handling the racks.

The body consists of two decks, each 90 inches long and 66 wide, with a slight rail at the sides and ends to prevent the load shifting from movement of the machine. The upper deck is two feet above the lower, and is supported by four corner and two side stanchions, tied by bolted angle straps, the construction being light, but very strong. The two decks have a total area of 82.5 square feet.

With this form of body the crates can be handled from either side and the rear, or from the front or the running boards. The full freight

A. O. Dunk, president of the Puritan Machine Company, Detroit, has purchased the assets of the Reliable Dayton Auto Company of Chicago, from S. Winternitz & Co. The purchase includes all patterns, tools, service parts and other property formerly used in manufacture of trucks. The entire stock has been removed to the Puritan Machine Company's warehouse.

INTERESTING CONSTRUCTIONAL DETAILS.

ONE of the claims made for the use of the Daimler flexible coupling, which has been adopted by several motor truck makers in this country, is that this has a sufficient universal action at all times to meet practically any condition. It is also maintained that it is light; that the wear is almost negligible, and that replacement can be made at comparatively small expense.

The Daimler coupling consists of two spiders having three arms, the centres being 120 degrees apart. Each of these is bolted to a series of three or more rings of specially prepared leather, so that the bolt centres are each 60 degrees apart. With small sizes, round washers are used on either side of the leather rings, but with the large sizes keystone washers are employed, these better distributing the strain upon the leather.

Most makers use these couplings between the gearset and the differential, either one or two as may be believed necessary. In the Stewart 1500-pound wagon they are utilized between the clutch and gearset, the accompanying illustration indicating the manner of installation.

Among the special fittings brought to the attention of the public recently, is the engine operated winch shown herewith. The machine in question was designed for the transportation of laundry machinery of considerable weight, such as would need the services of an extra crew of men to handle.

The winch is simple, consisting of a cross shaft with a drum at either end, outside of the driver's seat. This shaft is connected with the transmission gearset and so coupled that it can be operated in either direction, control being by two pedals.

Two skids are carried in recesses in the deck of the body, these being arranged to be drawn out and placed at any convenient angle. The machinery is drawn into and lowered from the body on the skid, and with rope attached to it the freight can be handled quickly and without difficulty by the power of the engine, the rope being carried over sheaves directly back of each drum.

Aside from the pedals, the sheaves and the drums, no evidences of the equipment appear. From four to six men would be necessary to handle the freight usually carried by this truck.

ADDS SPECIAL LINE.

Cadillac Motor Car Company Producing Several New Body Installations.

Announcement is made by the Cadillac Motor Car Company, Detroit, that it is placing in the market a chassis of 134 inches wheelbase, to which several new body installations will be fitted. These include patrol wagons, ambulances, undertaker's wagons, fire apparatus and hotel

Daimler Flexible Leather Coupling Between Clutch and Gearset on Stewart Machine, and Engine Operated Winch on Special Atterbury Chassis.

and livery 'buses and others of similar character.

The 'bus may be had with capacity for 10 persons, and the body may be either open or closed. The undertaker's wagon may be used as a combination hearse and casket wagon. And, in addition to the vehicles listed above, it is possible to secure light delivery wagons with screen sides or with enclosed bodies for small package delivery, etc.

William Besserlich, designer of the Four Wheel Drive truck and one of the founders of the Four Wheel Drive Auto Company, Clintonville, Wis., has disposed of his interest in that concern, and it is understood that he is negotiating with Pacific Coast capital for the establishment of another company somewhere in the State of California.

HINTS ON CARRYING SMALL PARTS.

MANY motorists, especially those owning cars which have seen considerable service, make it a practise to carry an assortment of bolts, nuts, cotter pins, etc. The methodical automobilist places these in separate containers, but some jumble the supplies indiscriminately in the tool box.

Even when carried in small boxes there is opportunity for the covers to work loose, spilling the material. A handy container for nuts, bolts, etc., is to take a screw cap box, such as is utilized to mail bottles and cans containing liquids. These can be obtained easily and by using the small sizes the different articles can be compactly carried. Generally the containers are lined with cardboard or similar material, preventing rattling.

A very handy spark plug carrier can be manufactured with the screw cap boxes. Select a box large enough to carry three or four plugs and divide it into compartments, arranging these so that the plugs will fit snugly. Patches and cement, and a number of other supplies can be stored in these containers and by equipping them with labels the desired material is quickly located.

CLEANING RADIATORS.

The Northwestern Chemical Company, Marietta, O., maker of Se-Ment-Ol, Carbonox, etc., makes the following suggestion for cleaning radiators:

Whenever soda is used to clean out a radiator in which calcium chloride has been used as an anti-freezing solution, the soda reacts with the chloride, forming sodium chloride or common table salt. This new formation is liable to harden and create trouble. Therefore, when using the soda solution it should be employed hot.

A practical and efficient method of cleaning a radiator, one that will remove all sediments, etc., without damaging the cooler, is to insert live steam into it, but the petcocks at the bottom of the radiator must be left open, else the fins will be subjected to an undesirable pressure.

ADJUSTING COILS.

A well designed induction coil should not draw more than .25 or .5 ampere to each cylinder with the motor running, and if the cylinders

miss with this adjustment, decrease the gap of the spark plug, provided, however, it is larger than that recommended for the system. In adjusting the vibrators it should be borne in mind that half a turn generally increases the current required from one-third to 1.5 amperes, considerably in excess of that needed to operate the coil efficiently. Keep the contact points clean and true and if economy be desired, adjust lightly or use an ammeter.

CURING SQUEAKS.

A body squeak is generally caused by it moving on the frame and the usual practise is to use oil to reduce the friction. A better method is to make a thin paste of Dixon's motor graphite and gasoline and apply it to the parts by means of a squirt gun or a feather. The gasoline will evaporate, leaving the graphite between the surfaces, and it is stated that this treatment will permanently cure the trouble.

AIR VENT IN CARBURETOR.

The air vent in the bowl of the carburetor should be kept free, as it is utilized to equalize the pressure between the fuel in the float chamber and the atmosphere. If the opening becomes clogged a vacuum will be created.

WATER JACKETED CARBURETORS.

The use of the hot water jackets of the carburetors is not necessary in warm weather, although some contend that the heat assists in the vaporization of the fuel.

LEAKING DIFFERENTIAL.

Announcement is made by the Dixon Crucible Company of the perfection of a lubricant for differential housings, one that will not leak out. It is a mineral oil product and contains no fats or tallow.

SUBSTITUTE FUNNEL.

If in need of a funnel while on the road, etc., and one is not obtainable, the bulb type of horn may be utilized. Remove the tube and reed before using.

NEW GARAGE LAW IN MASSACHUSETTS.

MOTORISTS and garage proprietors will be interested in the new garage law recently enacted by the Massachusetts legislature, portions of which went into effect May 15, and the remainder of which will go into effect Oct. 1. It would appear that the new statute would have an important bearing on all garages, public or private, hereafter to be constructed, and on all garages housing more than four machines now in existence.

The requirements for new garages, constructed after May 15, specify what locations are permissible and how near the various sizes of garages may be to other buildings. The following are the most important construction requirements:

Section 15—In any case where a building is divided by an unpierced fire wall from the foundation to one foot above the roof, each portion of such structure so separated shall be considered a building.

Section 16—All stairways or elevator wells and all air or light shafts in a garage shall be enclosed in fire resisting walls or partitions; and all elevator and stairway openings shall be protected with standard automatic closing fire doors, which shall be kept closed except when the openings are being used; except as otherwise provided in (c) of section 26.

Section 17—Wireglass in windows or skylights of garages shall not be less than one-quarter of an inch in thickness, with wire mesh not more than seven-eighths of an inch and wire not smaller than No. 24 B. & S. gauge.

Section 18—All skylights in a garage, located within 20 feet of any building of greater height than such garage, shall be of wireglass, with metal sashes and frames.

Section 19—No pit shall be allowed in the floor of any garage.

Section 20—All basements used for the storage of motor vehicles shall have one or more independent exits therefrom direct to the outside air, for use in case of fire.

Section 22—Except as otherwise provided by statute, no building or part thereof, inside of the fire limits of any city or town, shall hereafter be converted into a garage and used as such, unless such building or part thereof shall be of fireproof construction throughout, and no building or part thereof hereafter converted to such purpose outside the fire limits of cities and towns shall be used as a garage unless made fire resisting by covering the walls on the interior and the ceiling of such garage with metal lathe and hard plaster not less than three-quarters of an inch in thickness; such garages shall have cement concrete floors and shall otherwise be in accordance with these regulations.

That portion of the law which will go into effect Oct. 1 applies to buildings used as garages previous to May 15, and reads as follows:

Section 26—On or before Oct. 1, 1914, all existing buildings or other structures in any city or town used as garages, with capacity for housing more than four motor vehicles, shall be made to comply with the following requirements:

(a) The floor of the first story shall be covered with cement concrete not less than three inches in thickness.

(b) All first-story ceilings of garages that are more than one story in height, if constructed of combustible material, shall be covered with metal lathe and hard plaster not less than three-quarters of an inch in thickness.

(c) All stairways and elevator wells leading upward from the first story shall be enclosed in partitions covered with metal lathe and hard plaster not less than three-quarters of an inch in thickness, or sheet steel well lapped and securely nailed, or with some other fire resisting material.

(d) All doorways in said partitions to be fitted with iron frames and standard automatic closing fire doors.

(e) All windows in exterior walls, which expose dwelling houses, hotels, mills, factories, or places of public assembly within 20 feet, shall be fitted with wireglass and metal sashes and frames, or closed up solid with fireproof material.

(f) If the chief of the district police, or the official designated by him, so directs, any building of more than two stories in height, having a wooden interior in which a public garage is maintained, shall have a sprinkler system installed throughout the building except in such part as may be separated from the garage by unpierced fire walls and floors.

OFFERS MOTORCYCLE REGIMENT.

Federation of American Motorcyclists Can Furnish Men Within 30 Days.

President Patterson of the Federation of American Motorcyclists has wired the War Department at Washington that that organization can be prepared to place a regiment of motorcycle riders, 1000 men, in the field within 30 days. President Patterson states that nothing would please him more, in case of war, than to take command of such a regiment, and he feels certain that there are many seasoned captains in the organization capable of officering a company of riders.

The plan suggested is that the riders should either be formed into a single regiment, or divided into small companies to be used as dispatch bearers, scouts and patrols. Members of the Kansas Short Grass Touring Club have signified their desire to form a nucleus of this organization, to be supplemented by other F. A. M. riders all over the country.

The Centaur Motor Company of Chicago, agent for the Jeffery line, has adopted a plan of organizing weekly trips to the factory of the Thomas B. Jeffery Company, Kenosha, Wis., in order to give prospective buyers full opportunity to inspect the plant and note the methods employed in the construction of the product.

The Perkins-Campbell Company, Cincinnati, announces that its new Ford specialties and general catalogues are now ready. The former covers leather Ford goods and seat covers and latter lists leather specialties for automobile work.

FEATURES OF RAYFIELD SMALL CAR.

APPLYING the definition of the Cyclecar Manufacturers' National Association, the cyclecar made by the Rayfield Motor Company, Chrisman, Ill., is properly placed in the small car division. Its four-cylinder motor, with 2.75-inch bore and 4.5-inch stroke, has piston displacement of 106.9 cubic inches. The maker's rating is 18 horsepower. The wheelbase is 96 inches and the tread standard, 56 inches. The car weighs 700 pounds, fully equipped.

According to the circular issued by the maker, the Rayfield Motor Company is owned by the Rayfield Manufacturing Company. The concern is somewhat well known in the industry as maker of the Rayfield car, which has taken part in several contests, and which was represented in the international sweepstakes 500-mile

wheels carry 28 by three-inch tires, and the equipment includes Prest-O-Lite tank, gas headlights and rear lamp. A top, windshield and other equipment are supplied as extras.

USES PISTON VALVE MOTOR.

Twin City Cyclecar from Minneapolis Also Presents Other Innovations.

Although the Twombly Car Corporation, New York City, is the first cyclecar maker in this country to announce a machine utilizing a piston valve motor, the product of that concern is properly placed in the light car division, under the ruling of the Cyclecar Manufacturers' National Association. Moreover, the Twombly machines produced this year are utilizing a standard poppet valve motor. It would appear, therefore, that the first true cyclecar car to utilize a piston valve motor is the Twin City, recently announced by the Twin City Cyclecar Company, 804 South Ninth street, Minneapolis, Minn. It possesses other novel features as well.

The Twin City motor is a four-cylinder, air-cooled unit, with bore of 2.5 inches and stroke of 3.5, giving a piston displacement of 68.7 cubic inches. This is rated by the maker at 16 horsepower, but it is stated that it has developed 20 on the block. The operating speed is 2000 revolutions a minute. The piston valves are actuated by a patented mechanism, which is said to be similar to an eccentric movement, but differs in that a longer dwell is permitted when the valves are being opened, and a corresponding quicker movement when they are being closed. This mechanism runs in oil, and no springs, rollers, guides or tappets are used.

The spring suspension is another feature. Two double coil springs of vanadium steel are set crosswise of the frame at the front, while two others of the same size and shape run lengthwise of the frame at the rear.

The transmission is friction, and drive by single chain inside the frame. Wire wheels are used, carrying 28 by three-inch tires. The wheelbase is 101 inches, and the tread 36. The two passengers are seated side by side.

Rayfield Small Car, Designed by Men Responsible for Rayfield Carburetor.

race on Indianapolis speedway Memorial Day.

The designers of the Rayfield small car are William and John Rayfield, who first designed the famous Rayfield carburetor. They became interested in cyclecars in September, 1912, and their first machine was equipped with a motor-cycle engine, planetary transmission, V belt drive, etc. The present model is said to have been the result of long experimentation, and to be the first constructed with a four-cylinder, water-cooled motor.

Ignition is by Mea magneto and the carburetor was designed by the Rayfields. Lubrication is by constant level splash, maintained by means of a rotary pump. The sliding gear transmission affords two speeds forward and reverse, and drive is by shaft to a bevel gear rear axle. The springs are of the cross type, and are held to be unusually long so as to give extremely easy riding qualities. The two passengers are seated side by side with the driver at the left. The wire

SUGGESTIONS FOR THE NEW CAR OWNER.

Value of a Practical Knowledge of the Components of the Chassis--The Four-Cycle Motor Defined with Special Reference to the Model T Ford.

The second installment of the serial on the construction, operation, care and repair of the model T Ford deals with the strokes of the four-cycle motor, and the explanation of its operation will be of value to all new owners not familiar with the internal combustion engine, in that the principle involved is similar in all four-cylinder, four-cycle, poppet types.

AFTER the new owner has driven his car sufficiently to become familiar with its operation, it is not unlikely that he will be the recipient of considerable gratuitous advice from his friends as to its care and maintenance. It is very possible that these suggestions will not correspond with those given by the maker in the instruction book, which should be followed in preference to all others, as the manufacturer is best informed. Experimentation with the mechanism of the car is apt to be costly and the design cannot be improved upon by the novice.

Principles Involved.

While the instruction book gives directions, in the opinion of the writer, they do not deal sufficiently with the principles involved. The information obtained from a continuous study of the book must be memorized to be useful and it is a difficult task to remember the numerous instructions. It is obvious that the owner depending upon this book to extricate him from troubles experienced on the road will be involved in difficulties without the book to consult, and naturally must rely upon a passing motorist for assistance. Particular reference is made to the correction of minor troubles experienced with the ignition or fuel supply system, both of which should be thoroughly mastered.

A practical knowledge of the location, function and operation of each component of the chassis is not difficult to acquire and this, coupled with experience, will enable the owner to undertake long trips over all kinds of roads with confidence that he will be able to complete any ordinary repair.

Units of Chassis.

It is the intention of the writer to take up in logical sequence each component of the chassis, to describe its construction and operation, and to explain its relation to other members of the same group of units. As the chassis is composed of a large number of distinct units,

each of which is necessary to the proper operation of the whole, to clearly define this assembly, it will be divided into groups as follows: The motor itself, fuel supply system, ignition, lubrication, cooling, clutch, variable speed gearing, method of drive, rear and front axles, steering gear, springs, road wheels, frame and tires. For the particular benefit of the new owner and those contemplating the purchase of the car, the groups above referred to will be briefly explained.

Groups Defined.

The motor is an internal combustion engine, frequently referred to as a hydrocarbon engine. Its energy or power is derived from the explosion or burning of the mixture, which is composed of the vapor of gasoline mingled with air.

The ignition system is an electrical equipment which is productive of a spark in the cylinders of the motor, igniting the explosive vapor and at the predetermined instant. Means are also included for obtaining a high-tension current from a low-tension source of supply.

The fuel supply system includes a tank or container for carrying the gasoline, a device termed a carburetor, which mixes certain proportions of the fuel and air, and means for conveying this mixture to the cylinders.

Lubrication involves a supply of oil or grease to all parts subject to friction or wear, these including the components of the motor, transmission, rear axle, steering gear, etc.

Function of Clutch.

The clutch is a device which enables the operator to interrupt the energy of the motor, or in other words, the engine can be started and run without its power impelling the car. It serves several other purposes, among which is that of permitting the machine to be started without imposing undue stresses upon the driving mechanism. The variable speed gearing, also called the transmission, permits of a reduction of car speed without necessarily decreasing that of the motor. This is essential in addition to the usual gear reduction between the motor and the road wheels for, as will be explained later, the energy of the engine is developed by the number of revolutions of the crankshaft; that is, when the

latter is revolving slowly the power transmitted to the driving wheels is not as great as when the motor is turning at its maximum. The variable speed gearing is necessary for surmounting steep grades and where considerable resistance is encountered. It also provides means for reversing, or driving the car backward, as the crankshaft of the motor always rotates in the same direction when it is operating.

Rear Axle Assembly.

Under the head of the rear axle are included the differential, driving axles, brakes, springs, etc. The differential or equalizing gears, permit of turning corners. The driving axles transmit the power from the differential to the road wheels, and the two sets of brakes are utilized to

after it is ignited and a pressure is obtained that is turned into mechanical energy by mechanism. This energy is derived because the explosive mixture is confined or compressed, and when ignited the gases seek the path of the least resistance. This expansion or pressure is termed the firing or impulse stroke.

Elements of Motor.

The internal combustion engine consists primarily of a cylinder, a piston, a crankshaft and a rod connecting the piston to the crank of the shaft, as will be noted by reference to Fig. 2, which is a phantom view of the model T Ford motor published by courtesy of the maker. The cylinder is machined smooth and fitted in it is the piston which is provided with rings, utilized

Fig. 2—Longitudinal, Phantom View of Model T Ford Motor, Showing the Location and General Arrangement of Its Components.

check or stop the movement of the machine.

The steering gear and its linkage enables the driver to control the movement of the front road wheels and the direction of the car. The springs are utilized to absorb road shocks, thereby protecting the mechanism from undesirable stresses. They also contribute to the comfort of the passengers and their construction has an important bearing upon the life of the tires.

Components of Motor.

Troubles of the gasoline motor are quickly located and remedied if one is familiar with its principles. The internal combustion motor is a form of heat engine because its power is derived from the burning of a gas vapor, which expands

to prevent leakages between the cylinder walls and the piston.

Operation of Motor.

Within the piston is mounted a wristpin on which the upper end of the connecting rod oscillates. The other or large end of the connecting rod is attached to the crankshaft, which in turn is secured to the flywheel. The operation of the crank and connecting rod is best understood by comparing its action with that of a grindstone actuated by the foot. The piston may be compared to the treadle, the connecting rod to the member attached to the treadle and crank, and the flywheel to the grindstone. The last named revolves because the crank is off

centre relative to the centre supporting shaft of the stone.

The object of the flywheel is to equalize the rotation of the crankshaft by storing up the force of energy, or the impulses, and giving it out again during the exhaust, intake and compression strokes. Were it not for the flywheel the motor would be driving the machine on each impulse stroke, and the car driving the engine at other times.

Power or Impulse Stroke.

Referring again to Fig. 2, it will be noted that a combustion chamber is formed by the piston, cylinder head and walls. If a combustible charge be placed in this space and exploded, the only member that can move will be the piston, which will be forced downward by the pressure of the expanding gases. As the piston descends it imparts a motion to the crankshaft through the medium of the connecting rod, and as this member is hinged at the ends and free to oscillate as the crankshaft revolves, the piston will be carried back again, when it reaches the lower end of its downward journey, by the momentum of the flywheel.

As the piston moves upward the burnt gases are expelled through an outlet, and the entire burnt charge is forced out when the piston completes its up-stroke. If another charge be introduced into the combustion chamber, and ignited, the power stroke will be repeated and the crankshaft will continue to revolve so long as the power impulses on the piston are continued.

Function of Valves.

Each cylinder is provided with two mechanically operated valves, an intake and an exhaust. The intake permits the mixture to pass into the cylinder during the suction or intake stroke, being opened and remaining so for a predetermined period of the stroke. It is closed during the succeeding or compression stroke, impulse and exhaust strokes.

The exhaust valve allows the burnt charge to escape at the proper time and after the useful energy of the explosion has been utilized. It is open, as is the intake valve, but one of the four strokes. Both valves are normally kept seated or closed by the tension of the valve springs, and are lifted or opened by the revolving cam, which actuates a pushrod and the valve stem. These components are clearly shown in the illustration and a little study will make clear their construction.

The motor has a cycle or series of four operations consisting of: First, suction (intake); second, compression; third, expansion (firing);

fourth, exhaust. They are accomplished in two revolutions of the crankshaft, corresponding to two downward and two upward strokes of the piston. As will be noted by Fig. 2, two pistons are up when the other two are down, and this and the number of revolutions necessary to obtain a power stroke should be well understood by the novice if he is to master valve timing.

EMPIRE 31 OILING SYSTEM.

The work of replenishing the supply of lubricant in the crankcase of a motor should not be hurriedly performed and the suggestions of the maker as to cleaning the oil reservoir and filter or screen should be complied with. The Empire Automobile Company, Indianapolis, Ind., maker of the Empire model 31, gives the new owner some good advice in this respect.

The system utilized for lubricating the motor

Components of Oiling System of Model 31 Empire.

is of the constant level splash, the oil being drawn from the reservoir in the lower crankcase by a plunger pump. The lubricant is screened before passing to the suction pipe, dash sight feed and bearings, and it is advisable to remove this screen and clean it.

When the float gauge indicates a supply of oil and the dash gauge does not show any lubricant dropping, the screen should be removed and inspected. Clean with gasoline but do not wipe with a cloth, as it may contain lint, which will clog the mesh.

Occasionally run a wire through the opening of the petcock, which is utilized to indicate when the proper oil level is obtained in replenishing. The float gauge is employed to denote the supply on hand when the level is below that indicated by the petcock. The contents of the crankcase are emptied by displacing a drain plug shown in the accompanying illustration.

COLORADO-TEXAS GOOD ROADS TOUR.

DURING the past two years, the people of the Southwest have been decidedly active in the construction of improved highways, and this applies particularly to the district represented by Colorado Springs, Pueblo and Manitou in Colorado. Recently, 32 members of the chambers of commerce in these three cities formed a party of tourists, intent upon preaching the gospel of good roads, over a route which hereafter is to be known as the Colorado-to-the-Gulf highway.

The tour was planned, and carried out in part, as a sociability run and to encourage the greater development of the main highways of the South-

west have been voted for improvement. Throughout Texas, Oklahoma and Kansas there is a growing sentiment in favor of good roads, and this sentiment is finding expression in the building of splendid highways.

Details of the Trip.

The party left the Garden of the Gods May 6, going by way of Walsenburg and Trinidad, across the Raton pass into Raton, N. M. Because of recent snows and rains on the pass, some difficulty was experienced the first day, but Clayton, N. M., was made the night stop. It was found that under normal conditions the roads throughout this portion of New Mexico would

be good. At Texline the party entered Texas, and for the next 16 days the tour was entirely within that state.

Because the Canadian river had washed away the bridge, the Amarillo Chamber of Commerce arranged for the shipment of the cars from Dalhart to Amarillo, and the next morning found the tourists ready to resume their trip. Through the Panhandle country splendid roads were encountered, as well as constant evidences of recent activity and road development. Everywhere there was keen interest in the Colorado-to-the-Gulf highway, and a determination to make this a completely graded and developed route.

At Dallas, it was decided to change the original itinerary, go-

ing directly to Galveston. During this portion of the trip weather conditions were most favorable, but on the first day of the homeward journey, with the cars headed from Houston to San Antonio, heavy rains were encountered. Although the Coloradoans battled for three days against almost unprecedented flood conditions, they finally were forced to ship their cars home from Louise. Members of the party desire it distinctly understood that floods and not poor roads caused this change in plan. In fact, it is stated that had they been able to reach Wharton even a few hours prior to their actual arrival, it is highly probable they would have visited Victoria and San Antonio with little difficulty.

Governor O. B. Colquitt officially received the

Colorado-Texas Tourists Leaving the Garden of the Gods, Near Colorado Springs.

west connecting the states of Colorado, New Mexico, Texas, Oklahoma and Kansas. Among the results were those of bringing the people of Colorado into closer acquaintance with those of the other commonwealths and of demonstrating not only the feasibility, but the pleasures of touring over the roads which are being developed rapidly in that section of the United States.

Found Road Conditions Good.

Road conditions, on the whole, were found to be good, and, considering the fact that the party followed, during the entire trip, the heaviest rains the Southwest has experienced in years, they were surprisingly good. Some poor ways were encountered, but the encouraging feature is that in most cases where these now exist work has either already been started or bonds

One of the Good Roads Typical of the Panhandle Division of Texas.

visitors at Austin, and expressed to E. J. Eaton, official representative of Governor E. M. Ammons of Colorado, his interest in the mission of the party, Texas' keen activity in good road development, and its desire to co-operate with Colorado in every way possible.

In Oklahoma and Kansas.

The return trip through Oklahoma and Kansas followed closely the original itinerary, although made by train instead of by automobile. Great interest was expressed all along the line in the mission of the trip. In Oklahoma the recent organization of the Oklahoma, Texas and Gulf Highway Association has given an impetus to road development, and it was found that in practically every county special efforts had been made to bring the roads to the best possible condition in anticipation of this tour. For this reason members of the party regretted exceedingly that they were unable to make this portion of the trip in their cars, but they were shown pieces of road at various points, which were an indication of the activity in progress.

Kansas, too, was found to be alive to good roads, many of which it already has. The Santa Fe trail, over which the return was mapped out, is a well graded and improved highway, and, while the travellers did not have opportunity to ride over any portions, glimpses of it from the train windows, both in Kansas and Colorado, indicated that it already is a splendid highway, with much improvement provided for this coming year.

After the party was compelled to take to the train, it was given several opportunities to travel over sections of highways. The Denison Chamber of Commerce and the Automobile Club of Denison escorted the party over a long portion

of the original itinerary, as did the people in Wynnewood and Pauls Valley. The Oklahoma City Chamber of Commerce signalized the completion of a 20-mile stretch of fine dirt road between that city and Edmund, by forming an automobile party for this portion of the journey. The Arkansas City Commercial Club piloted the visitors over the rock road between that town and Winfield, Kan.

Despite the failure of the original plan, the tour was beneficial in every way, particularly in arousing enthusiasm in improved roads, both among those who took part therein and those with whom they came in contact en route.

WINS HIGHWAY CAMPAIGN.

Road Association in St. Joseph County, Indiana, Carries Local Election.

M. L. Williams, secretary of the Lincoln Highway Association of St. Joseph county, Indiana, writes that that organization was successful in its campaign to carry the road election held by the county commissioners May 28. The result was a big majority for a plan involving the laying of a centre strip of concrete 18 feet wide, backed up by six feet of gravel on each side, across St. Joseph county, which is expected to be completed this year.

This will close up one of the worst pieces of highway in the state, between South Bend and New Carlisle, a section with which many motorists are familiar. When the plans and specifications shall have been carried out tourists will be assured of 26 miles of road that is second to none.

In the Oil Field District at Electra, Tex., on the Colorado-Texas Tour.

ELECTRICAL TOOLS AND EQUIPMENT.

Various Types of Portable Drills, Grinders, Etc., Capable of Completing a Wide Variety of Work at a Minimum of Expense.

THE practise of electrifying the repair shop and garage is becoming more general, and this is more specially noticeable in the tool equipment. The convenience of electrically operated machines appeals to the mechanic, and their use in many instances is a benefit to the customer, as considerable time is saved over the manually operated equipment. Where the drill, grinder, etc., are to be used occasionally, it is obvious that electric power results in economy in operation.

Portable Electric Drill Press.

PORTABLE DRILL PRESS.

Among the electrically operated tools is the portable drill press marketed by F. W. Lieberknecht & Co., Brookline, Mass. It can be placed on the floor, bench or directly upon the work to be drilled, and current supply is taken through the usual cord and lamp socket arrangement. It is held to be absolutely sensitive to a No. 70 drill, and its sensitivity can be adjusted by a spiral spring. Means are also provided for compensating for wear of the rack and pinion. Among other advantages claimed for the drill are the following: Platen will turn about its centre and about the upright column; depth of hole can be adjusted by a micrometer screw, which is not shown in the illustration; and drill press can be set directly on work for drilling vertical holes.

The specifications are as follows: Maximum diameter of drill, .375 inch; diameter of platen, 6.5 inches; maximum distance from chuck to platen, eight inches; face of driving pulleys, .75 inch; weight, 45 pounds; motor, .125 horsepower, alternating or direct current.

The same company is marketing a portable type of electric saw table shown in an accompanying illustration. It is held to be very efficient and economical of current, and to be well

constructed. The dimensions of the table are 12 by 14 inches. Its height is 12 inches and the maximum diameter of the saw is six inches. The tension of the belt is secured by the weight of the motor, which is either an alternating or direct current. A switch, plug and 10 feet of cord are supplied with each equipment, details and price of which will be supplied upon request.

CINCINNATI BENCH DRILL.

The Cincinnati Electric Tool Company, Cincinnati, O., is manufacturing a line of electric drills, and at Fig. 3 is shown the No. 0 combination sensitive bench drilling stand with a portable type of hand drill. The latter can be utilized independently of the stand, or as a sensitive bench drill, providing two tools in one. The hand drill is locked or released in a bracket, by means of thumb nuts. This tool is designed particularly for shops where both bench and outside drilling is to be done.

The stand is made to hold portable hand drills of .25, .375 and .5 inch capacities, and the drill bracket with drill can be set at any point on the column, and raised or lowered as desired. The weight of the drill and the bracket is counterbalanced by means of a spring on the column, and the drill is maintained in vertical alignment by means of a key on the bracket and keyway in the column. The depth of the hole to be drilled is regulated by a stop at the rear of the column. The lever feed is provided with a quick return.

Lieberknecht Portable Electric Saw Table.

The height of the column is 30 inches and the distance from base to drill chuck is 14 inches when the bracket is set at its highest point. The distance from column to centre of table is five inches and the diameter of the latter is eight inches. The base dimensions are nine by 11 inches. The weight of the stand is 60 pounds. Larger stands are made with lever or hand feed wheel, to carry portable drills of .75, .875 and 1.25 inches capacity. The capacity of the drills is from .25 to .5-inch steel, according to the type. Complete details and prices will be supplied upon request.

STANDARD PORTABLE DRILL.

The Standard Electric Tool Company, Cincinnati, O., is marketing a line of high power universal portable electric drills, one of which is shown here-

Cincinnati Bench Drill.

low frequency circuits, 60 cycles or less.

The Standard drills are built on the unit plan, consisting of five units, and can be easily disassembled. All armature spindles run on enclosed ball bearings and thrust is cared for by ball bearings. The motors are of the series commutating type, gears of high grade hardened steel, and the make and break type of switch is located in the handle. Special attention has been paid to cooling and they are guaranteed not to heat under severe and continuous service. Extremely high power is emphasized in the design. In tests of the drill it has been demonstrated that it requires but one minute and 26 seconds to drill a .5-inch hole through two inches of steel.

Nine types are manufactured, these having a drilling capacity ranging from .25 to 1.25 inches

of steel. The reaming capacity varies up to .6875 inch. Spade handles are supplied with four types and feed screw or spade with five. The last named come equipped with No. 2 and No. 3

Morse taper socket, and breast plates are furnished when specified.

Each drill has variable speed, which regulates automatically up to its maximum capacity, and there is no racing. Standard tools will operate on all, no change in winding being necessary, only the voltage must be the same in each instance. They will also operate off any one phase of two or three-phase circuits of the same voltage, thus enabling alternating current power circuit connection where this is desirable. Each drill is carefully tested before shipment. The company issues a booklet giving details and prices, which will be mailed free upon request.

ELECTRIC GRINDERS.

The Standard Electric Tool Company also manufactures a number of high power, ball bearing portable electric grinders. Types 3B, 6B, 2Ba and 3Ba are similar in construction and one of these is shown in an accompanying illustration. They are constructed to be operated on alternating or direct current and are particularly adapted for grinding small tools, etc.

Standard Bench Grinder.

Standard Portable Electric Drill.

COLE'S NEW PLANT FORMALLY OPENED.

ONE of the important features of the week, in connection with the 500-mile race in Indianapolis, was the official opening of the new

hundred and eighty-three 60-watt lamps are used to light the building, and in this connection it may be added that the factory could be operated 24 hours a day without impairing the service, insofar as light is concerned. Fourteen-inch reflectors are equally spaced so that no shadow will be cast, making ideal working conditions.

General View of the New Building of the Cole Motor Car Company, as Seen from Market and Davidson Streets.

factory building of the Cole Motor Car Company, which had been under construction for nearly a year. This latest addition is 100 feet wide on the East Washington street side, 376 feet deep from East Washington to Market street, and has 132 feet frontage on Market street. Accompanying illustrations give some idea of its extent.

Over 500 tons of steel were used in the construction of the plant, and 13,000 tons of concrete. There are 15,814 panes of prism glass in the fenestra sash, exclusive of the offices. Placed end to end these would reach 4.5 miles. If the columns of the building were placed in the same manner they would extend 4676 feet into the air. The smoke stack rises 113 feet from its foundation and is one of the largest in the city. Nine

The floors throughout are of concrete. The latest type of construction is used in the employee's lockers, and rest rooms, modern plumbing, steel clothes lockers, sanitary drinking fountains and plenty of ventilation all supersede the old type of factory, with workmen's coats

hanging on a nail any place that happens to be convenient. Fireproof vaults provide spacious storerooms for each department's archives.

Many Cole owners and dealers were present when President J. J. Cole received the keys and opened the new structure. To these he made it plain that the factory and methods of the company always would be open to the public, to the end that owners and prospective purchasers might be in a position to acquaint themselves fully with the production of what has come to be known as the Standardized Cole. "We are proud of our new place", said he, "and the co-operation of the public. By this, I mean the general public all over the country. I feel sure that we will not only increase our production, but go steadily on building a good car at the right price".

Looking Down the Main Floor of the New Cole Building, Before the Machinery Had Been Installed.

SIoux CITY'S 300-MILE RACE IS NEXT.

WHILE there will be no opportunity for American manufacturers to regain the honors taken from them at the international sweepstakes 500-mile race until next Memorial Day, now that that event has been held interest is being centred in the 300-mile contest at Sioux City, Ia., July 4. It is as yet too early to give a list of entrants, but E. R. Schultz, manager of the Sioux City Motor Speedway Association, has been assured by W. F. Bradley, foreign racing representative, that many of the European machines will remain in this country to compete for the \$25,000 which the Sioux City Automobile Club, assisted by the business men of that city, has posted for the coming event.

Not all of the foreign drivers can be expected to take part, since some of them are entered for the international Grand Prix in France, which is scheduled for July 4. Delage, Peugeot and Sunbeam cars are also entered for the Grand Prix, but this does not mean that those machines which competed on the Indianapolis track will not remain in this country. It is understood that Christiaens' Excelsior and Friedrich's Bugatti already have been entered for the Sioux City race, and that there is a strong possibility that these men will drive them.

The situation thus presented is decidedly promising to those who are seeking another opportunity to test the relative merits of American and foreign built machines. The conditions under which the Sioux City event will be run are somewhat different than those obtaining on the Indianapolis speedway. The new track is a dirt course, of a character which packs well when oiled and rolled, and it is pointed out that foreign and American drivers would be on an equal footing with respect to knowledge of the track, since the race meet scheduled for June 30-July 4 is the first to be held thereon. The Indianapolis oval is paved with brick.

To carry this line of conjecture one step further: It may be suggested that if the foreign cars finishing at the head of the list Memorial Day were to be entered for the Independence Day contest, and these were to be manned by other drivers, there would be opportunity to judge whether the foreign machines really were so much faster than American cars, or whether it did not depend somewhat upon the man at the wheel. For this reason, if for no other, there is a strong desire to see the six countries represent-

ed in the 500-mile race again pitted against each other in the forthcoming event.

LOS ANGELES-PRESCOTT RACE.

An Effort Is Being Made to Establish a New Annual Event on the Coast.

Prescott, Ariz., is to hold a Frontier Day's celebration July 3-6, and the Prescott Automobile Club has sought the assistance of racing promoters in Los Angeles in arranging for a Los Angeles-Prescott road race during that week. It is more than probable that the contest will be held and that it will be made an annual event.

The distance between the two cities is about 320 miles, and it is proposed to hold the race under similar regulations to those governing the annual Los Angeles-Phoenix race, which usually takes place in November. There will be one difference, however. The roads between Los Angeles and Prescott are said to be ideal. And, it is added, the weather conditions in July are such as to preclude all possibility of rain or other disturbances.

The last 44 miles of the course lies over the Prescott Loop, so-called, a stretch of road winding through mountains and valley, that is recognized as one of the fastest in the country. It was built entirely by funds provided by the Prescott Automobile Club. Automobile races will be held over this portion of the course in any event, 10 entries already having been received.

HAYNES FOR RUSSIAN CONTEST.

President of Odessa Automobile Club Will Drive One in Moscow Event.

Announcement already has been made in these columns that the Russian Imperial Automobile Club has arranged a cross country reliability run to be held over a course leading from Moscow to Odessa in August. At least one American car will be represented in the event, since the president of the Odessa Automobile Club has purchased a 1914 model Haynes, equipped with electric gearshift and made by the Haynes Automobile Company, Kokomo, Ind., which he will enter and drive in this contest. The Haynes took part in its first competition in 1895, when it won a prize of \$175 in the Chicago Times-Herald race.

AMERICA'S INITIAL CYCLECAR RUN.

WHAT will go down in automobile history as the first American cyclecar run was held under the auspices of the Cyclecar Club of New England, May 30-31, the itinerary being from Boston to Springfield and return. Nine machines took part in the event, the roll of honor, if such it may be termed, reading as follows: E. P. Blake, G. W. Weldon, A. G. Frezoli, W. W. Watson and R. D. Brazeal, Imp; H. R. Bard and R. G. Shaw, Mercury; E. A. McGrath, Dudley Bug, and Arthur P. Young, Trumbull.

These nine and some others, passengers, left the headquarters of the club, Hotel Oxford, Boston, at 9:30 Memorial Day morning, and proceeded to Wellesley, South Framingham, Marlboro and Worcester, where a stop was made for lunch at the Hotel Bancroft. Thence the way led through Leicester, Spencer, Brookfield, Warren and Palmer to Springfield.

This first day's run was without special incident, the roads being exceptionally good over this portion of the trip. Absolutely no trouble was experienced in negotiating the hills. Of course there was plenty of excitement, since this was the first opportunity that had been afforded in many of the towns to view the little machines, and full advantage was taken of this fact. Every time the tourists stopped they were immediately surrounded by a crowd of interested prospective buyers.

After a banquet at the Hotel Kimball the evening was spent in calling the attention of Springfield enthusiasts to the merits of the various products represented, and, Sunday morning, an early start was made up the Connecticut valley, through Holyoke, Northampton and Deerfield to Greenfield, where luncheon was served at the Hotel Wendell. Nothing but good roads was encountered that morning.

Crossing the Connecticut at this point the little machines made their way to Athol, some portions of the trip affording abundant opportunity to test their hill climbing ability. The way to Gardner was over a splendid new piece of macadam, and it was 5 in the afternoon when the party stopped in Pittsfield for dinner. Here the owner of a Rocket machine joined the tourists for some little distance, the route lying through Lunenburg, Ayer and Harvard to Concord. Inasmuch as some members of the party lived in Lawrence, the tour officially came to an end in that city, although the Boston members re-

turned to the Hub by way of Lexington and Arlington.

The affair was a decided success, both as a demonstration of the roadability of the machines and as affording a splendid opportunity to call the attention of the public to them. Immediately after the return to Boston the board of directors of the club decided to hold a series of such events. The next run will be held the latter part of June, going north and east from Boston, while another is being arranged to go toward the south shortly thereafter.

TIRES BURST RIMS.

Some Remarkable Results in Tests Conducted by Goodyear Tire & Rubber Company.

One of the mechanical marvels of the age is the pneumatic tire, according to officials of the Goodyear Tire & Rubber Company, Akron, O., which has been conducting a series of tests during the past six months to determine rim strength. These experiments were made for the Society of Automobile Engineers, and practically every type of rim, clincher and straight side, was used.

The method consisted in taking Goodyear tires out of stock, putting them on rims to be tested and forcing air into the tires until something gave way. The rims, of course, were not mounted and were not reinforced by wheels. It is significant that not a single tire gave way.

The tests were severe. Some tires were inflated to 400 pounds to the square inch before the rim reached the limit of endurance and collapsed suddenly. It is stated that actual figure 8's were made of sturdy steel, and that in many cases the same Goodyear tire was used for a number of tests, breaking one rim after another—some tires being used as high as 14 times.

The office of the H. W. Johns-Manville Company in Duluth, Minn., has been removed to larger quarters at 327 West First street, the change being necessary in order to take care of the increased business. The new office is located on the ground floor, with ample opportunity for the display of automobile accessories and other products of the company, the headquarters for which are at Madison avenue and 41st street, New York City.

BAILEY ELECTRIC MAKES NEW RECORD.

IT WILL be remembered that Col. E. W. M. Bailey, treasurer and general manager of S. R. Bailey & Co., Amesbury, Mass., successfully accomplished a tour from Boston to Chicago in October, 1913, utilizing a Bailey electric roadster, made by that concern. This make of machine has several distance records to its credit, but it is maintained in addition that it is the first electric car to go over the road from Boston to New York City in 24 hours.

This latest record was established May 14-15, the car leaving Boston at 4:12 in the morning of the 14th and arriving in New York City at 3:21 the next morning. A detailed statement of the run is to be found in an accompanying table, which shows that the total mileage was 247.8, this being covered in an elapsed time of 23:09:00, and a running time of 10:52:00.

On the Chicago trip the daily mileage ran as high as 173.5, between Syracuse and Buffalo, N. Y., while on its first day out the car covered the 161 miles between Boston and New Haven. It may be stated, however, that on that trip no attempt was made to set up a daily record, since the main object was to demonstrate that an electric could be utilized to advantage for long distance touring.

The car used in the most recent journey was a stock Bailey electric roadster, equipped with 60 cells of A-5 Edison battery, made by the Edison Storage Battery Company, Orange, N. J. Current was charged into the battery at convenient points along the way when stopping for meals and for rest. The company holds that the average speed of 22.8 miles an hour compares very favorably with that of gasoline machines.

GLIDDEN TOUR ENTRIES.

Latest Details of the Plan for the Reliability Run and New Hampshire Outing.

Highway commissioners from the six New England states will be present at the midsummer outing of the American Automobile Association, at Bethlehem, in the White mountains of New Hampshire, July 4-6. These are S. Percy Hooker, New Hampshire; W. D. Sohler, Massa-

chusetts; Charles C. Gates, Vermont; Lyman H. Nelson, Maine; Charles J. Bennett, Connecticut, and Robert B. Treat, Rhode Island. In view of this fact, plans have been laid for a good roads convention on the closing day of the outing.

The outing will follow the completion of this year's national reliability tour, more generally known as the Glidden tour, which will be a non-stop event, starting from Chicago, June 29, and ending in Boston, July 2. Entry blanks may be secured by addressing the members of the committee as follows:

Lewis R. Speare, Cambridge, Boston, Mass.; F. X. Mudd, Fisher building, Chicago, Ill.; Charles G. Janus, P. O. Box 1400, Columbus, O.; Laurens Enos, 621 Main street, Buffalo, N. Y.; Robert P. Hooper, Cherry and Juniper streets, Philadelphia, Penn.; Dr. H. M. Rowe, Harlem square, Baltimore, Md.

Entry blanks and information may also be secured from the headquarters of the American

Automobile Association maintained at 437 Fifth avenue, New York City, and in the Riggs building, Washington, D. C.

The K-W Ignition Company, Cleveland, O., states that it has the sole right to apply the words "Road Smoothers" to devices intended to have a shock absorbing action. The road smoothers made by this concern are a combination of helical spring to take up the shock, an air chamber to check the rebound and anti-side motion links to prevent side rocking and consequent skidding in turning corners.

Officials of the Panama-Pacific exposition announce that it has definitely been decided to hold the Vanderbilt Cup race Feb. 22, and the Grand Prize event March 5, 1915.

The Japanese government has decreed that in the future license cards shall be carried on the steering column.

EQUIPMENT, TOOLS, FITTINGS AND SUPPLIES.

WILLIAM J. Bailey, 407 Mulberry street, Newark, N. J., is marketing the Climax grease cup, a cut-away section being shown here-

The Climax Grease Cup.

with to depict the construction. It is of the compression type, and it is stated that the top cannot drop off, even if the cup should be inverted. A slight pressure downward and to the left re-

leases the inner cylinder, enabling easy filling, or the outer cylinder may be supplied if desired. The cylinders are of drawn brass tubing and a close telescoping fit, preventing leakage and the entrance of road dust. The cylinder caps are of heavy brass, hard soldered to the cylinder, and the air vents in both cylinders are so located that renewing the supply of lubricant is very easy. When withdrawing the inner cylinder these air vents prevent suction, as well as the grease coming away with the part. A double ball grip is employed to prevent the plunger turning and wear. The Climax grease cup is produced in standard and special sizes. Prices will be supplied upon request.

STERLING HACKSAW BLADES.

One of the most important and useful of small tools in the garage, repair shop and service station is the hacksaw blade. It is employed to cut metals of all kinds, tubing, pipe, steel, iron, brass, etc., and to obtain satisfactory results it is necessary that a blade be used that will obtain the best general service on all such metals.

It is the opinion of practical hacksaw makers

Sterling Adjustable Hand Hacksaw Frame.

that a medium pitch blade about 24 teeth to the inch, in a 12-inch blade about .625-inch wide, and in an eight-inch blade, .5-inch wide, should give the best general results without the operator continually being obliged to shift the blade in the frame for different classes of work.

The Diamond Saw & Stamping Works, 361 Seventh street, Buffalo, N. Y., specializes in hacksaw blades and frames, and the Sterling trade mark is well and favorably known to the trade. An accompanying illustration shows its adjustable frame, which takes eight, nine, 10, 11 and 12-inch blades. The frames are light, strong in the centre, and can be quickly and easily adjusted to take the blades named. The blade is adjustable to four different angles. The frames come nickelled or polished.

The company also manufactures solid frames for eight, nine, 10, 12 and 14-inch blades. These are constructed of high grade material and are nicely finished. In addition to producing blades for hand frames and of different thickness,

Sterling Hacksaw Blade.

length, width, teeth, etc., the company makes a large variety of blades for power machines. Descriptive matter and prices will be mailed free upon request.

UNI-COIL FORD IGNITION.

The New York Coil Company, 338 Pearl street, New York City, manufacturer of master vibrators and other well known accessories for the model T Ford car, has just placed on the market the Uni-Coil ignition system, which is especially designed to operate on the Ford fly-wheel alternating current magneto.

The system consists of an elevated gear bracket attachment, which is clamped to the end plate of the motor after first removing the regular timer. Bevel gears transmit motion to a vertical shaft running through the bracket upon which is mounted a combined timer and high-tension distributor, or synchronizer, as it is termed. The new system eliminates all of the old wiring with the exception of a single lead, connection being made to only one unit of the coil box. A

cable runs from the distributing part of the apparatus and is connected to the high-tension terminal of the same unit. The timing or circuit

Uni-Coil Ford Ignition System.

operating mechanism within the distributor is almost identical with that employed in regular magnetos.

The maker claims that the system times the spark perfectly and is the first to operate satisfactorily on the flywheel magneto. There is but one adjustment and troubles heretofore experienced with the Ford timer are eliminated. The system is easily cared for. Claims are further made to the effect that the system con-

tains all the desirable features of the high-tension magneto. Instructive literature fully explaining the device in detail will be sent upon request.

ECONOMY WELDING OUTFIT.

The Economy Welding Machine Company, Kansas City, Mo., specializing in welding equipments, is marketing what is known as the Economy Junior outfit. It was designed to meet the demand for the moderately priced high grade equipment, and one of its qualities is the provision made for generating the acetylene gas, a feature that will appeal to those not conveniently located to a source of supply.

As will be noted by the accompanying illustration the outfit is mounted upon a substantial wooden platform, which is 30 by 53 inches and fitted with roller bearing caster wheels. This permits of moving the apparatus in proximity to the work.

The oxygen generator is a steel storage tank, 16 by 48 inches, and the steel wash bottle is eight by 48 inches. All are constructed for 200 pounds working pressure and are tested to 300. The generator is provided with an Economy oxygen relief valve, regulating valve, high and low pressure gauges, stop pressure valves, hose connections, drain cocks, etc. The steel retort is five by 21 inches, fitted with gas or gasoline burners.

The acetylene pressure generator is 18 by 48

inches, oxy-acetylene welded, and tested to 20 pounds working pressure. The carbide hopper has a capacity of 25 pounds, and the carbide is fed by a hand feed of special design.

The balance of the equipment includes the Economy diaphragm relief valve, with gas tight bonnet connecting with relief pipe; regulating valve, flash back preventer, drying and filtering chamber, pressure gauge, hose connections, two-inch drain valve, etc. The torch is the No. 1 style, and has seven welding tips, numbers 1 to 7, and a removable cutting attachment with three tips. The company is issuing a pamphlet on welding which will be mailed free upon addressing the home office.

CINCINNATI BALL JOINTS.

The Cincinnati Ball Crank Company, Oakley, Cincinnati, O., is marketing a ball joint for spark and throttle controls. One of the qualities of the design is the use of an internal spring construction which takes up wear, eliminates noise and prevents backlash or lost motion. It comes completely assembled, 100 to the box.

SLOCOMB MICROMETER.

The J. T. Slocomb Company, 29 Oxford street, Providence, R. I., is manufacturing the Slocomb micrometer, which is constructed to withstand severe service without affecting its accuracy. It is made in all styles and sizes and comes with inch or metric measurements.

Economy Junior Welding Equipment.

CURTISS FLIES ORIGINAL LANGLEY PLANE.

WHILE the Wright brothers are justly credited with being the first persons ever to fly in a heavier-than-air machine, they have at all times acknowledged the debt they owed to the experiments carried out by Prof. Langley of the Smithsonian Institution, who was the first to design a machine of this type that would fly. The Langley biplane, or aerodrome as it was called, fitted with a steam engine, made its first free flight over the Potomac river, Dec. 12, 1896, covering over a mile in the air, but without a passenger. Subsequently, in 1903, at least two attempts were made to fly Langley machines, fitted with an internal combustion engine and carrying a pilot, but in each instance the machine was wrecked while being launched from a catapult on top of a house boat.

The entire aviation industry has freely acknowledged its debt to Prof. Langley, and his name receives highest honors among aviators and designers today, although at the time of his death, and for some years previous, his machine always was referred to as "Langley's Folly". Recently, Dr. Charles D. Walcott, secretary of the Smithsonian Institution, and Dr. A. F. Zahm, recorder of the Langley Aerodynamical Laboratory, conceived a plan for completely vindicating the Langley design—not Langley's memory, for that needs no vindication today.

Glenn H. Curtiss was selected to take charge of the experiment, and the original Langley aerodrome was taken to Hammondsport, N. Y., from the Smithsonian Institution, Washington, where it has been on public view for a number of years. In this machine, May 28, 1914, nearly 18 years after it was first assembled, Glenn H. Curtiss flew over the waters of Lake Keuka, carrying not only the weight originally intended, but an overload of 340 pounds, this extra weight being in the form of pontoons and other fittings to facilitate launching from the surface of the water.

The machine itself was the original Langley aerodrome, the only changes in its construction, aside from the pontoons and launching fittings, being the replacement of a few broken ribs, resurfacing for the wings and one or two new wires. The original gasoline motor was employed, the original propellers and all of the original framework. The result, therefore, is a complete vindication of the principles of design and construction developed and applied by Prof. Langley.

Immediately after the successful termination of the test, Dr. Walcott issued a public statement setting forth the objects of the experiment as follows:

I was well pleased with the launching this morning. Although the machine and pilot weighed 340 pounds more than the machine and pilot of 1903, it rose gracefully from the water on the very first trial, and maintained remarkable stability both in the air and on the water. I assigned to Mr. Curtiss the task of rehabilitating the original machine and of testing it over the water, first, for the purpose of vindicating Dr. Langley's design, and second, to ascertain the practical value of his design in the present state of aviation. It is my hope that succeeding trials will amply justify the good opinion which aeronautical engineers, both here and in Europe, have long entertained of Dr. Langley's design.

The one man more closely in touch with Prof. Langley and his work than any other, unless it may have been Octave Chanute, a Chicago engineer, whose experimental gliders became the forerunners of the first Wright biplanes, was Dr. Alexander Graham Bell, inventor of the telephone. Dr. Bell observed several of Prof. Langley's earlier experiments, including the first actual flight of 1896, and with the latter's permission wrote the reports later published officially by the Smithsonian Institution. Within a few months after Prof. Langley's death, Dr. Bell formed the Aerial Experiment Association, with which were also associated Lieut. Thomas F. Selfridge, U. S. A.; F. W. Baldwin, J. A. D. McCurdy and Glenn H. Curtiss. As a result of the work done by these persons the first Curtiss biplanes were constructed and flown. As soon as Dr. Bell heard of the successful flight of the Langley aerodrome he telegraphed Curtiss as follows:

Congratulations on your successful vindication of Langley's drome. This is the crowning achievement of your career, at least, so far. My best wishes for your continued success.

Already the success of this latest experiment has reawakened interest in the patent litigation, which has been under way between the Wright Company, the present owner of the Wright patents, and Glenn H. Curtiss and others, and which was decided recently in favor of the plaintiff. It was maintained by those interested in the defense that practically all present aeroplanes embodied principles worked out to a successful conclusion by Prof. Langley, before the Wright brothers actually made flight. What effect, if any, this most recent demonstration will have upon reopening the litigation, it is too early to determine.

Tarvia

*Preserves Roads
Prevents Dust—*

This road is three years old—

Roads around New National Museum,
Washington, D. C., Constructed
with "Tarvia X".

HERE is a Tarvia-built road that for three years has carried the heavy traffic of sightseers to the New National Museum in Washington.

Ordinary macadam would have lasted but a few months in this location.

The addition of "Tarvia X" as a binder, when the road was constructed, has been sufficient to keep the surface in splendid condition for three years, with the prospect of very little maintenance expense in the near future.

Tarvia is a dense, viscid coal tar product of

great bonding power. It introduces an element of plasticity in the roadway that binds the stone in a tough matrix. Internal friction under heavy loads is prevented. Water runs off the surface instantly, and the tarviated macadam will not ravel on slopes. The surface is automobile-proof, producing no dust.

Tarviated macadam in the end costs no more than ordinary macadam—its first cost is a little higher, but its maintenance cost is very much lower.

Tarvia is made in three grades: "Tarvia X" is suitable for building Tarvia-macadam roads; "Tarvia A" and "Tarvia B" are thinner grades suitable for roads already in use, to preserve them and make them dustless.

Booklets free on request.

BARRETT MANUFACTURING COMPANY

New York Chicago Philadelphia Boston St. Louis Kansas City Cleveland

Cincinnati Minneapolis Pittsburgh Seattle Birmingham

THE PATERSON MFG. CO., Ltd.: Montreal Toronto Winnipeg Vancouver St. John, N. B. Halifax, N. S. Sydney, N. S.

When Writing to Advertisers, Please Mention The Automobile Journal.

NEWS OF THE MANUFACTURER AND DEALER.

The following concerns have been incorporated recently to manufacture or deal in automobiles, accessories, etc.:

Winslow Automobile Company, Fort Smith, Ark.; \$5500; to deal in automobiles; L. F. Brock, R. N. Winslow, S. L. Williams.

Pike Rubber Company, Akron, O.; \$50,000; to manufacture and deal in rubber goods; O. C. Pike, F. Grether, F. Selzer, V. R. Hardy, E. V. Hammaker.

Blair Auto Supply Company, Blair, Wis.; \$2500; to operate a garage; C. J. Gibson and others.

Lawson-Pratt Sales Company, Boston, Mass.; \$5000; to conduct an automobile business; D. Lawson, R. T. Pratt, E. B. Stanwood.

Tomberg Auto Company, Brooklyn, N. Y.; \$1000; to conduct an automobile business; C. Tomberg, W. P. Finn, S. Barson.

Lomar Motor Car Company, Chicago, Ill.; \$1,000,000; to manufacture automobiles.

Ghezzi Vehicle Fenders Company, New York City; \$10,000; D. Ghezzi, F. Tauro, A. Zerbarini.

Far Rockaway Motor Bus Line, Cedarhurst, N. Y.; \$210,000; G. W. Foran, C. A. Johnson, T. A. McWhinney.

South Side Machine & Auto Company, Clintonville, Wis.; \$15,000; to operate a garage; W. Splittgerber, F. Gerbert, A. Poetter.

Astoria Taxicab Corporation, New York City; \$3000; G. L. Doyle, W. F. Wund, A. V. Kenealy.

Dobbins' Automobile Exchange, Newark, N. J.; \$50,000; H. W. Dobbins, Jr., G. Dobbins, D. C. Dobbins.

Pneumatic Shock Absorber Company, Philadelphia, Penn.; \$100,000; to manufacture automobiles and supplies; F. R. Hansell, George Martin, S. C. Seymour.

Henderson Transportation Company, Watertown, N. Y.; \$5000; to conduct a motor car business; R. W. Butterfield, L. D. Butterfield, J. Nellis.

Gillen-McVean Ambulance Company, Youngstown, O.; \$10,000; to conduct an ambulance and taxicab business; A. F. Gillen, W. V. Gillen, D. McVean, J. I. McVean, F. A. Orseifer.

Auto Tire Corporation, Indianapolis, Ind.; \$25,000; to deal in automobile tires, accessories, etc.; Walter Myers, A. A. Clark, K. W. Gant.

Western Coast Automobile Company, Los Angeles, Cal.; \$75,000; to conduct an automobile business; R. J. McCarthy, R. J. McIntyre, W. T. Sprouls.

Lower Falls Garage Company, Wellesley, Mass.; \$5000; to conduct a garage; D. A. Baldwin, G. R. Williams, N. J. McGaffin.

Croswell Auto Company, Croswell, Mich.; \$5000; to deal in automobiles.

Detroit Air Pump Company, Detroit, Mich.; \$100,000; Alexander F. Sterling Blackwood, David G. Barnett, Emanuel T. Berger.

United Light Company, Cincinnati, O.; \$5000; to deal in electric supplies; W. H. Odell, William R. Divers, Albert D. Alcorn, Grace Divers, Frank A. Cooper.

Chelsea Manufacturing Company, Newark, N. J.; \$100,000; to manufacture motors, engines, etc.; E. R. Milles, L. E. Hall, O. F. Root.

American Militaire Cycle Company, Cleveland, O.; \$100,000; to manufacture and deal in motors and motorcycles; M. L. Thomsen, E. Frederick, A. Henry, Vernon E. Davis, H. E. Downing, M. H. Gallagher.

R. K. Mickey Company, Bloomfield, N. J.; \$50,000; to manufacture electric lamps for automobiles, etc.; R. McNeill, M. L. Mickey, R. K. Mickey.

Merkel & Spacher, Rochester, N. Y.; \$15,000; to conduct a bicycle and motorcycle business; C. A. Merkel, Joseph G. Merkel, George M. Spacher.

United Anchor Tire Company, New York City; \$2000; to deal in automobile tires; Frank H. Cross and others.

Delcher & Arndt Company, Plymouth, Wis.; \$50,000; to operate garage and machine shop; Adam Delcher and others.

Wake Auto Company, Raleigh, N. C.; \$25,000; to conduct a general machine and repair shop; W. G. Allen, O. B. Penny, Frank Allen, E. H. Baker, F. H. Phillips, J. W. Harden.

Bradley Electric Garage Company, Dayton, O.; \$10,000; to conduct an automobile, garage and accessory business; Albert T. Miller, T. H. Hlester, Francis Bradley, Frank Blessing, L. E. Bradley.

Dixie Auto Supply Company, Louisville, Ky.; \$6000; to deal in automobiles; A. H. Drake, H. Jansen.

Motor Sales Company, Louisville, Ky.; \$6000; H. O. Herr, A. W. Lee, Jr., R. W. Herr, Jr.

Auto Comfort Robe Company, Gloversville, N. Y.; \$25,000; to manufacture Comfort automobile robes.

Thiefproof Auto Lock Company, Dover, Del.; \$50,000.

Jaegers Manufacturing Company, Dover, Del.; \$400,000; to manufacture motor trucks, engines, etc.; Walter P. Garrow and others.

Euclid Penn Auto Supply Company, Cleveland, O.; \$20,000; to deal in automobile supplies and accessories.

Auto Combination Switch Lock Company, Columbus, O.; \$10,000; to deal in accessories.

Canadian Bartlett Automobile Company, Toronto, Ont.; \$1,000,000; to manufacture automobiles.

Flanders Electric Company, Pontiac, Mich.; \$100,000; to manufacture automobiles; M. Rothschild, Don C. McCord, B. F. Edgar.

Panama Equipment Company, St. Louis, Mo.; \$5000; to deal in automobiles; H. F. Herfuth, John F. Schneider, Garfield G. Giese.

Mattison Taxicab & Transfer Company, Minneapolis, Minn.; \$100,000; Allen M. Crowell, Charles S. Mattison, Frank S. Mattison.

GARAGE AND DEALER.

E. T. Paul, Columbus, O., has installed a new vulcanizing outfit at 122 Parsons avenue.

W. F. Smith, Cleburne, Tex., has purchased an interest in the Corson garage, at the corner of Mill and James streets. The equipment will be improved and the stock enlarged.

The Harrisburg Auto Top Tire Repair Company, Harrisburg, Penn., is erecting a fireproof building. It will be modern throughout.

Benson & Shuhart, Kenmare, N. D., has installed motors and other machinery in its garage and is now prepared to handle repairs of all kinds.

John T. Locke, Lowell, Mass., has taken charge of the Jean garage, at 31 Shattuck street.

C. Hoskins, Edwardsville, Ill., has opened a welding shop at 207 North Main street. He will overhaul and repair automobiles.

Whitford & Barden, Beloit, Wis., is the name under which the business of the former Reaf & Johnson garage on Fourth street will be conducted. The new owners are Frank Barden and George Whitford.

The Thomas Auto Company, Little Rock, Ark., has installed a complete new electric department for charging electric cars and repairing storage batteries. The company handles the Cadillac cars.

Gragg & Rardin, Excelsior Springs, Mo., have reopened the East Broadway garage and will specialize in all kinds of automobile repair work, as well as conduct an automobile livery.

The Sea Street Garage, Lynn, Mass., carries a full stock of accessories and parts for general repairs.

The Auto Sales Company, Jersey City, N. J., dealer in rebuilt cars, will open for business at Newar avenue and Coles street.

Kelly & Clement, Algona, Ia., automobile dealer, has dissolved partnership. Mr. Kelly will conduct the business alone in the future.

E. B. Ottestead, Phoenix, Ariz., has become sole owner of the garage conducted by Ottestead & Wild, Mr. Wild having withdrawn from the business.

The Miller Rubber Company, Buffalo, N. Y., has opened an attractive salesroom at 1060 Main street, with R. J. Strong in charge.

C. E. Freeburn, Dayton, Ia., has purchased the Shostrom and Johnson properties on Main street, the buildings on which will be moved in order to permit the erection of a brick garage.

The Denison Automobile Company, Denison, Ia., has leased the second floor of the Saggau building, where its garage is located. The company will install an elevator so that cars can be taken from the garage to the repair shop, which will occupy the second floor.

P. J. Helerts & Son, St. James, Minn., is now sole owner of the Pioneer garage. The new management has

placed a number of experienced repair men in the machine shop.

J. J. Insley, Crawfordsville, Ind., has decided to remodel his livery stable into a modern garage. His livery stock was sold at auction and reconstruction of the building has begun.

The Seattle Automobile Dealers' Association, Seattle, Wash., recently organized, has elected the following officers: President, George W. Miller; secretary, A. S. Eldredge; treasurer, L. G. Nicolai.

The Phoenix Motor Car Company, Phoenix, Ky., has purchased the property at 166-70 East Main street, the buildings on which will be razed to make way for a modern garage. The price of the property is said to have been \$35,000.

Stanley D. Hall, Carthage, N. Y., has leased the Elmhurst garage and will operate it. He will also conduct an up-to-date repair shop. Oakland and Overland cars are handled.

Hess & Mitchell, Buffalo, N. Y., pioneer in the rubber business, has taken over the Goodyear service station at 1015 Main street. The new owner will handle both pneumatic and solid tires, operate a vulcanizing plant and care for automobile tires in general.

Edward Young, Joliet, Ill., has taken the agency for portable garages. He is the first dealer to take an agency of this kind in that city. A sample of the all-steel portable buildings offered by the agent has been erected for display near the E. J. & E. freight house on Cass street.

The A. Elliott Ranney Company, New York City, distributor of the Hudson cars, has leased the entire sixth floor of the building at the northeast corner of Broadway and 64th street. The company will use it as a service station. The location has 21,000 square feet of floor space. The company's headquarters are at 54th street and Broadway.

The Motor Sales Company, Huntington, W. Va., will remove from its present quarters to 1022 Fourth avenue. E. V. Carter is general manager.

The Benz Automobile Sales Corporation, New York City, will move to 1700 Broadway.

The Monroe Motor Car Company, Buffalo, N. Y., has taken larger quarters at Main and North streets. The building is modern throughout.

The General Auto Supply Company, Reading, Penn., is now located in its new and spacious quarters at 20 North Fifth street.

The Buffalo & Interurban Motor Delivery Company, Inc., Niagara Falls, N. Y., will remove to larger quarters at 508 Elderfield-Hartshorn building.

A. M. Signor, Scranton, Penn., has moved his garage from 329 Adams avenue to 515 Mulberry street, where he is better equipped to serve his patrons.

The Wheelock-Jeffery Company, Boston, Mass., New England distributor for the Oldsmobile cars, is located in its new headquarters at 916 Commonwealth avenue. The showrooms are spacious and elaborately finished.

The Cole Motor Sales Company, Pittsburg, Penn., has moved into the salesrooms at the corner of Craig street and Baum boulevard, formerly occupied by the Lozier company. C. C. Laughner is in charge.

The Ozark Motor Car Company, Springfield, Mo., is to occupy the building at 208 South Jefferson street. It is to be remodelled and will cost \$10,000. This building has been occupied by the Atkinson Motor Car Company.

The Nettleton-Crittenden Company, Boston, Mass., is now located at 1110 Boylston street. The concern is agent for Chandler and Paige cars.

Fred H. Goss, representing the Lyons-Atlas Company, Indianapolis, Ind., has taken a lease of one of the stores in the Motor Mart, Park square, Boston, Mass.

WITH THE MANUFACTURERS.

The Swinchart Tire & Rubber Company, Akron, O., makes a variety of tires for truck use. A special cellular tire for electric trucks is stated to be extremely economical of current consumption, as the flow or

"bunching" of the rubber is absorbed by the cells. Additional claims are that this tire transmits absolute traction; that it will not skid on wet or slippery pavements, and that the additional resiliency prolongs the life of both batteries and mechanism.

The National Rubber Filler Company, Midlothian, Tex., manufactures a rubber tire filler designed to take the place of the inner tube and air, which, the company states, ends all tire trouble. The company claims that it is made on the correct principle and out of the proper material to give service and satisfaction, high grade rubber cut in small pieces and vulcanized together being the medium employed.

The Leather Tire Goods Company, Niagara Falls, Ont., produces a new type of tire chain which differs from ordinary chains in having cross members made of heavy sheet metal pieces. These are formed so as to present the smooth, rounded side of the metal to the tire and the edges towards the road, and it is held that the best possible grip is obtained on the road and that there is a minimum amount of wear on the tire. They are known as the Kant Skid chains.

The Power Efficiency Company, Trenton, N. J., announces that it is entering the manufacturing field. The company will make automobile accessories, and the first of these that will be placed on the market will be a double spark plug. H. T. Caultet is president and E. Furman Hooper is secretary and treasurer. M. T. Minogue is general manager.

The Titan Storage Battery Company, formerly the

General View of the New Plant of the Titan Storage Company, Recently Opened at Chapel Street and Lister Avenue, Newark, N. J.

Baltimore Electric Storage Battery Company, has taken possession of its new factory at Chapel street and Lister avenue, Newark, N. J., an illustration of which is shown herewith.

The Allen Motor Company, Fostoria, O., recently announced that the company's plant will be enlarged during the coming season.

The Saginaw Motor Car Company, Saginaw, Mich., which was recently organized with a capital stock of \$150,000, will manufacture the Saginaw speedster. The new firm is composed of A. R. Thomas and W. L. Walls. The company has practically acquired the property of the Brooks Motor Wagon Company, which is well equipped for manufacturing purposes.

The Aetna Motor Truck Company, Detroit, has secured a factory at the corner of Richmond avenue and East Grand boulevard. The company plans to build, during the first year, 200 trucks of two tons capacity. The officers of the newly formed company are: President and general manager, J. George Wagner; vice president, Ernest E. Kinney; secretary, William A. Eldred; treasurer, John J. Wilson; director, George Humbert.

A. O. Dunk, president of the Puritan Machine Company, Detroit, has purchased the assets of the F. A. L. Auto Company, Chicago. This purchase includes all the patterns, tools, service parts and other property formerly owned by the latter concern, and the entire stock has been moved to Detroit. The Puritan Machine Company is now supplying parts to over 56,000 private owners whose cars were made by firms now out of business.

RECENT PATENTS.

Extra-Tire Lock, John U. Barr, New York City; No. 1,097,608. Filed March 15, 1912.

Driving Axle, Thomas J. Lindsay, Indianapolis, Ind., assignor to Lindsay Auto Parts Company; No. 1,097,653. Filed Aug. 7, 1911.

Dust Subduer for Motor Vehicles, Benno Samuel, Brunswick, Germany; No. 1,097,674. Filed Feb. 26, 1914.

Resilient Tire, Harry J. Sherrill, Salida, Col.; No. 1,097,682. Filed Aug. 19, 1912.

Rear Signal, Cyrus S. Vaughn, New Rochelle, N. Y.; No. 1,097,689. Filed May 23, 1913.

Carburetor, Robert Wellesley, Anthony Brewer and George Herbert Jones, London, England; No. 1,097,787. Filed Dec. 16, 1912.

Driving and Steering Mechanism, Magnodelix Leonard, Montreal, Que.; No. 1,097,807. Filed March 15, 1913.

Puncture Proof Inner Lining for Tires, William A. Ray, Jackson, O.; No. 1,097,820. Filed May 27, 1912.

Resilient Tire Filler, Claude S. Staten, Dallas, Tex.; No. 1,097,824. Filed July 29, 1912.

Resilient Wheel, Clarence Odum Vantrease, Nashville, Tenn.; No. 1,097,829. Filed Aug. 13, 1913.

Valve Truening Device, George G. Bouthinon, Hempstead, N. Y., assignor to G. B. Garage Company; No. 1,097,841. Filed Oct. 29, 1912.

Differential Transmission Mechanism, Frank Brown, Lexington, Va.; No. 1,097,843. Filed July 12, 1912.

Axle, Hiram P. Maxim, Hartford, Conn., assignor to Waverley Company, Indianapolis, Ind.; No. 1,097,866. Filed Feb. 27, 1908.

Mechanical Starter, Bernhard Volkmar, New York City, assignor to Volkmar Auto Starter Company; No. 1,097,898. Filed Jan. 12, 1911.

Motor, Allan D. Shaw, Sayanna, Ill.; No. 1,097,947. Filed Jan. 2, 1913.

Fuel Tank, Elbert M. Stever, Branchport, N. Y.; No. 1,097,950. Filed Dec. 3, 1913.

Motor, Jared V. Brown, Jr., Waxahachie, Tex.; No. 1,098,012. Filed Aug. 8, 1913.

Demountable Rim, Roscoe C. Knowles, Empire, Ala.; No. 1,098,040. Filed Aug. 7, 1913.

Air Starter, Don D. Miles, Jr., San Francisco, Cal., assignor to Benjamin Goodwin; No. 1,098,046. Filed Jan. 20, 1912.

Spark Plug, Richard Brown, Belvidere, Ill., assignor of one-half to Willis S. Brown; No. 1,098,093. Filed Nov. 4, 1911.

Universal Joint, Eugene P. Edwards, Plainfield, N. J., assignor of one-half to A. S. Giles; No. 1,098,101. Filed Oct. 29, 1912.

Spare Tire Holder, Alfred Freschl, Detroit, Mich.; No. 1,098,103. Filed Oct. 15, 1913.

Piston Ring, Harry Magee, Detroit, Mich.; No. 1,098,121. Filed Dec. 11, 1913.

Tire Inflating Apparatus, Frederick A. Ruff, Newark, N. J.; No. 1,098,173. Filed Aug. 26, 1912.

Tire, Ira C. Terry, Monroe, La.; No. 1,098,191. Filed July 10, 1912.

Spark Plug with Priming Device, Ira V. Beam, Elmira, N. Y., assignor of one-half to Nicholas D. Doxey; No. 1,098,214. Filed Dec. 12, 1912.

Magneto, William Casey and Isaac Lessen, Kingston, Ont.; No. 1,098,226. Filed Feb. 15, 1913.

Shock Absorber, Jeremiah C. Lautenbacher and Albert Geary, Schuylkill Haven, Penn.; No. 1,098,271. Filed Dec. 3, 1913.

Tilting Steering Wheel, Franklin C. Prindle, Washington, D. C.; No. 1,098,301. Filed May 19, 1913.

Incandescent Electric Headlight, Charles W. Dake, Chicago, Ill., assignor to Pyle-National Electric Headlight Company; No. 1,098,317. Filed June 17, 1912.

Starting Gearing, Percy C. Day, Milwaukee, Wis.; No. 1,098,344. Filed Oct. 22, 1912.

Speed Indicator for Passing Vehicles, Roy M. Dean, Chicago, Ill.; No. 1,098,358. Filed Nov. 18, 1909.

Spring Tire, Harry S. Gover, Bel Air, Md.; No. 1,098,375. Filed Dec. 13, 1914.

Buffer for Door, Joseph F. O'Brien, New York City; No. 1,098,393. Filed May 29, 1912.

Air Starting Means, Alfred Arnold Remington and Arthur John Rowledge, Birmingham, England, assignor to Wolseley Tool & Motor Car Company, Ltd.; No. 1,098,406. Filed March 18, 1913.

Valve Mechanism for Motors, Augustus F. Schmidt, Pittsburgh, Penn.; No. 1,098,411. Filed Oct. 10, 1912.

Differential Mechanism, Harry E. Bayly, Indianap-

olis, Ind.; No. 1,098,422. Filed May 12, 1913.

Magneto-Electric Generator, Richard H. Cunningham, New York City, assignor to Splittdorf Electrical Company, Newark, N. J.; No. 1,098,431. Filed Oct. 8, 1912.

Locking Device for Steering Wheel, Joseph E. Gibbons, Washington, D. C.; No. 1,098,435. Filed Nov. 24, 1913.

Nut Lock, Thurston Matheny, The Plains, O.; No. 1,098,454. Filed May 12, 1913; renewed April 17, 1914.

Motor, George McDowell, New York City; No. 1,098,455. Filed Aug. 17, 1912.

Anti-Skidding Device for Wheels, Martin Mossberg, Minneapolis, Minn.; No. 1,098,457. Filed Oct. 27, 1913.

Safety Engine Starter, William R. Clark, Muncie, Ind., assignor to Clark Crank Company, Indianapolis, Ind.; No. 1,098,480. Filed May 13, 1912.

Tire Tool, John W. Dyar, Detroit, Mich.; No. 1,098,488. Filed Aug. 6, 1913.

Motor, Herman W. F. Niekrantz, Toledo, O.; No. 1,098,522. Filed Aug. 11, 1913.

Motor Sled, John Francis Oakes, Copos, Minn.; No. 1,098,523. Filed June 10, 1913.

Motor, Joseph A. Williams, Cleveland, O., assignor to K-W Ignition Company; No. 1,098,539. Filed Dec. 19, 1910.

Cranking Device, Selby L. Williams, Richmond, Ind., assignor of one-half to Abiathar L. Way; No. 1,098,541. Filed Sept. 22, 1913.

COMING EVENTS.

June.

June 10-11—Isle of Man road race.

June 12-13—Chicago-Peoria annual reliability run.

June 15—Savannah Automobile Club run, Savannah, Ga.

June 17-18—Hill climb, Uniontown, Penn.

June 19—Track meet, Boston, Mass.

June 23-26—S. A. E. midsummer meeting, Cape May, N. J.

June 24-26—Meeting National Gas Engine Association, Chicago, Ill.

June 25—Track meet, Portland, Ore.

June 27—Race meet, Brooklands track, Weybridge, Eng-

land.

June 27-July 4—American Automobile Association's touring week.

June 30—Track races, Sioux City, Ia.

July.

HELP POLICE DEPARTMENT.**Indianapolis Car Testers Organize as Special Force for Speedway Week.**

Indiana automobile manufacturers organized their test car drivers into a vigilance committee to protect visiting motorists from a gang of automobile thieves, which they had reason to believe had selected that city as a profitable field, during speedway week. The movement started as a result of the loss of a brand new touring car loaned V. T. Cleesrath of the Bosch Magneto Company by Harry C. Stutz of the Stutz Motor Car Com-

pany, which was driven away from in front of the Claypool hotel during the busiest hours of the day shortly before the date of the 500-mile race.

In view of the fact that thousands of motorists were in the city throughout the week, and that many people are careless in leaving their machines standing alone for a long time, it was suspected that the thieves had decided they would be able to reap a large harvest. Accordingly, Stutz, National and Cole testers, as well as those of other concerns in that city, covered practically all of the streets in the Hoosier capital, and were of great assistance to the police department.

**“STOP AT HOTEL LENOX”**

Motorists who visit this hotel once, invariably tell their friends that—
for *Fair Rates*, complete and perfect equipment and unfailing courtesy

BUFFALO'S LEADING TOURIST HOTEL

unquestionably excels. Beautifully located in exclusive section—
North St. at Delaware Ave. Thoroughly modern—fireproof. Best
obtainable cuisine—quiet, efficient service.

J=H=S

**NO CAR OWNER CAN AFFORD
TO BE WITHOUT THEM**

They are the cumulative result of our nine years' experience in the manufacture of dependable spring suspension.

No matter how hard you inflate your tires, our absorbers insure perfect resiliency and save half your present tire expense. Unnecessary wear and tear on motor, transmission and other components is eliminated because they reduce vibration to a minimum.

The combined efficiency and durability of J. H. S. SHOCK ABSORBERS make them worth all they cost and more—they're the only kind leading mechanical engineers have considered fit to endorse.

For thirty days you can try them at our expense. J. H. S. are made for every known car.

That's the Lubricant

that stops the car in front of your door and starts it running again properly. It's so widely advertised and so meritorious that

Motorists

the world over demand it. It is made only from *one, uniform base crude oil* and manufactured by our "special process", which removes all free carbon and impurities, yet *leaves the molecules whole*. It burns up evenly and cleanly and leaves the least carbon deposit. Here's how you can benefit by this

Demand

for Havoline Oil. Write for our various advertising helps—both selling hints for your own use and strong, appealing literature for distribution among your customers. Our House Organ the "Sales Oiler" explains them in detail. It's free to you, if you want it.

NOTE! Our new Price Scale policy enables you to make "customers" where heretofore you had only "sales". Ask us how!

Write for the "Lubricant," a booklet to distribute among your trade

SPLITDORF MAGNETOS—low and high tension—are made in a wide range of models for all manner of work and they'll give your motor more power—make your motor run smoother and quieter than will any other make, and, equipped with one, you can always start your engine on a quarter turn.

We'll exchange your present magneto of any make on a liberal allowance basis for an up-to-the-minute SPLITDORF low or high tension.

SPLITDORF PLUGS are not experimental—they are standard. Known since their first appearance as the "common sense plug" they are exactly that—no more and no less. SPLITDORF PLUGS will outlast your motor—thousands are rarely removed from a cylinder head. There is nothing fanciful about them—they are made to endure any and every strain of ignition put upon them.

To do a good job in a hurry—use

Vanadium Quick Finishing Varnish

1. It's quick. It dries out of dust in two hours and hard overnight.
2. It's high-grade—a real Valentine varnish. Brilliant as a mirror and stays so. Heavy in body, yet easy-working and flowing. No runs. No sags. No brush marks.
3. It is especially fine for hot weather use.

Send for special trial offer of Vanadium

Can be quickly and easily attached to any car

**BUMPING DOWN A FORTY MILE
FLIGHT OF STAIRS**

would be no greater shock to your nervous system and your kidneys than riding forty miles in the average car not equipped with

**VELVET
SHOCK ABSORBERS**

because it is mechanically impossible to build springs that will comfortably take care of any kind of load on every kind of road.

MORE MILES PER HOUR

You will never appreciate what a real pleasure motoring is till you ride on VELVETS.

You can get more miles per hour out of your car over any kind of roads. You will not rack your engine or break your springs. They absorb all shocks, jolts and vibration—prolong the life of your tires and assure you of a higher second hand price on your car.

VELVETS are elegant, small, durable—no boring or special fittings required to attach.

TRY VELVETS Get the best—VELVETS are the original and the first successful cushion spring shock absorber. Ask your dealer for VELVETS and see that you get VELVETS.

TEN DAYS AT OUR RISK Learn the truth about all shock absorbers—write today for descriptive booklet. Special VELVETS for Ford Cars. Distributors in all principal cities. Insist that your new car be "Velvet" equipped.

the birthplace of motor vehicles produced the Zenith Carburetor—for six years the unchanging standard of the best known makes abroad. For speed, for pleasure, for profit—in every field of motor activity—this scientific device is used by 150 famous motor cars of Europe.

The American Market is Developing Fast Already eight concerns well known as leaders in their various fields, have adopted the American Zenith after widespread comparison. They appreciate its many peculiar advantages, its positive simplicity, its great flexibility for any motor speeds, its freedom from numerous adjustments. They hail, in its absence of valves and springs and weights and moving parts, the coming of the fool-proof carburetor which, once set, is adjusted as long as their product lives.

Why You Should Know About It Baverly's principle of "the compound nozzle" made possible the Zenith. It is called the greatest step forward in carburetion since Kreb's early device. You should know more about the Zenith—what it will do for your product—what it will mean to your customers. A request will bring you facts. A thorough test will prove them.

There's no leak proof ring but the **LEAK-PROOF** Ring — insist

Boring and Turning the Casting

This is the first operation in the manufacture of the **LEAK-PROOF** Piston Ring. These pot castings are made of special Processed Gray Iron from a formula perfected after many years of experiment. This metal is wonderfully tough and close grain and possesses great natural elasticity—is soft enough to take the wear from the cylinder yet the rings made from it will outlast the motor. These castings before being formed into rings are allowed two weeks seasoning to relieve the strain that is peculiar to cast iron. The micrometer held by the operator checks the accuracy of the cutting tools.

LEAK-PROOF Piston Ring quality is built from the ground up—the same standards in carefulness and accuracy are followed throughout.

Power Depends on Piston Rings

Full power—no half measure—*all* the power contained in every ounce of gasoline in your tank. Unfailing power for the hill climb—rough roads—heavy going. Strong and steady motor service all day—day after day.

It depends on the piston rings. Full power can only follow perfect compression—and such compression requires the use of

The Name
LEAK-PROOF
Stamped On
Every Ring

Piston Rings

MADE BY McQUAY-NORRIS MFG. CO.

The only piston ring that is effectively gas-and-oil-proof because of its "sealed openings and the equal and sustained bearing it obtains on the cylinder.

The superior quality of the metal used in the **LEAK-PROOF** Ring—the strength and simplicity of its design—the careful testing it undergoes for flaws—the accuracy of its finish—these are the reasons why it is the most durable, economical and efficient piston ring. Made in all sizes—easily adjusted.

Send for Free Booklet—

It tells all about piston rings and why you should equip your engine with the **LEAK-PROOF**. How it will pay you in fuel economy and prolonged motor life. Write for it.

Do you know the lubricating system of your car ?

It is one of the most important things to know because an oil which is suited to ~~the~~ ^{your} system may not be the best for another.

UNIVERSITY
OF
CALIFORNIA

Thousands of motors are ruined each year because their owners lack this knowledge.

The Platt & Washburn Refining Co. has spent thousands of dollars in physical and chemical laboratories in a study of all brands of motor oils on the market and scientific research by actual tests into the requirements of automobile engines.

The results of these tests are embodied in the Veedol Lubrication Chart which will tell you the lubricating system of your car and recommend a grade of Veedol exactly suited to it.

Veedol is a highly refined oil from Pennsylvania paraffine petroleum—the result of over 30 years experience with lubricating oils. Get a copy of the chart from your nearest dealer or write us for one. The information it will give you may double the life of your car.

Platt & Washburn Refining Company

Established 1878 Incorporated 1885

Philadelphia

TO DEALERS: We want responsible representatives everywhere for Veedol. If there is no AGENT near you, write at once for terms and full information about the intensive co-operative selling plan by which we are introducing Veedol to car owners in your neighborhood.

The 9 lubricating systems

1. Full Splash
2. Splash With Circulating Pump
3. Pump Over and Splash
4. Force Feed and Splash
5. Pump Over
6. Separate Force Feed
7. Force Feed
8. Full Force Feed
9. Knight Slide Valve Motor

THIS name stands for the finest brake lining possible to make. It represents a high degree of quality and wearing power which no competitive product has ever been able to attain. We could cheapen

in many ways and sell it at a lower price. But that we will never do. The integrity of the Raybestos name and the safety of the Raybestos user far outweigh all other considerations.

Whenever you see the name Raybestos, you will know it rep-

resents the very utmost in safety, serviceability and strength.

In these days of frenzied competition in the brake lining field, we believe this declaration of principles is needed. And we back it up with a definite one year guarantee that no other maker duplicates.

THE ROYAL EQUIPMENT CO.

Bridgeport, Conn.

Hartford

AUTO COMFORT

EQUIPMENT

THE HOME OF HARTFORD AUTO COMFORT EQUIPMENT

Automobile accessories of admitted excellence which contribute to the maximum enjoyment of motoring—each a quality product and a proven factor in promoting comfort, economy and safety.

Truffault-Hartford

SHOCK ABSORBER

The Truffault-Hartford Shock Absorber is the inevitable choice of motorists who give the three-fold problem of greater comfort, safety and economy, the study it deserves. For ten years this standard device has "made good" by making "Every Road a Boulevard." Today a quarter-million motorists enjoy constant comfort through its use. Twenty-five leading makers recognize Truffault-Hartford as "The Pioneer and the Best" by adopting it. Inventive ingenuity earned for the Truffault-Hartford the exclusive right to use the principle of Rotary Friction. Science and results prove that this is the only principle that actually absorbs shocks and vibration. Absolute comfort, lowered upkeep cost and greater safety are logical results.

Prices—Five Models—\$60, \$50, \$35, \$16. Special Ford Type, \$16.

Hartford Bumper

The strongest motor car bumper in the world—no other statement does justice to the Hartford Bumper. A veritable breastwork between car and passengers and the dangers of collision. The four-leaf friction-springs—an exclusive feature—completely absorb the shock and jar.

Saves repair bills by preventing smashed headlights, damaged radiators, twisted mud guards, broken springs, etc. Beautifies the smartest car. Made of staunch metal tubing reinforced with a solidified cement-like composition, combining maximum strength with minimum weight. Attached to any car in 15 minutes. Four sizes—\$15, \$12.50 and \$10. Special Ford Type, \$10.

Hartford CUSHION SPRING

Hartford Cushion Springs insure the degree of flexibility which most automobile springs lack. These comfort-conserving devices increase flexibility and provide for easy riding on average roads just as effectively as Truffault-Hartford Shock Absorbers control excessive flexibility and provide easy riding on rough roads. In combination, these devices offer super-comfort on all roads under all conditions. Hartford Cushion Springs eliminate the continual annoyance and discomfort of travel over small ruts and bumps, car tracks, cross-walks, cobblestones, etc. They are compact and unobtrusive, of the finest material and workmanship, and easily applied to any car.

Four Models, \$35, \$30, \$25. Special Ford Type \$16.

Hartford Auto-Jack

A bright spot in many a wayside stop for repairs is the easy, rapid, efficient work of the Hartford Auto Jack. This handsome tool lifts a heavy car with wonderful ease and quickness. No muscle needed, no back-breaking, perspiring labor—just a simple wrist-movement and up goes the car; a turn of the reversing lever and down it comes smoothly, without jerk. It's all in the gears, ingeniously devised to multiply energy. Made for the motorist willing to pay a little more for something very much better.

Price, \$6.50.

Guarantee: "Money back if not satisfactory." Under this broad policy all Hartford products are sold. Any article of our manufacture not proving satisfactory after 30 days' trial from date of purchase, can be returned and the purchase price will be refunded.

THE EASIEST RIDING CAR IN THE WORLD

MARMON

The New Marmon "Forty One"—132" Wheelbase—\$3250

An Extraordinary Car

Backed, not merely by what we "claim" for it, but, by *actual proof* of value, comes this new Marmon "Forty One".

But again we want to remind you—the Marmon is sold—not merely on what the manufacturer or dealer "says", but on the *actual proof* of the car itself.

The new Marmon "Forty One" is now ready to bring you its own proof of value. *Ask for it.*

Three Great Ideas

In this limited space, we want to give you just three reasons why this new Marmon "41" is a better car to sell or to own than any other automobile offered to the dealer or owner.

1st—"41" Appearance: Note the sloping hood with its rounded radiator; the harmonious lines of the perfectly formed body; the commodious rear seats; clean crowned fenders. *No other American car* so perfectly blends the final word of the coach-maker's art with the highest development of automobile engineering and manufacture.

2nd—"41" Equipment: The only car bearing complete BOSCH equipment for lighting, starting and ignition. These world-famous makers have designed and proved this installation solely for the new Marmon "41." The wonderful, new Bosch lamps with parallel-ray, parabolic reflectors, appear *first* in this combination. The new Bosch water proof spark plugs, switches, bulbs, and every other unit in the system is designed by Bosch engineers to make this *complete* system representative of the acme of automobile electrical equipment. *Every wire* except a single one to the horn, is Bosch equipment and every detail, as well as the complete system, is backed by their *guarantee* and *world-wide service*. This is but one of the many superior equipment features of this extraordinary car. Add to it a perfected one-man top of distinctive design, Silvertown Cord Tires, the *highest priced* and *best tire equipment* which any manufacturer can provide; and you gain another impression of why this car *must* prove its value.

3rd—"41" Construction: The Marmon "41" six-cylinder engine, with the distinctive Marmon continuous circulating oiling system, the Marmon seven-bearing crankshaft and many other developments of design and construction originated and developed on Marmon cars, are already proven to you. If not, it will pay you to investigate. The new Marmon "41" adds to these features an improved Marmon transmission with cross gearshift slide on ball bearings. This and other refinements make it the *most perfect piece of motor car mechanism* ever marketed in America at anywhere near its price.

A Fourth and Greater Idea

It will pay every wise dealer and buyer to know the details of this new Marmon "41".

To the dealer, who is located where Nordyke & Marmon Company is not now represented, this car offers the *profitable* opportunity to form a *permanent* relation with a solid, substantial manufacturer, backed by over 63 years of successful manufacturing experience. It furnishes the further opportunity of *making sales* wherever there is a wise buyer with knowledge of real motor car value and a desire for the *best*. If you are this dealer—get in touch with the Marmon Sales Service Department now and learn what the co-operation of this organization means to you.

To the owner, who has wished and waited for the best of automobile values at a *logical price* and *really knows* how to discriminate, here is the greatest idea in motordom—make us *prove* the value of the Marmon "41."

NORDYKE & MARMON COMPANY

Prest-O-Lite

The Sure Cure for Lighting Troubles

“Don’t lose any more time or money on this electric system—

The easiest and best way to save yourself further bother and expense—
The only way to get satisfactory and dependable light—

Get Prest-O-Lite”

That’s what the wise repairman says, and—
Every Night Proves It!

Thousands of motorists who have tried out electricity for lighting and are tired of paying for constant repairs and replacements are having these systems torn out of their cars and going back to Prest-O-Lite.

Eliminate the useless complication and troubles of electricity—cut down weight—increase power. For the cost of one repair bill or a battery renewal, you can make the change from electricity to the safe, satisfactory, saving service of Prest-O-Lite.

No matter what self-starter is on your car, be sure your lights are gas lights. Reliable light is just as essential as fuel.

Convenience
The Prest-O-Lite, or any other good automatic gas lighter, offers you every “push-the-button” convenience for lighting, dimming or extinguishing your gas lights. The automatic reducing valve prevents the flame from exceeding the proper height.

Use the Coupon
Get the real facts about satisfactory lights today. Wake up to the new meaning of gas lighting with every comfort, convenience and economy. Your address brings it.

METZ "22"

Introducing the New Fore Door Model
Stream Line Body, Plate Glass Rain-Vision Wind Shield
The Ideal Car for Cross Country Driving or City Use

\$495 Equipped Complete

Big, roomy seats, with thick, tufted upholstery and deep cushions, built for luxurious comfort.
Four-cylinder 22 1-2 H. P. water cooled motor, Bosch high tension magneto, Prest-O-Lite tank, best quality Goodrich clincher tires.

Fore doors of liberal dimensions, 20 inches wide.

Left-hand drive, with center control.

Gearless Transmission—the kind that won the Glidden Tour.

WINNER OF THE GLIDDEN TOUR

The Metz "22", in open competition with cars of all makes and prices, won the last Glidden Tour, from Minneapolis, Minn., to Glacier National Park, Mont., the three METZ cars being the **ONLY** cars that held *perfect scores*, without time extension or additional allowance of any kind, for the entire eight days of the contest. The METZ cars were the lowest priced cars

in the tour, and they were the only cars in it that were equipped with *gearless transmission*.

Mr. Chas. H. Metz has been building cars of this type and developing their perfection, *sixteen years*. As a result, the METZ "22" is today the most practical car on the market, regardless of price, horse power, or any other qualification.

METZ WINS!

WESTERN UNION TELEGRAM

UNIONTOWN, PA. JUNE 18 1914

METZ COMPANY,

WALTHAM, MASS.

IN HILL CLIMBING CONTEST AT UNIONTOWN, PA., METZ WINS EVENT TWO AGAINST FIELD OF THIRTEEN SPECIAL RACING CARS, TIME FOUR MINUTES, THREE-FIFTHS SECONDS. KLINE SECOND, MERCER THIRD, CHANDLER FOURTH. FORD, MAXWELL, BUICK, OVERLAND, HUDSON IN ORDER NAMED. METZ ALSO WINS SECOND IN THE FREE FOR ALL CONTEST, BEATING FIFTEEN OF THE BIG SPECIAL RACING CARS, INCLUDING SIMPLEX, MERCEDES, PACKARD, MERCER, OLDSMOBILE, BUICK, STUTZ, LOZIER, ALL THE WAY FROM TWENTY FIVE SECONDS TO ONE MINUTE AND TWENTY-TWO SECONDS. THIS THREE MILE CLIMB IS DECLARED TO BE THE MOST DIFFICULT IN THE COUNTRY.

CHAS. H. METZ.

LET FACTS MOULD YOUR OPINION

If any further evidence was needed of the superiority of *gearless transmission*, this latest performance of the *gearless* METZ "22" surely supplies it in overwhelming measure. METZ leads the leaders.

The METZ "22" is the most compactly built car in the world, and is extremely economical in operation and upkeep. METZ owners travel 28 to 32 miles on 1 gallon of gasoline, 100 miles on 1 pint of lubricating oil, and 10,000 to 12,000 miles on a single set of tires. It makes 50 miles per hour, and at hill climbing is unsurpassed. Its engine develops more horse power per 100 pounds of car weight than any of the big touring cars, and its gearless transmission does away entirely with gear trouble. It is easy to drive and easy to take care of; and it costs so little to buy it, and so little to run it, that it combines in greatest degree absolute *economy* with absolute *luxury*.

TO DEALERS

The demand for a small car that is reliable in performance and economical in operation, is increasing enormously. The new METZ "22" Fore Door Model meets this demand precisely. We want a representative in every city and town. Be first in your section. Write us for terms and new Catalog "Q."

PUBLISHER'S AND READER'S PAGE.

The Index of Tours in the Eighth Annual Touring Number of The Automobile Journal, to be published July 10, is so compiled that it is possible for tourists to start from any point and arrive at any given destination in the United States or Canada, utilizing the routings presented. In addition, all the principal vacation spots, night stops and chief centres throughout the country are indexed according to tour, page and map location. The maps are unusually distinct.

Preparing the Car for the tour is a subject in which every motorist is interested. Practical suggestions for inspecting, adjusting and repairing the components of the chassis will be comprehensively dealt with in the July 10 issue. The article will be supplemented with description of time and labor saving tools useful in the overhaul of the car. Many other mechanical articles will be included, making the issue the most complete of its kind ever published. The price will remain the same as usual, 10 cents.

As to Advertisers of practical accessories, supplies and equipment. The Eighth Annual Touring Number of The Automobile Journal, to be published July 10, will reach thousands of prospective purchasers at a time that they are in the market. The edition will be retained and referred to continuously the entire year, according lasting publicity.

The Equipping of the car for the tour requires careful consideration to eliminate excess weight and economize space. This subject will be dealt with by one familiar with touring requirements.

Touring Garments will be described and illustrated in the July 10 issue and the offerings of the designers for the season are such that there is a wide variety of practical models. The article will contain suggestions for the man who desires to be well dressed while on the road, as well as

protected when at work around the car when en route. Latest motoring apparel for women will be discussed and the styles illustrated.

SPLITDORF FORD SPECIAL

WATERPROOF HIGH-TENSION MAGNETOS

that are giving thousands of the popular motors the response and flexibility of the highest-priced automobiles!

Every owner of a Ford automobile owes it to himself to investigate the SPLITDORF high-tension magneto that is revolutionizing the running of thousands of these remarkable cars.

Every refinement has been incorporated in the SPLITDORF instruments to make them as simple, positive and reliable as the demands of the constantly growing thousands necessitate—in a word, they are built for the multitude and carry the SPLITDORF GUARANTEE.

An installation of the thoroughly tested SPLITDORF FORD SPECIAL high-tension magneto—designed and manufactured specially for Ford cars, commercial as well as pleasure—will convince an owner of its absolute merit in getting "the best out of the motor."

With its installation in a few hours by the comparative novice, the expense of vibrators, coils and batteries passes away and A HIGH-TENSION SYSTEM SECURED that gives truly remarkable results.

Write for "Ford Power Possibilities"—a booklet showing how any Ford owner can increase his motor efficiency. It's FREE

A VISION
of your car,
disastrously skidding
on the slippery turn ahead—

You have neglected to put on Weed Chains. **You** anxiously view the slippery turn ahead and have **a mental picture of your car skidding into the school children.**

Stop nursing anxiety and coaxing calamity. For Safety's sake—for your own peace of mind fully equip your car today with

Weed Anti-Skid Chains

The Only Real Safeguard Against Skidding

Safety demands that all tires be equipped with Weed Chains. It doesn't require the gift of second sight to see why this is true. **Rubber slips—never grips.** Rubber will agree to anything the road has to offer. It is the weaker element. It slides on wet pavements like a cake of soap rubbed on the moistened hands. Rubber lacks the bite-and-hang-on ability to prevent skidding.

Weed Chains are diamond hard—many times harder than their opposing element the pavement or road. Wheels equipped with Weed Chains automatically lay their own traction surface. They grip without grinding—hold without binding. **No matter how muddy or icy the road,** they hold on like a bull-dog, prevent side-skid and drive-slip.

Weed Chains are attached in a moment without any jacks. They do not injure tires. Sold for ALL Tires by Dealers Everywhere

TRUCKS GAIN HEADWAY IN MUNICIPAL WORK.

Cities and Towns in Their Various Departments Use Motor Equipment, in Place of the Old-Fashioned Horse Drawn Outfits, with Entire Satisfaction.

SEVERAL years ago, motor apparatus for municipal work of all kinds was considered partly as a luxury and partly as an experiment. It was only recently that the majority of city and town authorities began to recognize that the introduction of automobiles into fire, police, water works, health, school and other departments means a positive increase in municipal operating efficiency, which in turn works an increase of economy in the long run, despite the relatively high initial cost of automobile equipment when com-

pared to the first cost of horse drawn vehicles.

Fire departments were the first municipal organizations to prove this. It soon developed that cities using motor equipment for fire fighting were rapidly cutting down the fire losses suffered by residences and places of business. Progressive fire chiefs were quick in seeing that fire trucks by arriving several minutes earlier at places of conflagrations were often able to quench a fire which would have spread considerably, perhaps once and for all beyond the control of the firemen, had the arrival of horse drawn

Fig. 1—Motor Truck Transferring Passengers to and from Infirmary at Tewksbury.

Fig. 2—Three-Ton Truck and Dumping Body Used by Lawrence, Mass., Highway Department.

equipment been awaited. Water works departments soon followed suit by recognizing the merits of emergency outfits. Likewise, automobile ambulances soon demonstrated their superiority over the old-fashioned equipment and today there is hardly a city of any importance in this country where they are not found.

Especially New England has blazed the way and is still doing so. Motor fire fighting apparatus is found in most leading cities and, having been dealt with many times before, no specific instances will be cited.

The Boston water and sewerage board, which maintains the large park system of the Hub, has in its service a truck, Fig. 4, which is designed to transport a number of men and such tools as are needed to make what repairs are required. The truck here shown is a 1500-pound White wagon and since its installation has given utmost satisfaction to the authorities.

An emergency wagon of the Boston water department of the Department of Public Works is shown in Fig. 3; this vehicle has an open body,

people requiring medical attention to places where they can get it is worth a goodly investment. Therefore, the city hospital has installed two 1500-pound White trucks with special bodies so designed and sprung that patients can be very quickly placed into the interior of the wagon and brought to the hospital. This installation is, of course, only one of many in New England.

Boston also operates a school transfer wagon, seen in Figs. 3 and 7. This truck is covered and equipped with side curtains, which may be rolled down on the sides of the body and fastened outside. The design of the body is very similar to that of the water and sewerage works emergency wagon.

Another interesting application of the motor truck in public works is seen in Fig. 1. This 1500-pound wagon is used by the Massachusetts State Infirmary at Tewksbury for the transfer of passengers to and from Lowell, and it has been in this service for the past three years. Besides this automobile, the institution operates a tour-

Fig. 3—Four Trucks Used by City of Boston, from Left to Right: Emergency Wagon of Water Department; Public Ground Department's Wagon; School Committee's Transfer Wagon; Park Department's Wagon.

Fig. 4—Emergency Wagon of Metropolitan Water and Sewerage Board, Boston.

ing car and two small cars, which serve for the carrying of food from the general kitchen to the several divisions of the infirmary. This work is done three times a day and keeps the machines going most of the time.

Another special truck in the service of the State of Massachusetts is seen in Fig. 5. This is a 3000-pound chassis, has a low, open body and is used for carrying all sorts of freight, as well as arms and ammunition between the state arsenal at Watertown and the different places where military forces are stationed.

A three-ton truck with dumping body used by the street department of Lawrence, Mass., is illustrated in Fig. 2. It is a White truck. A similar vehicle is in use in New Bedford, Mass.

All the instances quoted above are of such service where speed and reliability, the great virtues of the motor truck, are of importance, but where profit is not looked for nor low cost of operation a determinant quantity. Service is the main thing, even if it is expensive. But there is no lack of examples of truck operation in fields where efficiency must be had at a low price. Following is a short description of a truck, and its work, used by the water department of Lynn, Mass., in extending a supply main to the Ipswich river in the town of Lynnfield. This extension is being built of 30 and 36-inch iron pipe and 7000 tons of pipe will be handled in all. Each pipe section weighs about 2.5 tons.

Fig. 8 illustrates the five-ton truck used for the carrying of the pipe sections from the wharf to the point of in-

Fig. 5—Truck Used by Massachusetts State Arsenal for Various Materials.

stallation. The power needed for loading or unloading the truck is supplied by the motor and transmission through a chain driven pinion mounted above the gearset and connected to a bevel gear on the winch cross shaft, which carries a drum at each end. Above the chassis and winch is a platform with openings in it just above the winch ends and with rolls, preventing the rope from binding when it is taut. Two heavy hooks hold a large single sheave block and two transverse bolsters are in place on the platform beneath the hooks. A cable secured to an eye on the far side of the platform is wound around the pipe and the winch and by applying the power of the engine the pipe is hauled up, one man being sufficient to guide the rope.

The truck carries two pipe sections, making up its carrying capacity of five tons. In addition to this load it draws a trailer, which consists of a pair of large wheels and an arched axle from which the pipe section is suspended. Two ratchet gears and a lever arm which may be lengthened by a long pole serve for raising and lowering the pipe.

The complete train, consisting of truck and trailer, travels at a rate of approximately 4.2 miles an hour. Six-sevenths of the material to

Fig. 6—Two White Trucks Equipped as Ambulances and Used by the New Haven Hospital.

be hauled is 36-inch pipe; hence 2400 sections have to be carried from the landing place to the point of destination. On the average the truck has made six trips a day, thus hauling 18 sections, or 45 tons. About 133 days are required to carry all the 36-inch pipe and 30 days to carry the 30-inch pipe. Double teams of horses could make only two trips a day, and it has been estimated that the saving obtained by using motor trucks for this work amounts to 73 cents a ton, or \$5110 for the complete work. Thus the truck will have more than paid for itself when the job is finished and it will be retained by the City of Lynn for divers municipal service, to be worked at mere operating and maintenance cost.

The City of Lynn now owns and operates also two Federal trucks and two touring cars, all of which are kept in a municipal garage combined with the city's stable.

It goes without saying that there are many other opportunities for the motor truck to be put to use in municipal work, such as sprinkling wagons, garbage carts, etc. Undoubtedly these types will be more generally motorized in the near future, and in less than a decade the horse will probably have been eliminated as a factor in public transportation of this sort.

There is a considerable amount of

experimentation going on at present in all the various fields of municipal transportation, and there can be no doubt that the motor truck, if once it has a general and fair trial, will come out with flying colors.

PROTEST FREIGHT CHARGES.

The Lansing, Mich., Chamber of Commerce and the Manufacturers' and Jobbers' Association of that city made complaint against the Central Freight Association, which has a membership in several railroads, that the rates out of Lansing to interstate points on motor car wheels, hubs and brake drums are "excessive, unreasonable and discriminatory". The protest was made at a hearing of the Interstate Commerce Commission June 9.

A revision of Cleveland's traffic ordinances provides that every vehicle, motor or horse drawn, must be equipped with tail lights. The clause is a drastic departure in the new "Safety First" ordinance, operative on everything but a baby carriage. Every vehicle carrying material which projects beyond the dimensions of the body must have a light hanging on the extreme rear end of the load.

Fig. 7—Transfer Wagon of Boston School Committee.

Fig. 8—White Truck Equipped for Pipe Haulage, and Trailer, Which Are Doing Splendid Work in Lynnfield, Mass.

CHICAGO ENFORCING HEADLIGHT LAW.

CHICAGO has begun the enforcement of the headlight ordinance which does not permit motor vehicles equipped with dazzling or glaring lights to be operated on the city streets. The law, which came into effect March 30, provides that a board of motor vehicle headlight inspection be appointed to definitely determine what devices and what arrangements could be permitted as non-glaring.

Lights or devices submitted by manufacturers for inspection are tested first under dark room conditions in a special laboratory at the City Hall. This test is for dazzling or glaring effect alone. The lights that are tentatively approved at this examination are then tested at night under road conditions. Approximately 25 manufacturers, dealers and inventors have supplied from one to four devices each for test. Twelve have been approved by the board, and others are being held subject to further adjustment.

It is the intention of the board to approve, after a fair test, as many lights and devices as reasonably comply with the ordinance, and whenever it has concluded that a rejected device could be changed so as to comply, it has suggested such alterations and offered reinspection.

Whenever a device is approved by the board, a certificate of inspection is issued stating that compliance with the ordinance has been made, and a definite description of the device is incorporated enumerating the exact conditions under which it was approved. Copies of these certificates may be issued by the manufacturer to those who purchase the device and as long as the conditions as to candlepower and adjustment of the headlight are maintained the same as those stated in the certificate of inspection, the owner will be free from molestation by the police. The object of the board, on the whole, is to take away from the policemen the determination of whether or not a certain light is glaring.

It is understood that the ordinance will be enforced for the present only on the streets under the jurisdiction of the city police. The park systems and the boulevards are under the supervision of the police of the different park boards, and so far no definite arrangement has been made toward the application of the non-glaring regulations by these boards. It is stated, however, that the park boards will co-operate with the city police in enforcing the ordinance.

The devices approved are as follows:

Monarch dimmer, made by the Distributors & Manufacturers Company, Chicago. It consists of a frosted celluloid disc to be set against either the inside or outside of the glass.

The Nicholas, made by the Wanner Manufacturing Company, Chicago.

The Daylight dimmer, made by the Dimmer Company of America, Chicago. This comprises a celluloid shutter, which is opened and closed by an attachment on the lights.

The Evening Star, Herman Manufacturing Company, Chicago. A series of opaque glass shutters are set just inside the glass front of the lamp and incline slightly upward and backward. Applicable to acetylene lamps.

The Ritter lamp, made by J. S. Ritter, Chicago. It comprises a molded glass of alternate concentric opaque and clear rings.

The Ellis deflector, made by the Ellis Time Stamp Company, Chicago. A metal construction so designed that it is applicable to any lamp in service. A series of tilting shutters project the rays downward.

Vesta Eclipse, made by the Vesta Accumulator Company, Chicago. It comprises a ground glass, except a circular area in the centre, which is covered by a removable metal disc attached to the outside of the glass, the disc to be utilized in the city. A ground glass device is also made, replacing the usual glass.

Safety First Non-Glare, produced by Charles G. Molam, Chicago. It consists of a parabolic mirror reflector of white enamel with a painted metal cap for fitting in front of the bulb.

The Fowler, made by the Fowler Lamp Company, Chicago. It comprises a concave opalescent or milk white glass.

Nodaz, made by the Ward Leonard Electric Company, Bronxville, N. Y. This device consists of a pair of translucent wings, pivotally mounted, opened and closed by means of electric magnets.

Challen, made by the Challen Anti-Glare Company, Chicago. It is placed inside of the lamp and consists of two annular parts of different diameters placed in front of the centre, but so arranged as to diffuse the rays. It is adaptable to electric and acetylene lamps.

Auxiliary bulbs, Vesta Accumulator Company, Chicago. An auxiliary four-candlepower bulb is substituted for the usual member and is placed close to the upper part of the reflector.

Other devices approved include the J-M, made by the H. W. Johns-Manville Company, New York City; the P. G. N. lamp, made by the J. P. Pagin Lamp Company, and a design by the American Double Lens Glass Company of Chicago. It is stated that frosted bulbs will be approved by the board.

NEW YORK MAKES TESTS.

Under the direction of the technical committee of the Safety First Society, a number of non-glaring devices were tried out in New York City recently. The designs were fitted to machines and the cars were driven over all types of roads, so as to bring into play every factor needed in eliminating the glare from the headlights. No reports or awards were made, the work being simply a demonstration for the officials. Mitchell May, secretary of state of New York, and Borough President Marcus M. Marks, Borough of Manhattan, were among the observers.

CHICAGO-INDIANAPOLIS SOCIABILITY RUN.

Cyclecar Enthusiasts Complete 440-Mile Run Over Sandy and Muddy Roads to Speedway Races and Return---Woods Mobilette Acts as Pacemaker.

THOSE who have questioned the practicability of the cyclecar for touring or its ability to negotiate rough country roads will find ample

proof of the capabilities of these little machines in the successful termination of the sociability run from Chicago, Ill., to Indianapolis, Ind., and return, a total distance of 440.4 miles. Much of the route was over sandy and muddy roads with steep grades, but the cars came through in fine condition. In the last leg of the journey, about 135 miles, there were numerous stretches of bad going, which compelled slowing down the machines to about 10 miles an hour, but excellent time was made. On the first day's run the ther-

mometer registered 96 degrees, but in spite of the intense heat no tire or mechanical troubles were experienced by any of the participants.

Woods Mobilette, Official Pacemaker in Sociability Run of Cyclecars from Detroit to Indianapolis, Ind., and Return—The Car Was Piloted by Wallace Bucher—O. Richard Wolfe, Captain of the Run, Is Shown in the Rear Seat.

The tour was participated in by Chicago and Detroit cars, one group leaving the former city at seven in the morning on May 28, the other members leaving Detroit about the same time, meeting the Chicago contingent at Rochester, Ind., from which point they travelled together to Indianapolis. Just outside the city the tourists were met by a large number of cyclecars and a motor truck carrying a brass band, and escorted to the monument, where pictures were taken.

The 235-mile run from Chicago to Indianapolis was accomplished in two stages, 143 miles

being made the first day. The return trip was made over a different route, with the exception of the first 31 miles, the distance being 204 miles.

The Woods Mobilette, made by the Woods Mobilette Company, Chicago, was the official pacemaker, and was driven by Wallace Bucher, the construction manager, who was accompanied by O. Richard Wolfe, captain of the run. The machine rolled into Indianapolis on schedule time and arrived at the showrooms of the company in Chicago without experiencing any other

Cyclecars Grouped About Monument After Arrival in Indianapolis, Ind., from Detroit—From Right to Left, Woods Mobilette, Official Pacemaker; Scripps-Booth, Mercury, Dudley Bug, Vixen.

trouble than the changing of a shoe just after leaving Rochester. A cut from a broken bottle was the cause of the delay. Although the machines were averaging 20 miles an hour, the pacemaker caught the other cars and assumed its official position.

On the last leg of 135 miles an average speed of 24 miles an hour was maintained, and at times a speed of 40 miles an hour was attained. It was demonstrated that on rough country roads the narrow tread of the cyclecar is an advantage, and that holes in the roads can be avoided by passing between them.

The Woods Mobilette Company has reason to be proud of the performance of its product, as the pacemaker car averaged better than 20 miles an hour in the run to Indianapolis, and over 24 miles an hour on the return trip. At the night and noon stops the cars attracted considerable attention from the residents of the country

for 150 miles at a 20-mile-an-hour schedule and three controls. Many leading cities and towns will be visited.

President Percival offers a silver trophy to the make of car finishing with the largest number of clean scores, and another cup will be given by President W. H. McIntyre of the Imp Cyclecar Company of Auburn, Ind., for the driver having the best general efficiency score. Silver cups will be awarded for the different classification winners, also perfect score certificates. Entry blanks and complete details can be obtained by addressing Dr. Charles G. Percival, president of the Cyclecar Club of New Jersey, Teaneck, N. J.

FUEL IS CHEAPER.

The price of gasoline has again been reduced in Kansas City, Mo. The latest drop, from 12 to 10.8 cents a gallon, makes a decline of 4.7 cents

Showing a Group of Drivers and Cyclecars Photographed in Indianapolis—From Left to Right, Woods Mobilette, Imp, Scripps-Booth, Mercury, Imp, Dudley Bug.

through which they passed. The successful completion of a tour of 440 miles over varying road conditions afforded ample opportunity for testing the efficiency of the various makes represented.

NEW JERSEY CLUB PLANS RUN.

Plans are being promulgated by the Cyclecar Club of New Jersey to hold a 350-mile reliability run on Sept. 6, 7, 8, according to Dr. Charles G. Percival, president of the club. The start will be made from Newark, N. J., on Saturday afternoon, Sept. 6, and the night stop will be at Trenton, where the tourists will be entertained with a theatre party. The second day's run will be to Philadelphia, with the noon control at Atlantic City, where a stop will be made to allow the contestants to take a dip in the surf. The return to Newark will be over a different route, which calls

since November. The last cut was made by the Standard Oil Company and was immediately met by the independents, who have met all cuts promptly.

Braender tires will be used by several prominent drivers in the Sioux City races, July 4, according to the Braender Rubber & Tire Company, Rutherford, N. J. William Chandler, Ralph Mulford and Richenbacker will equip their cars, the "Braender Bulldog", Peugeot and Duesenberg Special, respectively, with the Braender product.

The next meeting of the Cyclecar Club of New Jersey will be held at one of the leading hotels at Newark. It will be preceded by a luncheon, at which the McIntyre trophy and other cups competed for in the cyclecar competitions held recently will be awarded.

SCRIPPS-BOOTH STARS AT TEANECK RACES.

THAT the cyclecar has arrived was demonstrated by the very successful race meet held under the auspices of the Cyclecar Club of New Jersey, which organization has the honor of being the first to give a meeting in this country under the sanction of the Cyclecar Association of America. The contests, which were varied, were held Saturday, June 13, at Teaneck, the farm of Dr. Charles G. Percival, president of the Cyclecar Club of New Jersey.

Four events were on the card, these comprising a slow race, up grade on the high gear; reverse gear event, 75 yards, up grade; highest average or secret time, and a hill climb. The machines were divided into classes, according to the classification adopted by the Cyclecar Asso-

ident of the Cyclecar Manufacturers' National Association, for the driver who scored the largest number of points in the meet.

The manufacturer's cup in the cyclecar class was won by the Scripps-Booth team, captained by H. C. Fairchild of Newark, N. J., with 30 points. The two Twombles, driven by F. Haag and G. A. McLaren, the Newark distributors, won the manufacturer's cup for the light car class with 20 points.

The events took place over a specially constructed track 50 feet wide and 1500 long. Dr. Percival took special pains to make it as uneven and as steep in grade as possible, it having a gradient of one in seven.

The races were preceded by a 38-mile endur-

Some of the Participants in the Endurance Run from Newark to the Farm of Dr. Percival, Where the First Cyclecar Meet Was Held.

ciation of America, comprising the cyclecar, having motors of not more than 71 cubic inches cylinder displacement and 750 pounds chassis weight; light cars, with motors of not more than 101 cubic inches cylinder piston displacement and 950 pounds chassis weight, and small car class, having motors of not more than 125 cubic inches cylinder displacement and 1150 pounds chassis weight.

William Bouldin, 3rd., of East Orange, N. J., carried off the honors at the meeting with his Scripps-Booth stock cyclecar, winning the hill climb, reverse gear race and secret time event. The slow race was also won by a Scripps-Booth, P. G. Scull of Newark, N. J., being declared the winner over James Pearsons of New York City, who drove an O-We-Go. Bouldin captured the McIntyre cup offered by W. H. McIntyre of the Imp Cycle Car Company, Auburn, Ind., and pres-

ance run from Newark through the towns of Bloomfield, Passaic, Paterson, Hackensack, Arcola and Bogota, to the farm of Dr. Percival, where the club members, cyclecar trades people and contestants were entertained at luncheon previous to the contests. A number of out-of-town guests were present, including officials from cyclecar manufacturing concerns. All of the machines finished with a perfect score, completing the distance in one hour and 18 minutes.

The events were held under the rules compiled by the contest committee of the Cyclecar Association of America, which governs all cyclecar competitions in the United States. The meet was a success from every viewpoint. The summary of the events follows:

1000-Yard Hill Climb.

Cyclecar Class—Won by William Bouldin, 3rd., East Orange, N. J., Scripps-Booth; second, James Pearson, New York City, O-We-Go; third, H. C. Fairchild, Newark, N.

J., Scripps-Booth; fourth, P. G. Scull, Newark, N. J., Scripps-Booth. Time, 26 seconds.

Light Car Class—Won by F. Haag, Newark, N. J., Twombly; second, G. A. McLaren, Newark, N. J., Twombly. Time, 27 seconds.

75-Yard Reverse Gear Race.

Cyclecar Class—Won by William Bouldin, 3rd., East Orange, N. J., Scripps-Booth, time, 18 seconds; second, H. C. Fairchild, Newark, N. J., Scripps-Booth; third, James Pearsons, New York City, O-We-Go; fourth, P. J. Scull, Newark, N. J., Scripps-Booth.

Light Car Class—Won by G. A. McLaren, Newark, N. J., Twombly, time, 20 seconds; second, F. Haag, Newark, N. J., Twombly.

75-Yard Slow Race.

Cyclecar Class—Won by P. G. Scull, Newark, N. J., Scripps-Booth, time, 4 minutes, 40 seconds; second, James Pearsons, New York City, O-We-Go; third, H. C. Fair-

child, Newark, N. J., Scripps-Booth; fourth, William Bouldin, 3rd., East Orange, N. J., Scripps-Booth.

Secret Time Race, 1.5 Miles.

Cyclecar Class—Won by P. G. Scull, Newark, N. J., Scripps-Booth, time, 4 minutes, 28 seconds; second, William Bouldin, 3rd., East Orange, N. J., Scripps-Booth; fourth, James Pearsons, New York City, O-We-Go.

Light Car Class—Won by F. Haag, Newark, N. J., Twombly, time, 4 minutes, 10 seconds; second, G. A. McLaren, Newark, N. J., Twombly.

Imp Trophy Cup for Greatest Number of Points in Cyclecar Class—Won by William Bouldin, 3rd., East Orange, N. J., 13 points; second, F. G. Scull, Newark, N. J.; third, James E. Pearsons, New York City; fourth, H. C. Fairchild, Newark, N. J.

Manufacturers' Cup, Cyclecar Class—Won by Scripps-Booth team.

Manufacturers' Cup for Light Car Class—Won by Twombly team.

WILLYS ANNOUNCES NEW SIX-CYLINDER CAR.

AN ANNOUNCEMENT of more than general interest to the automobile trade and public, but particularly so to the many dealers handling Overland cars, is that the Willys-Over-

land with so complete and inclusive a line as to enable them to satisfy the demands of all customers with the product of a single manufacturer.

After having been passed upon by Mr. Willys

Overland Six-Cylinder Seven-Passenger Touring Car, Announcement of Which Is Made by the Willys-Overland Company—The New Machine Is Provided with Every Convenience and Will Sell for \$1475.

land Company, Toledo, is to market a seven-passenger, six-cylinder car, with every modern convenience, to sell for \$1475.

So quietly were the plans made that no inkling of Mr. Willys' intention to enter the six-cylinder field was made public until recently, although the Overland engineers have been developing and testing the new car for some time. It is stated that the machine embodies the best of material and workmanship. The design is founded on sound engineering practise. The retail price is made possible by the quantity production of the factory, which produced 50,000 four-cylinder cars this year.

While a larger number of four-cylinder machines will be built in 1915, the new car will serve the purpose of providing the Overland dealers

and his sales staff, the production of the new six will progress with the usual Overland celerity, so that an adequate supply will be ready for the market late in the summer or early in the fall.

In appearance the Overland six is stylish and attractive. It has a long stroke motor, rated at 45-50 horsepower, streamline body, 35 by 4.5-inch tires and demountable rims, electric lighting and motor starting, as well as other modern conveniences. The wheelbase is 125 inches.

The Eighth Annual Touring Number of The Automobile Journal, to be published July 10, will be the most comprehensive ever compiled. It will be replete with hundreds of new photographic reproductions of scenes of interest and beauty.

DETROIT ADOPTS SAFETY TRAFFIC RULES.

DETROIT'S new traffic rules, which make for safety of the pedestrians and permit of parking motor cars more compactly, are being taught to the automobilists, pedestrians and other users of the streets. Traffic is more complicated in Detroit because of its practically one main street, Woodward avenue, which thoroughfare is very popular with motorists.

The more important improvement in the regulation of traffic is the marking off of special spaces across the streets for the exclusive use of the pedestrians. These spaces have the width of the sidewalk, an average of 18 feet, and are marked off with white paint, as shown in the accompanying illustration. All vehicles, horse drawn, motor driven, street cars, bicycles, etc.,

in this space". These signs are easily read.

Of the estimated 17,000 automobiles owned in Detroit, it is stated that between 2500 and 3000 are parked daily between the hours of 11 and 5 o'clock within a radius of half a mile from the City Hall. The first improvement the traffic department inaugurated was the parking of the cars in the business district. In the more important streets and those wide enough, eight-foot spaces have been marked off for a distance of about a quarter of a mile. All machines are parked obliquely, instead of lengthwise, and it is estimated that three times as many cars can be parked by this method than were formerly. It is figured that, with 190 cars parked obliquely, a saving of 760 feet of space is effected in a short distance.

Showing Detroit's Busiest Corner, Woodward Avenue and Fort Street, and the White Safety Lines for Pedestrians.

must stop in front of the first white line. Pedestrians are requested to cross the streets within the lanes or marked spaces. Whenever someone crosses beyond the marked lines, the traffic officers stationed at the crossings signal to him or stop him when possible, and call his attention to the white lines, as well as request that he must not cross the street or square outside the marked lines.

Small posts, bearing the following inscription, are placed, during the hours when traffic is most heavy, at the principal crossings, on both sides of the car tracks: "Vehicles must not stop on crosswalks. Drivers will be prosecuted". Another sign is "Danger. Cross with the cars". On the curbs or sidewalks on several streets and in front of theatres and big stores are posts bearing the following notice: "Motor cars must not park

The new regulations are to be rigidly enforced. If the machines are not parked properly the officers propose to tow them to the nearest police station, where their owners will be warned and arrests will follow the second offense. Minneapolis, St. Paul, Indianapolis and other cities have adopted the safety lines, and policemen are empowered to force pedestrians disregarding the rules to return to their starting point and cross within the zones.

Complete Directions are supplied in the Eighth Annual Touring Number of The Automobile Journal, with detailed mileage points and total miles from the night stop, both going and returning. The value of this routing cannot be over-estimated, since it permits of using the itinerary in any way desired.

SUNBEAM WINS TOURIST TROPHY RACE.

THE ORDER OF FINISH.

No.	Car and Driver	Time	MPH.
4	Sunbeam, K. Lee Guinness.....	10:37:49	56.44
19	Minerva, Riecken.....	10:57:38	54.74
12	Minerva, Molon.....	11:22:20	52.76
3	Straker-Squire, Mitchell.....	11:22:50	52.72
1	Minerva, Porporato.....	11:40:44	51.35
8	D. F. P., Bentley.....	12:24:01	48.38

A SUNBEAM car, driven by K. Lee Guinness, retained the supremacy of England in the Tourist trophy race held on the Isle of Man circuit, June 10 and 11, breaking all records for the event by averaging 56.44 miles an hour for 600 miles, 300 of which were driven on June 10. It was the fifth win for England since the classic event began with the Gordon Bennett trials in 1904, when C. Jarrott, driving a Wolseley, won with a mean speed of 35.5 miles an hour. The best previous record up to Guinness' performance was 50.5 miles an hour, by W. Watson in a Napier in 1908, but this contest was but 339.5 miles.

New Record Established.

Guinness made excellent time when it is considered that the circuit abounds with many steep grades and tortuous turns and that the race was limited to motors with a piston displacement of 202 cubic inches. He put the Sunbeam to the front in the first lap in the opening day and was never headed. During the first eight laps of the 37.5-mile circuit he averaged 57.5 miles an hour, and his fastest lap was at a rate of 59.3 miles an hour. But six machines finished, the Minerva, equipped with a sleeve valve motor of the Knight type, taking second, third and fifth places, thereby winning the team prize of \$1500 offered for the best average of a team of three cars in the race. A Straker-Squire, an English machine, finished fourth, while sixth went to the D. F. P., a representative of France. Of the 23 cars entered 14 were eliminated because of mechanical troubles, two upset and one did not start because of a burst flywheel. The showing of the specially designed Vauxhalls was a keen disappointment, two going out in the first lap of the first day, while the other upset in the 13th lap.

Special Motors Used.

The majority of the cars were equipped with special racing motors and were restricted to a minimum weight of 2408 pounds. The chassis were required to have a minimum tread of 54 inches, and a wheelbase of not less than 108. Under the rules all machines had to be fitted with mufflers or an effective means of silencing the exhaust that would meet with the approval of the

judges. The use of any kind of fuel was permitted.

Two of the Sunbeams took the lead from the start when one was forced out by a broken universal joint in the 12th lap. Very little tire trouble was experienced, and with the exception of the German cars Dunlop tires were used on all machines. The drivers of the Minervas furnished the thrills, taking corners at high speed. These cars were early protested because of the excessive smoke, but the judges overruled the protest.

Fast Time on Hill.

Time was taken of the contestants on one of the mountain climbs on the circuit. Many of the leaders averaged 55 miles an hour, remarkable speed for such small machines. Under the rules the contestants had to cover eight laps or 300 miles each day.

The motor used in the winning Sunbeam is a special design with valves in the head. The four cylinders are cast en bloc and have a bore of 3.18 inches and stroke of 6.29. The engine is very compact and has a small appearance when compared to other types because of the use of two separate cases for the camshafts. Two intake and two exhaust valves are fitted to each cylinder, and by using two camshafts rocker arms are eliminated. Instead of a roller a very light rocking finger is interposed between the cam and the pushrod. Drive is by a train of spur gears.

Features of Sunbeam.

Another departure from Sunbeam practise is the use of a ball bearing crankshaft. Three bearings are employed, and in order to mount the centre bearing the crankshaft is made in two parts. Balancing masses are used and these are light. Lubrication is by air pressure from a dash tank and there is a pump in the sump which exhausts it, returning the oil to the tank. The clutch is a Ferodo-faced cone and a clutch brake of large size is employed. The gearset is of the four-speed type and behind it is an expanding design of brake. The axle construction is conventional, but the propellor shaft is exposed and has two universal joints. The rear springs are underslung semi-elliptic and both front and rear sets are equipped with Houdaille shock absorbers.

The Information presented in the Eighth Annual Touring Number of The Automobile Journal, July 10, could not be secured in any other form for less than 100 times the price.

C. A. C. WINS INTERCLUB MATCH.

Defeats Chicago Automobile Association in Annual Contest, for First Time in Five Years, by Revised Score of 188 to 246—Seventeen Perfect Score Cars.

WHAT may be termed the most important touring contest of the season, now that the Glidden tour has been abandoned, is the annual interclub team match between the Chicago Automobile Club and the Chicago Athletic Association, a contest for the private owner and one in which no one in the trade is permitted to take part. For seven years the rivalry between the organizations has been very keen and the winning of the event, held on June 12 and 13, by the Chicago

The Interclub Trophy.

Automobile Club, is its first since 1909, the Chicago Athletic Association having five bars on the interclub trophy.

The run was from Chicago to Peoria, Ill., and return, a total distance of 360 miles, and the C. A. C. won by a revised score of 188 to 246 for the C. A. A. The latter was represented by 12 cars and had few points penalty, but, owing to its having a smaller team, it was charged a full point each time, while the C. A. C., with 15 cars, was penalized twelve-fifteenths of a point. Also it had two more perfect score cars, which cut down its demerits. As will be noted by an accompanying table, which gives the penalties by day and credits, the C. A. C. had 10 perfect score machines, and the C. A. A. seven.

The regulations evolved by the Chicagoans are simple. They penalize for work and time and for motor stops, and instead of being an individual affair the demerits are charged against the team. As a result the contestants take long

chances. Recognition is made of a driver who has a clean score, five points being awarded. According to the rules it is not necessary that the teams be equal in number, as a fractional penalization is made where one team is larger than the other.

The second day's run from Peoria, Ill., to Chicago, was marred by rain and the muddy roads were responsible for the spoiling of several perfect scores. At Peoria the Chamber of Commerce, the Peoria Country Club and the Creve Coeur Club played hosts to the tourists, who were accompanied by a number of prominent Chicago city officials. The rules that governed the contest were as follows:

Entries.

The contest shall be a team match between teams composed of members of the two organizations above named, who are not identified with the motor industry, and who must own the cars they drive. Sons of members may drive as heretofore. The team with the fewest points penalization shall hold the trophy. The losing team shall pay for a dinner to be given the winners immediately following the completion of the match.

Cars.

There shall be no restriction as to cars entered other than that they shall be fully equipped according to catalogue specifications.

The contest shall be run under grade three of the American Automobile Association classification, which reads as follows: "A contest of any duration in which penalties are imposed for time and road work only, but in which the final operative test and preliminary and final technical examinations provided for in rules 435, 502, 504, 505, 506 and 516 are omitted, shall be known as a contest of the third grade under the rules of the A. A. A."

Penalizations.

The winning team shall be that team which has the fewest penalizations according to the following schedule:

Time.

One point per minute or fraction thereof, late in arrival at any control or checking station, each car being given a leeway of three minutes to allow for a difference in watches. In case of penalization due to work done on the car on the road, the time taken in doing the work will be added to the running time to the next control.

Credits.

For each perfect score a credit of five points will be given the team which this car represents. In case of teams of unequal size, a fractional credit will be given the same as when penalties are fractionalized.

One point per man per minute, or fraction thereof, for labor by driver or passengers.

Two points per man per minute, or fraction thereof, for labor by workmen other than driver or passengers.

Two points per man per minute, or fraction thereof, for replacement of damaged parts by drivers or passengers.

Four points per man per minute, or fraction thereof, for replacement by workmen other than driver or passengers.

Three points per occurrence for replenishing gasoline, oil, or water, outside of fuel controls.

Motor Stops.

One point per minute, or fraction thereof, for motor stop when no work is done. No penalty for motor stop

during period when work is being done on car, for which work or replacement a penalty is imposed. (See A. A. A. rule 519.) There shall be no penalty for motor stops occasioned by signals of drivers of horse drawn vehicles, observer to be the judge.

Rule 519. Motor Stops.—Motors may be stopped at controls and while gasoline is being taken on. Other stoppages of motors between the starting and finishing of each day's run, except for tire trouble, will result in a penalty of one point per minute or a fraction thereof for time stopped when no work is done on car. No penalty, however, shall be charged for a motor stop during the time occupied by a replacement or work in a car for which replacement or work a penalty is imposed. Cars can check in at the night controls only on schedule time just the same as at noon. If entrants get in control ahead of time, motor must be kept running until time is up.

Motors of White steamers may be stopped for not exceeding 10 seconds in order to disengage the clutch when stopping or starting the car; also the motors of Stanley steamers must necessarily be stopped while the car is stopped. Steam cars may be stopped without penalty in order to replenish the water tank at the fuel controls. Cars cannot voluntarily leave the course.

Stopping the motor to put on tire chains will be permitted.

There shall be no penalty for tire work except in case the contestant fails to finish within two hours of his

Accidents to accessories will not be penalized except in case of shock absorbers, which will be charged at the rate of two points per man per minute taken in repairing same.

In case the contesting teams are not of equal size, the smaller team shall be penalized according to the above schedule, while the larger team shall be given a fractional penalization, the numerator of which fraction shall be the number of cars in the smaller team and the denominator of which fraction shall be the cars in the larger team.

Women Not Eligible.

No women are allowed to participate either as passengers, observers or drivers in the team match.

In case of illness after the start emergency drivers may be used.

Drivers must not rely upon information obtained from observers as to route to be followed or as to any question as to penalties or rules.

Each car must be checked in with the starter 30 minutes before the start or else be penalized one point per minute for each minute late in reporting after that time. This means 6:30 a. m.

Observers.

The joint committee shall appoint observers, one for each car, and said observers shall occupy the seat beside the driver throughout the run. Each observer shall be provided with a blank form on which record shall be

Final score, 246.					

Note—The Chicago Automobile Association had fewer points penalty, but owing to its having a smaller team it was charged the full point penalty each time, while the Chicago Athletic Club, with three more cars, only was penalized twelve-fifteenths of a point. Also it had two more perfect score cars, which cut down its demerits.

schedule time at any control, when he is penalized 200 points; if more than three hours late, he is given 250 points for that day. Failure to finish either day's run incurs a penalty of 250 points, or 500 points for both days.

Motor stops will be allowed without penalty for tire repairing, but in such an event the tire must be entirely deflated by puncture or accident, of which the observer shall be the judge.

The total maximum penalization for any car shall be 400 points for both days, except in case of withdrawal.

A penalty of 200 points will be imposed for failure to finish each day's run within two hours of the scheduled time or for disqualification for any cause each day, 250 points for that day.

Penalties.

A contestant withdrawing from the match shall incur a penalty of 500 points. If a contestant is more than three hours late at either night control he is automatically withdrawn from the contest and is penalized 500 points.

Lubricators must not be adjusted during the match, but grease cups may be screwed down at controls. Oil, water and gasoline may be taken on at controls only.

In working on tires a driver may receive assistance from passengers without penalty.

In working on a car a driver may receive assistance from passengers, but the usual penalties will apply.

made of any occurrence which receives penalization. He shall also see that this blank form is handed to the checker at each control or checking station, in order that the time of arrival may be stamped thereon, receiving same from checker after the time has been marked. At the end of the run the observer must sign his card and hand it to the judges at the finishing point.

Running Regulations.

Entrants must conform to the laws and ordinances of the road and shall show due consideration to other participants in the tour and other users of the highway. Arrest for violation of the speed laws will result in a penalization of 10 points for each and every offense.

Protests.

All protests as to entries must be made to the referee before the start. All other protests must be made during the run on or before noon the next day after the contest, and must be in writing.

Regulations.

Every entrant must become acquainted with these rules and by entering agrees to abide by them. He shall hold the Chicago Athletic Association and the Chicago Automobile Club harmless and indemnify them against any loss or damage directly or indirectly growing out of the operation, management or control of the car entered by him from the time it starts in the contest until the completion of the contest.

ENGINEERS CONVENE AT CAPE MAY.

President Leland Opens Semi-Annual Meeting of S. A. E. with Pertinent Address—
Taxation of Motor Vehicles One of Many Interesting Papers.

THE semi-annual meeting of the Society of Automobile Engineers at Cape May, N. J., opened with the standards committee meeting

Tuesday afternoon, June 23, which was followed in the evening by a meeting of the boards of governor sections.

The business session Wednesday afternoon was inaugurated by the address of President Henry M. Leland, who is so well known to the automobile industry that comment is unnecessary. He spoke of the opportunities of the engineer, both from the engineering standpoint and as men, and complimented the members of the automobile industry. He said in part:

Perhaps more closely related to engineering interests is our standing and affiliations as engineers. It was my privilege in 1910 to be entertained with some of you, by the Institute of Engineers of Great Britain, with a large party of the members of the American Society of Mechanical Engineers. In the summer of 1913 I again had the privilege of going with the same society when we were entertained by the German Engineering Society in 12 of the principal cities of Germany. We were most royally entertained and the trip was from the beginning a revelation of the most interesting experiences for a mechanical engineer. One thing that impressed itself very strongly upon me was the greater, the better standing which the engineers of both Germany and England seem to have with their governments and communities, as compared with conditions in this country.

In many ways we saw unmistakable evidence of the better standing of the engineering profession in both these countries than we enjoy here in the United States. In casting about for a reason for this state of things, it occurred to me that it may be due to the fact that in both these countries all the various classifications of engineers are merged together in one great national engineering organization. This gives far reaching and more important dignity and standing to the profession and I hope that measures will be taken in the not distant future to have all engineering societies in the United States join in a like organization.

The automobile engineers of America have the greatest reason to be proud of the progress and development of their profession in the very few years of its existence. History has nothing to record to compare with it. This progress would not have been possible except for the peculiar genius of our trained young men which enables them to think and act quickly and accurately.

Similarly the members of the Society of Automobile Engineers have cause to feel pride in their organization which has so quickly and thoroughly shaped itself into the technical heart and head of the industry. It draws together in personal fellowship all members of the great family. It unitedly solves the problems which none alone could master.

Taxation of Motor Vehicles.

One of the most interesting papers to be presented at the meeting is that to be read on Thursday, June 26, when C. O. Egerton and S. I. Fekete, members of the society, will read "An Engineering Basis for Taxation of Motor Vehicles", which discussed the wear of highways from an engineering point of view. The paper follows:

Within the last 10 years the highway builders of this country and Europe have been compelled to make radical and costly changes in their methods of road construction. That these changes have been occasioned largely by the introduction of automobile traffic is undeniable, for the problem of economic construction and maintenance of roads for horse drawn vehicles was satisfactorily solved approximately a century ago by English and Continental road builders.

But because automobile traffic has destroyed roads which successfully sustained animal propelled vehicles, let us not indict it with wanton destruction of property until its side of the case has been fairly presented. If we were to take a typical automobile and a typical horse and wagon of equal weight and move them over parallel stretches of equally good roads at equal speeds until the road surfaces were no longer fit for economical use, we would probably discover that the roads would wear out at very nearly the same time. If one road lasted longer than the other it would quite possibly be the road traversed by the motor car.

Actually, then, the cause of the increase in road destruction is due in the first place to the speed at which the motor car can move as compared with a horse and wagon; and in the second place to the increased volume of automobile traffic as compared with animal traffic. The cause for the former popular demand for a specific automobile tax arose probably from the fact that the motor car when first introduced was considered a luxury, while the horse and wagon have been regarded as necessities from time immemorial. At the present day, however, this distinction is certainly obsolescent if not obsolete. While it is essentially illogical that horse drawn

vehicles should be exempt from specific taxation, when they undoubtedly do their share of road damage, it is nevertheless a fact that motor vehicle users are the staunchest supporters of road extensions and maintenance.

nance, as well as the greatest beneficiaries therefrom, and as such should not escape a reasonable share of the expense so entailed, whether the cost is levied as a specific motor car tax or as one upon personal property. As-

suming then that the motor car owner is to pay a reasonable tax, the amount of his contribution should be in direct proportion to the amount of damage which his vehicle is capable of inflicting upon the road surface.

The amount of damage which a vehicle can inflict upon a road is fundamentally dependent upon its weight and its velocity, but in order to better study these elements we must dissect them as far as possible.

The destructive power of weight alone upon a given type of road surface may be summarized as follows:

1. It is proportional to the pressure per square inch of tire contact.
2. It is dependent upon the character of contact, i. e. whether metal, solid rubber, or pneumatic tires are used.
3. It is inversely proportional to the contact diameter of the wheel.

The destructive power of velocity in conjunction with weight upon a given type of road surface is proportional to the linear distance which the point of road contact progresses in a unit of time which is, of course, directly dependent upon the capacity of the motor.

In other words, combining both elements of weight and velocity, the destructive capacity of a motor vehicle is dependent upon the resistance encountered due to contact of various types of wheels with road surfaces at various speeds.

To set forth as clearly as possible the state of equilibrium existing between the forces producing and the forces consuming the vehicle's energy, let us suppose that we have in a convenient place on the moving vehicle two indicators. Let us say that the first indicator registers the speed of the car. The second indicator registers the horsepower acting through the drive wheels at the speed shown by the speed indicator. If now we start the car and gradually increase the speed until we are unable to make our speed indicator register any increase of velocity, we shall arrive at the conclusion that the power registered at that speed by our power indicator is being entirely consumed in overcoming external forces acting upon the car.

The external forces which prevented increase of speed in our supposed car are two in number, and are:

1. The resistance which the surrounding air offers to being displaced by the moving car.
2. The resistance which the road surface offers to being displaced by the wheels of the moving car.

Let us consider the general characteristics of these two resistances.

The work required to move a vehicle against air resistance is proportional to the area exposed and proportional to the square of the velocity at which the vehicle moves. If we plot as a curve the work required to overcome air resistance, using for abscissae the velocities of the moving vehicle in miles per hour, and for ordinates intensity of pressure at each velocity, the curve will be similar to that shown in Fig. 1.

According to the theory of rolling friction, a body passing over a surface produces a depression in that surface. The depth of this depression depends upon the relative hardness of the surface and that of the body.

The force required to produce motion in the above rolling body varies directly as the pressure between the body and the surface; directly as one-half the chord of the arc of depression; and inversely as the radius of the rolling body.

Referring to Fig. 2,

$$F = \frac{W \cdot oc}{r} \quad (1)$$

$$oc = \frac{F}{W} \cdot r \quad (2)$$

W = Weight in pounds upon wheel.
F = Force in pounds to produce horizontal motion.
r = $\frac{1}{2}$ diameter of wheel.
oc = Coefficient of rolling friction.

In this equation the fraction $\frac{F}{W}$ represents nothing else than the force per pound of weight required to cause rolling motion.

The magnitude of the fraction $\frac{F}{W}$ may be accurately determined experimentally from the various combinations of road surfaces, types of tires and wheel diameters in common use at known speeds. Let us suppose we have determined by means of draw bar dynamometer or by retardation the value of $\frac{F}{W}$ required to move various diam-

eters of wheels equipped with a certain kind of tire over one class of road surface at known speeds. Having done this we may from equation (2) compute the values of oc for various sizes of wheels for each possible combination of tires and road surfaces. The results of the foregoing computation may then be tabulated; a separate table being made for each combination of tire and road surface and each table giving the value of oc corresponding to various possible diameters of wheel.

If we plot a curve representing the work required to overcome road resistance, using for abscissae the velocities of the moving vehicle in miles per hour, and for ordinates the magnitude of the tractive effort F, which will be required to overcome the force caused by road resistance at that velocity, we will have a curve similar to that shown at Fig. 3.

The force F is in effect that which would be directly exerted by a horse in dragging a vehicle.

In our case we must instead deal with a force tending indirectly to produce horizontal motion by rotating a wheel. In other words, we have a mechanical couple composed of a force F tending to rotate the wheel through the medium of a gear or sprocket; opposing the road resistance R applied at the tread of the tire. (See Fig. 4.)

Instead, therefore, of pure rolling action we have a

combination of rolling over the road surface and a tangential force acting between the tire and the road surface.

There will be two stages of the tangential phase:

First, when the torque rotating the wheel is less than the torque due to the adhesion between the tire and road. Second, when the torque rotating the wheel is more than the resisting torque due to adhesion between the tire

and road. In other words, the two stages are when the tire does not slip and when it does slip.

There are three general classes of road surface to which we should give consideration in regard to their behavior under the action of wheels.

The first class, such as brick and concrete, which show comparatively little deflection under the action of rubber tires.

The second class, such as asphalt, macadam, and bituminous macadam, which show some noticeable depression under wheel action.

The third class, such as gravel, earth and sand, which show very considerable depression under wheel pressure. In other words, the surfaces are classified according to the approach of their materials toward theoretically perfect elasticity.

If we take the case of a concrete road or one of brick supported upon a concrete foundation, we have a condition closely resembling that of a beam uniformly supported from below and acted upon from above by repeated stresses. By simply making the depth of concrete sufficient the section subjected to stress will be able to sustain an almost infinite number of deflections without fracture. Consequently it would appear to be a practical impossibility to destroy an adequately constructed concrete road by rolling a loaded wheel over it.

If destruction exists, then it must be due principally to the abrasive action of the rolling body. Abrasive action being purely a function of the relative hardness and relative speed of the rubbing surfaces, it is obvious that an ordinary steel wagon tire can do much more damage than a rubber tire for the following reasons:

A concrete surface consists actually of an almost infinite number of minute particles of sand and rock which project very slightly above the cement matrix in which they are embedded. The abrasive action therefore consists in either dislodging these from their bed or in crushing them. A rubber tire clearly cannot crush these particles, for being so much softer it is merely depressed by them and dislodgement while not impossible is improbable since it would be liable to occur only when the tire has in addition to its rolling motion a slip relative to the road surface. Below the average legal limit of speed this slippage has been shown to be so small as to be almost negligible. (See deduction of Henry Southern on "Tire Slippage at Brooklands Race Track", S. A. E. data sheets.)

A steel tire in passing over projecting particles, however, has by virtue of its hardness the power to crush them. They then become powder, which is removed by wind, weather or other passing vehicles, leaving other similar particles exposed to subsequent similar action.

Let us suppose the second class of road surfaces is composed of a layer of short vertical rods fitting into sockets at their lower ends to allow oscillation in the direction of progression (see Fig. 5). The displacement of these rods as the wheel passes over them will be as follows: First, the rods ahead of the wheel are deflected in the direction of progression. Second, at some stage of the passage of the wheel the tangential component force due to the drive of the wheel becomes greater than the normal component due to the weight carried, with the result that a rod is deflected opposite to instead of in the direction of motion; thus creating or tending to create a space between it and its neighbor.

If, instead of independently acting rods, we have a surface layer composed of small crushed stones held together only by some adhesive compound, either a rup-

ture or a severe strain is certain to occur at the point of deflection reversal.

With a substance possessing theoretically perfect elasticity the amount of work necessary to produce fracture of a given section is of course a fixed quantity; and the fracture may be produced either by applying a force of great intensity for a short time or by applying a small force for a long time.

A road surface composed of macadam held together by a bituminous binder is far from possessing perfect elasticity, so that while the viscous properties of the binder may reunite the particles of stone after a strain has been produced by a slowly acting force, it is reasonably certain that a suddenly applied force will completely rupture the continuity of the binding compound.

The power to produce this rupture is then clearly a function of the velocity with which the neighboring particles are separated and hence proportional to the velocity of the vehicle.

This tendency to break the continuity of the road surface is, however, only the first stage of the destruction. The second stage is reached when the speed of the vehicle is such that there is appreciable slippage between the tire and the road surface. The particles which have become loosened by the first stage of the process or during the passage of some preceding vehicle are then actually extricated from their place in the surface by contact with the tire which then has motion relative to the road surface instead of merely rolling over it.

In the case of road surface composed of yielding material, such as sand, gravel or earth, having no extraneous material to bind its particles together, the particles subjected to pressure from a wheel are displaced until brought to rest by the friction between neighboring particles. If we assume a static condition of a wheel resting upon such material, it will resemble that shown in Fig. 6. Suppose further that the material is composed of small, nearly uniform spherical particles. As the load of a wheel is applied acting through the resultant W to one particle of the upper surface, this particle is depressed, and as it moves downward it divides the pressure between two particles beneath it. These two in turn divide the pressure between three, and this process continues downward until the pressure has been distributed among so many particles that each particle no longer has sufficient pressure upon it to produce motions in its neighbors.

In other words, a state of stable equilibrium has been reached. Of course, instead of one particle being in contact with the tire, its weight is distributed in small increments like W^1 (Fig. 6), which are resisted by uniformly distributed small increments R^1 (Fig. 6), but the process of weight distribution is essentially as described and we have formed beneath the tire a cone shaped mass. The sides of the cone make the angle B with the base,

which is, in fact, the angle of repose for the material under consideration. Such is the condition under static load.

Supposing now that we have the wheel progressing

at a considerable velocity and at the same time exerting a turning effort against the road surface, we will have a condition similar to that shown in Fig. 7. We must now deal with a resultant pressure on our hypothetical cone, the direction of which is no longer vertical, but deflected toward the rear of the moving vehicle. The pressure in question is the resultant of the combination of weight on the moving wheel with a tangential component due to the torque which produces rotation in the wheel. What we find, therefore, is that the axis of the cone is no longer vertical, but takes such an angle that the rear surface of our cone shaped mass approaches or passes a horizontal line at the road surface. As long as the cone remained with its axis vertical there was sufficient mass of particles surrounding it to prevent any upheaval, but with the inclined position some of the stressed particles in the area of disturbance are exposed. The result is that there is an actual upheaval or wave formed behind the wheel. Because of this wave there is a displacement of material from the road surface.

It should be noted here that the same power of wave formation exists in the case of a horse drawn vehicle, the only difference being in degree and direction of propagation of the wave. The horse drawn vehicle propagates its wave ahead of instead of behind it, due to the fact that the friction of the wheel hub on the axle sets up a resistance to rotation which is balanced by a force acting between the tire and the road surface.

The conclusion we may draw from the analysis, however, is that the power as well as to some extent the velocity of the vehicle is instrumental in destroying the soft type of road surface. Perhaps the most perfect engine of destruction ever devised for this class of road is the horse drawn buggy with an extremely narrow steel tire which cuts into the road surface with all the speed and effectiveness of a thin knife, leaving a rut which is augmented by succeeding vehicles with even normal tire widths. The action of tires having excessive pressure per unit of contact surface is therefore abnormal and will not be included in our analysis.

A potent factor in destruction of both soft and medium-hard roads is the action of a car as it passes rapidly around a curve. In this case the tendency of the tire to skid under the action of centrifugal force is proportional to the square of the velocity of the car and the radius of the curve upon which the car turns. The point we wish to bring out, however, in this connection is that the velocity of a vehicle is a considerable factor in the destruction of all classes of roads, and that for a given type of tire the coefficient of c will differ for each type of road.

Now that we have noted the effect of resistance to car velocity upon road surfaces, let us next look into the general relation of power to resistance. In Fig. 1 we plotted a curve which expressed the magnitude of the force set up by the air resisting the passage of a vehicle moving at various speeds. In Fig. 3 we plotted a curve which expressed the magnitude of the force set up by the road surface resisting the passage of a wheel moving at various speeds. The total resistance encountered by the car is, therefore, equal to the sum of the two individual resistances. In both Figs. 1 and 3, the scale of abscissae and ordinates was the same, so that if we wish to express graphically the magnitude of the total resistance to motion of a moving vehicle, we may do so by plotting on the same scale of co-ordinates a curve, the ordinate of which at any given speed is equal to the sum of the ordinates for each of the characteristic curves at that same speed. Fig. 8 shows such a curve. The work by which we overcome the work due to total resistance, represented by the area under the combined resistance curve (Fig. 8) is nothing else than the work delivered at the rear wheels by the motor acting through the medium of the transmission system.

Suppose that we plot upon the same system and scale of co-ordinates, a curve, the ordinate of which at any given speed is equal to the magnitude of the force propelling the aforesaid vehicle. Then assuming that our horsepower is of constant magnitude it will be represented by a curve shown in Fig. 9.

As a means of comparing this latter with our total-resistance curve, let us superpose one upon the other, keeping our base line and origin coincident as in Fig. 10. Near the point of zero velocity the ordinates of the propelling force curve are much higher than those of the total-resistance curve. The ordinates of the total-resistance curve, however, increase as we move toward the right until we finally reach a point at which the ordinate

is equal to the ordinate of the propelling force curve for that velocity.

The significance of this coincidence is that at this velocity the propelling and resisting forces are exactly in equilibrium, and that this velocity may be maintained but cannot be exceeded. If we consider a vehicle of the same mass as the one just mentioned, but impart to it a propelling force equal to only one-half that of the first body, then clearly the curve of propelling forces will intersect the curve of total-resisting forces at a point much nearer the zero velocity than was the case with the first body. Hence, maximum possible velocity is proportional to propelling force.

Should we wish now to pass from a consideration of propelling and resisting forces to a consideration of work required for propulsion and resistance, we may do so by comparing the areas under the plotted curves. From such comparison we shall see that from the point where the curves of propulsion and resistance intersect, the velocity will remain constant and its product by the ordinate at that point will be equal to the power required to maintain that velocity.

The moving vehicle which has been under consideration might be either an animal or a mechanically propelled vehicle, and still be susceptible to the same treatment, but of course the power and resistance curves would present different characteristics. As an example, Fig. 11 shows the curves for a horse drawn vehicle and a motor car. In the case of the horse drawn vehicle the only resistance which we have to overcome is the road resistance. The line representing the propelling force is

a straight line parallel to the base line and its distance above it is proportional to the number of horses pulling upon the vehicle.

Nearly every state in the Union imposes a limit upon the speed at which a vehicle may travel over its roads. An average taken of the limits in 38 states shows itself to be approximately 25 miles per hour.

In volume one of the S. A. E. data sheets is a table compiled by Mr. Churchward, giving ideal speeds in miles per hour for vehicles of various weights. A prefixed note says: "Taking everything into consideration, that is to say, life of engine, transmission, tires and maintenance of vehicle as a whole, experience has shown that the following table of economic speeds is approximately correct".

The speeds given in that table are lower than the average of the state limitations. If we consider that on our graphical representation of road resistance and tractive forces, our lines represent average relative conditions of power to road resistance, it is clear that an average automobile has a power which is sufficient to exceed the speed limits fixed either by law or by general expediency regarding life and maintenance of car. The question naturally arises at this point, therefore, why should we, as is now the general tendency, tax a man in proportion to the power of his motor when actually he must not only break the law to use the full power for which he is taxed, but also must shorten the life of his vehicle by so doing. It is quite presumable that with efficient police regulation a man cannot habitually or with impunity exceed fixed speed laws. Moreover, looking at a motor car as a pleasure vehicle, it is

doubtful if the occupants of a car derive any genuine pleasure or benefit from speeds in excess of 25 miles an hour.

Looking at the subject from all angles, then, it is very doubtful if a conservative man cares to drive his car at a higher average speed than 25 miles an hour, so that the average of road resistance which we must consider will be that encountered at that speed. But as we have previously stated, the destructive effect of a vehicle on the road at a given speed is measured by the resistance encountered at that speed; so that our measure of the destruction which a car can cause to a road will occur at the legal speed, which is 25 miles per hour.

Any road vehicle, then, should be primarily taxed in proportion to its road destructive power and hence in proportion to its road resistance at its allowable speed, and not at a speed in excess of that, even though the motor may be of sufficient horsepower to maintain a higher rate of speed.

It is not alone sufficient, however, that the vehicle should be taxed entirely in proportion to the road resistance. As is very evident, certain classes of vehicles use the roads a far greater number of hours per day, week, or month, than do other classes, and the amount of work which they do in destroying roads is directly proportional to the relative length of time during which they are in motion on the roads.

The problem of determining an average of the number of hours per day spent by each class of vehicle on the roads is somewhat difficult. In this respect we will class vehicles under the heads of commercial and pleasure vehicles. Of the commercial vehicles, omnibuses use the roads the greatest number of hours per day. If we assume that they give continuous service (365 days per year) from 6 in the morning until 9 at night, we shall be well within the actual limits of operation. This gives 15 hours per day during which they use the roads.

Motor trucks are the next in order of length of time per day, which, if we consider the average business day, will be about 10 hours. Inasmuch as there are but about 300 working days per year, allowing for Sundays and holidays, the average as compared with omnibuses and

pleasure cars will be $10 \times \frac{300}{365}$ hours, which makes a daily average of about $8\frac{1}{4}$ hours.

With pleasure cars the time factor is very indefinite. Let us assume that a man drives his car to and from his home and his place of business twice a day, and goes out for an hour's ride in the evening and spends about nine hours in his car on Sunday. The number of hours consumed in trips to and from work may be estimated at a maximum of three per day. Let us say that considering all seasons of the year, the man drives on an average one hour in the evening. Now adding in the nine hours of Sunday driving we get a total of $18 + 6 + 9 = 33$ hours per week, and an average of $4\frac{1}{4}$ hours per day.

If our assumptions have been approximately correct we must further modify our road resistance by discriminating between the different classes of vehicles, that is, omnibuses, trucks and pleasure cars in the proportion of 15, $8\frac{1}{4}$ and $4\frac{1}{4}$. That is to say, that if we regard the

tax rate for pleasure vehicles as the basic rate, the rate for trucks will be about $1\frac{1}{4}$ times the basic rate, and the rate for omnibuses will be $3\frac{1}{4}$ times the basic rate.

In justice to the road builder it would be well to establish lower limits of speed for vehicles of excessive weight per square inch of tire contact. This, in fact, has been done in some states, notably in Massachusetts and New York. At just what point these limits should be established could be determined by experimental means.

After one has scrutinized the superposed characteristic curves of power and resistance and grasped the significance of the area representing work to the right hand side of the line of 25-mile-per-hour velocity, he cannot but understand what a comparatively small portion of the average horsepower of a motor is actually used in doing destructive work on the road. And understanding this fact it would be logical to give consideration to some tax system bearing a more direct relation to road destruction than does the horsepower scale.

Such a mode of taxation would in no wise work injustice either to the state or to the vehicle user and would tax the user in proportion to the total yearly road destruction of his car at legal speed. This road destruction could be calculated by some formula which takes into account the various items of weight, wheel diameter and type of tires.

While it is not entirely within the scope of this paper to derive such a formula, we may suggest one taking the general form here shown:

$$\text{Total tax} = \frac{W \cdot oc}{r} \cdot Vm \cdot K \cdot \text{tax rate per unit.}$$

In this formula.

W represents the total weight of car.

oc = Coefficient of rolling friction.

r = $\frac{1}{2}$ tire diameter.

Vm = Legal velocity in miles per hour.

K is a factor proportional to the average number of hours per day which a given type of vehicle uses the road relative to the standard type on which the tax rate is based.

The value of oc should be determined only after a series of exhaustive experiments.

To bring out more clearly the radical differences between the two systems of taxation, let us take a practical example.

Suppose we consider a touring car and a medium-capacity truck. The monetary value of each is about the same. The touring car has a motor of the same bore, stroke and number of cylinders. The touring car has pneumatic and the truck solid tires. Under the horsepower scale both vehicles pay the same tax. If they travel over a road at the same rate of speed, however, it is hardly probable that they do the same amount of damage, and yet for this damage both must pay equally.

On the other hand, if we taxed each vehicle in proportion to the destruction each might cause to the road, each pays only for its share of the destruction.

Which system of taxation appears then to be more logical; the one based on horsepower or the one based on destructive power?

(Continued on Page 69.)

METZ DEFEATS BIG FIELD IN HILL CLIMB.

HAVING proven its efficiency in touring by winning the Glidden trophy, the Metz car, made by the Metz Company, Waltham, Mass., demonstrated its hill climbing abilities by defeating a big class of cars of 300 cubic inches and under in the second annual hill climb of the Automobile Club of Fayette County, Penn., held June 17 and 18. In this event the Metz defeated the Kline car, which won the free-for-all. When it is considered that the piston displacement of the Metz is 196 inches against 296.5 of the Kline, the performance is all the more remarkable. In

the free-for-all the Metz was second, defeating a large field of high powered machines.

The climb took place on a three-mile hill, the road rising 3007 feet in three miles, and abounding with bad turns. The maximum grade is 12 per cent. The best time was made by the Kline car, 3:57.6, with the Metz, driven by J. McCann, second, in 4:04.2. The first day's racing was for amateurs, Mercers winning two of the three races, R. C. Bigler taking the free-for-all and the \$1600 to \$3000 class event. Cash prizes amounting to more than \$5000 were offered.

GENERAL NEWS OF THE INDUSTRY.

Judge Bennett of Superior Court of Connecticut Refuses Permission to Receivers of Pope Manufacturing Company to Sell Plant, Etc., to a Syndicate.

JUDGE William L. Bennett of the Superior Court of Hartford, Conn., at a hearing held June 24, declined to authorize the sale of the Pope Manufacturing Company, now in the hands of a receiver, for the sum of \$1,800,000.

The plan submitted by a Boston syndicate provided for a payment of \$400,000 cash and the balance in five-year notes, and in making his decision Judge Bennett stated that the Connecticut courts had never allowed its receivers to indulge in financial speculation.

Immediately after Judge Bennett's decision the interested parties held a conference looking toward a basis for another offer. A representative of the Boston syndicate is stated to have told the court that it was the desire to pay enough for the Pope properties so that the merchandise creditors would be protected in full and also to pay the expense of the receivership. It was also said that a reorganization of the company was contemplated with a capital of \$2,800,000.

The 300 stockholders and 1500 or more creditors of the Pope Manufacturing Company received notices of the offer of \$1,800,000 which, if it had been accepted, would hardly pay the outstanding bills of \$1,750,000, the creditors state. The plan proposed by the syndicate was to give the preferred stockholders opportunity to subscribe for one share of stock in the new corporation for every eight shares held in the present company. Common stockholders were to receive one share of common stock for every 12 shares that they now hold, and one-half share of common with each full share subscribed for.

KRIT COMPANY PROSPEROUS.

Pays 20 Per Cent. on Outstanding Indebtedness, Making a Total of 30 in Four Months.

The Krit Motor Car Company, Detroit, has made a payment of 20 per cent. on its outstanding indebtedness, which, with a 10 per cent. payment in February, makes a total of 30 in four months. The officers of the company state that business has been at least 30 per cent. better thus far this year as compared with the corresponding period last year. The business in the

West is reported excellent, and as the crops in Oklahoma and Kansas are large, a big business is anticipated in these states. The exports of the company have grown steadily, especially in South Africa, South America and New Zealand.

NEW SPRING COMPANY.

Pallau Steel Company Organized to Manufacture Automobile and Vehicle Springs.

The Pallau Steel Company, Mt. Clemens, Mich., has been organized with a capital stock of \$75,000, of which \$60,000 has already been subscribed. The company will manufacture automobile and vehicle springs, and plans are being prepared for a factory building, 175 by 75 feet. A. J. Pallau, the promoter and vice president, has been connected with the Detroit Steel Products Company for several years. The officers of the company are: President, A. T. Donaldson; vice president, A. J. Pallau; secretary and treasurer, Clifton D. Jackson.

SETS ASSETS SALE ASIDE.

Property of Atlantic Vehicle Company Sold to Lot Bidders, a Newark Concern.

The sale of the assets of the Atlantic Vehicle Company was set aside and the bids of the lot bidders were accepted. The Boeger-Meyer Machine & Tool Company, 140 Lafayette street, Newark, N. J., purchased the good will, drawings, patterns, jigs and tools, and most of the finished parts.

PAYS DIVIDEND.

Creditors of Michigan Buggy Company Receive Another Payment and a Fourth Is Promised.

The Detroit Trust Company, receivers for the Michigan Buggy Company, has mailed the creditors of that concern a third dividend, and a fourth is promised. Deals are said to be pending for the sale of the plant and real estate.

BUYS PALMER & SINGER.

Singer Motor Company, Inc., Purchases Trade Name, Etc., and Will Supply Parts.

The Singer Motor Company, Inc., 630 Jackson avenue, Long Island City, N. Y., has purchased at a private sale the trade name, good will, patents, drawings, etc., of the Palmer & Singer Manufacturing Company, and will supply repair parts for the car of that name, also maintain a service station.

Work on the Singer Six is progressing rapidly and the first chassis is now being tested on the road. Deliveries will commence, it is stated, about July 15. It is understood that the new car will be sold with a complete equipment, including electric lighting and motor starting, and wire wheels, at a price well below \$2500.

ADDS TO SELLING FORCE.

General Sales Manager Philp of Dodge Bros. Makes New Appointments.

Dodge Bros., Detroit, is increasing its sales organization, as two more appointments have been made by General Sales Manager A. I. Philp. He has appointed H. D. Day, Boston representative, and John A. Nichols, Jr., will have charge in Seattle. Mr. Day's territory includes all of the New England states with the exception of Connecticut. He is not only well known in the automobile industry, but among business men. Mr. Nichols was formerly a newspaper man and has been identified with the industry as a superintendent of branches, also in an advertising capacity.

PLAN CYCLECAR TAXICABS.

Twombly Taxicab Company Organized to Carry Passengers for 25 Cents the First Mile.

The Twombly Taxicab Company has been organized in the State of New York with a capitalization of \$500,000, to carry passengers for 25 cents the first mile and five cents a quarter-mile thereafter. A radical feature of the enterprise is a clause in the selling contract which provides for the above named rates.

The company is planned by W. Irving Twombly, New York City, who is the builder of the Twombly cyclecar. He is vice president and general manager of the new company. D. Stuart

Dodge of Phelps, Dodge & Co., New York City, is president. It is stated that these two men control this company, as well as the Twombly. The founder of the concern states that 1000 have been spoken for in New York City, Philadelphia and Boston, and that this number will be built in the factory at Nutley, N. J., between Oct. 1 and Feb. 1. The first cabs will be completed shortly and it is stated that one has been built.

The cab will have a 44-inch tread, 92-inch wheelbase, four-cylinder, water-cooled motor, bore of 2.75 inches and stroke of four; improved landaulet body and provision for carrying baggage.

WILL MAKE SMALL CARS.

Malcolm Cyclecar Company to Manufacture a Machine of That Name.

The Malcolm Cyclecar Company has been organized to build a car of that name and it is announced that the plant, which is located in Plymouth, Mich., 18 miles from Detroit, will be in operation within 10 days. The list of stockholders includes such well known Detroit business men as Homer McGraw and H. Jay Hayes. The directors of the company are as follows: Charles H. Bennett, vice president and manager of the Daisy Manufacturing Company; B. B. Bennett, general manager of the Bennett Manufacturing Company; C. H. Lawrence, E. Malcolm Jones and C. A. Fisher. E. Malcolm Jones will be retained as general manager and C. H. Lawrence as sales manager. C. A. Fisher is treasurer.

WINNERS USED RAYFIELD.

Living up to its reputation for thorough-going efficiency, the Rayfield carburetor aided two winners at the recent Uniontown, Penn., hill climbing contest. The Kline, which won the free-for-all, and the Buick, winner in the 300-459 cubic inches piston displacement class, were both Rayfield equipped.

One of the Features of the Eighth Annual Touring Number of The Automobile Journal to be published July 10, is that each of the itineraries listed is prepared with a view to connecting all sections of the country, so that it is possible to start from any given point and arrive at any given destination in the United States or Canada, utilizing the routings presented.

SHANKS WITH PREMIER.**Former Winton Man to Direct Sales and Advertising for Indianapolis Concern.**

Announcement is made by the Premier Motor Manufacturing Company, Indianapolis, Ind., of the appointment of Charles B. Shanks as director of sales and advertising. He assumed his new duties June 15. The status of Sales Manager Macey and Advertising Manager Bieling is not to be affected in any manner by the change, it is stated.

Mr. Shanks is one of the pioneers of the industry, having been connected with it, largely in the sales and advertising department, since the days of the single-cylinder machines. For nearly 10 years he was sales and advertising manager for the Winton Company in Cleveland, O., a position which he resigned to become business manager of the Class Journal Publishing Company, New York City.

POPE-HARTFORD'S FUTURE.**Receiver Asks Permission to Continue the Business for Another Three Months.**

In his petition for the approval of the semi-annual report presented by Col. George Pope, receiver for the Pope Manufacturing Company, Hartford, Conn., to Judge Bennett of the superior court, request was made to be allowed to continue the business of the company for another three months period, dating from June 22. It is expected that, unless the stockholders or creditors have been able to present some favorable plan for reorganization involving the purchase of the plants as a whole, before the expiration of the additional three months, the receiver will be obliged to recommend the cessation of manufacturing operations and forced liquidation.

Referring the court to schedules on file, the receiver holds that there will be but one question as to the future conduct of the business on which there can be any difference of opinion. All the product now in course of manufacture must be completed and sold, excepting possibly 150 model 35 cars, which are not yet in finished parts. The receiver recommends that the manufacture of these cars be pushed as rapidly as possible.

The schedule shows that there is on hand parts and material valued at \$22,217 expressly suitable for 150 cars of the model 35 type, this being a four-cylinder machine. How much of the raw material, finished parts, supplies, etc.,

valued at \$168,038.13, can be used in the completion of these 150 cars is problematical. A considerable part can be used thus, turning an item which cannot be profitably sold in its present state into marketable merchandise.

A comparative statement of assets shown by the receiver's inventory of Oct. 27, 1913, and an inventory of the receiver's books as of April 30, 1914, is made, showing \$1,853,438.66 on the first date and \$1,905,469.13 on the latter.

TWO RECEIVERS APPOINTED.**Randall-Faichney Company of Boston Is in Temporary Financial Difficulty.**

Judge Dodge of the United States district court in Boston has appointed Charles P. Blinn, Jr., vice president of the National Union Bank of that city, and Benton Whidden of Brookline, Mass., receivers for the Randall-Faichney Company of Boston, and Watertown, N. Y. The concern is well known in the industry as manufacturer of accessories, but also produces a line of druggists' supplies, etc. The receivers are ordered to furnish a joint bond of \$50,000.

The petition for the appointment of receivers was brought by the Cutter & Wood Supply Company of New Jersey, one of the creditors. Inasmuch as the schedule shows liabilities of \$282,000 and assets of about \$400,000, it is not thought that the trouble will prove of more than temporary character.

KNOX MOTORS AFFAIRS.**Court Decision Opens Way for the Establishment of Its Sales Organization.**

A decision has just been handed down by Judge Morton in the United States district court for Massachusetts which definitely settles all question as to the transfer of the old Knox Automobile Company, Springfield, Mass., to the new Knox Motors Company of that city. The sale of the entire plant and property of the old company to E. O. Sutton, who is now treasurer of the new concern, has been confirmed by the court. Pending this confirmation, tentative plans for the conduct and wide extension of the Knox business had been formed and were partially under way, but with the receipt of news that the sale had been confirmed, execution of these plans was begun with a rush.

H. G. Fisk, treasurer of the Fisk Rubber Company, Chicopee Falls, and one of the best known

men in the industry, already had been elected president of the Knox Motors Company. Announcement is now made of the advancement of Charles F. Barrett to become advertising manager. George M. Davis, who was with the Pierce-Arrow Motor Car Company, Buffalo, N. Y., for four years, and more recently with the Packard interests in Albany, has become assistant sales manager.

The Knox Motors Company already had the nucleus of a dealers' organization through branches in New York, Boston, Chicago and Kansas City, and these will be continued and their organization not only will be enlarged, but their scope increased widely. Applications have been received from a number of high grade dealers for allotments of territory, and it would appear that the opportunity to handle Knox-Martin tractors was a great incentive to dealers.

The production department had partially completed the thorough systematizing of the factory and the effect of Judge Morton's decision is to make possible the unification of the entire Knox organization, both producing and selling, in a way that has not been practicable heretofore. The latest Knox touring cars were coming through the factory at the time, and added impetus was given to their production. Orders also have been issued for quantity production in Knox-Martin tractors and fire apparatus.

AMERICAN EFFICIENCY SURVEY.

More About the Purposes of the Organization Which Will Test Motor Car Units.

President Harry Newman of the American Efficiency Survey of Motor Car Units, Chicago, Ill., explains the purposes of that organization in the following manner:

It is our purpose to have the 70 odd units of importance in the list of motor car construction parts put through the scientific laboratories which have been placed at our disposal by Purdue University, Lafayette, Ind., to get what we think is the greatest hall mark that scientific men could give and to make known to the world the findings of the reliable men of the best equipped laboratories in the world. Already the board of engineers has made its findings on one important adjunct of the motor industry, and it is conducting the most exhaustive tests imaginable in another phase.

Honesty and truth, stamped with the Purdue University laboratory hall mark, will be sufficient guarantee for the American Efficiency Survey of Motor Car Units; it will be accepted, will this verdict of the scientific men, by the makers of the motor car units, as a badge of honor among the captains of industry. There will be weight behind the report of this survey, and the exploitation of the manufacturers who "pass highest" in this rigid test will be the subsequent pleasure of the officials of the survey.

In my opinion this is the greatest step that has been made to establish independent, disinterested standards in the automobile industry which, in point of capital in-

vested, is second in this country, being surpassed only by the steel industry.

The board of engineers includes the following: C. H. Benjamin, D. Eng., dean of the engineering schools at Purdue; Louis E. Endsley, M. E., professor of railway mechanical engineering—in charge of the Master Car Builders' Association tests; M. J. Golden, M. E., director of the mechanical engineering laboratories; Robert G. Pilkington, M. E., resident engineer, who has had years of experience in the largest concerns of the motor car industry, and C. Francis Harding, B. S., E. E. These men will direct some of the most exacting and strenuous tests of motor parts, tires, oils, etc., the engineering world has ever known.

GOODYEAR AND THE DEALERS.

Meetings Held Periodically in Order to Bring Out Merits and Service Given by Company.

Surprising results are accompanying a series of car and tire dealers' meetings which the Goodyear Tire & Rubber Company is conducting in the various principal cities. The Goodyear Company, having proved in the practise of its own sales policies that a remarkably successful tire business can be conducted on a standardized merchandising basis, has been interesting dealers in the development of standards in at least a part of their own business. The meetings are held in behalf of better merchandising and have not been merely occasions for the exclusive exploitation of Goodyear. The company takes the view that as fast as dealers declare themselves for certain standards, all tire companies must come into line; tire manufacturers, car makers, dealers and the consuming public will alike be benefited and the whole industry encouraged.

The Goodyear Company believes its tires now represent the lowest possible cost a mile to the user, and that standard making should be followed by standard selling. The company declares for the dealer, for its distribution. It has no proposition for the jobber or middleman, and is also discontinuing retail business at its branches to give the dealers a clean field.

Adjustments are also simplified. Defective tires will be adjusted more liberally than ever before. This, it is figured, will also finally help the consumer, by reducing the price he must pay and educating him to obtain maximum mileage through proper tire care. Everywhere dealers are indorsing these and a number of other Goodyear policies, which, no doubt, will be of great benefit to the trade and consuming public alike.

NEW ACCESSORIES FOR THE MOTORIST.

WALTZ AUTO SEMAPHORE.

A Combined Tail Light and Illuminated License Number.

The Irwin-Waltz Interests, City Hotel building, Ellwood City, Penn., is manufacturing the Waltz Auto

semaphore, which differs from the usual types of devices designed to signal the direction, etc., to be taken by the car. The Waltz is a combined tail light and illuminated license number and comprises a case having three compartments, each of which is fitted with an electric bulb.

The case is covered with a celluloid plate bearing the license number in the shaft of a double headed arrow which is set in an opaque background. The heads of the arrow rest on separate compartments of the case and are illuminated when desired by means of two push buttons located convenient to the driver. A dashboard switch operates the license number. The current supply may be the electrical equipment of the machine or a set of dry cells, etc.

CELLO SEARCHLIGHT.

Wireless Design Operated by Push Button with Dry Cells.

The A. S. Campbell Company, 284 Commercial street, Boston, is manufacturing the Cello Wire-Less searchlight. As the name implies the construction is without wires, to prevent opportunity of short circuits, and the design makes for easy and rapid installation. The light is equipped with the same reflector as is used in high grade lamps.

The connection to the batteries is made through a highly polished flush deck socket, and when the light is not in service, a cap screwed on to the deck socket makes a water proof fitting. The push button A operates the lamp, and pressing down obtains a flash, while a half-turn gives a steady illumination. The flexible cable is in-

dicated by B, and C is the hinge joint obtaining movement.

The deck swivel is locked by a nut D. E is the bronze contact spring and F the deck socket, which connects to the main wiring below. The self-cleaning, positive contact is shown at G. H is the cap screw utilized when the lamp is not in service.

The design is very sturdy and can be set at any convenient angle. It is stated that ordinary type can be read at a distance of 1000 feet and that the lamp will operate economically on six dry cells. It is adapted for service with a storage battery or dynamo, and the bulb is an eight candle-power six-volt member. The finishes are: Brass, bright nickel and black nickel.

CAMERON WIRE WHEEL.

Ford Design Installed Without Any Alterations.

The Cameron Wire Wheel Company, 47 Adelaide street, Detroit, is marketing a wire wheel for the model T Ford car. One of the qualities of the design is that it is interchangeable with the regular wood wheels

fitted to the Ford machine. The Cameron construction is also detachable, and is designed to carry 30 by 3.5-inch tires.

The wire wheel is securely locked by means of special studs, these taking the place of the old bolts used in the wooden members. The locking studs are operated by a socket wrench, much in the same manner as the demountable types of rims. As the original brake drums are not interfered with there is no change to the brake adjustment, etc.

One of the features emphasized by the maker is the lacing of the spokes, it being held that they will not catch in ruts, and that at the same time they afford ample resistance to torque and lateral stresses. The wheels are finished to withstand weather, being first copper plated, then given two coats of black enamel. The Ford design comes in sets of five. The company also manufactures wire wheels for standard cars.

Equipment and supplies for the motor car will be featured in the Eighth Annual Touring Number of The Automobile Journal, July 10.

WIZARD WASHER.

Hands Are Not Wet and Design Is Stated to Be Very Efficient.

The Century Foundry Company, 1620 North Carolina street, Syracuse, N. Y., is marketing the Wizard wash-

er, designed to enable the owner and others to wash the machine without the usual equipment of rubber boots, aprons, etc. One of the qualities of the washer is that the hands do not come in contact with the water.

The Wizard consists of a special nozzle, a ball bearing turbine motor, a 14-inch extension and two interchangeable brushes, one long and pointed for washing corners, etc., and the other shaped like a sponge for flat surfaces. The nozzle throws a hollow film of water completely around the rapidly rotating brush, and it is stated that it removes all deposits without injury to fine finishes.

BANKER WINDSHIELD DEVICE.

Permits Adjustment of Ford Shield and Provides Ventilation.

The Banker Windshield Company, Ellsworth and Negley avenue, Pittsburgh, Penn., is manufacturing a device for windshields for the Ford car and machines of similar size. The design is particularly intended to provide a clear vision when driving in a rain or snow storm, when the view is more or less obstructed.

The attachment permits of adjusting the top half of the shield, it replacing the usual hinges, and the maker states that any owner can fit the design without trouble and in a short time. As will be noted by the accompanying illustration, the shield may be set at an angle and the adjustment can be made as desired.

MAXIM FORD MUFFLER.

Embodies Same Principle as the Fire-arm Silencer.

The Maxim Silencer Company, Hartford, Conn., maker of the well known Maxim gun silencer, has

brought out a design of muffler for the model T Ford car in which is embodied the same principles as those incorporated in the device used on firearms. The design differs radically from the usual type of muffler.

The exhaust gases enter the Maxim muffler at the expansion chamber, then pass to the whirl chambers, a feature of the Maxim silencer. These are formed by three segments of sheet steel separated from each other at the joints, so as to obtain a circumferential discharge. The next chamber is made in a similar manner and has discharge spaces pointing in an opposite direction, thus obtaining the whirl referred to. The noise wave is thus divided and subdivided and is gradually dissipated. The silencer comes with brackets to fit car and includes a tall pipe for clearing rear spring. Its dimensions differ from the Ford muffler only in diameter, being 5.75 inches.

HIBBARD MAGNETO.

A Novel Design Differing Radically from Usual Practice.

The Grip Nut Company, Chicago, is marketing the Hibbard magneto, presenting several interesting features which differ from conventional practice. It is of the true high-tension type, operates at half engine speed with four-cycle motors, and has two armatures, each containing its own primary and secondary winding. It is of the four-pole type, four straight bar magnets being employed instead of the horseshoe design.

It is stated that almost any degree of advance or retard may be obtained, the change in the spark occurrence being accomplished by shifting the armatures and not the field or breaker box, as is used in present constructions. Another innovation is that the distributor is located inside the magneto, and the entire so-named distributor board revolves.

The breaker mechanism carried at the end, consists of four stationary cams, for the four-cylinder type, and

they are made of fibre. Each point of the interrupter is carried on a separate strip of metal and the two are held together by the pressure of a spring. The shifting of the armature is accomplished by a slot in the shaft, a sleeve and a spool. A pin attached to the spool is moved backward or forward.

CHANEY HEADLIGHT DIMMER.

Practical Design for Eliminating Glare of Electric Lamps.

One of the latest devices for eliminating the dazzling effects of the electric headlights is the Chaney automobile incandescent lamp dimmer, manufactured by the L. F. Chaney Company, Springfield, O. The design is simple, very compact, and may be installed easily by the owner without a knowledge of electricity, as the wiring is very simple, there being but the connections shown in the illustration.

One of the qualities of the design is that the lights may be regulated to meet all requirements. The dimmer is mounted on the dash and being equipped with a kick type of lever, the driver can move the last

named member to each of the four positions provided.

Placing the lever to "Low" effectually dims the lights, eliminating all glare. Medium and high positions are included, also an "Out". The installation of the Chaney dimmer is made easily. Three small holes are bored in the dash to retain the front plate and dimmer and a fourth opening for the shaft member, to which the handle or lever is attached. Being of the flush dash type, the design does not detract from the appearance of the car.

SIGNALLING DEVICES.

Noticable among the new accessories of the season are signalling devices, many of which are designed to relieve the driver of the trouble of manually warning a vehicle approaching in the direction the car is travelling that he is to stop or make a turn. Some of the devices provide a day and night signal, but the majority are designed to be illuminated at night and for service where the traffic is heavy. Generally the license number is illuminated or provision made for lighting the number plate.

METALCRAFT FUNNEL.

Has Offset and Two Extensions and Two Filters for Fuel.

William Vogel & Bros., 47 South Ninth street, Brooklyn, N. Y., is manufacturing the Metalcraft offset fun-

nel, one of the qualities of which is that filler caps not accessible with ordinary funnels may be reached easily. The design is particularly adaptable to special types of cars having fuel tanks not easily reached.

As will be noted by the accompanying illustration, the Metalcraft funnel is provided with two sectional spout extensions, these being seven inches long, also an offset elbow, which when coupled with the other members gives an extension some 20 inches long, sufficient to reach the filler of any rear tank of the pressure type.

The design is constructed of seamed sheet iron with locked seams, and is galvanized.

NURINKLE VULCANIZERS.

Proper Temperature is Automatically Regulated.

Among the manufacturers specializing in vulcanizing equipments for the private owner is R. E. Stevenson, Muncie, Ind., who is marketing a design termed the Nurinkle. It is constructed for motorists who undertake the maintenance of their tires and inner tubes, and who are not familiar with the operation of vulcanizing. The Nurinkle is of the portable type, very compact, and the maker states that the instructions are so simple that anyone can obtain perfect results with this design.

It employs gasoline as a fuel, and one of the qualities of the construction is that too large a supply of fuel cannot be utilized, as a cup integral with the vulcanizer prevents this mistake. The amount is held to be such as to provide sufficient heat to maintain a correct steam pressure, and to keep the vulcanizer at a uniform and proper temperature to effect a repair. One of the qualities of the design is that the flame is turned away from the tire without the use of a separate deflector.

MULTIBESTOS BRAKE LINING.**Special Weave Eliminating Brass Wire and Cut to Size.**

The Standard Woven Fabric Company, Framingham, Mass., maker of the well known Multibestos brake

lining, is marketing the Multibestos Ford special, a brake lining which is held to meet every condition of service on the Ford car.

It is similar in weave and appearance to the standard material, but differs in that the interwoven brass wire is eliminated. As the lining operates in a bath of oil in the Ford machine, it is treated by a special process with a composition that renders it oil proof.

Multibestos Ford special comes in neat pasteboard boxes, each containing a complete set of linings, three in number, these being 23.5 inches long, 1.125 wide and .15625 thick. Brass rivets are enclosed for attaching the linings. The straight lining and rivets will be sold separately if desired.

COLUMBUS TRAFFIC SIGNAL.**A Day and Night Signal Operated by Pedal and with Red Light.**

Edward S. Adams & Co., Columbus, O., is manufacturing the Columbus traffic signal, which presents a number of interesting features, among which is that it is of service in the daytime as well as night. As will be noted by an accompanying illustration the signal is in the form of a disc attached to an arm which, when raised as indicated, denotes that the machine is about to make a right hand turn.

There are two of these signals, one on either side of the windshield to which they are attached, and each disc is raised independently of the other by pressing a pedal convenient to the driver. Normally the arm bearing the signal is in a vertical position, but upon wishing to signal the traffic officer or a machine approaching in the rear, the pedal is touched with the foot, raising the arm. The signal is finished in red,

and at night is illuminated by an electric bulb, current for which is supplied by a set of six dry cells. A switch is included for cutting off the current supply in the day time.

J. M. SHOCK ABSORBER.**New Design Termed No. 3 for the Model T Ford Automobile.**

The J. M. Shock Absorber Company, Inc., 210 South 17th street, Philadelphia, maker of the well known J. M. shock absorber, has brought out a new design, termed the type No. 3, for the model T Ford car. It is based on the same helical spring principle and the same high grade material and workmanship for which the products of this concern are noted is incorporated. The maker calls especial attention to the sliding sleeve container, the automatic oiling attachments, and the adaptability of the design to the Ford machine.

The hanger is a high grade steel drop forging with rigid attachment for insertion and great strength is emphasized in the construction. The interior of the hanger contains a bronze bushing and at a point where the wear is concentrated. This part may be replaced for a very slight cost, doubling the service of the ab-

sorber. The new J. M. type comes in pairs for the rear springs, but front members are supplied. They are moderately priced. That illustrated is a rear design.

MOTOR STARTERS.

The editor of this department wishes to acknowledge several letters from readers inquiring as to the practicability of lighting dynamos and electric motor starters for the model T Ford car. Several have complained of experiencing considerable difficulty in starting the engine and wish to know if a motor starter will overcome the trouble.

The electric and mechanical types of motor starters rotate the crankshaft of the engine much faster than by the manual method, especially when the motor is given a quarter turn. The spinning of the crankshaft generally results in the engine responding, as considerably more fuel is drawn from the jet of the carburetor. The practicability of the starters has been demonstrated in service, and there is a wide variety offered.

PROGRESSIVE DECARBONIZER.**Employs Oxygen and Includes Rechargeable Generator.**

The Progressive Manufacturing Company, Reading, Penn., is introducing a popular priced oxygen car-

bon removing equipment which is designed for the small garage and the owner. It consists of an oxygen generator, which is held to be easily operated and which may be utilized indefinitely when refilled with the proper dry chemicals.

One of the qualities of the equipment is stated to be the use of non-poisonous material. Another feature is that the gas is always at low pressure, which eliminates the need of reducing valves. The outfit comes complete with sufficient material for cleaning a large motor, and the usual flexible hose is provided. Extra charges may be obtained at a nominal cost. The principle is similar to the conventional decarbonizing equipments.

SECURITY TIRE ENAMEL.**A Rubber Compound for Protecting Shoes from Weather.**

Security tire enamel is manufactured by the Security Reliner Company, Montgomery, N. Y., for which the D. Henry Bonner Company, Cambridge, Mass., is New England distributor. It is a specially prepared liquid paint made from a pure rubber combined with selected pigments, and is stated to be quick drying.

The preparation is made for protecting and preserving tires, mats and other rubber articles exposed to the action of the weather, and when applied to a casing dries rapidly, imparting a beautiful gray appearance. It is applied with a soft brush after the shoes have been cleaned, and it is stated that it spreads perfectly, leaving no brush marks. The maker claims that it will fill cuts, preventing moisture penetrating to the fabric, etc. Security tire enamel comes in press top cans, having capacities ranging from one-half pint to a gallon. It is moderately priced.

COOLING DEVICE FOR OLD MOTORS.

THE internal combustion motor is held to be most efficient when a certain temperature is attained, beyond which there is a loss of

Simple Form of Starting Ratchet: A, Pin in Crankshaft; B, Ratchet Fitted to Starting Crank; C, the Components in Place.

power. The cooling system of the modern automobile is so efficient that the water will not unduly heat, even if the motor be run idle for some time.

This does not hold true of some old engines, particularly those of early vintage. While much of the overheating is due to the imperfect circulation of the cooling fluid, caused by worn pumps and deposits in the water jackets and radiator, the design of the motor is sometimes to blame.

The writer can recall several makes of cars which could not be run idle for any great length of time without the water boiling, and this trouble was experienced when the cars were being driven, especially on a warm day.

An owner who possessed a car built in 1907, a model equipped with a four-cylinder motor, was troubled by overheating despite numerous attempts to remedy the trouble. The third and fourth cylinders were the chief offenders, and after much careful study the motorist, who was of an observing nature, adopted the plan shown in an accompanying illustration.

As will be noted it is an adaptation of the funnel or ventilator used on vessels. It was constructed of sheet brass rolled into shape, riveted, and fitted to the hood between the third and fourth cylinders. The lower part of the ventilator was provided with a lip for attachment and secured by machine screws and lock nuts.

The owner states that the device was a success; that a considerable draught of air was deflected onto the cylinders. It was found, however, that in rainy weather more or less water

was carried to the motor. This trouble was remedied, it is stated, by fitting a lip to the top of the ventilator as shown.

STARTING CRANK TROUBLES.

The starting crank seldom gives trouble, but after long service the bushing forming the bearing becomes worn, creating play which causes trouble if the design be of the jaw clutch type. With these it is important that the clutch of the crankshaft and that on the starting handle align. When the bearing of the latter becomes badly worn the jaw members will slip, and, if the trouble is not corrected, difficulty will be experienced in starting the motor.

A method of eliminating the trouble is shown in an accompanying illustration. It consists of displacing both jaw members, and drilling and fitting a substantial pin to the extension of the crankshaft. It is a good plan to secure the larger pin, as shown at A. The clutch member is depicted at B. This is made from steel and slotted as shown, two being provided, diametrically opposite. The starting handle is fitted to the clutch and pinned, but in attaching it should be so fitted that the motor will be turned over past the ignition point before the handle attains a vertical position. This is important.

The clutch in position on the crankshaft is shown at C. It will be seen that the slotted member grips the pin, but upon the motor starting the pin will push the clutch out of engagement. The

Ventilator Made by Motorist to Prevent Overheating of Third and Fourth Cylinders.

cost of making the clutch, etc., is not great, and it is decidedly more satisfactory than the one previously referred to.

SOUTH AFRICAN MOTORING SITUATION.

Reasons Why American Cars Are Making Such an Appreciable Gain Among the Importations--Overlands, Cadillacs and Chevrolet in Alpine Tour.

AT THE 12th annual banquet of the Royal Automobile Club of South Africa, held recently in Cape Town, it was demonstrated that there were something over 7000 motorists in the South African Union, who drive their own cars. This figure was determined by the amount paid in taxes, each motorist driving his own machine being required to pay a tax of 20 shillings. Previous to March 1, £14,000 had been paid, and since that time it is estimated that between £3000 and £4000 has been collected. Since this money must be expended upon roads, it follows that there is at present something like \$90,000 available for this purpose.

Another interesting development at the banquet was the remarkable manner in which American made machines have established themselves in the South African market. In 1912, for instance, the percentage of British cars was 54, and that of American makes, 33. Last year the importations of cars had increased from about \$2,800,000 to \$5,500,000, but the British makes had fallen to 48 per cent., while American cars had risen to 40.

The reason for this condition was explained by one of the speakers, who held that it was because the American manufacturers specialized on one particular size and make of machine and were able to turn them out in enormous quantities. He said that the British manufacturer was just beginning to awaken to the fact that what was wanted was not a highly finished product, but something serviceable for general use.

A factor that is expected to work to the decided benefit of those doing an automobile business in South Africa, is the discovery of a new process for extracting motor fuel from shale coal. It is stated that it is now possible to extract 20 to 30 gallons of fuel from a ton of the coal, instead of five to six as formerly.

AMERICAN CARS IN ALPINE TOUR.

Three Overland, Three Cadillacs and a Chevrolet in Big Austrian Event.

No less than seven American made cars are competing in this year's Alpine tour of the

Royal Automobile Club of Austria. Seventy-four cars left Vienna June 14 on the 1700-mile tour of the Alpine roads in that country, and were due to return June 23. It will be some few days before definite results will be learned in America.

The seven American machines are: Chevrolet 16, entered by Karl Strakosch; Overland 43, A. H. Neukirchen; Cadillac 45, 46 and 47, F. S. Bennett, Ltd.; Overland 60, Arnold von Bessel; Overland 62, Willys-Overland Company, Ltd. The other countries represented by machines are: Great Britain, Germany, Belgium, Italy, France and Austria.

NEW EIGHT-CYLINDER CAR.

Hillman Utilizes Two Four-Cylinder Engines, Driving Separately to Rear Axle.

While complete details have not reached this country, it is understood that a new eight-cylinder car has made its appearance in Great Britain, having been given its initial trials on the Brooklands track last month. This machine is a Hillman, utilizing two four-cylinder engines, with bore of 60 mm and stroke of 120 mm (2.36 by 4.72 inches), working side by side and transmitting power by separate shafts to the rear axle. In its original trials it developed speeds averaging about 70 miles an hour, although it is expected to do much better than this.

At the same time Hornsted, in his big Benz, made one lap of the Brooklands track from a standing start in 1:38.07, a speed of 101.57 miles an hour, which is said to be the fastest it has ever been done. He also secured a new record for 10 laps, which he covered in 15:23.83, or at a speed of 107.82 miles an hour, lowering the 90 horsepower record held by a Napier and the class J mark held by a Lorraine-Dietrich.

AMERICAN CARS RULED OUT.

Empire Touring Model Cannot Win, Although It Finishes with a Perfect Score.

Rules governing automobile reliability tours in Australia are to be revised as the result of the

perfect score performance of an American made Empire car in the recent New South Wales run. Driven by C. B. Bradley of Sydney, the Indianapolis touring car made the entire trip without repair or adjustment of any kind, being one of six to finish out of the 12 which started. This condition was so manifestly unfair that protests came not only from the American, but also other competitors. One of the Sydney papers took up the matter editorially, as follows:

Amongst the five cars to complete with full points for reliability was C. B. Bradley's Empire, which ran from start to finish without stopping her road wheels for any cause whatever. Considering it was the only American car to finish with full points for reliability, and that the placed cars cost nearly three times more than the Empire, it speaks well for the cheaper car, more especially as it ran with full touring equipments, including erect windscreen. It is, of course, generally understood that under the existing formula American cars have no possible chance of winning, and there is at present a movement on foot to add a special section in future competitions for American cars. The first trial will be held about August.

NEW RECORD IN TARGA FLORIO RACE.

DRIVING the same S. C. A. T. car with which Snipe won the Targa Florio race in 1912, Ceirano won the annual Sicilian road race, May 24-25, covering the 1050 kilometers (655 miles) in 16:51:31, a new record for the course. The best previous time was 19:18:40, made by Nazarro in a Nazarro car in 1913. The prize winners this year were:

Car	Driver	Time
S. C. A. T.	Ceirano	16:51:31
De Vecchi	Gloria	18:41:30
Fiat	Lopez	19:45:26
S. C. A. T.	Colombo	19:45:53
Nazarro	Cortese	19:58:11
Elka	Lucca	19:58:52

It will be noted that all the cars to finish with in the money were of Italian make. There were 34 entrants, 31 of which started. France was represented by a Renault, De Dion-Bouton, De Dietrich and Peugeot; Germany by a Benz and America by a Ford.

The Targa Florio race was instituted in 1906 by Vincenzo Florio, and has been run each year under the original rules. The course covers practically the entire island, starting and ending at Palermo. No portion of the road is covered a second time, and the surface is not specially prepared in any way. Drivers are required to be constantly on the lookout for obstructions, since no portion of the course is patrolled for the event.

The winning car is a 30 horsepower machine. The four-cylinder motor has bore of 100 mm and stroke of 150 mm (3.9 by 5.9 inches). The winning driver is the son of Designer Ceirano of the S. C. A. T. factory, and a relative of the Ceiranos identified with the Itala and S. P. A. companies.

OLD BOARD RE-ELECTED.

Same Officers Will Serve the Boston Automobile Dealers' Association Next Year.

At the annual meeting of the Boston Automobile Dealers' Association, held early in the

month, the old board of officers was re-elected as follows: President, J. H. MacAlman, Stearns-Knight; vice president, J. S. Hathaway, White; treasurer, F. A. Hinchcliffe, Winton; secretary and general manager, Chester I. Campbell; directors, J. W. Bowman, Stevens-Duryea; J. W. Maguire, Pierce-Arrow; E. A. Gilmore, Chalmers; C. P. Rockwell, Jeffery; F. E. Wing, Marmion; C. E. Fay, Ford; F. A. Hinchcliffe, J. S. Hathaway and J. H. MacAlman.

ST. LOUIS GETS CONVENTION.

Federation of American Motorcyclists Will Meet in That City July 15-18.

The board of directors of the Federation of American Motorcyclists has decided upon St. Louis, Mo., as the convention seat for this year's national assembly. The event will take place July 15-18, and delegates will be present from every section of the country.

Aside from the business session, the convention will be of interest from the fact that the national championship races will be held on the excellent dirt track, under the auspices of the St. Louis Motorcycle Club. Several tours to the convention are now being arranged. One of these will start from Chicago, another from San Francisco, and still others from intermediate points in the East, South and West.

According to the Bosch Magneto Company, New York City, every one of the prize winners in the Prince Henry flight of May 17 to 24, inclusive, was equipped with Bosch magnetos and spark plugs.

Rene Thomas, winner of the 500-mile Indianapolis speedway race, has been driving a Cole car, the use of which was tendered to him by the Cole Motor Car Company of Indianapolis, Ind., since the race.

FEATURES OF TONELYTE LIGHTING SYSTEM.

AN ENGLISH lightning dynamo which employs a principle similar to that formerly utilized by an American manufacturer, for con-

Fig. 1—Wiring Diagram of Tonelyte Electric Lighting System.

trol, but differing slightly in its details, is the Tonelyte, a description of which appears in a current issue of the Autocar. The illustration at Fig. 2 shows the regulator and automatic cut-out, which are carried separately from the dynamo in a case.

It will be noted that the device comprises two metal cylinders mounted on a plate, at the centre of which are a number of thin carbon discs placed between two copper blocks. Inside of each cylinder is an iron drum or core carrying a winding. The cylinder shown at the right in the illustration regulates the output of the generator. An iron core carries a single winding of wire, which forms part of the main circuit from the dynamo to the battery. When a current is passed through this wire a magnetic field is brought into being, the effect of which is to cause the iron core to endeavor to take up a position exactly in the centre of the iron cylinder. Normally, the core is held somewhat above the central position, since the lever projecting below rests against a long pivoted lever, the free end of which is pressed upward by a spring controlled button.

When the current flows, however, the core pushes its way down, compressing the spring and moving the pivoted lever. This lever carries nearer to its pivoted end a spindle connected with the lower of the copper blocks in the controlling device. Upon a downward movement of the drum, caused by the passage of a strong current, the pressure holding the discs together is partially released.

When the discs are pressed together the current will flow through them with little or no resistance, but upon the plates being separated the resistance is increased. This is the principle employed for controlling the output of the dynamo.

The iron cylinder on the left in the illustration at Fig. 2 also contains a similar core, but it carries two windings and performs the function of a cut-out. When the core moves downward against the coil spring it forces two substantial silver contacts against one another, completing the main circuit.

The operation of the system is made clear in the diagram at Fig. 1. The primary winding passes around the cut-out core, across the contact points and then around the output control core, thence to the battery. The field circuit passes around the cut-out core, and then reaches a point where two optional paths are offered. One of these leads through a choking coil C C and the other is through the carbon discs C D. When the pressure between the discs is considerable, an easy path is provided for the current, but when the pressure is reduced the resistance to the current is increased to a great extent, and consequently the strength of the dynamo field is decreased, and the output of the generator prevented from rising above that determined by the maker.

The dynamo may be classified as one including an electro-magnetic cut-out and with a regulation of output by means of resistance in the field circuit, as previously explained.

Fig. 2—Tonelyte Regulator and Cut-Out—The Former Utilizes Carbon Discs to Set up Resistance.

VALUE OF DAILY INSPECTION OF CAR.

AFTER the new car has been driven for a few days it is an excellent plan to go over the chassis components and tighten any nut or bolt that may be loose. Some of these will stand a slight taking up, especially if the machine has been operated over rough thoroughfares.

The motorist who makes it a rule to go over the chassis very carefully at least once a week, and who gives the more important components, the steering linkage and brakes, for example, attention, is insuring his machine against road troubles.

CARE OF FANS.

With the arrival of hot weather the owner will do well to examine the fan belt to see if the tension is correct. If covered with lubricant it is advisable to remove it and clean with gasoline, and if the belt is laced or the ends secured by metal couplings, these should be examined for wear. The belt should be so adjusted that it will not slip, but not so tightly that it will impose undesirable stresses upon the fan bearings. The grease cups should be turned down and the supply of lubricant renewed.

Sometimes the cause of the motor heating is due to the fan blades being bent from their original position. They should be inspected and if any are out of line, bent to conform with the others. Watch carefully for loose bearings, especially if the fan is mounted on the radiator and its blades rotate close to the fins. Too much play in the bearings may result in the blades striking the radiator, and this would ruin the cooler in a very short time.

CHANGE WATER IN RADIATOR.

Manufacturers of radiators recommend changing the water in the cooling system at frequent intervals. In the warm weather the fluid becomes more or less heated and if hard deposits a scale in the fins of the cooler, impairing its efficiency. Remove the water at least once a week, flush out the radiator with clean, and renew with rain water if possible.

TIRE HINTS.

This is the time of the year when the motorist who has been operating his car during the

cold weather begins to experience tire trouble unless new shoes have been fitted after the overhaul. Frequently the cause of the blow-out is water which has worked in through an apparently minor cut in the tread, and reaching the fabric has rotted it.

It is a good plan to remove the casings and inspect their interiors. Discolored spots indicate that moisture has penetrated the walls and that deterioration has begun. The walls should be firm and hard, and when they yield easily to pressure, it indicates that the plies of fabric have become separated.

Back up these weak places with a good grade of fabric and cement the material to the casing, and be careful to eliminate wrinkles in the work. If in doubt as to the condition of the casing, take it to the expert for his opinion. While it is admitted that it is not a pleasant task to remove one or more tires, it should be borne in mind that it is more easily accomplished in the garage than on the road. Many times several hundred miles are added to the life of an old shoe by backing up weak places.

Cuts, large and small, should not be neglected. They allow dirt to work in between the rubber and the fabric, forming what is known as a sand blister, and if neglected the tread will separate from the carcass. Portable vulcanizers are inexpensive, easily operated, and permit of repairing a cut without removing the shoe from the wheel. There are several preparations on the market for mending cuts which are practical, provided the instructions of the maker are followed.

AIR LEAKS IN INTAKE.

Many times hard starting and missing on low motor speeds is caused by improperly fitting gaskets between the intake manifold and cylinders or carburetor flanges. A simple method of testing for air leaks is to use cylinder oil, covering the suspected part with the lubricant while the motor is operating. If the oil is drawn in it will indicate a leak.

The fit of the spark plugs and exhaust connections is best tested with the motor cold. Make a soapsuds and place it on the suspected parts, and turn the motor over slowly. If any leaks exist they will be indicated by the bubbles given off. This method is valuable in locating leaks in the pressure fuel feed system.

ZIP IS NOW IN LIGHT CAR DIVISION.

DURING the past few weeks there has been a noticeable tendency on the part of the pioneer American cyclecar manufacturers to take their machines out of the true cyclecar class, by fitting four-cylinder motors of sufficient bore and stroke dimensions to place them in the light car division. The Zip Cyclecar Company of Davenport, Ia., is one of the latest to make an announcement of this nature.

In the future, Zip machines will be equipped with a four-cylinder, water-cooled motor, with bore of 2.5 inches and stroke of four, giving a piston displacement of 78.6 cubic inches. The weight also has been increased slightly, and is now 800 pounds. This has been brought about as the result of redesigning the body, although the wheelbase remains at 92 inches and the tread at 40.

The new motor is of the L head type, with the valves on the right side housed with aluminum cover plates. The valves are 1.125 inches in diameter with opening of .1875 inch, the spur toothed timing gears running in a bath of oil. The crankshaft is of high carbon steel, heat treated, and the connecting rods I section, drop forged. The camshaft is one-piece, drop forged carbon steel, bone hardened and ground. The crankshaft bearings are heavy duty babbitt. The cylinder head is removable, as well as the lower half of the crankcase, giving ready accessibility. Cooling is by thermo-syphon; lubrication by splash, circulated by pump; ignition is by magneto, and the carburetor is a Kingston.

Transmission is by friction disc, 12 inches in diameter, mounted on New Departure ball bearings, and floating free on the sleeve, pressure being applied by pedal. The spur wheel is 13 inches in diameter, with hard fibre filler face, 1.25 inches, and bevel edges. This is mounted on a 1.5-inch ball bearing shaft. Extra large pulley wheels are fitted to the jackshaft for operating the belt drive, which is of the original design, short belts running over large pulleys to give maximum contact. Belts are six-ply, extra heavy.

The frame is channel section, pressed steel, 2.5 inches deep, having three cross members, re-

inforced by eight gussets and two motor cradles, which are bolted with two bolts to each cradle on either side of the frame. Full elliptic springs are used both front and rear, these being 26 inches long with three-inch spring action in front and four-inch in the rear. Both axles are of I beam section, the front one with steering knuckles forged in one piece, mounted on case hardened pins having a bearing on case hardened washers.

Clutch and brake pedals are of the ratchet type, set wide apart. The service brakes are of the expanding type, operating on six-inch drums on the rear wheels. The brake shoes have 1.125-

The New Zip, with Four-Cylinder Motor, Now in Light Car Division.

inch face and are lined with Raybestos. The emergency brake operates on the transmission reverse. Wheels are of wire, carrying 28 by 2.5-inch tires, the hubs being fitted with ball bearings.

The body is of the fore door roadster type, seating side-by-side, with the driver at the left. The seat is 37 inches wide, 17 deep, and the back is 18 inches high. Ample leg room is afforded, the distance from the seat back to the dash being 52 inches. A luggage compartment is provided at the rear. The equipment consists of a top, dust hood, full set of curtains, folding glass windshield, electric headlights and tail light, six-volt, 40 ampere-hour storage battery, electric horn, tools, repair kit, jack, etc.

It may be stated that the increased demand for Zip machines has made necessary the enlargement of the factory, so that the plant now occupies a brick building of five stories.

CORRESPONDENCE WITH THE READER.

Premier Water Trap—Curious, Portland, Ore.

I read recently that the Premier automobile uses a water trap to strain the fuel. How is it constructed and how does it differ from strainers used on cars?

The water trap referred to is used on the series M Premier car, made by the Premier Motor Manufacturing Company, Indianapolis, Ind. It is a filter or strainer, and its function is to prevent water or foreign substances reaching the carburetor.

Fig. 1—Water Trap Used on Premier Cars.

The construction is shown at Fig. 1 and the device is attached to the bottom of the fuel tank. Water is prevented from flowing with the fuel to the carburetor by a standpipe extending vertically as shown in the drawing. Water, being heavier than gasoline, settles in the bottom of the trap and is removed by displacing a drain plug.

Eureka Generator—Reader, Liberty Mills, Ind.

Having read an account of lighting generators for small cars in your valuable book on page 66 of the May 10 issue, I would like to be informed as to the mounting of the Eureka, Jr., for a model T Ford car, as I note that the Ford company states in one of its books that the current from the Ford generator should be used only for ignition.

The generator referred to is manufactured by the Henricks Novelty Company, Indianapolis, Ind., expressly for the small car, and is adaptable to the Ford automobile. The company supplies the necessary brackets, bolts, pulleys, etc., for a small sum, and the installation of the dynamo does not require any alterations as the brackets are made to fit accurately. The equipment for mounting the generator is shown at Fig. 2, the parts disassembled being depicted at A and fitted to the motor at B.

To install, the radiator is removed, also the Ford fan bracket. The latter is replaced by the Henricks bracket marked Ford B and the pulley Ford C attached by four screws to the regular fan pulley on the side next to the motor. The generator bracket A is secured as shown at B, on the left hand side of the engine, new bolts being utilized. The dynamo is secured to the bracket by means of two cap screws, and lock washers are utilized. Drive is by belt in the installation illustrated, and it will be noted that

the extra pulley does not interfere with the conventional member. The attaching can be done by the owner as, as has been previously stated, there is no fitting or alteration.

Maxwell Model E—R. E. D., Brooklyn, N. Y.

Being a subscriber to The Automobile Journal, would like to ask a few questions through your correspondence column.

1—Will you show me in plain figures how the horsepower of a 4.25-inch square motor is figured according to the A. L. A. M. or S. A. E. ratings as applied to New York State?

2—In my model E 1910 Maxwell car I find a little end play in the wristpin and connecting rod bearings. Would this cause a knock in the engine or cause any irregular running? How much play should there be, if any, and what is the method of adjustment?

3—Will you show me the method of timing the valves on this same engine, according to the marks on the fly-wheel?

4—What is the method and force required to remove and replace the rear wheels of this car?

5—What effect would a defective tube coil have on the engine?

6—Can you tell me if there is any law in New York City requiring a permit to keep your automobile on your own premises? The owner has already paid a fee for a license to run his car and now it seems he must pay another for the privilege of keeping the same car on his own premises, which is double taxation and therefore would seem unconstitutional. I would like to have your opinion on this point.

Thank you in advance and trust that I will not take up too much of your valuable space and time.

1—The A. L. A. M. and S. A. E. rating referred to is the same, and it is utilized in New York State for computing the horsepower of a motor. It is based on an assumed piston speed of 1000 feet a minute and considers the bore only. The formula consists of squaring the bore, multiplying the result by the number of cylinders and dividing by 2.5. For example: The bore mentioned in the question is 4.25. To figure the horsepower, square the bore (4.25×4.25), which equals 18.0625, which multiplied by the number

Fig. 2—Mounting Eureka, Jr., Lighting Generator on Ford Motors: A, Bracket, Pulley and Fan Bracket; B, the Equipment in Place.

of cylinders, four, becomes 72.25, which divided by 2.5 gives 28.9, the horsepower rating.

2—If the writer remembers correctly the wristpins of the motor referred to oscillate in the piston bosses and if worn and loose are likely to cause a knock. The bushings may be renewed provided the wristpin is not worn too badly. If not familiar with the work it is best to consult an expert. There should not be any play in the connecting rod bearings. A loose connecting rod will cause a knock. Adjustment is provided by removing shims from the bearing caps. The scraping in and adjusting of these bearings require experience if satisfactory results are to be obtained. A loose wristpin or connecting rod should not cause any irregular operation of the motor, but play should be removed, as damage may result.

3—The valve timing of the engine may be checked up by utilizing the flywheel marks referred to. The method was described and illustrated in the April 25 issue. The marks refer to the opening and closing points of the valves, also the dead centres, figures and letters being used. For example: I O 1-4, denotes the opening points of the first or fourth cylinder, and I C 1-4, their closing points. Similarly E O and E C denote the opening and closing points respectively of the exhaust members.

The method of utilization of these points is simple. Rotate the flywheel in its normal direction until the mark I O 1-4 comes opposite the centre of the last cylinder or the indicating mark. With the marks registering, the inlet valve of the first or fourth cylinder should begin to lift. If not, the adjusting nut of the tappet is loosened and the tappet mechanism lengthened until the valve stem just begins to raise. The closing point is checked in a similar manner. After resetting the valves and locking the nuts, it is a good plan to check the opening and closing points a second time. If it be borne in mind that the crankshaft of the motor makes two complete revolutions to complete the four strokes, the timing will be made much easier, as the valve action may be checked upon each half revolution of the crankshaft. It will be necessary to know the firing order of the motor, however.

4—The rear wheels are fitted to a taper axle and locked by a nut and cotter pin. Sometimes the wheels can be removed easily. It may be necessary to employ a wheel puller.

5—A defective tube transformer coil would cause irregular operation of the motor.

6—Other than the fire department regulations, the writer knows of no ordinance or law

requiring the owner of a motor vehicle to pay a fee or take out a permit to store a private machine on the premises.

Timing Haynes Motor—Information, Bridgeport, Conn.

Can you give me the timing diagram of the 1912 Haynes motor, or the proper clearance between the valve lifter and valve stem?

The timing of the Haynes models 21 and 22, 1912 and 1913 motors, is as follows: Intake opens five degrees after top dead centre and closes 32 degrees after lower dead centre. Exhaust opens 47 degrees before lower dead centre and closes two degrees after top dead centre. The clearance between the valve lifter and valve stem should be .006 inch. The better method of setting the valves would be to observe the timing

Fig. 3—Timing Diagram of Models 21 and 22, 1912 and 1913 Haynes Motors.

as given above and shown by the diagram presented at Fig. 3.

Wristpin Design—Reader, Peoria, Ill.

I have a knock in my 1912 Haynes motor. The repairman says it is loose wristpins. How are they fitted and if badly worn what would I have to do?

The wristpin used in the motor mentioned is of the fixed type and is retained by a split ring very similar to a piston ring, the ends of the pin being slotted to take the ring. If the pins are worn oval it will be best to fit new ones, and to scrape in the connecting rod bearing, as this will doubtless be found out of true.

Timing Magneto—Reader, Everett, Mass.

Am informed that you published a drawing showing how to figure out the lead of magneto for motors of dif-

ferent sizes. Being a new subscriber, would appreciate your publishing the information.

The timing diagram referred to is shown at Fig. 4 and was compiled by the Bosch Magneto Company, New York City. With this it is a simple matter to determine the angularity of the crankthrow from vertical, providing the stroke and piston travel in inches are known.

As to timing: The magneto is generally installed so that the contact points of the interrupter mechanism open at a certain point, corresponding to a predetermined angularity of the crankthrow from vertical, the relation of the pis-

Fig. 4—Bosch Timing Diagram for Ascertain the Angularity of the Crankthrow from Vertical When the Stroke and Piston Travel Are Known.

ton travel to the rotation of the crankshaft depending upon the stroke and the length of the connecting rod.

While it is a comparatively simple matter to ascertain the piston travel in inches, it is not so easy, however, to determine accurately the rotation of the crankshaft, and the timing diagram referred to will save lengthy computations. In it the relation between the piston travel and the connecting rod length is 1:4.5. The vertical lines numbered at the bottom give the stroke of the motor in inches, the rotation of the crankshaft in degrees being indicated by the slanting lines

and the figures at the right. The figures on the left and the horizontal lines indicate the piston travel in inches.

To illustrate the use of the diagram: Let it be assumed that it is desired to find the piston travel for an advance of 30 degrees on a motor having a six-inch stroke. The vertical line for the desired stroke may be identified by the figures at the bottom of the diagram, and this vertical line followed until it cuts the diagonal line indicating the desired number of degrees, which is 30 in the present case. The horizontal line nearest this point is followed to the left, and in the illustration it will be noted that it indicates about .5 inch.

Consequently in setting a magneto on an engine having a stroke of six inches, it will only be necessary to insert a wire in the opening of the petcock of the proper cylinder, the first, for example, and turn the flywheel backward past dead centre until the piston has descended about .5 inch. This will correspond approximately to a rotation of 30 degrees of the crankshaft.

Studebaker Horsepower—H. E. R., Viroqua, Wis.

Can you give me, or near, the horsepower of the 1914 Studebaker Four? I have purchased one of these and it gives good satisfaction. As the factory does not give the rating this year I would like to know it if possible.

The Studebaker Four has a bore of 3.5 inches and stroke of five, and according to the S. A. E. formula, which considers bore only, is rated at 19.60 horsepower, and has a piston displacement of 192.4 cubic inches. This rating is very conservative and the writer understands that it has been greatly exceeded in dynamometer tests to which all Studebaker motors are subjected.

Emergency Light—A. H. Mohr, Arcadia, Ia.

Please give me a little information on attaching an electric emergency light to the storage battery. I have a No. 79 model Overland.

By an emergency light it is presumed that a trouble or inspection is referred to. There are several methods of making a connection such as to one of the lamps, cutting in on a circuit or wiring from the battery. It would be best to consult the agent from whom the car was purchased as to the proper bulb to use and method of connection. This information will be supplied by the factory upon addressing the service department.

One of the feature articles of the annual touring number of The Automobile Journal will be complete instructions for the remedying of ignition troubles.

PUBLICITY MAN EVOLVES NEW SCHEME.

THERE is little reason to question the statement that the automobile industry has been responsible for a large number of schemes for directing the attention of the public to a given product. Publicity managers have vied with each other in their efforts to secure something new and original, until it would almost seem that the field had been entirely covered. It remained for the H. J. Koehler S. G. Company of New York City, distributor for Koehler trucks and Grant passenger vehicles, to devise what appears a decidedly new application of a principle that is somewhat well known.

An accompanying illustration shows a Koehler wagon in front of the National History Museum in New York City, with a Grant roadster mounted thereon and a young woman seated in the roadster, apparently guiding its movement. The camera fails to do complete justice to the scheme evolved by the publicity man.

On the chassis of the delivery wagon has been installed a special platform with skirts that drop a considerable depth for its full length. Between this platform and the chassis rollers are fitted, these being coupled by gearing, so that when the roadster's engine is started the moving rear wheels drive the rollers underneath, and these in turn move the forward rollers and wheels at the same speed. The high speed ratio is employed and the effect is that of the roadster moving on the deck of the wagon. In addition, power from the rollers turns signs mounted in the skirts of the platform.

It may be that the idea was suggested from the fact that the company was requested to provide a float to lead the annual actors' parade. At least the combination made its first appearance on the streets at that time, with Miss Stella Mayhew at the wheel of the Grant car, which was

painted white. Of course the advertising feature was not so marked as it was made later. Patents have been applied for by V. V. Kranich, who was responsible for much of the design.

MAKERS ELECT OFFICERS.

Col. Clifton Again Heads the National Automobile Chamber of Commerce.

Col. Charles Clifton, treasurer of the Pierce-Arrow Motor Car Company, Buffalo, N. Y., for eight years at the head of the national motor car

Novel Method of Displaying Grant Car, Mounted so as to Move on Rollers Fitted to Koehler Delivery Wagon Chassis.

manufacturer's organization, was re-elected president of the National Automobile Chamber of Commerce at its annual meeting in New York City early in the month. The other officers are:

Vice president, Wilfred C. Leland, Cadillac Motor Car Company, Detroit; second vice presidents, Hugh Chalmers, Chalmers Motor Company, Detroit, gasoline division; Windsor T. White, White Company, Cleveland, O., commercial vehicle division; H. H. Rice, Waverley Company, Indianapolis, Ind., electric division; secretary, R. D. Chaplin, Hudson Motor Car Company, Detroit; treasurer, Col. George Pope, Pope Manufacturing Company, Hartford, Conn.; general manager, Alfred Reeves, New York City.

Board of directors, the officers and S. T. Davis, Locomobile Company of America, Bridgeport, Conn.; C. C. Hanch, Nordyke & Marmon Company, Indianapolis, Ind.; Alvan Macauley, Packard Motor Car Company, Detroit; W. E. Metzger, American Electric Car Company, Chicago; H. O. Smith, Premier Motor Manufacturing Company, Indianapolis; Albert L. Pope, Pope Manufacturing Company, Hartford, Conn.; L. H. Kittredge, Peerless Motor Car Company, Cleveland, O.; John N. Willys, Willys-Overland Company, Toledo, O.; E. R. Benson, Studebaker Corporation, Detroit.

THE INDIANAPOLIS RACE.

In analyzing the results of the fourth annual international sweepstakes 500-mile race, it is necessary to start with the proposition that the French machines won because they were the best cars. There has been no attempt, however, on the part of the French manufacturers, or, for that matter, the makers of any of the foreign machines competing in that event, to mislead the American public into the supposition that these cars were the stock product of the concerns whose name they bore. There simply has been a difference of opinion between the manufacturer in this country and abroad as to the value of speed contests from a strictly scientific viewpoint.

The speedway management has announced a programme for the immediate future which, upon first consideration, possesses elements of impossibility. However, there is food for thought in the suggestion that the American position with regard to racing must undergo a radical change. While foreign cars have been competing with machines of home production practically ever since the inception of the industry in this coun-

try, it is only within the past two years—or, more properly speaking, during the last two 500-mile races—that the real modern racing creations of foreign manufacturers have been sent to the United States.

For a number of years there has been disposition on the part of European motoring prints to scoff at the so-called stock car event. It is also true that, as soon as America practically dropped the stock car contest, Great Britain inaugurated the standard car event, which is different largely in name only. But Great Britain, in keeping with Continental Europe, has not abandoned the special racing creation.

There is a wide difference between the freak, composed of standard products, put together for racing purposes, and the specially built racing machine. One has no other object than to win a prize, while the other is designed and constructed to demonstrate some particular theory which is expected to have practical value to the industry. The results of the last 500-mile race indicate somewhat conclusively that Europe has progressed much further along this line of endeavor than America, albeit, for the first time, there was some evidence that American manufacturers and designers are giving thought to this feature in speed contest work.

RESULT OF BUSINESS METHODS.

In view of the conditions which have prevailed during the past fiscal year—for, measured by the production “season”, the automobile year virtually comes to an end July 1—the fact that many concerns were practically sold out a month ago indicates in no uncertain manner the stability of the motor car industry. There is little doubt, however, that the application of business principles has played an important part in the success thus manifested. There is still much room for improvement, but it will be less difficult to maintain the newer methods once they are firmly established.

Automobiles must be sold today, with strong emphasis on the “sold”. Business principles must permeate every department of the business. Those concerns—manufacturer or dealer—which recognize this fact cannot help but reap the benefits accruing to the successful business man. And, after all, the purchasing public likes to do business in a businesslike way.

PIERCE-ARROW 1915 LINE ANNOUNCED.

IN KEEPING with its policy to build the best all around motor car possible, to price it on a basis of fair profit, and to add each year such additional equipment as has demonstrated its real worth, the Pierce-Arrow Motor Car Company, Buffalo, N. Y., announces that its series Three automobiles will be sold at the same prices as the series Two.

The series Three will be built in three sizes. The 66 horsepower chassis will be known as the 66 A-3, the 48 horsepower as the 48 B-3, and the 38 horsepower as the 38 C-3. The bore and stroke of the motors is as follows: 66 A-3, five-inch bore, seven-inch stroke; 48 B-3, 4.5-inch bore, 5.5-inch stroke; 38 C-3, four-inch bore, 5.5-inch stroke.

In general appearance the cars differ materially from the previous designs. Without reducing the road clearance it has been found possible to lower the bodies and running boards of all models by increasing the drop of the central portion of the frame. This change has led to the adoption of pressure feed and placing the fuel tank at the rear of the chassis. An advantage of the change is the placing of the carburetor much higher, and it is more accessible.

Many improvements have been made, which lighten the labors of the driver. The accelerator, throttle and spark controls have been simplified, and the electric motor starter is now operated by a push button, no pedal being necessary. Instead of the plug for locking the ignition, a Yale lock and removable key are provided. It is stated that it is practically impossible to start the motor if the hood be locked and the key displaced from the switch. The action of the engine primer has been greatly simplified, and the housing of the universal joint between the clutch and transmission made more complete.

All three motors are six-cylinder, four-cycle, water-cooled units, with the cylinders cast in pairs and with mechanically operated, interchangeable inlet and exhaust valves located on opposite sides. The company holds that this arrangement obtains a shorter and lighter motor, larger valve openings without abnormal lifts,

more even distribution of weight and more accurate cam setting. Following the Pierce-Arrow practise of many years, all crankshafts are provided with seven bearings. The timing gears are of helical design.

Lubrication is by pressure feed to the crankshaft and connecting rod bearings, timing gears and to the upper portion of the cylinder walls. Two absolutely independent ignition systems are fitted. Cooling is by a centrifugal pump with large radiator. The carburetor is of special Pierce-Arrow design and manufacture. The single wire system is employed for the electric lighting and starting systems, separate units. The battery is of ample capacity, is suspended to

Pierce-Arrow Model 38 C-3, of the New Series Three, Having New Design Fenders, Lower Suspension of Body, and with Pressure Fuel Feed Replacing Gravity.

the chassis frame, and is very accessible.

The clutch is of the cone type, leather faced with flat springs to provide easy engagement. An oil ring, attached to the flywheel, maintains the clutch facing in a most efficient condition. The gearset is of the four-speed type, and has an interlocking device between it and the clutch to prevent damage through careless operation. A dust proof double universal joint is interposed between the clutch and the gearset. The service of the power tire pump is obtained by means of a claw clutch engaging with the countershaft of the transmission.

The drive shaft has two large universal joints, as well as a sliding member at the rear to compensate for spring action. A torque rod with a spring cushioned and swivelling front support and pivoted rear connection cares for all tor-

sional reactions. The rear axle is of the semi-floating type and, although very sturdy, is light. Its light "unsprung" weight is held to be re-

dividual front seats, arranged with a space between them to give easy passage from the front to the rear compartment. This enables the driver or passenger in the front seat to leave the car on either side as desired. The undivided type of front seat will be provided, if specified, at no extra cost. All cars are right hand drive and right hand control.

The steps of the touring cars are illuminated by two electric lamps in the back of the front seats, and the tail lamp and license illuminator are a unit. The fuel tank is well protected from injury by a bumper construction. The headlights are carried on the front fenders as in the series Two, and have been changed slightly to conform to the new fenders.

Entirely new bodies are offered. The standard brougham, landaulet, suburban and landau have rounded corners and domed roofs. The lines are noticeable for their simplicity and general beauty. The optional flat roofed broughams and suburbans have roofs with slightly rounded corners and they dip slightly toward the front of the car. The brougham, landaulet and suburban landaulet have unusually wide windows and are built with flat roofs. All standard dome roof designs have arched doors. All standard and optional flat roof bodies are without the arched doors.

With few exceptions all Pierce-Arrow bodies built since 1904 have been constructed of cast

Pierce-Arrow Touring Car, the Equipment of Which Includes Electric Lighting, Motor Starter, Power Tire Pump, Etc.

sponsible for the large tire mileage obtained. The axle shafts can be removed readily without dismounting the housing. Tapered roller bearings are utilized, and the wheels are made in the factory, of carefully selected, dried and treated wood.

The brakes are ample in size and are noticeable for their smoothness of action and gripping ability. The steering gear is of the screw and nut type, and all components are ample in size, accessible and adjustable. In keeping with its policy to equip its product with the best accessories procurable, the Pierce-Arrow Motor Car Company will fit all chassis with Goodrich Silvertown cord tires as standard.

Many new features of design are incorporated in the numerous types of bodies offered. The lowering of the frame has resulted in all 48 and 66 bodies being suspended three inches lower, while the 38 designs are 2.5 inches nearer the ground. This lowering of the bodies not only makes them more attractive, but easier of entrance.

The fenders are of new design, being wider, and afford greater protection from mud and water than formerly. A one-man top of Pierce-Arrow design and construction is standard equipment on all touring cars. The regulation cape top of heavier and more rigid construction is offered as an option at no extra cost.

The standard touring cars are fitted with in-

One of the New Types of Enclosed Bodies, Having Rounded Corners and Simple Lines.

aluminum instead of sheet metal. This provides great strength and rigidity and makes possible the elimination of the usual heavy wood backing.

The Pierce-Arrow demountable rims (Johnson patent) are a feature of the equipment. The wheels do not depend upon rims for their strength and no particular care is necessary in adjustment to secure perfect tire alignment. The extra tires and rims are carried on the right hand running board.

The balance of the standard equipment includes the following: Hand inspection lamp, clock, speedometer and odometer on separate dials arranged in a cluster on the dash in connection with the oil and fuel pressure gauges, voltmeter, ignition and lighting switches, starter button, magnetic fuel gauge on tank, power driven tire pump, bulb and electric horns, collision bumper, Pierce-Arrow folding trunk rack, demountable rims, shock absorbers, complete set of tools, supply of oils and greases, extra valves and springs, locked ignition and starter switch, dash cabinet, tool compartments, tire carrier, robe rail, Jiffy curtains, windshield and front compartment ventilator, tonneau lamps in touring cars and dome lights in enclosed machines, adjustable foot rest, telephone to chauffeur, arm loops, utility and smoking sets, Waltham clock, dash clock, umbrella holders, rolling curtains, draperies and frameless windows with regulators in closed cars, hat straps, floor carpets in tonneau, parcel nets and pockets.

The range of color and upholstery specifications open to the selection of the purchaser is practically unlimited. All of the standard combinations are the result of careful study and selection. Particular care has been exercised, as in the past, in the choice of colors with regard to harmony of combination and durability of pigments.

GALVESTON BEACH MEET.

Sanction Has Been Issued for Automobile Speed Contests July 30-Aug. 3.

From present indications, Galveston, Tex., is to stage the only automobile beach meet to be held this season. A sanction has been granted by the contest board of the American Automobile Association, and professional events will be run July 30, Aug. 1 and 3, while events for amateurs will be scheduled for July 31.

This will be the sixth annual Galveston beach meet, and the interest has increased very materially from year to year. The entry blanks are not yet ready, but it is understood that the committee in charge has appropriated some \$5000 for cash prizes, and that several cups will be awarded during the meet.

FUEL AND OIL MILEAGE.

Car-Nation Car Completes 838 Miles on 27 Gallons of Gasoline and Two of Oil.

Some interesting fuel and oil figures have been obtained by the American Voiturette Company of Detroit, maker of the Car-Nation car. According to the figures submitted one of these machines travelled 838 miles on 27 gallons of gasoline and two of lubricating oil. N. T. Brotherton of Detroit, with D. D. Thurber as a passen-

Showing the Unusually Large Frameless Windows of New Pierce-Arrow Enclosed Body.

ger, left Detroit to attend the races at Indianapolis, Ind., a distance of 312 miles. The tank contained eight gallons of fuel and two stops were made to purchase four and five gallons. On the return trip, previous to which considerable mileage was rolled up, 10 gallons were bought, and upon arriving in Detroit the tank was found to contain 1.5 gallons. Mr. Brotherton estimates that considerably more oil was used than would be normally, as the engine was new. The machine carried, in addition to two passengers, three heavy dress suit cases, two sets of golf clubs, spare tires and other material. Although the roads were rough in many places, no mechanical trouble was experienced and the tourists thoroughly enjoyed the trip. Mr. Brotherton figures the cost of the trip at half a cent a mile, including tires. The cost by railroad one way is \$11.80.

AMERICA'S INITIAL ELECTRIC CYCLECAR.

WHAT is believed to be the first electric cyclecar to be developed in this country, at least, is the Heubner, the design of O. E. Heubner, 131 Sumpter street, Brooklyn, N. Y. The primary object of the designer was to produce a machine that would meet the demand for a low priced, small capacity commercial cyclecar, simple in construction, easy to handle and reliable in service. In order to keep the cost down, Mr. Heubner decided upon the use of but three wheels, with the single wheel as the driving member, this construction involving a reduction in friction and tractive effort, in addition to the saving of one wheel, sprocket and tire.

As originally designed, this machine was fitted with a 25-ampere, 18-volt motor, driven by a nine-cell battery, the latter having a weight of

Heubner Cyclecar, the First Electric Design to Be Produced in This Country.

200 pounds. This machine was with the driving wheel at the rear, and the delivery van placed between the two forward wheels. The wheel-base was 96 inches and the tread 54, while the loading space was 36 by 31 by 27 inches.

The machine illustrated was the second one built. It will be noted that the driving wheel is in front. This model is designed to carry a load of 300 pounds, instead of 200, as with the first, and the battery has 12 cells instead of nine. The speed is rated at 10 miles an hour, with a battery mileage of 40 to 50.

The original model has been subjected to numerous tests, and has covered a total distance of 2500 miles. It has average 23 miles to a charge, and the total running cost, including battery renewal, overhauling, painting, oil, charging, driver, storage, interest on investment and 25 per cent. depreciation, is said to have figured out at four cents a mile. The new machine has

not seen sufficient service to give figures of this nature.

It is understood that Mr. Heubner has interested capital in the venture and that pleasure and commercial cars of this type, also with four wheels, but with one driving wheel, are to be manufactured and placed in the market in the near future.

JOY IS SIGNALLY HONORED.

President of Packard Company Becomes Director of National Chamber of Commerce.

The election of Henry B. Joy of Detroit to the board of directors of the Chamber of Commerce of the United States is an honor alike to Mr. Joy and the automobile industry. He is president of the Packard Motor Car Company, Detroit, and holds the same office in the Lincoln Highway Association.

Mr. Joy's connection with the automobile industry dates from 1900, soon after he purchased his first machine from J. W. Packard of Warren, O. It was largely through his activity that the co-operation of Detroit capitalists was secured in the organization of the Packard Motor Car Company and the removal of the plant to that city. In 1903 he became general manager of the concern and later was elevated to the presidency.

FINDS BUSINESS GOOD.

New York Dealer Reports a Prosperous Outlook upon His Return from the West.

That the outlook for business has not been brighter in 10 years is the opinion of Louis Mansbach, treasurer of the Times Square Automobile Company, New York City, upon his return from a business trip throughout the West. He not only visited a large number of automobile factories, but many dealers, large and small, and his statement of conditions as he finds them will prove of exceptional interest. He says:

Good crops are pointed to and this makes the farmer a large potential buyer, especially of the lighter cars. I have found that many of the leading manufacturers, anticipating an active, widespread demand, from this source alone, for five-passenger, four-cylinders cars in the \$1000 class and under, have concentrated their facilities with the idea of being able to meet this demand. Cars of this type are hard to find in the second hand market. This also helps the builder of new cars.

B. A. GRAMM'S POWER DUMPING BODY.

AMONG the concerns engaged in the production of commercial vehicles which have recently added a power dumping mechanism as a standard body installation, is the Gramm-Bernstein Company, Lima, O., maker of B. A. Gramm's trucks. The new design was not placed in the market until repeated tests in continuous service had demonstrated its practicability in every way.

The chassis is a standard construction, except for the addition of such necessary equipment as is required to operate the power hoist, which is actuated by the driver from the seat. The design is such, however, that the weight of the body is unusually well distributed, and a considerable percentage is carried forward of the rear axle. The body is so installed that it can be elevated to an angle of 40 degrees.

Back of the driver's cab is mounted a cylinder filled with oil, and the piston rod carries at its upper end a cross arm with a larger sheave at either end. Wire cables anchored to the chassis frame are carried over these sheaves, and are attached to arms projecting downward from the forward end of the body.

The oil is circulated from the upper side of the piston and forced into the lower end of the cylinder by a gear pump that is driven by the propeller shaft ahead of the transmission gearset. As the piston is forced upward in the cylinder, the body is carried upward to the extreme elevation, where it stops automatically, and the oil will bypass when a certain pressure has been reached. By reason of the oil pressure after the body has been elevated the piston will fall to the bottom of the cylinder, the oil having a cushioning effect.

APPROVES SHALER VULCANIZERS.

Goodyear Tire & Rubber Company Orders Them for All Its American Branches.

Shaler vulcanizers, made by the C. A. Shaler Company, Waupun, Wis., which have been in

use for a number of years by car owners, garages and automobile manufacturers, have received still another seal of approval, which is very gratifying to the maker. One of the largest tire producers in the country, the Goodyear Tire & Rubber Company, Akron, O., has ordered a stock of these vulcanizers for every Goodyear branch in the United States.

It is understood that the Goodyear company has decided that car owners can obtain the best possible service from tires only by taking care that the small cuts are sealed before sand, dirt and water are permitted to disintegrate the fabric. It is stated that instructions have been is-

Five-Ton B. A. Gramm's Truck, Fitted with New Hydraulic Hoist and Dumping Body.

sued to each branch to see that as many Goodyear users as possible employ a Shaler vulcanizer to prevent premature tire deterioration.

BECOMES DETROIT MANAGER.

J. M. Flannery Will Direct Distribution of K. D. Carburetors in State of Michigan.

J. M. Flannery has been appointed manager of the K. D. Carburetor Company of Cleveland, having charge of the company's interests in the State of Michigan, with offices at Detroit.

Mr. Flannery, for the past six years, was associated with F. J. Alvin with the Kingston Carburetor Company, the latter now being sales manager of the Sears-Cross Company.

GOODRICH COMPANY'S TOURING BUREAU.

FROM Cape Cod to the Golden Gate, and from Michigan to Florida, the B. F. Goodrich Company's touring bureau has covered the country with sign posts to guide the motorist on his way. Not only that, but the Goodrich people have mapped almost every good road in the country and put their vast collection of data, relating to routes and touring information, into books, which are being distributed free of charge.

Year by year, this service, which is held to be the only one of its kind in the world, has been extended, until the 1914 edition of these books presents data covering 300,000 miles of the best touring routes in this country, Canada and Eu-

Touring Data Supplied Free by B. F. Goodrich Company.

rope, plotted so that motorists can go anywhere they want to and have a safe and sure guide all the way. Each book covers a particular territory and there are also "road logs" of different tours and routes connecting large centres; "Rules of the Road", crammed full of information about driving, care of the car and the tires, and other information, and the "Memory Book of Motor Yesteryears", in which the tourist can record his trip records, odometer readings, speedometer readings and character of the hotels and garages visited en route.

During the coming touring season the Goodrich touring bureau will send out 2000 pieces of touring information daily. This service is offered cordially to every motorist, whatever the make of car or tires used by him. There is no charge whatever for advice, information or route books.

The American tourist abroad has not been overlooked, and the European route book, now ready, gives customs regulations of the princi-

pal countries, how to ship the car, and how to get about on the Continent. In addition to a fully equipped factory in France, the B. F. Goodrich Company has branches in London, Paris, Brussels, Frankfurt and Marseilles, with agents and stockists in all the principal European cities. At all of these inch-sized tires, either Safety tread or otherwise, are carried in stock for the special benefit of the American tourist abroad.

All the books mentioned herein may be had free upon request made to the nearest branch of the B. F. Goodrich Company, or by addressing the factory at Akron, O.

A. A. A. GOOD ROADS PATRIOTS.

Will Rally July 4 in the White Mountains—
Many Notables to Be Present.

Governor Felker of New Hampshire will head the list of noted speakers who will address the good roads session of the midsummer meeting of the American Automobile Association, to be held at Hotel Maplewood, Bethlehem, N. H., on the afternoon of July 6. White mountain visitors generally are invited to attend the highways gathering, which will be in charge of Chairman George C. Diehl of the A. A. A. National Good Roads Board.

State Highway Commissioners S. Percy Hooker of New Hampshire, Lyman H. Nelson of Maine and Charles W. Gates of Vermont will tell of roads development in their respective states. An address which will have some reference to federal aid will be delivered by Paul D. Sargent, the state highway engineer of Maine, who was formerly acting director of the United States office of public roads of the Department of Agriculture. Col. W. D. Sohler, chairman of the Massachusetts Highway Commission, also expects to be present.

The A. A. A. is accentuating New England territory this summer, for the reason that a year hence there will be a decided trend to the Pacific Coast, on account of the Panama-Pacific Exposition in San Francisco, and the magnet of wonderful road accomplishments in southern California, as well as in Oregon and Washington. Early inquiries to the A. A. A. touring bureau indicate a substantial army of road travelers who will head westward in 1915.

PLANS FOR THE NEXT 500-MILE RACE.

FIVE hundred miles at 100 miles an hour, without a stop or tire change, on one gallon of oil and 25 gallons of gasoline, is the difficult target set by the management of the Indianapolis motor speedway for the motor industry of the world to reach during the next three years. It is expected that the fifth international sweepstakes race, to be held Memorial Day, 1915, will show a distinct step in that direction.

While all the details of the next competition have not been arranged as yet, it is announced that the cubic inch piston displacement will be cut from 450 to 300. The minimum weight will remain the same, 1600 pounds. These specifications are expected to stay in force for at least three seasons, or until every branch of the science in this class of competition has been thoroughly probed. When there is no more to be learned, it is explained that a further reduction will be effected, less than 161 cubic inches being the final goal.

The speedway management holds that regulations of this character naturally put automobile racing into the experimental division of the industry, where it properly belongs. It is added that the day when makers can take stock and semi-stock models and compete with them successfully is past, as was proven by the results in the last 500-mile race.

Europe has for some time regarded such contests in the light of a laboratory, not as a proving ground, and it is expected that a number of American manufacturers will enter this field from business, if not patriotic, motives. In order to carry out this plan it will be necessary to institute special racing departments, having no connection whatever with the ordinary branches of production, except to lead the way.

The statement continues that this movement will see the finish of the "barn built" car, which has been so prominent in American racing of late. With the finest engineering skill and the best of materials required to win success, it is not thought likely that the heterogeneously assembled freak will have a chance. The only thing that will be left to do is to quit.

In advancing the art, the speedway management proposes to do its material as well as its normal share. To render high speed work more safe, the surface of the track will be widened 15 feet on the inside and retaining walls will be built all around it. Additional comfort will be provided for drivers and mechanics by a club-

house outside the grounds, this to be fitted with a swimming pool and other conveniences. The statement concludes that if the gasoline efficiency of the present era is not raised wonderfully during the next few seasons, it will not be the speedway's fault.

MERCER DEFEATS STUTZ.

Texas Owners Seek to Determine Relative Merits of Two Makes of Cars.

Following the recent 500-mile race at Indianapolis, Ind., the feeling between Mercer and Stutz owners in Houston, Tex., ran high. Varied claims were made for the cars of each make, and the rivalry finally culminated in a match race between a stock Mercer touring car carrying driver and two passengers and a stock Stutz "Bear Cat" raceabout with driver only.

Two one-mile trials were held, in which the Mercer covered the distance the first time in 57 seconds and the second time in exactly one minute. The Stutz made the mile the first time in 1:06 and the second in 1:07. At least, that is the information that comes over the wires from Houston, but the matter does not appear to have been settled, since the Stutz owner is said to have challenged the Mercer owner for another race on the Galveston beach, during the beach meet to be held the latter part of July.

MUCH INFORMATION.

Red Book of New England Has Many Points That Motorists Will Find Invaluable.

The Red Road Book of New England is meeting with considerable favor among automobilists. In addition to all the regular maps, it includes nine plates, which show not only automobile routes in the White mountains, the play ground of New England, but also gives much detailed information that every motorist desires to know.

The city maps are especially noteworthy. By the intentional elimination of many streets unnecessary to the automobilist, each map stands out with its information like a cameo, the main thoroughfares only being shown. Along these are such landscape marks of importance to the autoists as are visible from a distance.

MOTOR & ACCESSORY MANUFACTURERS.

MOTORISTS and others connected with the industry will be interested in the brief explanation of the work and purposes of the Motor & Accessory Manufacturers presented below. From time to time, mention is made of this organization in motoring prints, but, aside from the fact that it is the representative body of the accessory concerns, very little is known about it by the average layman. The following statement has been prepared by James H. Foster, president of the association:

By James H. Foster.

Since the inception of the Motor & Accessory Manufacturers, 10 years ago, the board of directors

James H. Foster, President, Motor & Accessory Manufacturers.

had aimed to run the organization on a business basis and along conservative and productive lines, without noise or hoorah. Because of this fact, many people probably do not know that the membership of the association now numbers 262 firms and corporations of the highest standing, and perhaps few people realize that the combined capital of the said interests represented in the membership is somewhat over \$440,000,000. From a small beginning the association has grown into one of the strongest trade associations in the world. During the steady growth, many of the original plans

of the organizers have been followed out successfully and the trend of the times and varied changes in the industry have brought about conditions opening up a number of new fields of endeavor for the association. Just how the Motor & Accessory Manufacturers benefits its members is obvious to a certain extent, and beyond that, there are many benefits which members are in a position to receive, but which are not quite so obvious to the person who is unfamiliar with the organization and its work. Its primary objects are to promote in all lawful ways the interests of makers of automobile motors, motor parts, or accessories; to aid in the protection of its members; to secure the advantages to be obtained by mutual co-operation; to facilitate the collection of the claims of its members and the diffusion of information concerning the trade, dealers, credits and other matters of interest to the members of the association.

The membership is limited to individuals, firms or corporations exclusively manufacturers and as such engaged in the manufacture of motors, motor parts, appliances or accessories used on or in connection with motor vehicles, or who may make so large a portion of the product disposed of by them as to be in the discre-

tion of the board of directors considered eligible for membership.

How New Members Are Benefited.

For example: Take a typical concrete case of a condition which is arising frequently. An inventor or an engineer has a certain patented device which he is anxious to see manufactured and marketed. The device or design has certain obvious merits. He interests capital in his proposition and the capitalists are willing to concede that the article is one of merit and stands good chances of being marketed profitably. In getting down to cases, however, when considering forming a company, the capitalist often says to the owner of the patent:

"You have a good thing and we are interested in backing your proposition, but I and my associates are not automobile men. We do not know the ins and outs of the motor accessory industry. You are an engineer and an inventor and not a business executive. You say that you will secure the services of a competent sales manager and business staff, but the matter of gathering together a good organization is a gamble. How do we know that your prospective organization is going to be competent to cope with new conditions arising, meet competition and emergencies, patent litigations, etc."

And the reply is:

"As soon as we organize and commence manufacturing we shall apply for membership in the Motor & Accessory Manufacturers, which is an organization that will materially aid us in introducing our product in a profitable and practical manner".

For instance, there is the credit department, which furnishes ratings on all automobile manufacturers, corporations and individuals connected with the automobile industry, and collects and disseminates other useful financial information to members. Then there is a traffic department, with information and advice on all matters pertaining to the receiving and shipping of goods and proper routes. Also there is a legislative department, which collects, for reference purposes, copies of all state and federal legislation when introduced, affecting either directly, or indirectly, members' interests, and is otherwise active in automobile legislation.

This makes a very fair and convincing argument for the capitalist and after more details of the association are explained to him, if he is not already familiar with the work of the organization, its benefits are at once apparent.

However, the Motor & Accessory Manufacturers is not of benefit only to new members, nor is the period of its usefulness confined to those months when a new member is getting his business started. The departments operated and results otherwise accomplished are strikingly beneficial to long time members as well. In fact, of 39 charter members, there are still 29 identified with the association.

The Motor & Accessory Manufacturers solicits additional members, not because it requires them to swell the treasury, but because "In Union There Is Strength". It offers to such new member the firm knowledge that it receives 262 times as much as its one contribution in collective benefits. Besides, it is a commercial duty for a firm, whether just establishing itself, or already established, to be within the field of benefits which this inter-communicative membership privilege grants.

Members agree that the credit department alone is a feature that makes membership well worth while. The more progressive concerns, selling either largely or in a limited way, feel that they cannot afford to be outside the privilege of these reports.

Concerning Show Matters.

The Motor & Accessory Manufacturers has been able to save the industry hundreds of thousands of dollars in needless or unwise expenditure. One thing that has been aimed at has been the matter of endeavoring to govern attempts to increase the expense of members exhibiting at shows. The fact that practically every city of any size has its annual automobile show—and quite frequently shows occur simultaneously—makes it impossible for a manufacturer of parts and accessories to exhibit at all of these during a show season. Incidentally, the expense involved is too great.

This resulted in what is known as the sanction rule. It was generally agreed that two national shows a season involves sufficient expense for the average manufacturer to afford, and accordingly, the two national shows in New York and Chicago, respectively, were chosen to be sanctioned by the Motor & Accessory Manufacturers. Their members were privileged to exhibit at these and not elsewhere. Hence, instead of chaotic competition reigning, the matter of exhibiting the goods of members to the public and to the trade each winter has been systematized so that every member is placed on an even footing with his fellow members.

The association does not exploit show benefits especially. They are present, but the aim of the organization is to bear most heavily on the fraternal and co-operative benefits secured by membership, rather than on such side issues as are involved in exhibitions. It is most important for members to be under protective care in show matters.

TO HANDLE BRAENDER TIRES.

Gross Hardware Company, Milwaukee, Appointed Sole Agent for Wisconsin.

Announcement is made by the Braender Tire & Rubber Company to the effect that it has ap-

outing and over 400 machines were necessary to transport the youngsters to and from the beach. These cars were contributed by members of the association and private owners of Boston, who responded liberally to Mr. Campbell's invitation to loan the use of the cars with drivers for the day. The expense of the outing was met by members of the association, who contributed several hundred dollars, and the subscriptions of the general public.

The run to and from Nantasket beach, which is over one of the most delightful roads in Massachusetts, was made without a single mishap, and the little ones, many of whom had never ridden in an automobile, enjoyed the ride immensely.

At the beach Secretary Campbell dined his guests at the Nantasket hotel, and during the day there was plenty of pop corn, candy, ice cream and those delicacies that appeal to chil-

Showing a Part of the Fleet of Automobiles Which Transported the Children in the Seventh Annual Outing Conducted by the Boston Automobile Dealers' Association.

pointed the Gross Hardware Company, 126 Grand avenue, Milwaukee, sole agent for the Braender Bull Dog non-skid tire for the State of Wisconsin. The connection, which seems a most promising one to the parties concerned, was effected through the efforts of A. J. Duth of the Alfredal Company, who has represented the Braender tires at Chicago.

SEVENTH ANNUAL OUTING.

Boston Automobile Dealers' Association Entertains Children at Nantasket Beach.

Secretary Chester I. Campbell of the Boston Automobile Dealers' Association, played host to about 2000 crippled, orphan and destitute children Wednesday, June 10, when the annual outing of these little ones was held at Nantasket beach.

It was an ideal day for the seventh annual

dren. The merry-go-round and other beach attractions were free to the youngsters, many of whom are shut up most of the year in charitable homes in and around Boston.

There was entertainment for the drivers of the cars and some very nice prizes were donated by Boston merchants. Arthur Duffy, the well known sprinter, was starter for the games, and James T. Sullivan, automobile editor of the Boston Globe, was referee of the contests.

That the outing was a decided success was largely due to the personal supervision of Mr. Campbell, who gave his usual careful attention to details and whose efforts are appreciated by the children, as well as those who contributed to make the event an enjoyable one.

Preparing the Car for the touring season will be comprehensively dealt with in the Eighth Annual Touring Number of The Automobile Journal, particularly overhaul of chassis components.

METZ RETAINS THE GLIDDEN TROPHY.

THERE will be no Glidden tour this year. At least, that is the present indication. Because of lack of entries, the Chicago Automobile Club, which had the non-stop Chicago-Boston event in charge, has abandoned the undertaking. As a result the Glidden trophy will remain in the possession of the Metz Company, Waltham, Mass.

Once before, in 1912, there was no Glidden tour, and for the same reason. Early in that year, the contest board of the American Automobile Association sought to substitute the A. A. trophy for the famous classic, and, although two routes, one from Washington through New England to Ottawa, and the other from Detroit to New Orleans, were mapped out, insufficient entries made it advisable to abandon the attempt.

Last year, 21 cars covered the 1233 miles between Minneapolis to the Glacier national park in Montana, the Glidden trophy being awarded as a team prize. The three Metz 22.5 horsepower roadsters composed the only team to make the trip with a perfect score.

This year the regulations adopted for the annual national reliability tour, as the event is known officially, prohibited the Metz from defending its title to the famous cup, since it was to be made the award in the class for cars selling at more than \$1200. With less than a month remaining before the start of the event, but two cars had been entered, a Hupmobile and a Jeffery, and neither of these were eligible for the Glidden trophy.

The history of the Glidden tour is told by the following tabulation:

Year	Route	Miles	Victor
1905	New York-Bretton Woods-New York	871	Pierce
1906	New York-Buffalo-Bretton Woods	1135	Pierce
1907	Cleveland-Chicago-New York	1570	•
1908	Buffalo-New England-New York	1670	†
1909	Detroit-Kansas City	2533	Pierce
1910	Cincinnati-Southwest-Chicago	2851	Chalmers
1911	New York-Jacksonville	1454	Maxwell
1913	Minneapolis-Glacier Park	1233	Metz

*Won by team representing Automobile Club of Buffalo, composed of two Pierce cars, a Thomas and a Packard; no award was made.

For some months there has been a movement on foot looking toward a transcontinental tour from New York City to San Francisco in 1915, under sanction from the contest board of the American Automobile Association. It is entirely probable that this event will be held, the Panama-Pacific exposition at San Francisco being the objective point of the tourists, and it seems feasible

to make this the next competition for the Glidden trophy. Every effort will be made, however, to have the regulations so framed that the Metz Company may have full opportunity to defend the honor so richly earned during the tour of 1913.

MR. AND MRS. WISHART.

Bridegroom May Be at the Wheel of a Mercer in Sioux City 300-Mile Race.

Spencer E. Wishart and Miss Louise McGowan, second daughter of the late Hugh J. McGowan, traction magnate of Indianapolis, were married at the bride's home in Indianapolis, June 23. Mr. and Mrs. Wishart will spend a portion of their honeymoon abroad, but it is not expected that they will sail until some time in July, since Mr. Wishart is scheduled to drive a Mercer car in the 300-mile race on the Sioux City speedway, July 4. And he will return in time to drive a Mercer in the Elgin road races the latter part of August.

Wishart is said to be independently wealthy. He has been driving high speed cars in all sorts of contests for the past eight or nine years, purely through love of the sport. It was in the 1909 Vanderbilt Cup race that he came prominently into public notice. In that event he made round after round of the Long Island course, setting the pace for a field of veterans, although mechanical trouble eliminated him before the close.

For a number of years Wishart drove foreign cars only, these machines being owned and entered by him. Since September, 1912, he has been seen at the wheel of the Mercer. In his first race with that machine on the dirt track at Columbus, O., he secured world's records for all distances between 75 and 200 miles. Last year he drove a 300-cubic inch Mercer into second place, directly behind Jules Goux in the Peugeot, in the 500-mile race at Indianapolis.

An exhibition of electric pleasure vehicles was held last month in the new showrooms of the New York Edison Company, Irving place and 15th street, New York City, under the auspices of the Electric Vehicle Association of America. Among the cars on view were the following: Ohio brougham, Rauch & Lang town car, Detroit runabout, Baker brougham, Waverley roadster and a Ward coupe chassis.

DETAILS OF XENIA, A TRUE CYCLECAR.

WITH a factory having capacity for 30 cyclecars a day, the Hawkins Cyclecar Company has begun the production of the Xenia machines at Xenia, O. During the month of May it is stated that an average of five machines a day was manufactured, and plans were perfected for doubling this output during June.

The experimental car, which was known as the Hawkins, was in actual use for nearly a year before the factory was opened, and is said to have demonstrated its efficiency in every particular. It is explained that the first stock car was started on a 1000-mile trip the same day it was completed, and immediately after its return to the factory, without adjustment, it was sent out on a time trial for two miles, with two passengers, and covered the distance over fine macadam in two minutes flat.

The company is incorporated for \$50,000, and there is no stock for sale. The officers are: President, George Little; vice president, John W. Prugh; secretary, A. V. Perrill; treasurer, C. H. Little; engineer, P. E. Hawkins; directors, the above and Marcus Shoup, J. F. Orr, H. S. LeSourd and T. H. Zell. The factory is a fireproof structure, affording 20,000 square feet of floor space, and it is stated that it has been fully equipped with modern machinery.

The Xenia is a true cyclecar, having a two-cylinder, air-cooled De Luxe motor, with bore of 3.5 inches and stroke of 3.67, giving a piston displacement of 70.6 cubic inches. The wheelbase is 100 inches; tread, 36, and road clearance, nine. The weight is 600 pounds. The two passengers are seated tandem.

Ignition is by the Atwater Kent Unisparker system, and the carburetor is a Schebler. Transmission is of the planetary type, with disc clutch, affording two speeds forward and reverse. This is directly connected to the drive shaft by heat treated bevel gears running in oil. Final drive is by belts from jackshaft pulleys to the rear wheels. The belt has a cable insert and is claimed to be practically stretchless.

The frame is of pressed steel and the spring suspension is held to be of an exclusive design,

this being underslung in front, and suspended on a cross member at the rear, cantilever. Brakes act on the rear wheel hubs. Wheels are of wire, taking 28 by 2.75-inch tires.

VEHICLE TAXATION.

Universal Fee for Road Maintenance Urged to Solve Difficulty of Highway Upkeep.

Howard E. Coffin, vice president of the Hudson Motor Car Company, Detroit, said recently that all vehicles, whether horse or motor driven, will be taxed for road maintenance. Appropriations for road building have been made generally, but little attention has been paid to financ-

The Xenia is a True Cyclecar, Seating Its Two Passengers Tandem.

ing a proper road maintenance year after year. He recognized the neglect of the highways as a serious offset to the large outlays for new roads that are constantly being made throughout the country.

Mr. Coffin is said to have been instrumental in the preparation of a paper on "An Engineering Basis for Taxation of Automobiles", that is to be read at the meeting of the Society of Automobile Engineers, to be held at Cape May, N. J., June 23-27. He, however, disclaimed all responsibility as to the paper, stating that it is entirely the work of C. O. Egerton and S. I. Fekete, who are members of the Hudson Motor Car Company's engineering staff. At the same time he indicated plainly his familiarity with the subject and his own personal conviction as to the correctness of the principle of taxing all users of the highway on the basis of the benefit derived.

TOURING WITH ELECTRIC AUTOMOBILES.

WITH the object of pointing out the adaptability of electric automobiles for suburban use, the New York Electric Vehicle Association, Irving place and 15th street, New York City, has prepared, and is distributing through manufacturers and agents of electric cars, what is believed to be the first touring route book ever provided especially for the users of such vehicles. The book has 54 pages and is entitled "Electric Touring".

It indicates resorts and routes within the touring capacity of the electric, showing the map distances, alternate routes and charging stations.

J. S. Codman, Treasurer, Electric Motor Car Club of Boston.

The longest runs are to Poughkeepsie on the north, New Haven on the east and Trenton and Atlantic City on the south, the starting point in each instance being the Metropolis. A particular feature of interest to electric vehicle men is the designation of charging sta-

tions and the route mileage between each.

In this connection, it is of interest to note that the Electric Vehicle Association of America, with headquarters at 29 West 39th street, New York City, is giving this subject important study, as is evidenced by the following discussion, prepared for that organization, by J. S. Codman, treasurer of the Electric Motor Car Club of Boston:

By J. S. Codman.

Has the day of the electric touring car arrived? Or, if not, how far distant is it, and what must yet be done to hasten its coming? We cannot say that the day has come, but on the other hand it is close at hand and the obstacles still in its way are neither many nor great.

Already the electric has ceased to be merely a town car. In addition, it is now the ideal runabout for both city and country work. It is more convenient, more dependable, more comfortable and cheaper to operate than a gas car, and within the last few years has been so developed that actual road runs of 70 to 100 miles have

been made at a speed considerably greater than the usual road speed of the gas car.

Tours Already Made.

As regards touring, the electric has sufficient speed, and two notable tours made within the year show also that rough, muddy and hilly roads and bad weather are not real obstacles.

Last summer, a tour of between 500 and 600 miles was made in an electric through the Green mountains of Vermont and the White mountains of New Hampshire, and no difficulty was experienced. The distance from Boston to Burlington, Vt., 258 miles, was made at an average running speed of 19 miles an hour. The route taken was through Fitchburg, Ashby, Jaffrey, Dublin, Marlboro, Keene, Walpole, Bellows Falls, Springfield, Rutland, Brandon, Middlebury, New Haven and Vergennes, and motorists who have been over this route will recognize that some parts of it present many difficulties. The slowest run was from Keene, N. H., to Springfield, Vt., 42 miles, at 16.7 miles an hour, and was made almost entirely after dark. The fastest section covered was from Boston to Fitchburg, at 21.3 miles an hour. The 78 miles from Rutland to Burlington, including detours, was made at exactly 20 miles an hour.

An even more notable run was made last October, from Boston to Chicago, during the worst weather of the season, which turned many roads into sloughs of almost impassable mud, but again no greater difficulty was experienced than might be expected with any car under such circumstances.

Difficulty of Charging.

If the electric automobile is not lacking in speed and is fully capable of meeting all road conditions, what then is the obstacle to its use for touring? As is evident everywhere, it is the difficulty in getting charged on the road. This difficulty, however, is not to any great extent a difficulty inherent in the car itself.

It is true that a battery cannot be filled as quickly as a gasoline tank, but on the other hand, the delay is not great if proper facilities can be obtained. Boosting a battery at high current rates is perfectly practical today. The Edison battery is notable in this respect, and even lead batteries, it is now understood, can be charged without injury at much higher rates than was formerly thought possible, if only proper care is taken to reduce the rate before the gassing point is reached.

I have, on one occasion out on the road, boosted a battery at 200 amperes for one hour. This battery was composed of Edison A-6 cells, rated at 45 amperes normal current, and it absorbed in that hour enough charge to have carried me about 50 miles. On this occasion my cable was passed through the window of the electric light station and connected directly to the exciter bus, and very little time was lost in getting connected.

In touring, however, an opportunity such as the above is seldom offered. Usually, much time is lost in getting connected, and the ampere rate obtainable is usually low. It is this inability to get satisfactory charging service which is the one great obstacle to touring in an electric. Public charging stations are few and far between, and when found are, as a rule, equipped with a hopelessly inadequate 30 or 40-ampere rectifier. On the other hand, if you go to the electric plant itself, where there is ample power, you will nearly always find those in charge totally unprepared, and you cannot be accommodated unless someone in authority happens to be on hand, and only then after much time consumed in getting ready. It is not practical to spend an hour getting ready to begin a half-hour's boost.

The Central Station.

The overcoming of this great obstacle to touring with an electric is something we must leave largely in the hands of our central friends. Generally speaking, they are most willing to help when an emergency arises, but this does very little real good. What is needed is apparatus all ready for use, and someone about the premises who knows what ought to be done.

Of course, there are central stations which provide ample and convenient charging facilities, but they are very exceptional. In most of the small towns, and even

In many large cities, proper facilities for charging are either non-existent or are very inadequate.

Taking New England for example: Massachusetts is, as compared with the other states, well equipped with charging facilities, and yet what are the figures? McGraw's Central Station Directory reports 114 electric light companies operating in over 300 of the 333 towns and cities in Massachusetts. On the other hand the list of charging stations compiled by the Electric Motor Car Club, after a canvass of all the garages and electric light companies, indicates only 53 towns in which the charging stations are supposed to be located, and only 28 towns where more than 50 amperes can be obtained.

Equipment Necessary.

It would certainly seem that where there is in a town no public charging station capable of giving an adequate boost, at least 100 amperes at 125 volts, the electric light company itself should have ready for use a service connected with the exciter bus. This service should consist of a switch, fuses and terminals for connecting to the cable and charging plug, which every motorist should carry himself. It would be best to have ready a cheap resistance coil for controlling the current, but often even this is unnecessary, especially when the Edison battery is used. Measuring instruments are not necessary, especially when the Edison battery is used. Measuring instruments are not necessary, as it is the service rather than the amount of current which should be charged for, and further, an approximate measurement can usually be made by means of the instru-

ments on the car itself. Such an outfit would be very inexpensive.

In the face of records of this kind, it is time for the central station man to do his part, and if he cannot arrange a neat little installation of battery charging equipment by using his exciter for this service at a cost which is too small to consider, he must indeed be lacking in enterprise. It ought not to be necessary for an electric automobilist to telephone ahead from a point several hours' run away in order to secure the required charge on arrival.

We are inclined to think that most central station men will go out of their way to accommodate the cross country driver of an electric automobile in the particular rare instance when such a machine comes along, but what is really needed is a readiness-to-serve policy which will make the purchase of a charge as simple a matter as the buying of five or 10 gallons of gasoline from the village grocery—a continuous availability of the charging apparatus at all hours and at a fair price.

With the increase of day service even among the smallest central stations, the time has passed for indifference or sluggishness in the matter of being ready to charge vehicle batteries at 2 in the morning as well as at 6 in the evening, through simple home made flexible connections and resistances, whose cost is nominal. Of course, the electric automobiles will not come until the small central station is prepared to charge them; the latter must get into line and be ready for the business, and the ultimate profits are already clear to the far-sighted student of electric vehicle development.

DETROIT ELECTRIC MAKES LONG RUN.

PRACTICALLY coincident with the convention of the National Electric Light Association in Philadelphia, at which Thomas A. Edison and Dr. C. P. Steinmetz prophesied that inside of 10 years the central stations of the country would be reaping \$60,000,000 a year additional net profit from the sale of current to electric vehicles in the "off-peak" hours, R. L. Heberling of the Philadelphia Storage Battery, and J. D. Maxwell, Jr., of the Detroit Electric Car Company, made a demonstration of the capabilities of a modern high powered electric car for general cross country work.

Leaving Philadelphia, Sunday morning, in a stock Detroit electric roadster, with standard battery equipment, such as is regularly furnished in cars of this type, they went to Washington, D. C., stopping for "boosts" at Wilmington, Del., and Bel Air, Baltimore, Md. After a pleasant evening and a good night's rest, several hours were spent in driving about the National Capital, before returning to the Convention city Monday.

The details of the trip are told in the accompanying table.

While this run established a new record for an electric car between these points, it also demonstrated the wonderful development which has taken place in battery construction. Philadelphia is held to be the home of the storage battery industry, and can point with pride to the great reductions in weights and increases in capacity accomplished by the Philadelphia Storage Battery Company.

REMY LINE IN EUROPE.

The Remy Electric Company, Anderson, Ind., maker of ignition, lighting and motor starting systems, has appointed Walter H. Johnson, 60 Haymarket, London, England, as manufacturer's agent in Europe. Mr. Johnson will also open a completely equipped service station to take care of all users of and dealers in the well known Remy products in that section of the world.

"SAFETY FIRST" WHEN TURNING CORNERS.

A PARAGRAPH in the instruction book of a well known car manufacturer deals specifically with the thoughtlessness of some drivers

Diagram Showing Correct and Improper Method of Turning Corners.

when turning into another road, and the suggestions are emphasized by diagrams which are reproduced herein. They will be of decided value to the new driver and some of the more experienced operators who do not practise the consideration for others that they should.

The practise of driving across an intersecting road, heedless of what may be coming on the road that crosses it at right angles, and especially when the view is obstructed, is responsible for many narrow escapes from collisions and accidents.

In turning a car into another road at the right the driver should keep his car as near to the right hand side as possible, as shown at Fig. 1. Here the machine A is turning to the right while the car B is proceeding in an opposite direction. Under these conditions there is room for both to pass.

Fig. 2 depicts the automobile B proceeding in a right hand direction, and the machine A in turning into the road has swung around the centre of its intersection. Under these conditions the operator of the car B will have ample time to check the motion of his vehicle, as he has practically the width of the street in which to bring it to a stop if necessary.

The diagram at Fig. 3 shows the wrong way of making a corner. Here the driver of the machine A has cut sharply to left and it is obvious that the operator of the automobile B has but little opportunity to avoid a collision, the blame of which, of course, rests upon the driver of the other car.

If every driver will bear in mind that the other operator is entitled to a safety share of the highways and extends that courtesy he would receive, there is no doubt that much would be done to overcome the thoughtlessness above re-

ferred to. Highway courtesy or etiquette of the road is to be commended under all circumstances.

NOVEL CRANK HOLDER.

The starting crank handle should not be allowed to swing idly, as its bearing is subjected to unnecessary wear which in time will cause an annoying rattle. While leather holders with straps can be purchased for a small sum, considerable ingenuity in the design of a crank handle holder was noted by the writer.

The machine was a model T Ford, and attached to the headlight brackets was a strip of round rubber or cable as shown in the accompanying illustration. It was so secured that when the handle was placed in a vertical position there was sufficient tension of the rubber to hold the handle as indicated in the drawing.

Not only is the fitting inexpensive and easily made, but the owner of the car states that it prevents the handle from rattling and that he can obtain quicker service in starting than with the usual strap method. The rubber was covered with a braid to protect it from the weather and the installation does not detract from the appearance of the machine.

A motorist who has had considerable experience in setting carburetors recommends adjusting them at night, when the color of the exhaust is noted more easily. This method is well known to carburetor experts, who advise an adjustment that will result in a purple flame. A yellow flame

Novel Crank Handle Holder Constructed of Rubber Band or Cable.

denotes too much air, and a blue too much fuel. The work is performed with the cut-out open or with the exhaust manifold displaced.

ELIMINATING DEFECTS OF DIFFERENTIAL.

THE differential is generally described as a form of equalizing gear which permits the machine to round corners. Its function is to permit one wheel

Fig. 1—Romeiser Differential Gear.

to travel slower than another when turning, but at other times the wheels should revolve at the same speed, even when one wheel has traction and the other is either on a greasy surface or clear of the road. Because of the

differential gear, directly the grip between the rear wheels varies the rate of revolution of the wheels changes and one will slip. If the spinning wheel be on a slippery road, there is a tendency for the car to slide or skid. If one of the rear wheels be resting on a slippery surface and the other obtains a grip on the road surface, the first named will spin, or, in other words, take the drive, because of the least resistance. In such a case the machine would be moved slowly if at all.

The Luxmore Differential Company, 21 East Van Buren street, Chicago, is to market a differential gear which is held to overcome the above named defects and to improve the usual differential. The mechanism shown at Fig. 2 is the invention of Dr. William Luxmore of Chicago and eliminates the conventional divided rear axle, employing as it does a one-piece construction.

By means of a roller clutch in both rear wheels, operating in unison through the agency of a small connecting rod which works in a groove in the shaft, a positive two-wheel drive is stated to be obtained upon the application of power. Upon the car deviating from a straight line of travel the acceleration of the speed of the outer wheel releases the roller clutch. The wheel then runs free or ratchets ahead, and independently of the axle. The inner wheel, being engaged with the clutch, takes the entire drive, the reverse of the conventional differential gearing. Upon a return to the straight course, the outer clutch,

having been held in position by the controlling connector rod, is again engaged, and the wheel resumes its share of the drive. The operation of the clutch mechanism varies according to the variations in the line of travel, and the machines may be driven backward or forward. The inventor claims simplicity and durability, as the design eliminates many parts. Accessibility is a feature, as the clutch mechanism can be reached from the outside of the hub without displacing the wheel.

ROMEISER DIFFERENTIAL.

An ingenious arrangement for limiting the freedom of the differential gear is noted in the design by W. Romeiser, shown at Fig. 1. The differential proper follows conventional practise, but the right hand axle shaft is provided with a splined extension A and the left hand shaft carries an internally splined shell or sleeve B. Between the members A and B are plates C, these being normally held in contact by means of a coil spring D.

This clutch tends to cause the two axle shafts to rotate as a unit, but upon the car deviating from a straight line of travel, the clutch slips, allowing the differential to operate in the usual

Fig. 2—Luxmore One-Piece Rear Axle and Differential Mechanism Utilizing Roller Clutch in Rear Wheels.

manner. From the design it may be deduced that the function of the clutch is to prevent a too free action of the differential.

PUTTEE TIRE HAS STRIPS WOUND HELICALLY.

A NEW type of motor car tire is being introduced in England by an accessory house which has given the casing its name of Harrods Puttee. It is stated to be of Australian design and manufacture and differs materially from conventional types, as will be noted by the accompanying illustration.

The usual method of building a casing by superimposing layers of fabric that extend the entire length and width is replaced by a system in which strips of fabric from three to four inches wide are wound helically over the shoe, the strips being set at an angle as shown, and overlapping each other for about five-sixths of their total width. All except four of the strips are brought down to and around the bead. Layers of rubber are utilized between the strips, amalgamating them with the tread and with each other.

Sectional View of Harrods Puttee Tire, an Unusual Type of Construction.

Many advantages are claimed for this peculiar construction, among which is that each strip, being a single unit, the tire is still entirely homogeneous, and external injury can affect none but the strips immediately damaged. It is stated that it is possible to replace one or more strips with new without impairing the efficiency of the casing or detracting from its appearance, and at a reasonable cost.

It is held that the overlap of the strips provides a fine foundation for retreads, which will adhere perfectly to the old casing by reason of the inter-fabric films of rubber, which provide a good contact.

VULCANIZING HINTS.

Goodyear Tire & Rubber Company Makes Some Practical Suggestions in Its House Organ.

In a recent issue of "No-Rim-Cut News", the house organ of the Goodyear Tire & Rubber

Company, Akron, O., some practical as well as useful suggestions are made in the department devoted to vulcanizing hints. The following are extracts from the publication:

"Vulcanizers are sometimes at a loss to explain why the gum does not flow freely, and presents a rough surface when taken from the cure. The most common cause of this difficulty we find to be the lack of sufficient pressure on the inside of the casing. When vulcanizers use steel coils in retreading it is important to wrap the tire very tightly in order to secure this pressure. The better method is to employ air bags instead of coils, because the air pressure forces the gum against the cross wrapping. For sectional repairs always use a sectional air bag. If the bag does not fit snugly it should be padded with strips of cured fabric.

"Under-curing of sectional repairs is often traceable to the condition of the molds. If they are clogged with dirt or if air pockets form, it takes longer to heat them, and consequently longer to cure the repair. Water sometimes collects in molds with the result that, while the pressure may be correct, the temperature will be too low to accomplish the cure in the prescribed time. Once a month you should disconnect the steam pipes and shoot a strong current of compressed air through the molds. A surprising amount of dirt will be dislodged by this process. There will be comparatively little trouble from this source if your molds have a drain at the lowest point where water is likely to collect, and a petcock at the highest point to allow trapped air to escape. In our repair department we keep this petcock open slightly all the time, to insure live, dry steam".

The number of causes for an intermittent miss of a cylinder is legion. One out of the ordinary is the failure of the valve to seat because of a gummed up valve stem. If caught upon the road with a valve stem in such condition the trouble may be corrected by cleaning the part with kerosene or gasoline, after which the stem should be lubricated with clean oil.

It is a good plan when purchasing a new machine to make a note of the manufacturer's number, that of the motor if marked, also the type or model. These data will not only be useful in ordering new parts, etc., but will be of value if the car be stolen.

SUGGESTIONS FOR THE NEW CAR OWNER.

Explaining the Strokes of the Four-Cycle Motor with Special Reference to the Model T Ford Four-Cylinder Engine.

(By C. P. Shattuck.)

The third installment of the serial on the construction, operation, care and repair of the model T Ford deals with the strokes of the motor, firing order of cylinders, etc. Owners of new automobiles who are not familiar with the poppet type of internal combustion engine will obtain much useful information from the data contained herein, as the principles involved are similar.

IT IS generally conceded that the modern gasoline engine is so perfected that it will give considerable service without attention other than renewing the supply of fuel and lubricant. This contention is borne out by the thousands of cars being operated by persons who have no other knowledge of the motor than that required for starting and stopping it.

There is another class of owners who ac-

each member of the different chassis groups, the faulty operation can be located quickly. Many troubles are closely allied, ignition and carburetion, for example, and many novices make the mistake of altering the adjustment of the carburetor when the trouble is due to the electrical apparatus, or vice versa.

Value of Knowing Motor.

To many the gasoline motor appears to be complicated, but if its principles be studied, and the function of each part and its relation to another be understood, it will be surprising how simple the construction really is. A thorough knowledge of the function of each component of

Fig. 3—Illustrating the Strokes of the Model T Ford Motor and the Position of the Intake and Exhaust Valves When the Cylinders Are Being Charged with Explosive Vapor, the Mixture Compressed, Ignited and Expelled.

quire by experience sufficient knowledge of the engine to remedy minor ignition and carburetor troubles, relying upon the expert repairman when an adjustment is necessary or an overhaul is needed.

The third group comprises motorists who study the principles involved, and this information, coupled with practical experience, enables them to successfully overhaul the chassis, as well as to correct troubles. The value of such knowledge is obvious. It not only gives the owner confidence, but reduces the cost of the maintenance of the machine to the minimum. And frequently the experienced operator by making a simple adjustment when on the road eliminates opportunity of serious trouble.

By familiarizing oneself with the function of

each group, the ignition system for example, is important, for it will enable one to locate the trouble quickly, thereby saving considerable time over the guess work method indulged in by some owners.

The writer holds that it is vitally important that the strokes, valve mechanism and timing of the motor should be well understood. Such knowledge will be invaluable on the road, as well as in the garage, for to rewire the ignition system without recourse to multi-colored wires and diagrams one must be familiar with the firing order of the motor and the proper position of the piston.

Strokes of Motor.

It has been explained that four strokes or movements of the piston of a four-cycle motor

are necessary to obtain one working impulse or power stroke. The strokes are defined as intake, compression, firing (power) and exhaust. The

Fig. 4—Showing the Position of the Pistons During the Strokes—Note That Two Are Always Up When the Others Are Down.

mixture or explosive vapor is drawn into the cylinder by the suction of the piston on the intake stroke, during which impulse the piston moves downward. This operation will be made clear by reference to cylinder numbered 4 in the drawing at Fig. 4. The piston is at the top of the stroke or dead centre, and the intake valve, through which the mixture is drawn by suction, is open. In practise, however, this valve does not open with the piston on dead centre, but after the piston has started to descend, for reasons which will be explained later.

Intake Stroke Defined.

The intake valve remains open until the piston has descended and closes slightly after it attains its bottom position, which is termed the lower dead centre. The explanation of top and lower dead centres should be well understood, as it will be of value in the discussion on valve and ignition timing.

Compression Stroke.

Upon the piston completing its intake stroke, the intake valve closes. During this movement the exhaust valve is seated. With both valves closed the piston begins its upward or compression stroke, so-called because the piston compresses the mixture into what may be termed, for explanation, a small space. If the vapor were not thus compressed the explosion obtained would be weak. The principle is the same as with the explosion of powder. The more it is confined the greater the energy obtained from the combustion. The position of the piston and valves after compression is indicated at 2, Fig. 4.

Firing Stroke.

The mixture is now ready to be exploded by the electric spark provided by the ignition sys-

tem. Both valves are closed when the combustion occurs, and the expansion of the gases drives the piston downward (firing stroke) as the gases seek the path of the least resistance. The energy derived is due to the fact that three sides of the explosion chamber are rigid. A simple analogy is that of a muzzle loading gun, the motor cylinder being the barrel, the mixture the powder and the piston the bullet.

Both the intake and exhaust valves remain closed during the firing stroke, and the exhaust member is utilized to clear the cylinder of the burnt products of combustion. Upon the piston completing the stroke or downward movement, the exhaust valve opens, and upon the piston moving upward the gases are expelled or pushed out, passing through the exhaust pipe and muffler to the open air.

Valve Operation.

It will thus be seen that the valves are closed during the compression and firing strokes, and that the intake is open only during the charging of the cylinder and the exhaust when the burnt products are being expelled. The strokes are repeated as long as fuel is supplied and the mixture ignited by the electric spark, assuming, of course, that the valves function properly and that other components are in working order.

Referring to Fig. 4 once more, it will be noted that the pistons of the No. 1 and 4 cylinders are at top dead centre, firing and intake strokes respectively, and that the pistons in the second and third cylinders are down or at lower dead centre.

Crankshaft.

It will be understood that two pistons are always up when the other two are at lower dead centre. It is this point and the strokes that oc-

Fig. 5—Diagram Explaining Firing Order of Motor and Location of Valves.

cure in sequence in the first, second, third and fourth cylinders that are confusing to the novice. With the Ford motor the firing strokes of the cyl-

inders are separated, occurring in the following order: First cylinder fires first; second, second; fourth, third; third, fourth. The motor does not fire 1, 2, 3, 4, as is commonly supposed, because of the arrangement of the crankthrows of the crankshaft, as shown at Fig. 4.

The reason for arranging the crankthrows in this manner is to mechanically balance the working parts, for it should be borne in mind that three of the four strokes are idle; that is, they do not provide any energy. Those who have operated the car with one cylinder failing to deliver the impulse stroke, or missing as it is called, have noted the lack of power, and the decrease is more than would be the case if the faulty cylinder were entirely eliminated, because a certain amount of energy is required to overcome the resistance of the compression stroke of the next cylinder to fire.

Firing Order Defined.

The sequence of strokes is shown in an accompanying table and a careful study will enable one to know what the exhaust valve of the third cylinder is doing when the intake of the first cylinder is beginning to open.

Firing Order 1-2-4-3.

Cylinder 1	Cylinder 2	Cylinder 3	Cylinder 4
1—Firing	Compression	Exhaust	Intake
2—Exhaust	Firing	Intake	Compression
3—Intake	Exhaust	Compression	Firing
4—Compression	Intake	Firing	Exhaust

It will be seen that when the piston of the first cylinder is about to begin the firing stroke it is at top dead centre, as is that of the fourth cylinder, which is beginning the intake stroke. Pistons 2 and 3 are at lower dead centre, therefore they must be compressing and exhausting respectively.

With the table referred to it is an easy matter to determine the position of each piston and that of the valves. It will be noted that the proper sequence of strokes is observed irrespective of whether the table be read vertically or horizontally. It will also be seen that the impulse strokes occur every half-revolution of the crankshaft, or, in other words, four power strokes occur every two complete revolutions.

As previously stated, a knowledge of the strokes is very important, for it will enable one to rewire the timer of the motor and replace secondary cables without reference to colored wires or a timing diagram.

At Fig. 5 is a diagram depicting the arrangement of the valves, the construction and operation of which will be discussed in another installment.

(To Be Continued.)

HOLD SOCIABILITY RUN.

Event Under Auspices of Washington Section of Electric Vehicle Association a Success.

The first electric automobile sociability run of the Washington section of the Electric Vehicle Association of America was held recently and 54 cars competed. The run started from in front of the main entrance to the Smithsonian Institution and the 14-mile course was laid out through the Speedway and Rock Creek Park, the finish being at the Joaquin Miller cabin, where a basket luncheon was served. The run was a sealed event, each contestant endeavoring to cover the 14 miles, observing all traffic and speed regulations, within a secret time selected by a prominent government official. The course was covered in one hour and 30 seconds, and the

Electrics in Sociability Run Conducted by Washington Section of Electric Vehicle Association of America.

prizes donated were as follows: Silver picture frame, Washington section of the Electric Vehicle Association of America; silver cup, Emerson & Orme; electric teapot, J. J. Bartram; automobile clock, Dupont garage; inner tube, United States Tire Company; electric chafing dish, Potomac Electric Power Company.

A further truce of two weeks has been declared in the gasoline separator war between the City of New York and the dealers and garagemen. The garagemen and the Municipal Explosives Commission, which will conduct the prosecutions under the ordinance, were to have presented their cases before the Welfare Committee of the Board of Aldermen Friday, June 12, but the illness of the garagemen's chemist caused a postponement to Friday, June 26. Tests are being made by both sides together and separately and the garagemen, on the results obtained, have hopes of securing the repeal of the ordinance.

PRACTICAL TOOLS FOR THE REPAIR SHOP.

THE Williams "Big Ten" set, shown in the illustration, is the product of J. H. Williams & Co., Brooklyn, N. Y. It has a capacity for 78 sizes of most prominent nut, screw and set screw sizes in United States and other standard millings, and was designed to provide the maximum of service in the machine shop, etc. It is particularly adaptable to the garage and repair shop, as the wrenches fit A. L. A. M. and S. A. E. standard nuts and cap screws. The milled openings vary from .3125 inch to 1.4375 inches. The wrenches are constructed of the best material, and the roll shown comes at slightly extra cost.

"Big Ten" Wrench Set.

FOSNACHT VALVE RESEATER.

The repairman is frequently called upon to reface and reseat the valves of a motor and it is important that this work should be performed accurately. H. G. Paro, suite 719, Michigan boulevard building, 30 North Michigan boulevard, Chicago, is marketing the Fosnacht valve reseating equipment, shown in an accompanying illustration. This tool has demonstrated its practicality in service, having been utilized in a large number of garages.

The maker calls special attention to the time and labor saving qualities of the tools, also to the fact that the equipment is such as to make possible the reseating of valves in a large number of motors, the size of the cutters being such as to accomplish general work. The maker claims great accuracy for the reseater and points out that valves may be placed in a perfect condition in considerably less time than with the usual methods. The tool is moderately priced and complete details and prices will be supplied the

Fosnacht Valve Reseater.

trade upon the receipt of a postal card at the address previously given.

JACOBS DRILL CHUCK.

The Jacobs Manufacturing Company, Hartford, Conn., is marketing the Jacobs improved drill chuck, shown in the accompanying illustration, and the maker states that it possesses many advantages over ordinary types. In general form it is similar to the well known spanner sleeve chucks, but has a toothed sleeve and key which the manufacturer states makes for decided efficiency, as by the action of the key the initial or final adjustment of the drill is made easily and quickly by one hand.

The No. 3 chuck is shown, and it has a capacity up to .53125 inch. The total length of the jaws extended is 3.9375 inches, with jaws retracted, three inches. The outside diameter is 2.3125 inches, and its weight without the key is slightly over two pounds.

No. 3 Jacobs Improved Drill Chuck.

This type was designed to meet the demand for a convenient, accurate, durable drill chuck of the capacity above named, and is not only especially adapted and convenient for service in a lathe, but a hole may be bored through the chuck and spindle the size of its full capacity. It is also convenient for holding rod stock, etc.

One of the qualities of the Jacobs design is that it may be easily disassembled and assembled. It is taken apart by forcing the sleeve over the smaller or jaw end of the chuck, when the nut, which is made in halves, may be taken out, leaving the jaws free for removal. When the jaws are retracted, they extend into a recess in the sleeve, which makes it necessary that they be partially extended before attempting to displace the sleeve. The company manufactures a wide variety of these chucks and will supply complete details and prices upon request.

SPECIFICATIONS OF THE IDEAL MOTOR CAR.

(By C. E. Davis, S. A. E.)

AT THE semi-annual meeting of the Society of Automobile Engineers to be held at Cape May, N. J., June 23-26 inclusive, there will be presented on the third day a paper by C. E. Davis on the ideal car, it being the introduction of the discussion upon the subject. The future car for economy, luxury and business purposes will, in the opinion of Mr. Davis, be constructed in accordance with the following general specifications:

Design.

The car will have a harmonious streamline effect, utilizing substantial materials in the body, fenders, bonnet, radiator and wheels, combined in such a way as to eliminate molded surfaces, sharp corners, dust pockets, projecting hinges and handles; the head, side and tail lights being blended into the general outline, and the tool box, tire and luggage carriers concealed in dust proof compartments provided for in the body design. The wheelbase should be 128 to 132 inches for cars accommodating two to five persons.

Weight.

The car filled with gasoline, oil and water should not weigh over 2750 pounds. This can be accomplished without reducing the factor of safety below absolute security by employing a large percentage of pressed steel parts properly designed.

Stability.

The centre of gravity should be low and as near the centre of the car as possible, the weight being carried between axles.

Motor.

A four-cylinder valveless motor, 3.75 by 5.5 inches, carefully constructed to give reliable economic service under all conditions at speeds varying from 200 to 3000 revolutions a minute, and developing at least 60 horsepower at 2500 revolutions a minute. (No type of motor barred.)

Carburetor.

Optional. Sealed type desirable. To be located on the left hand side of the motor, close connected and properly water jacketed. If adjustable, dash or steering post regulator to be used.

Chassis.

To be low, not over 19 inches from the floor line to the top of the frame, with a road clearance of 10.5 inches. Frame to be of pressed steel electrically welded, without side bends and designed

to house the rear cantilever springs. A dust guard under the entire length to reduce wind resistance and dust raising.

Wheels.

Thirty-six by 4.5-inch wire wheels, with quick, detachable rims, using extra wheel or shoe as desired.

Brakes.

Two sets. As service brakes, one set of internal brake shoe type to act on all wheels to avoid skidding; one set of internal brake shoe type to act on rear wheels, only for emergency. Brake drums to be covered and as nearly dust proof as possible. All adjustments to be outside and easily accessible.

Springs.

Forward springs semi-elliptic and rear springs cantilever, all with wide, thin leaves to insure flexibility and easy riding. (If shock absorbers are used, they must have a time element to take the rebound, but be active on the down movement.)

Front Axle.

Sheet metal design, including steering knuckle and connections; central pivot knuckles, preferably of the caster type.

Rear Axle.

Sheet metal design, worm gear drive, 3.5:1 ratio, with worm under the axle. Torque and drive to be taken through tube with large end thrust ball; leather or rubber disc universal connection to propellor shaft, with suitable rod connections to insure proper spring action. The axle to be so constructed that thrusts for worm and gear are permanently fixed and at the same time easily dismountable for inspection. Total unsprung weight of rear axle, 200 pounds.

Gasoline and Oil Tanks.

To be located in dash cowl, with filler openings outside the car and easily accessible. Gasoline tank for pressure system to be divided, one part high for gravity feed on hills or starting in case pressure fails. Tank to be so vented that evaporation odors will be eliminated.

Steering Gear.

Standard worm and gear, locking type; cross steer preferred and adjustable to any desired angle.

Transmission.

If mechanical, four or more speeds forward and one reverse; either silent chain or gear. A

new petrol-electric transmission will give at least 10 speeds forward and one reverse. It will also have a charging section and serve as a starting and lighting outfit, operating in connection with a standard storage battery.

Control.

If mechanical, a single rocking central lever located well forward. A better method would be pneumatic or electric, operated by buttons. If petrol-electric transmission is used, a control box located on the steering post and designed to carry horn and light buttons is easily available.

Radiation.

Thermo-syphon with liberal radiator and piping.

Magneto.

High-tension.

Starting and Lighting.

The future type will be a flywheel combined generator and motor without revolving wires, requiring no auxiliary driving mechanism and capable of being easily disassembled, combined with a magneto connection similarly operated.

Lights.

Two side lights artistically mounted on fenders and movable to light sharp turns of the road. One tail light on the rear fender to light rear number plate. One centrally located headlight, having a deflector to either dim or turn lights in either direction to insure safety from glare when in the city or meeting cars on the road, and with a provision for lighting front number plate.

Horn.

To be mounted well forward either under or attached to fender and operated from the steering wheel.

Electrical Connections.

To be vari-colored wires or bars, thoroughly protected, easily mounted and traced by means of tool box chart.

Speed Indicator.

To be carefully housed and driven from propeller shaft, with double dial, one for the driver and one for the rear seat.

Tools.

Under front seat on driver's side.

Tires and Tubes.

To be carried in dust proof compartments in body behind rear seat.

Body.

To be designed on streamlines with fender, bonnet and cowl in harmony. Wide doors; deep low seats. French style of upholstery or air cushions, with plenty of room for long-geared people. Luggage to be carried under passenger's side of front seat, back of front seat and under rear seat in easily accessible, dust proof compartments.

No boxes or racks on the outside of the car or on the running boards. Concealed hinges and handles to insure a smooth outline.

Top.

To be a one-person operated, disappearing design to close tight for winter.

Bonnet.

To be of the inside concealed hinge variety similar to the Alexis Kellner design.

Windshield.

Vented, curved glass to conform to the cowls in such a way as to prevent back or overhead drafts.

Speed.

Car to be governed at a maximum speed of 50 miles an hour, and for touring purposes, 25 miles an hour, and adjusted to operate on direct gear for city work down to four miles an hour and to pick up to the maximum governed speed in 100 to 150 feet. With a four-speed mechanical transmission direct on third, third speed should cover all ordinary hills. With petrol-electric transmission, change of speed and power can be made without releasing clutch, and all changes are noiseless.

Noiselessness.

This is best obtained with valveless motor, silent chain transmission and worm gear axle. In petrol-electric transmission, with valveless motor and worm gear axle.

Durability.

The above combination, well cared for, should give eight years' satisfactory service so far as mechanism goes, and easily cover 120,000 to 150,000 miles, tires, of course, being excepted.

Accessibility.

The same careful study should be given to all details of the design that is applied to all machine designs. All parts should be easily accessible and removable with the simplest possible tools, either on the road or in the garage, and with no possibility of damage to upholstery or finish. All adjustments of brakes, carburetor and magneto to be easily reached.

Efficiency.

This is largely up to the driver. With careful handling an average of 20 miles to the gallon should be easily maintained.

Vibration.

If the car is properly built there will be no unpleasant vibration or noise to cause fatigue, even on the longest journeys.

In General.

The car ought to be marketed at a price not to exceed \$1500 and be good commercially from manufacturing, efficiency, economic, service and sales standpoints.

TENDENCY IN EUROPEAN CAR CONSTRUCTION.

(By Robert W. A. Brewer.)*

THE paper to be read by Robert W. A. Brewer, member of the Society of Automobile Engineers, at its meeting, dealt with the tendency in European car construction, and is as follows:

Body.

Cleanliness of design is only obtained satisfactorily by the elimination of flat surfaces presented either to the direction of motion or at the rear of the body. Streamline contour is carried out in a more complete manner than it is understood in the States, for greater attention is paid to the rear part of the body, as well as to the shape of the fenders. Seating capacity for four persons in a body width of about 44 inches, the backs of the seats reasonably high; that is, the seat cushions resting on the floorboards. The cowl so shaped as to merge with the wind screen set at an angle of about 45 degrees. This deflects the air current above the head of the occupants without imposing too great a wind resistance. The total head resistance, plus rolling resistance of such a body on a good, smooth road at 60 miles an hour, would be about 25 horsepower, and the motor, therefore, should develop about 36 horsepower on brake test at, say, 2000 revolutions a minute.

Motor.

Four-cylinder, high efficiency motors are far more popular than any other type. The six-cylinder motor has only a comparatively small field of adherents, and these are of the wealthier class. Anything between 80 mm and 90 mm bore, or even 95 mm, will cover the requirements. The ultra long stroke is disappearing. A good size would be 85 by 140 and it should easily develop the necessary power.

Gears.

Four forward speeds are necessary, direct on top. The gear ratio in the rear axle, 3.5 or four to one. This enables a very large range on top speed drive. The high rotational engine speed will provide the high car speed so long as the torque curve does not reach its peak.

Accessibility.

A modern motor being so reliable, accessibility is scarcely required, except to the carburetor and magneto. The former is preferably fed from

a fuel tank contained in the cowl, gravity supply to the carburetor itself, which is placed as high up as possible and often directly bolted to the engine casting. Personally, I prefer a special form of combined inlet and exhaust manifold, which gives a streamline flow, as with this manifold considerable fuel economy can be effected.

Control.

Right hand driving is universal with the gear levers in an enclosed gate. Throttle control by foot pedal with over-riding, hand-operated mechanism by small lever on the steering column.

Springs.

Semi-elliptic all round, with a tendency to the cantilever.

Efficiency.

It should be quite possible to get a brake mean effective pressure of 80 to 100 pounds a square inch from a modern engine. The compression ratio can be about 4.7 to one, but this depends on the contour of the combustion head. Such a motor should have no vibration, and when properly designed and made, runs equally smoothly at all speeds up to 2500 rpm. Pressurized lubrication to all the crankshaft bearings is essential. If the clearances are suitably made, there should be no signs of metallic contact on the big end bearings. This can be carried out quite easily in practise. Lightness of reciprocating parts is essential.

S. A. E. SECTION FOR CLEVELAND.**Prominent Men Endeavor to Organize Automobile Designers into a Branch Society.**

Organization of Cleveland automobile designers into a branch of the American Society of Automobile Engineers is the aim of a committee appointed at a recent meeting of workmen interested. The committee includes W. R. Strickland, R. W. Nightingale, A. S. Scaife, Christian Girl and J. H. Hertner, all connected with the industry in Cleveland.

There are nearly 100 designers in Cleveland's automobile factories, and the city is the geographical centre for 800 members of the national association. The organization of a branch would facilitate matters and bring about better results according to local members.

*Consulting engineer, London, England.

NEW LINES FOR THE GARAGE AND DEALER.

THE Universal Manufacturing Company, Racine, Wis., is marketing the Universal hand Ford starter, shown in the accompanying illustration. It is a new style of mechanical motor starter, and the maker states that it can be installed in a very short time without alterations to the car. It is operated by a handle located in the toeboard and convenient to the driver. It is stated that

Universal Ford Motor Starter.

the leverage obtained by a slight pull of the handle is so powerful that the device can be operated by a child. The Universal starter obtains a half revolution of the crankshaft, instead of the usual quarter turn, when cranking by hand. The material and workmanship are first class in every respect. The Universal starter is not only moderately priced, but is guaranteed. The company will supply complete details and dealers' proposition on request.

JUMBO ECONOMIZER.

E. Edlmann & Co., 227 West Illinois street, Chicago, is marketing the Jumbo economizer, shown in an accompanying illustration, and it is sold on a money-back guarantee. It increases the power of a motor because of the additional air ad-

Jumbo Economizer Controlled from Steering Column.

mitted to the intake manifold above the carburetor, and makes for economy in that maximum efficiency is obtained from the fuel burned.

One of the qualities of the Jumbo is that the amount of air admitted is controlled from the seat, a lever being attached to the steering column. This enables the driver to regulate the air supply as best meets the requirements of the motor.

The Jumbo is stated to be easily installed and it is added that the work does not require the services of an expert. It retails for a moderate price and the company has a special proposition for dealers, garages and repairmen, which will be forwarded upon request. The concern is issuing a bulletin on desirable accessories and invites the trade to write for the same.

TYPE A-1 HYDROMETER SYRINGE.

The majority of owners who store their machines at the public garage rely upon the attend-

Scientific Type A-1 Hydrometer Syringe.

ants to give the cars the attention needed. With the electric lighting and motor starting systems it is important that the storage battery be given that attention recommended by the maker. The density of the electrolyte denotes whether the cells are charged or discharged and the best method of ascertaining its condition is to take a reading, for which purpose a hydrometer is utilized.

The General Scientific Equipment Company, 2000 Market street, Philadelphia, maker of scientific instruments, is manufacturing the type A-1 hydrometer syringe shown in an accompanying illustration. By it it is a simple matter to withdraw sufficient electrolyte from each cell of the battery and note its density, as the hydrometer proper is enclosed within the tube containing the solution taken from the battery.

This enables a correct reading and prevents waste of the fluid. One of the qualities of the design is that the hydrometer floats freely in the electrolyte, insuring accurate readings. The retail price of the unit is moderate. Prices will be supplied upon request.

TO LESSEN COST OF FOOD.**Rate of Haulage by Road Vehicle Decreases,
While Freightage by Rail Increases.**

The National Chamber of Trade held its annual conference in Blackpool, England, recently. The president in his address commented upon the high price of food, which is mainly responsible for labor agitation, and the problem of increasing home supplies, and that it will engage the attention of the British government. He also referred to the growth of motor traction as promising cheaper food. "Much more use might be made of motor vehicles for hauling by road, and the state should take up at once the matter of providing and maintaining suitable roads for that traffic.

"While the cost of haulage by road has been reduced from one-third to one-half by the development of the motor vehicle, as shown by the American National Automobile Chamber of Commerce, and can be reduced further by the building of good, durable roads, the cost of transportation by rail has nearly doubled in the last 15 years. An investigation by the Lehigh Valley railroad shows that freight cars and locomotives cost more than twice as much now as in 1890, and that the cost of hauling freight was 46-100ths of a cent per car-mile 15 years ago as compared with 98-100ths at the present time.

"Motor trucks can deliver directly from farm to hotel, restaurant, or retailer the same day or the morning after farm produce is gathered, without any rehandling or delay, and therefore in better condition than under present systems, and can save to the consumer a large part of the commission men's charges and cartage costs, which often add 100 per cent. to the cost".

COMPLETES TOUR OF COUNTRY.**Sales Manager Warner of Oakland Company
Finds Business Good in All Sections.**

That the recent financial depression has been completely dissipated and that the 1915 season will see wonderful results attained in the automobile industry is the assertion of Fred W. Warner, general sales manager of the Oakland Motor Car Company.

Mr. Warner is in a position to speak authoritatively on the subject, for, having just returned from a tour of the Southwest, he has completed the last of a series of trips covering the entire

country. His purpose was to learn, first hand, conditions throughout the country and to become personally acquainted with the members of his organization. Mr. Warner says:

Our own records proved to us that there was no truth in the reports that the automobile industry was about to "break", and we were convinced that the condition was only temporary. Our 1914 sales record shows that we were not mistaken and, moreover, there are also many other automobile manufacturers who have met with success. This is true not alone of the motor car industry, for I have found that business throughout the entire country is on a safe and sound basis.

In the Southwest, the farmers, who as a class have a greater influence upon the financial condition of the country than any other body of men, are all prosperous, and this one fact is indicative of general prosperity.

AMERICAN HIGHWAY ASSOCIATION.**Fourth American Road Congress to Be Held at
Atlanta Nov. 9 to 14.**

I. S. Pennybacker, executive assistant of the American Highway Association, has just returned from Atlanta, Ga., where plans were completed for making the Fourth American Road Congress, Nov. 9 to 14, the most successful and striking convention ever held in the country. Arrangements have also been made for the greatest government exhibit, and the city itself is to be turned over to the visitors from all parts of the country. The movement for better roads in the United States is expected to reach its climax at Atlanta and the new government-maintained highway from Washington to Atlanta will be ready for the tourists who will attend the convention.

Charles P. Light, business manager of the American Road Congress, will leave for Atlanta within the next few days and will take charge of the arrangement of exhibits for the coming Road Congress and especially of the allotment of space for the exhibitors.

Hon. A. B. Fletcher, president of the congress and state highway engineer of California, and Hon. L. W. Page, president of the American Highway Association and director of the United States Office of Public Roads, are taking a deep and active interest in the success of the congress.

Electric Lighting may be said to be standard equipment on the modern automobile. As the efficiency of the system depends largely upon the storage battery, it is essential that it be given attention. This important subject will be fully discussed in the Eighth Annual Touring Number of The Automobile Journal, which will be issued on July 10.

POWER AND HAND DRILLING MACHINES.

MANY small repair shops whose capital is limited, as well as some concerns starting in business, do not feel able to invest in power

No. 1003 Yankee Drill.

drills and rely upon manually operated equipment. The North Bros. Manufacturing Company, Philadelphia, is producing what is termed the Yankee bench drill, which was designed to meet the conditions above referred to. Two types are produced, the No. 1003 being shown in an accompanying illustration.

It is made with one speed only, and being geared 49:14, one turn of the crank gives 3.5 revolutions to the spindle. The latter is of steel, .375-inch diameter, and all gears have teeth of extra strength. They are cut from solid stock and run smoothly and accurately. The pinion is of steel.

A small lever on the arm to the left of the spindle locks it fast to open and close chuck. The chuck is of steel, 1.75 inches long, one inch in diameter, and has three jaws of hardened tool steel. It is nickel plated and polished, and holds round shank drills up to .25-inch diameter inclusive.

The traverse of spindle (automatic feed) is 1.5 inches. The friction feed brings to and from the work quickly and the ratchet feeds automatically all drills from No. 54 to .25-inch without danger of breaking. The frame is finished in dead black. It comes neatly packed in a wooden box and the gross weight is 20 pounds. The No. 1005 drill is the same as the one described, but is made stronger, being designed for heavier work. Complete details and prices will be supplied upon request.

PRENTICE DRILLING MACHINE.

The Reed-Prentice Company, Worcester, Mass., maker of lathes for motor cars and general work and drills, is manufacturing the Prentice 20-inch upright drilling machine, shown in the accompanying illustration. It is of the sliding

head type, is equipped with back gears, and with a combined belt and worm driven power feed. This power feed may be disengaged automatically by means of an adjustable stop on the spindle quill tripping a mechanism and allowing the driving worm to drop out of mesh.

Counterbalance May Be Varied.

Both the spindle and the head are counterbalanced by the same weight, and the sensitiveness of the counterbalance may be varied to suit the case by merely moving the chain along the notched lever. The sliding head is securely gibbed to a wide way on the column and is stated to be very rigid when drilling. Crucible steel is used in the construction of the spindle, which is provided with a ball thrust bearing. It is possible to drill to any point on the surface of the table which, in addition to swinging around the column, may be rotated about its own centre. The base is of ample proportions and the column is rigidly bolted to it.

Specifications.

The specifications are as follows: Distance from column to spindle centre, 10 inches; maximum distance from spindle to base, 48 inches; maximum distance from spindle to table, 30 inches; vertical traverse of table, 21 inches; vertical traverse of head, 12 inches; vertical traverse of spindle, 7.5 inches; hole in spindle, Morse taper No. 3; largest cone diameter, nine inches; diameter of spindle, 1.375 inches; diameter of table, 16 inches; driving pulley dimensions, nine by 2.75 inches; speed of bottom shaft, 240 revolutions a minute; total height of machine, 76 inches; floor space, 44 by 18 inches; width of cone belt, 2.25 inches; cubic feet, 38. Prices and additional information will be forwarded upon addressing the company.

Prentice Upright Drilling Machine.

KNIPPER TO PILOT DELAGE AT SIOUX CITY.

WITH the winning car of the 1914 Indianapolis speedway race, two Peugeots and a strong field of American machines, the 300-mile race to be run at Sioux City, Ia., on the Fourth of July should be a warmly contested event. When the entry list closed there were 26 nominations for the \$25,000 purse, which will be contested for over the two-mile dirt track. Billy Knipper will pilot the Delage with which Rene Thomas won at Indianapolis, and Goux's Peugeot will have Bob Burman at the wheel, L. C. Erbes of Minneapolis, Minn., having bought the car and will back Burman for the balance of the season. The cars and drivers are as follows:

Stutz, Anderson; Stutz, Oldfield; Beaver Bullet, Keene; King, Kline; Mercer, Wishart; Braender Bulldog, Chandler; Marmon, Patschke; White, Shrunk; Chalmers, Wetmore; National, Bauer; Ray, Brock; Stafford, Callahan; Peugeot, Stringer; Chevrolet, Le Cain; Duesenberg, Haupt; Duesenberg, Rickenbacher; Sunbeam, Babcock; Metropol, Horan; Moon, Cailloutte; Mason, not named; Peugeot, Mulford; Gray Fox, Wilcox; Peugeot, Burman; Delage, Knipper; Chevrolet, not named.

TACOMA HAS GOOD LIST.

Over 20 Entries Received for Speedway Races, July 3 and 4—Track Reported Fast.

Arrangements are complete for the speedway races at Tacoma, Wash., July 3 and 4, and up to the present time over 20 cars have been entered. A number of well known drivers are expected to race, including Tetzlaff, Earl Cooper, Hughes, Pullen and Carlson.

The big event will be the free-for-all, in which there will be no restrictions of any kind on the cars. The prize is \$5500 and a perpetual challenge trophy. A cash prize of \$3500 and a perpetual challenge trophy will be put up for a 200-mile race for cars with piston displacement limit of 600 cubic inches. A 100-mile race for Washington, Montana, Oregon, Idaho, British Columbia and Alberta drivers, non-stock cars of 450 cubic inches piston displacement, completes the card.

BARNES STARS AT PORTLAND.

Driving an Eight-Cylinder Romano Special He Wins Leading Events.

Percy Barnes, driving an eight-cylinder special Romano, was the star at the two-day race meet held at Portland, Ore., June 13 and 14. He won the 25-mile race in 25 minutes and 40 seconds and the 15-mile event in 14 minutes and 35

seconds. In the elimination trials he circled the track in 55.4 seconds. Barnes also won the 40-mile event by four laps, his time being 41 minutes and 50.6 seconds. Welch in a Mercer won the 20-mile race in which A. J. Edwards and his mechanic were badly injured.

BRAENDER "BULLDOG".

Entered in the Sioux City Event by the Braender Rubber & Tire Company.

The Braender Rubber & Tire Company, Rutherford, N. J., has entered the Braender "Bulldog", shown in accompanying illustration, in the Sioux City event scheduled for July 4. The

Braender "Bulldog", Entered for Sioux City 300-Mile Race.

machine will be piloted by William Chandler, who drove it in the recent Indianapolis race. The car will be equipped with Braender tires, which have made such an enviable reputation in other races.

ISSUES NEAT BOOK.

Gray & Davis, Inc., Publishes "A Little Journey Through a Great Factory".

Gray & Davis, Inc., Boston, maker of the well known electric lighting and motor starting systems by that name, is publishing for private distribution a very neat book, entitled "A Little Journey Through a Great Factory". Over 40 pages are devoted to views of the factory, these showing the progressive steps in manufacturing the lighting and motor starting system. The various offices, etc., are also illustrated. A high grade coated paper is employed, and the illustrations are unusually clear and distinct. The book is well bound.

LABOR SAVING EQUIPMENT FOR THE GARAGE.

AN ALL around light is necessary in the garage and repair shop, and one of this type is being manufactured by R. S. Mueller, 425 High

Mueller Clamp Light, Having Adjustable Jaws, Polished Reflector and Ample Length of Cord.

avenue, Cleveland, O. The Mueller clamp light shown herewith consists of a socket with combined reflector and guard, mounted on a clamp of special design. The jaws of the last named member have a spread of 2.125 inches and may be easily and quickly applied to a bench, pipe, rod, spoke, fender, etc.

GREENERD ARBOR PRESSES.

One of the most practical and useful units of the machine equipment in the garage, repair shop and service station is an arbor press which can be employed for a number of purposes. For example, the old fashioned method of removing a transmission gear from its shaft is to utilize a sledge hammer, a practise that not only runs up a labor bill for the owner, but is likely to result in damage to the shaft. Removing flywheels, straightening axles, etc., which frequently require a pressure of several tons, is easily and quickly accomplished by the arbor press.

The Edwin E. Bartlett Company, 322 A street, Boston, has been making a specialty of arbor presses for years and the product of this concern

is well and favorably known among the machinery and manufacturing trade. The No. 15 Greenerd shown in the accompanying illustration was designed especially for garage work, and the maker points out that it will repay its cost in a short time and that it will build up trade, in that the cost of labor to the owner is considerably reduced by its use. The press is easily handled and the ram can be quickly run up or down by a small hand wheel in front of the machine.

The press provides 36 inches between the uprights, has a 12-inch opening under the plate, 26 inches over the plate and 48 inches over the lower or auxiliary plate. Being mounted on wheels the press can be easily moved to the centre of the shop to straighten an axle, or over a trap hole through which a crankshaft may be placed to remove a flywheel. The auxiliary plate at the bottom of the chamber under the revolving plate, having a receding centre and a self-conforming surface to press against, makes it very convenient when needed. This plate is removable.

The gearing is all of special heat treated steel, and vanadium is used in gears subject to the greatest stresses. One man can exert a pressure of 10 tons and two men, 16. The workman is able to "feel" what he is doing, therefore a pressure gauge is not needed. Greenerd arbor presses are built to endure and the No. 15 weighs 1300 pounds. The company makes 15 sizes. Complete details will be mailed upon request.

No. 15 Greenerd Arbor Press Especially Adapted to Motor Car Repairing, Etc.

AMERICAN AUTOS IN AUSTRALIA.

Low Priced Cars Meeting with Much Success —Farmers Are Buying in Large Quantities.

At present in Australia business is booming; in fact, it is a record year of prosperity. Every ambitious farmer or land owner is making money. In the northern part of New South Wales there is a number of small land owners who in previous years were merely making a living, but today they are fast becoming independent. It is with this class of people that the automobile trade is doing its greatest business.

These men cannot afford to pay for a high priced car, but with the coming of the American low priced car they are fast becoming automobilists.

The small car or cyclecar is meeting with success only in the city and chiefly among medical men. It does not seem that they are to be popular at present in the country districts, as the condition of the roads will not permit their being successfully used.

Business is progressing by leaps and bounds with at least three well known low priced American made cars. One of these makers is selling three times the number of cars he did a year ago. The higher priced American made car is not meeting with such success in Australia as it did a year ago. There appears to be a good market for a light, economical, popular priced automobile.

ANNUAL ELECTRIC VEHICLE SHOW.

Manufacturers Making Preparations for the Big Display, Oct. 7-17, in New York City.

The electric vehicle show, which is to be held the coming fall in New York City, already has four prominent makers who are desirous of exhibiting their cars. Although it is some months hence, these manufacturers want to make sure that their space will be reserved. They are the General Vehicle Company, the Ward Motor Vehicle Company, the Anderson Electric Car Company and the Walker Motor Vehicle Company.

The show will be held in Grand Central Pal-

ace, Oct. 7-17, under the direction of Charles Parker of the New York Edison Company.

NEW SAFETY AXLE.

Cox Brass Manufacturing Company Brings Out Axle and Radius Rod Support for Ford Car.

The Cox Brass Manufacturing Company, Albany, N. Y., maker of motor car specialties, has brought out an entirely new accessory for the model T Ford car. The Cox safety axle and radius support embodies "Safety First", the popular phrase of the day. The maker states that owing to the construction and design of the Ford front axle, the triangular radius rod being supported or connected above the centre, it has a tendency, on rough roads at rapid speed, to tilt or bend the axle toward the back.

Cox Safety Axle and Radius Rod Support for Model T Ford Automobiles.

The Cox device increases the rigidity of the car, and is stated to make driving much easier. It insures safety, as it provides a double truss support. As will be noted by the accompanying illustration, which depicts the device fitted to a Ford axle and radius rod, there are no holes to drill or alterations to make. An adjustable, movable clamp is utilized to connect the Cox device to the front axle, and it has an additional advantage in that it may be employed to line up the front wheels. The rear extensions and cross member are secured by clamps to the radius rod just back of the ball member, as shown. It is obvious that the design greatly adds to the sturdiness of the structure. The Cox safety axle and radius rod support is moderately priced and is constructed with the same high grade material and careful workmanship for which the products of this concern are noted. Complete details and prices will be forwarded upon request.

NEWS OF THE MANUFACTURER AND DEALER.

The following concerns have been incorporated recently to manufacture or deal in automobiles, accessories, etc.:

Hunter-Dammel Motor Car Company, Cincinnati, O.; \$5000.

Kuapp Motor Corporation, New York City; \$10,000; H. Hughes, T. G. Jenkins, E. B. McKellar.

Lynn Motor Cycle Company, Lynn, Mass.; \$2500; to deal in automobiles; Earl M. Lawrence, Fred A. Pratt, Ralph W. Reeve.

Long Ford Auto Company, Biddeford, Me.; \$150,000; J. H. Pierce, R. O. Brewster, D. W. Snow.

Clemens & Grell, New York City; \$5000; to deal in automobiles, motor boats, etc.; Otto Grell, Joseph Clemens, J. E. Smith.

H. J. Lupton Truck Company, Detroit, Mich.; \$25,000; to deal in commercial cars; Harry J. Lupton, Elmer J. Richmond, Asa B. Haseltine.

Liverpool Motor Car Company, East Liverpool, O.; \$10,000; to deal in automobiles; C. R. Larkin, S. J. Norton, H. A. McClain, Migarry Camarda, A. G. Ellis.

Tomberg Auto Company, Brooklyn, N. Y.; \$1000; to deal in automobiles; William P. Flinn, Salim Barson, Christiania Tomberg.

C. L. Fitzgerald Motor Company, Newark, N. J.; \$125,000; to deal in automobiles; C. L. Fitzgerald, William J. McAvoy, A. D. Rawson.

Cadillac Automobile Company, Boston, Mass.; \$100,000; to deal in automobiles; Albion L. Danforth, Bertha K. Danforth, J. James MacGregor.

Winslow Automobile Company, Fort Smith, Ark.; \$5500; to deal in automobiles; L. F. Brock, R. N. Winslow, S. L. Williams.

Lawson-Pratt Sales Company, Boston, Mass.; \$5000; to conduct an automobile business; D. Lawson, R. T. Pratt, E. B. Stanwood.

Merkel & Spacher, Rochester, N. Y.; \$15,000; to conduct a bicycle and motorcycle business; C. A. Merkel, Joseph G. Merkel, George M. Spacher.

Bantam Manufacturing Company, Boston, Mass.; \$200,000; to manufacture motors; Frank J. Tyler, Lucius S. Tyler, Harry L. Burrage.

Eagle Motor Company, Los Angeles, Cal.; \$100,000; Eugene W. Jump, P. O. Gordon, Charles E. Strong.

Federal Manufacturing Company, Inc., Nashville, Tenn.; \$100,000; to manufacture automobile wheels, parts and accessories; J. L. Dann, J. R. Tubb, B. B. Coffey, G. A. Puryear, William Hume, Jr.

Sampson Engineering Company, Louisville, Ky.; \$350,000; to manufacture automobile starters.

Harrison Motor Company, Boston, Mass.; \$10,000; H. B. Chessman, D. F. Collins, G. L. Ware.

Spool Valve Motor Corporation, Minneapolis, Minn.; \$50,000; to manufacture gasoline engines; L. B. Bird, C. H. Lundgren, J. E. Tappan.

Ashley Wire Wheel & Rim Company, New York City; \$50,000; to manufacture wire wheels; R. W. Ashley, F. W. Kolb, C. Gaschott.

Ball & Roller Bearing Company, Danbury, Conn.; \$100,000; Lewis Helm, J. H. Roth, William C. Barrett.

Springfield Valve Company, Springfield, Mass.; \$100,000; R. M. Keating, B. J. Griffin.

Masco Manufacturing Company, Detroit, Mich.; \$20,000; to manufacture steering gears.

Milwaukee Steel Products Company, Milwaukee, Wis.; \$25,000; to manufacture motor car and engine parts, etc.; A. R. Marggraf, E. M. Dougherty, Nicholas Kies.

Lombard Tractor Company, Waterville, Me.; \$250,000; to manufacture and deal in tractor engines; S. W. Lombard, A. C. Lombard.

Shea's Market, Lake Placid, N. Y.; \$50,000; to deal in automobiles, etc.; H. D. Hayford and others.

Empire Electric Vehicle Company, Wilmington, Del.; \$200,000; to deal in automobiles.

Lake Auto Company, Raleigh, N. C.; \$25,000; to deal in automobiles, etc.

John Dickens Company, North Paterson, N. J.; to deal in automobiles; Anna Dickens, John Dickens, Ellen Farley.

Barter & Longtin, Watertown, N. Y.; \$5000; to deal in automobiles and motorcycles.

Union Automobile Service Company, Detroit, Mich.; \$4000; to deal in automobiles.

Fred G. Rinker Auto Company, Indianapolis, Ind.; \$1500; to deal in automobiles; Fred G. Rinker, Charles V. Kinney, Charles F. Redding.

Graham Automobile Company, Chicago, Ill.; \$2500; to deal in automobiles; Charles E. Graham, A. S. Robertson, N. J. Shupe.

Southern Cyclecar Manufacturing Company, New Orleans, La.; \$10,000; to manufacture cyclecars.

Gary Auto Manufacturing Company, Gary, Ind.; \$50,000; to manufacture automobiles; George E. Paft, L. G. Throckmorton, William C. Flanagan.

L. & M. Manufacturing Company, Chicago, Ill.; \$10,000; to manufacture automobiles and accessories; Charles A. Larson, Louis Teuber, Iven Thorsell.

White American Locomotive Sander Company, Roanoke, W. Va.; \$75,000; to manufacture automobiles and trucks; W. H. White and others.

Kilgelsmith Electric Truck Company, Portland, Me.; \$300,000; to manufacture electric trucks.

Dequindre Auto Repair Company, Detroit, Mich.; \$5000; to deal in automobiles; Russell A. Lutes, Albert C. Glassner, Hugh M. Edwards.

Lomar Motor Car Company, Chicago, Ill.; \$1,000,000; to manufacture automobiles.

Republic Vulcanizing & Welding Company, Louisville, Ky.; \$5000; to repair automobiles and machinery; A. L. Rolli, Carl A. Tschanz.

Fordham Garage Company, Bronx, New York City; \$2000; to conduct a garage; Vincent DeMeo, Albert DeMeo, Nathan Levy.

Manchester Auto Garage Company, Manchester, N. H.; \$30,000; to conduct a garage; William C. Spear, William G. Berry, George H. Bammann, Edwin F. Jones, Robert L. Manning.

Case Garage Company, Fresno, Cal.; \$25,000; to conduct a garage and repair shop; O. L. Everts, F. G. Logan, H. L. Gepford.

Auto Truck Garage Company, New York City; \$50,000; to deal in trucks and conduct a garage; Alexander C. Brach, Henry J. Benjamin, Harry B. Emblem.

GARAGE AND DEALER.

Ray Worrall, Lebanon, Penn., has purchased the Commercial garage on Church street.

R. K. Johnson, Benson, Minn., has purchased the garage and equipment of Walter Harding.

Edward McShane, La Porte City, Ia., has sold his interest in the La Porte City garage to his partner, who will conduct the business.

C. G. Dourte, Swea City, Ia., has purchased the Bert Ley garage and will operate it.

R. J. McClure, Whitestone, N. Y., has purchased the interests of Joseph Daly in the Seventh Avenue garage. He will operate it in his own name.

William Ludwig, Bellaire, O., has taken over the Bayha garage on North Belmont street. He has been in the automobile business for some time.

Randolph Seavey, Hampstead, N. H., has purchased the Central Street garage at Derry, N. H., and will operate it.

U. G. Davis, Allenhurst, N. J., has purchased the garage formerly owned by Johnson Brem and has taken possession.

Wright & Wilson, Outlook, Mont., has sold its garage to George Simonet, Crosby, N. D., who is now making extensive improvements on it.

John Hinsler, Canby, Minn., has purchased the garage and repair shop of Anderson & Beshears. He will conduct the business as formerly.

The Cannon & Co. Garage, Belding, Mich., has been sold to Fred and Roy Lypps, who will continue the business. It was formerly owned by Richard Cannon and W. R. Cannon.

Louis H. Eisenlohr, Philadelphia, has purchased the garage at 424 Ludlow street.

The Houk Wire Wheel Company, New York City, of which J. Edward De Mar is the manager, will open a retail store at the corner of 58th street and Broadway.

The W. & H. Auto Repair Company, Indianapolis, is a new automobile repair and rebuilding plant which was opened recently. The firm is located at 620 East Minnesota street and has an establishment that is modern throughout.

John Osborne, Salt Lake City, of the Osborne Auto Tire & Supply Company, has opened a garage at 34 First street, to be known as the Eagle Gate garage. The Osborne company will remain in business.

The Auto Repair Company, Winston-Salem, N. C., is a new company formed recently, comprised of R. L. Brinkley, G. C. Jarvis and Orville Masten. The firm will conduct a repair business in the Nading building at the corner of Seventh and Trade streets.

Helmsmiller Bros., Hawkeye, Ia., has opened a new garage and repair shop. It is modern throughout.

Reid & Layne, Santa Monica, Cal., has opened its new garage, which has just been completed. The building is of brick and cement construction and cost \$25,000.

Roy Lampman, Pownal, Vt., has opened a first class garage at Pownal Center. A repair shop will be operated in connection with the garage.

The S. & S. Garage, Reading, Penn., has been opened by E. W. Schuhmann and Edward Smith at the corner of Spruce and Plum streets. The company is agent for the Falcon cyclecar and will carry oils and supplies.

W. O. Carlem and V. Schulz, Stockton, Cal., automobile ignition specialists, have opened a shop at 222 North Hunter street. The firm makes a specialty of overhauling and repairing magnetos, coils and electric starters.

The Cresson Motor Car Company, Cresson, Penn., has opened a new garage.

The Fall Creek Motor Company, Fall Creek, Wis., has just completed a new two-story garage which the company will occupy shortly. The new building contains showrooms, repair shop and vulcanizing department.

William C. Merz, Kewaskum, Wis., has purchased the Altenhofen garage at Random Lake, together with the agencies for the Ford and Case cars.

The Boyd Tire & Supply Company, Toledo, O., has opened a salesroom for the purpose of selling tires and accessories. The company is located at Jefferson avenue.

C. J. Schmidt & Company, Reading, Penn., has opened its new garage at 336-38 Madison avenue. The building has accommodation for 50 cars and every owner has a locker.

WITH THE MANUFACTURERS

The General Vehicle Company, Long Island City, N. Y., has erected a six-story concrete and steel building, which will be used expressly for the construction of electric vehicles and bodies. Building No. 5, shown herewith, will allow for an enlargement as soon as the company deems it advisable, and is for the G. V. Mercedes truck department of the company.

The Commerce Motor Car Company, Detroit, had a narrow escape from fire as the result of an explosion, which made a total wreck of the adjoining plant of the Mexican Crude Rubber Company. While the explosion was terrific, demolishing the heavy machinery and killing 10 men, with scores of wounded, the only damage suffered by the Commerce factory was the loss of thousands of small window panes. Several of the men at work assembling the delivery cars were blown over in a shower of glass. George B. Wilcox, the sales manager, reports production is unhampered.

The Jones Electric Starter Company, Chicago, Ill., manufacturer of the Jesco line of electric starting, lighting and ignition apparatus, has established a Detroit office at 1211 Woodward avenue. This branch will be in charge of E. L. Jones, E. E. He is vice president and chief engineer of the company.

The O'Mullins Quick Adjustable Wrench Company, Trenton, N. J., will manufacture a wrench which can be quickly adjusted and which stays adjusted until changed.

The Gadabout Motor Corporation of New York, Newark, N. J., has leased the factory building at the corner of Badger avenue. The company manufactures two-passenger cyclecars.

The Haynes Automobile Company, pioneer automobile builder of Kokomo, Ind., reports, through its general manager, A. G. Sieberling, that the month of May was a record-breaking month with that company.

The Moon Motor Car Company, St. Louis, Mo., has established agencies in Canada, South America and New Zealand.

The General Motors Truck Company, Pontiac, Mich., has just closed an order with the Indian Refining Company for seven two-ton gasoline trucks. This makes a total of 12 GMC trucks which the Indian Refining Company has purchased within the past month.

The Dayton Rubber Manufacturing Company, Dayton, O., manufacturer of Dayton airless tires and Dayton pneumatic tires, has moved its New York City office from

Building No. 5, Which Has Been Built for the G. V. Mercedes Truck Department of the Company and Which Will Be Enlarged Later.

1874 Broadway to 1851 Broadway, and now has one of the most attractive and up-to-date tire offices in that city.

The Champion Spark Plug Company, Toledo, O., announces that it is now turning out an average of 26,000 spark plugs a day. Four years ago the business was started in a small factory space in that city, the first daily production being about 400 plugs. The Champion plug is used in the factory equipment of Ford, Overland, Maxwell, Studebaker, Metz and many other cars.

The Swinchart Tire & Rubber Company, Akron, O., makes a variety of tires for truck use. A special cellular tire for electric trucks is stated to be extremely economical of current consumption, as the flow or "bunching" of the rubber is absorbed by the cells. Additional claims are that this tire transmits absolute traction; that it will not skid on wet or slippery pavements, and that the additional resiliency prolongs the life of both batteries and mechanism.

The National Rubber Filler Company, Midlothian, Tex., manufactures a rubber tire filler designed to take the place of the inner tube and air, which, the company states, ends all tire trouble. The company claims that it is made on the correct principle and out of the proper material to give service and satisfaction, high grade rubber cut in small pieces and vulcanized together being the medium employed.

RECENT PATENTS.

Rotary Valve, Henry Hopkes, Detroit, Mich.; assignor of one-half to Robert Hartenstein and one-half to Arthur F. Saenger; No. 1,098,574. Filed March 2, 1912.

Truck Brake, Russell Huff, Detroit, Mich.; assignor, by mesne assignments, to Packard Motor Car Company; No. 1,098,576. Filed May 7, 1908.

Resilient Wheel, Samuel Johnston, Sacramento, Cal.; assignor of three-eighths to Joseph D. Cornell and two-eighths to Sim Canman; No. 1,098,577. Filed July 17, 1912.

Tire Armor, Alvah L. Powell, Stockton, Cal.; assignor of one-fiftieth to Henry E. Wolfe; No. 1,098,588. Filed May 17, 1913.

Vehicle Spring, Marquis J. Todd, Buffalo, N. Y.; assignor to Buffalo Pitts Company; No. 1,098,598. Filed April 25, 1913.

Intake Manifold, Morton E. Hidden, East Orange, N. J.; assignor to Willis H. Simpson; No. 1,098,626. Filed June 13, 1913.

Spark Plug, Elmer C. Rauch, Coeur d'Alene, Idaho; No. 1,098,637. Filed Sept. 11, 1912.

Vehicle Jack, Brayton C. Richards, Chicago, Ill.; assignor to Henry S. Wilkel; No. 1,098,639. Filed Oct. 10, 1912.

Lathe Attachment for Crankshafts, Clinton E. Wilder, Erie, Penn.; No. 1,098,654. Filed Feb. 13, 1913.

Tire Pump, Charles P. McDowell and Richard H. East-er, Porter, Wash.; No. 1,098,674. Filed Sept. 19, 1912.

Pneumatic Tire Wheel, Julius Miskey, Dayton, O.; No. 1,098,677. Filed Oct. 4, 1913.

Motor, Paul H. Mueller and Ludwig H. Schuller, Brooklyn, N. Y.; assignors by direct and mesne assignments to L-M-S Motor Company; No. 1,098,679. Filed July 8, 1912.

Spark Plug, Adolph G. Bergstrom and Arthur Bergstrom, Rockford, Ill.; No. 1,098,705. Filed Dec. 30, 1912.

Resilient Wheel, William R. L. Ray, Fort Jones, Cal.; assignor of one-half to Maurice M. Zelle; No. 1,098,759. Filed May 31, 1912.

Motor Starter, Hans R. Setz, St. Louis, Mo.; assignor to Fulton Iron Works; No. 1,098,767. Filed March 24, 1913.

Resilient Wheel, Sanders Craig, Eagle Station, Ky.; No. 1,098,782. Filed Dec. 6, 1913.

Lubricating System, Paul Daimler, Cannstatt, Germany; assignor to the firm of Daimler-Motoren-Gesellschaft; No. 1,098,784. Filed Nov. 17, 1913.

Nut Lock, Jacob Farrell, Barronvale, Penn.; No. 1,098,790. Filed Aug. 13, 1913.

Motor, Charles Francis Jenkins, Washington, D. C.; No. 1,098,806. Filed July 3, 1911.

Axle Construction, John A. Marsh and Roy Ulrich, Jacksonville, Ore.; No. 1,098,816. Filed March 20, 1913.

Motor, Edward Moore, Syracuse, N. Y.; No. 1,098,824. Filed Sept. 8, 1908.

Shock Absorber, Francis X. Mudd, Chicago, Ill.; No. 1,098,826. Filed Oct. 23, 1913.

Carburetor, Clyde S. Munroe, River Forest, Ill.; No. 1,098,827. Filed Sept. 6, 1913.

Steering Knuckle, John Elmar Nelson, Hettinger, N. D.; No. 1,098,830. Filed May 10, 1913.

Bumper, Charles Welland, New York City; No. 1,098,860. Filed Feb. 14, 1914.

Starting Crank, Preston H. Breed, Pittsfield, Mass.; assignor, by mesne assignments, to Alden Sampson Manufacturing Company; No. 1,098,878. Filed March 2, 1910.

Intake Manifold, Howard S. Mountford, Algona, Ia.; No. 1,098,915. Filed Dec. 28, 1912.

Valve, Joseph Obermire and Daniel Krous, Catalpa, Neb.; No. 1,098,963. Filed Nov. 29, 1913.

Gasoline Gauge Structure, Frederick L. Pfahl, Akron, O.; No. 1,098,968. Filed May 26, 1913.

Nut Lock, John B. Young, Los Angeles, Cal.; No. 1,099,005. Filed March 7, 1913.

Ambulance Automobile, Frank E. Campbell, New York City; No. 1,099,020. Filed April 3, 1913.

License Holder, Louis Gottschall, New York City; No. 1,099,035. Filed April 17, 1913.

Motor, Charles M. Leech, Lima, O.; No. 1,099,065. Filed Oct. 8, 1912.

Shock Absorber, James Moir, Burlington, Ia.; No. 1,099,073. Filed July 20, 1913.

Carburetor, Thomas S. Hamilton, Tampa, Fla.; assignor to the Purified Petroleum Products Company. No. 1,099,086. Filed April 6, 1912.

Vulcanizer, Joseph Scott Benson, Riverside, Ia.; as-

signor to the Positive Supply Company; No. 1,099,112. Filed Nov. 19, 1912.

Electric Lamp, Ellsworth A. Hawthorne, Bridgeport, Conn.; No. 1,099,087. Filed Aug. 2, 1913.

Motor, Edwin L. Russell, Cleveland, O.; No. 1,099,102. Filed Aug. 21, 1911.

Motor Starter, Edgar F. Fruehbeck, Marfa, Tex.; No. 1,099,123. Filed Aug. 14, 1913.

Wheel, Robert Thomas Smith, Jr., Warrington, England; No. 1,099,133. Filed Dec. 27, 1913.

Demountable Wheel, Thomas I. Duffy, Chicago, Ill.; assignor to Henry Ellsworth and Albert E. Cross; No. 1,099,169. Filed Jan. 16, 1911.

Demountable Rim, Charles S. Goodfellow, Jersey City, N. J.; assignor to Albert Higson and Gustav H. Martens; No. 1,099,173. Filed Feb. 8, 1912.

Headlight, Oscar L. Vance, Decatur, Ind.; No. 1,099,217. Filed Oct. 29, 1913.

Folding Corner Seat, Harold H. Kennedy and Thomas J. Gibbons, Indianapolis, Ind.; assignors to the Waverley Company; No. 1,099,253. Filed Aug. 16, 1912.

Motor, Charles Sykora, Storden, Minn.; No. 1,099,271. Filed April 10, 1913.

Soft Tread Tire, Jacob W. Crusius, Paulding, O.; No. 1,099,282. Filed May 24, 1912.

COMING EVENTS.

June.

June 23-26—S. A. E. midsummer meeting, Cape May, N. J.
June 24-26—Meeting National Gas Engine Association, Chicago, Ill.

June 25—Track meet, Portland, Ore.

June 27—Race meet, Brooklands track, Weybridge, England.

June 27-July 4—American Automobile Association's touring week.

June 30—Track races, Sioux City, Ia.

June 30—Fourth International Rubber and Allied Industries Congress, London, England.

July.

July 1-3—Non-stop run, Chicago-Boston, for Glidden trophy.

July 2—Targa-Florio cup road race, Mandonic circuit, Italy.

July 3-4—Mid-summer meeting, American Automobile Association, Bretton Woods, N. H.

July 3-4—Road races, Tacoma, Wash.

July 3-4—Track race meet, Taylor, Tex.

July 4—Track race meet, Cedar Rapids, Ia.

July 4—Track races, Providence, R. I.

July 4—300-mile race, Sioux City, Ia.

July 4—Grand Prix, Lyons, France.

July 10—Track race meet, Rockdale, Tex.

July 17-18—Speedway meet, Seattle, Wash.

July 25-26—Grand Prix, Belgium.

August.

Aug. 16—International Light Car Race, Le Mans, France.

Aug. 21-22—Road races, Elgin, Ill.

Aug. 23—Coupe de l'Auto Race, Auvergne, France.

Aug. 27—Race meet, Brooklands track, Weybridge, England.

September.

Sept. 5—Track races, Milwaukee, Wis.

Sept. 7—Track races, Providence, R. I.

Sept. 9—Speedway races, Pomona, Cal.

Sept. 9—Road races, Corona, Cal.

Sept. 9—Grand Prix, Italy.

Sept. 14—Track meet, Milwaukee, Wis.

Sept. 26—Race meet, Brooklands track, Weybridge, England.

Sept. 26-Oct. 6—Show, Berlin, Germany.

October.

Oct. 1—Kerosene motor competition, Paris, France.

Oct. 2-3—Track meet, Oklahoma City, Okla.

Oct. 2-3—Track meet, Trenton, N. J.

Oct. 9—Speedway races, Chicago, Ill.

Oct. 9-Nov. 2—European trip, Society of Automobile Engineers.

Oct. 16-26—Automobile Salon, Paris.

Oct. 17-24—Show, Pittsburgh, Penn.

Oct. 19-26—American road congress, Atlanta, Ga.

November.

Nov. 6-16—Olympia show, London.

Nov. 8-11—Track meet, Shreveport, La.

AUTOMOBILE INSURANCE COMPANY.**Dealers, as Agents for Motor Underwriters, Can Insure Against Theft, Damage or Liability.**

Insurance has now been added as a department of the automobile industry. It is, or soon will be, possible for the man who buys a car to buy insurance of the dealer and to secure any adjustment as to repair through the manufacturer or dealer without going outside of the automobile industry.

This has been made possible through the Manufacturers' & Dealers' Motor Underwriters, Inc., New York City, which has entered the field with fire, theft, liability, property damage and collision insurance.

The officers of the new concern are: President, William E. Metzger; vice president, Ernest H. Greenwood; treasurer, Ballard McCall; manager of the metropolitan department, H. A. Bonnell.

The directors are: A. G. Batchelder, chairman of the executive committee of the American Automobile Association; Hugh Chalmers, president of the Chalmers Motor Car Company; Roy D. Chapin, president of the Hudson Motor Car Company; W. J. Foss, treasurer of the Foss-Hughes Company, Philadelphia; Ernest H. Greenwood; William B. Joyce, president of the National Surety Company; William M. Metzger, director of the National Automobile Chamber of Commerce; S. A. Miles, formerly general manager of the National Automobile Chamber of Commerce; H. H. Rice, vice president and general manager of the Waverley Company, and John N. Willys, president of the Willys-Overland Company.

The company plans to bring the maker, dealer and owner closely together, and its policy is unusual in that the owner who meets with an accident far from home need not be put to any delay in having his car repaired; he may go to the nearest dealer in the car he is driving, have the necessary repairs made, and the dealer and insurance company will attend to the matter in its further detail.

EXPERTS ADDRESS TRUCK CLUB.**Men Prominent in Motor Vehicle Field Give Interesting Addresses to Large Gathering.**

The Motor Truck Club of America held its monthly meeting June 17 at the Automobile Club of America. The speakers were: Fire Commis-

sioner Adams, F. E. Sampson, connected with the Exide Battery Company and formerly with the Fifth Avenue Coach Company; A. F. Masury, in charge of the service station of the International Motors Company; A. J. Slade, a consulting engineer, and G. A. Green, chief engineer of the Fifth Avenue Coach Company. A number of men prominent in the truck field also gave a general discussion on the subject. The papers of each of the speakers were illustrated by lantern slides.

ANOTHER FORD BOOST.**Detroit Man Inaugurates Novel Ideal of Showing Important Events in Big Automobile Centre.**

Henry Ford, of the Ford Motor Company, Detroit, has appointed A. B. Jewett to take charge of the moving picture department which has been recently installed in the Ford park plant and which will keep a number of men busy. Besides showing the most important events of the week in the city, the movies will depict interesting facts about the Ford plant.

It is reported that 50 picture houses have contracted for the Ford moving pictures, which are to be shown all over the state, also in Illinois, Indiana, Ohio and as far as the Coast. The pictures and films will be known as the Ford-Detroit Weekly.

FATALITIES DECREASE.**In Majority of Accidents Children Disregard All Laws of the Streets.**

Fatalities due to automobiles and motor trucks have decreased in New York City, according to statistics compiled by the National Highways Protective Society. During May 45 persons were killed in the streets. Of these, 21 were struck by wagons, 19 by motor propelled vehicles and five by trolley cars. The greater percentage of those killed were children. Secretary Edward S. Cornell states that car drivers are paying better attention to traffic rules than are drivers of horse drawn vehicles.

Touring Equipment is a subject in which all motorists are interested. The selection of practical accessories, etc., involves careful consideration. The Eighth Annual Touring Number of The Automobile Journal, to be published July 10, will contain suggestions for equipping the car.

CONTEST BOARD ANNOUNCES 1914 RULES.

THE contest board of the American Automobile Association has issued a synopsis of the 1914 contest rules explaining the changes that have been made. A more simple method of registration of stock models for touring contests has been provided, and the rules governing speed competitions of stock cars and stock chassis have been eliminated.

The class B classification has been eliminated and a new sub-division made in the class A price classification. Whereas formerly division 1A was for cars under \$800, there are now two divisions, 1A for \$450 and under and 2A for \$451 to \$800.

In a similar manner three new classifications have been added to the class C piston displacement classification. Whereas formerly the smallest division was for cars under 161 cubic inches, the new classifications are:

Cyclecar.....	Division 1C under 71 cubic inches.
Light car.....	Division 2C 71 to 100 cubic inches.
Small car.....	Division 3C 101 to 125 cubic inches.
	Division 4C 126 to 160 cubic inches.

The other divisions under classes A and C remain the same. There is no change in the sanction fees except whereas heretofore events 100 miles and over on specially constructed speedways have carried a fee of \$1000, the following modifications have been made:

Brick, Concrete, Wood, Etc.	
100 miles and under a day.....	\$250
101 miles and over.....	1000
Dirt and Other Materials.	
100 miles and under a day.....	\$250
101 miles and over.....	750
Dirt Only.	
100 miles and under a day.....	\$250
101 miles and over.....	500

Where programmes are composed entirely of events for cars under 125 cubic inches piston displacement, or \$450 in price, the sanction fees are 50 per cent. of those regularly prescribed. When such events constitute only a portion of the day's programme, the full fees will prevail.

In races of 100 miles or over the crew of a car must consist of a driver and a mechanic, and all mechanics must be registered.

A new rule is that governing the use of intoxicants in contests, the penalty being disqualification. There is no distinction between touring contests of six days and those over that period, as new grades for interclub and economy contests are included. A synopsis of the rules follows:

Grade one covers technical contests embrac-

ing preliminary and final examinations, tests of motor, clutch, gearset and brakes, with penalties for damaged or inoperative parts, lateness at controls and repairs and replacements.

Grade two imposes penalties only for lateness and work done.

Grade three imposes penalties for lateness in arrival at controls only.

Grades one and two may be conducted for stock or non-stock cars, but grade three is open only to non-stock cars.

Sanction fees for grade two contests have been reduced to \$30, and for grade three contests to \$10.

Stock car touring events may be conducted under price classification or piston displacement classification.

Touring cars and runabouts may compete together for the same prizes without reference to passenger carrying capacity.

There is no penalty for tire repairs and replacements, and the time consumed is added to the daily running time. Extra casings and tubes may be removed from competing cars in controls for repairs. Motors may be stopped during tire repairs without penalty. Demountable rims or wheels may be used in stock car events only where cars are regularly equipped.

The time lost on account of traffic delays occasioned by railroad crossings, congestion in city streets, open bridges, obstructed roadways, etc., will not be added to the daily running schedule, but such lost time must be made up.

An average speed of 14 miles an hour has been set for cars priced at \$450 and under, the former schedules of 16, 18 and 20 miles an hour remaining applicable to cars of \$451 to \$800, \$801 to \$1600 and over \$1600, respectively.

All cars are required to carry at least one passenger other than the driver, without regard to body equipment or carrying capacity.

Dry cells for ignition or lighting may be replaced without penalty, the work to be done in the car's running time.

Replacing or recharging of storage batteries where charging generator is regular equipment will be penalized.

Replacing or recharging of storage batteries where no charging means are furnished will be allowed without penalty.

The fixed penalty schedule has been amplified to provide penalties for damaged or inoperative equipment.

NEW YORK BOSTON CHICAGO TORONTO

Which Will It Be, Mr. Motorist,
A Check to the Repair Man,
or a Check to Friction?

The question rests entirely with YOU. Care in the selection of the proper lubricant NOW will save you much money before the end of the season.

The constant use of

on your car insures fewer repairs, least power loss, and least lubrication cost—thereby safeguarding the fine bearings and gears of your car against corrosion and wear.

"K-000 NON-FLUID OIL" is of proper consistency for use in compression cups on all bearings, for packing differential gears, steering gear knuckles, ball and roller bearings, etc. It lasts longer than any grease and is unaffected by temperature changes.

"K-00 SPECIAL GRADE" is softer than "K-000" and is designed for lubricating sliding gear transmissions. It cushions gear teeth, prevents abrasion and heating and insures smooth, quiet running.

Ask your dealer for the orange colored can bearing sprocket-wheel trade-mark shown above.

made the greatest step forward in carburetion since Krebs' early device when the Zenith was invented. And like practically all great inventions it was achieved by an amateur who started with an unbiased mind and applied common sense to the fundamentals of carburetion. Baverey's principle of "the compound nozzle" has made history.

**The Endorsement of Europe**

Today 125,000 Zenith carburetors are being used in high grade foreign cars alone. Factories in France, Germany and England are supplying over 150 concerns—names known around the world as Europe's best. At the recent London Show 41.5% of all cars exhibited were Zenith equipped. At Paris 46%—nearly half of all—carried this device of high efficiency. Europe's sanction comes slow—but means much.

The Carburetor with Trouble Left Out

The Zenith contains no moving parts, no valves, no springs. Once properly set, it has no wear and cannot be altered by the novice. It outlasts the car. Already eight well known American cars have chosen the Zenith above all as their standard equipment. Many more will follow as they test this famous device which for speed, for economy, for great flexibility is supreme. Science has given it the compound nozzle. Why not write for details?

Times Building

Pawtucket, R. I.

For Our "100 Million" Nation

Send an additional dollar and get a pair of Lincoln Highway pennants for your car. We also have some fine big wall maps in three colors, which show the route of the Highway, a great thing for your office, for two dollars

A growth of 7,000,000 in four years has placed the United States in a position where it "looms as the true colossus of the modern world".

In colossal achievements, it has surpassed the works of antiquity. The airy Gothic Spires of the Woolworth Building, the shining tip of the Tower, stand as eloquent attestations of this American progress.

It has remained for the United States to carry to successful termination, that gigantic project—the Panama Canal.

In constructive work of all kinds the American Nation has taken the lead, holding her Light of Liberty and Peace high above sordid jealousies and selfish desires, setting for the whole world a worthy and well meaning example of true Brotherhood and Co-operation. Justly we may be proud that we are Americans.

For another great thing is to be done—there is to be a true "Uniting of the Union." A great shining band of Brotherhood is to be stretched across the continent, from coast to

coast, state to state, city to city, linking the hearts of all true Americans still closer together.

The Lincoln Highway—continuous, connecting, improved — a road of beauty and comfort—*Your Way and My Way.*

A splendid national monument dedicated to the great citizen of the Republic, who stands as exponent of fine courage, lofty aspiration, and vigorous, masterful American genius. Lincoln could have no more appropriate — no more enduring—tribute.

You can share—you can help, in the building of this glorious memorial.

Do it—send five dollars to—

THE LINCOLN HIGHWAY ASSOCIATION

Dime Bank Building

Detroit, Mich.

PIERCE-ARROW

*A car whose luxury is added
to its genuine economy*

WE are constantly hearing of Pierce-Arrow owners, to whom the price of a new car means little, who have continued to run their original cars through a long series of years—often seven or more—with such increasing satisfaction that all the real refinements in later models have not been able to tempt them away from the Pierce-Arrow which seemed to them the ideal motor car.

Such lasting satisfaction has demonstrated not only the durability of Pierce-Arrow Cars—it has demonstrated that they are also most economical. For in cases of this kind the initial cost is not a new item every year. It is paid down *once*, and its returns are then distributed over many years of service, over miles of travel. Even when the charges for proper care and maintenance are added, the total expense of the Pierce-Arrow year by year is still less than that of new cars of greatly lower initial cost for the same period.

Multiply this economical satisfaction by Pierce-Arrow safety, comfort and luxury and a just measure of Pierce-Arrow quality is obtained. It gives a new value to the original investment. It means that with adequate maintenance the endurance is there, the vitality is there, the built-in worth is there, not merely for a single season or even for two, but over a long series of years.

The buyer of a new Pierce-Arrow has the comfortable assurance that the market in Pierce-Arrows is always an active one. The man whose investment must be, for any reason, somewhat lower, always knows that in buying a Pierce-Arrow from its first owner he is securing the better materials and better construction which constitute its vitality, and which make it a wiser, more economical purchase than a new car at the same price.

Pierce-Arrow cars are built in three chassis sizes, 38, 48 and 66 horsepower. These chassis are equipped with many types of open and enclosed bodies, including a runabout with interchangeable Victoria and coupe top.

WINTON SIX Model 21—Now Ready

A New Beauty for 1915

With Distinctive Individuality for You Personally

THE rare beauty of this car challenges admiration. Best of all, we give *your personal* car a special individuality to meet your own good taste and to distinguish *your* car from every other owner's car. But that's a matter we prefer to take up with you personally.

All the sterling features of Winton construction are retained in Model 21. The enlarged radiator and bonnet blend into a pleasing unit with the new body, which is of singularly attractive design. The raised stream-line panel has been seen heretofore on limousines only. Doors are wider and swing on concealed hinges. No outside handles. Seats are roomier. The cowl board arrangement is new. A tonneau light is provided. Springs are always automatically oiled by Dann cushion inserts. Wheel base 136 inches (on four-passenger and runabout cars, 130 inches). Especial provision has been made for the most satisfying comfort.

Note the Equipment:

Electric starter, or Air starter. You may have your choice *without* extra charge.

Complete electric lighting system.

One-man top of finest mohair; has easily handled curtains.

New-design rain-vision glass front.

Klaxon electric horn, concealed under bonnet.

Waltham eight-day clock, with highest-grade watch movement.

First-grade Warner speedometer.

Improved tire carriers at rear.

Demountable rims.

Tires—37x5-inch, all around.

Power-driven tire pump.

Full set of tools.

The price of the five-passenger car is \$3250 fully equipped, and—

You may write your own guarantee.

Write for 1915 catalog; now ready. Ask us about the exclusive feature of individuality for your own car.

An Eight Year's Endurance Run

One hundred and one Cartercars began service eight years ago, the first year that they were manufactured.

Today, after use and abuse for a period of more than twice the average life of a gear driven car, they are all in active use.

Many of these Cartercars have over 100,000 miles to their credit yet they are still economical cars for their owners in the matter of repairs.

The Cartercars that are being made today have many improvements added and are much more completely equipped with accessories and conveniences than were the first ones—

Yet the same principle, that of the gearless transmission, and the careful construction from the best materials are back of every Cartercar today just the same as in 1905.

The Cartercar that you buy today is the embodiment of long life, ease of control, powerful ability and economical operation.

If you will take a ride with us in a Cartercar you will see that we have not exaggerated our claims for it, and a few years behind the wheel of one will convince you that there is no better car manufactured at any price.

Come take a ride today. Just Phone the Nearest Cartercar Dealer and he will call for you.

Cartercar Company, Pontiac, Michigan

Branches at New York, Chicago, Detroit, Kansas City, Atlanta

MODEL 5-A

This big Cartercar has electric starting, lights and horn and full equipment of accessories.

(When Writing to Advertisers, Please Mention The Automobile Journal.)

\$1085 INCLUDING ELECTRIC
STARTING & LIGHTING

The New Regal—A Thoroughbred at a Popular Price

An overhung car—a one-chassis car—a big-production car—backed by a \$3,000,000 company

It's a car that doesn't carry the price-mark on it—the lines are those of a \$6,000 car most admired at the last London exhibit.

A car that will really hold five people—not crowded and jammed together—but comfortably. Plenty of body room and foot room in both driver's seat and tonneau; 23-inch tonneau doors—rear seat 48 inches wide

A motor that will just skim over the hills—39 h. p. on actual brake test—and an electric starting device that is the simplest and most efficient yet produced.

The new Regal will be made in tens of thousands—our whole big 10-acre factory will be devoted to this one chassis, with roadster and touring bodies.

You can get prompt deliveries, so that you won't lose sales through no fault of your own—and your profit will be satisfactory.

We are buying advertising for the new Regal just as we buy material—so much advertising for every car; and the amount will run well into the hundreds of thousands of dollars.

It starts with a 2-page spread in the June 20th issue of the Saturday Evening Post, and will be followed by page advertisements

THE REGAL MOTOR CAR COMPANY, 130 Piquette Ave., Detroit, Mich.
Canadian Factory: Berlin, Ontario

(When Writing to Advertisers, Please Mention The Automobile Journal.)

regularly in the other big weeklies. Large space will also be used continuously in the farm papers, trade papers, and over a hundred newspapers—all at our expense.

Quick Action Necessary

We are strengthening our organization at every point. We are after good dealers in every locality. The new Regal is already being turned out in quantity, and reservations are pouring in on us. Our distributors and dealers who have tried out the new Regal are doubling and trebling their specifications.

Don't delay, but write or telegraph at once regarding territory, or come in to the factory.

WHAT THE REGAL BUYER GETS

Direct Electric Starter	Left Side Drive
Electric Lights, with "Dummer"	Center Control
Electric Horn	300 to 500 lbs. Less Weight
Simplified Electric Wiring	112-inch Wheel Base
Removable Motor Head	Unusual Foreign Design
Gasoline Saver Valves	23-inch Tonneau Doors
Extra Size Brakes—12 inches	48-inch Rear Seat
Hidden Radiator Cap	Adjustable Wind Shield
One-Man Top	Inside Curtains

SPECIFICATIONS: Motor, 4 cylinders, cast en bloc—34 x 5. Removable motor top, giving easy access to pistons and valves. Three point suspension. **Starting:** Electric, acting directly on fly-wheel; three sources of power—generator, storage battery and dry cells. **Drives:** Left side, with center control. All operating controls on dash. **Springs:** Front, semi-elliptic; rear, three-quarter elliptic. **Ignition:** Atwater-Kent Unispark, delivering single spark and automatically adjusting itself to engine speed. **Asides:** Front, I-beam; drop forged; rear, three-quarter floating. **Brakes:** Internal expanding, external contracting; 12-inch brake-drum. **Body:** Full stream-line—hidden radiator cap. **Wheelbase:** 112-inches. **Weights:** Under 2,400 pounds with all equipment. **Equipment:** One-man top; inside curtains; electric head-lights with dimmer attachment; electric tail-light; electric horn with button in center of steering wheel; 32 x 3½-inch tires; demountable rims with one extra rim; clear-vision windshield; tools and tire repair kit.

EAGLEINE

The Motorist's Measure Is His Repair Bill

The dealer who sells EAGLEINE NO-CARBON OIL sells quality.

The owner who buys EAGLEINE NO-KARBON OIL buys quality.

The engine lubricated with EAGLEINE NO-CARBON OIL gives Quality, Service and Power.

EAGLEINE NO-CARBON OIL—An oil refined to afford the highest degree of lubrication, proven by years of use by experienced motorists, and sold with a guarantee of satisfaction wherever used. It costs no more than inferior brands.

Any owner who buys unknown quality oil takes all the chances; his repair bills, his pleasure, his satisfaction depend on QUALITY OIL.

EAGLE OIL & SUPPLY CO.
104 BROAD ST. BOSTON MASS.

(When Writing to Advertisers, Please Mention The Automobile Journal.)

What are you doing for the engine of your car?

No matter how good service it is giving you at present, it will continue to do so only if you treat it right—it **MUST** have the kind of oil that suits its lubricating system.

There are nine distinct systems of lubrication in general use. No one grade of oil can suit them all. A lubricant which is exactly right for one system may fail to lubricate properly an engine using another system. The result is likely to be an engine fit for the junk heap before its time.

Platt & Washburn Refining Company has spent thousands of dollars in physical and chemical laboratories in a study of all brands of motor oils on the market and scientific research by actual tests into the requirements of automobile engines.

The result of these tests is **Veedol** and the **Veedol Lubrication Chart**. Veedol is highly refined from Pennsylvania paraffine petroleum—the result of over 30 years experience with lubricating oils. The Chart will give you information which may double the life of your car. Get a copy from your dealer, or write us for one.

Inside Facts of Standardization

Come on the inside with us. Let us show you how and why, dollar for dollar and car for car, you never before bought the equal of the three new Coles. Let us give you the simple two-and-two-are-four facts which make it possible for you to buy the new Cole Ten Four at \$1665, the new Cole Little Six at \$1865 and the new Cole Big Six at \$2465. Here is why we can build cars at a lower cost and sell them at two-thirds less the usual margin of profit.

Cole buys units from the specialists for less than they could be made in the Cole factory.

And Cole gets with those units the best ideas of the biggest and best unit-specialists, all of whom in turn have the benefit of the counsel and co-operation of the Cole staff of automobile engineers.

Cole engineering adds all these units to the dominant Cole idea, securing for you the combined saving of cost and the combined betterment of product.

The unit-specialist makes a legitimate profit and produces a perfect unit. Cole makes a legitimate profit, which does not have to be huge, because Cole eliminates the burden of carrying a vast investment.

Thus Cole can give the motorist every modern improvement instantly, because Cole draws upon every resource of the specialists who have proven themselves best in their lines.

Today the greatest Cole triumph is the ability to build three sizes of cars and have them all of the same class, selling them at prices which represent simply the difference in the cost of building.

Standardization means simplification, systematization and centralization. Aside from Cole's purchasing power it necessarily enables Cole to build at a lower cost.

To build up the Cole units in one factory for Cole exclusively would require millions of investment and tie those millions up.

Standardization permits the turning of \$1,000,000 ten times in a year, where non-standardization would need \$3,000,000—which could be turned but three times in the same volume of business.

Because Cole capital can be turned three times to non-standardization's once, it is plain that Cole can build cars with but 33⅓% the average investment, and consequently can sell them at 66⅔% less the usual profit margin, and still be "even".

Dollar for dollar and car for car, you never bought the like of these three new Coles—and you have just read the dollar-and-cents reason for this.

Now let the Cole itself tell you the rest of its story—the story of perfect service provided for you by Cole standardization. We will gladly demonstrate the cars.

"Why the Standardized Car?"

Write today for our new booklet, "Why the Standardized Car?"—which tells you in everyday language why Cole is the car you should buy.

Tri-Phoon Air Pumps

for attaching to motors

for use in garages

The TRI-PHOON is an absolutely new three-cylinder air pump, built upon original lines. It pumps with the force of a hurricane and is a marvel of efficiency, delivering at 800 R. P. M. a steady flow of pure fresh air equal to the pressure drawn from an air tank charged 115 pounds to the square inch.

Its construction is marked by both simplicity and durability. All parts are of high-grade material and are an advance over the usual pump construction. There is perfect lubrication and it cannot get out of order.

Both the individual and garage pumps are very compact, light in weight, easily attached or handled and are

WHEN WRITING PLEASE MENTION THE AUTOMOBILE BUYERS' REFERENCE.

SPEAKING of appreciation, several weeks ago over 350 Indiana citizens descended on our plant in a body and said they wanted to purchase over a quarter of a million dollars worth of Overlands on the spot.

Mind you, these men came to us unsolicited. And they had the cold cash in their pockets.

They took one day's entire production, and to make sure of their purchase each man drove his car home the same day.

That's appreciation in the finest sense of the word.

SPEDOLENE

Designed Especially for
Gears ∴ Transmissions ∴ Differentials
Timing Gears ∴ Bearings ∴ Worm Gears

"THE LUBRICANT THAT KILLS HEAT"

Why you should use SPEDOLENE:

- FIRST** — It is made of the very finest grades of materials, a foundation particularly adapted to gears in automobiles and motor trucks. Purely a mineral compound, clean and wholesome; has no corrosive action, contains no animal matter, fats, greases, acids, lye, soda or water.
- SECOND** — Every process of its manufacture is carefully and thoroughly tested. This insures to the user **quality** that is absolutely uniform. **Spedolene** never varies and "every ounce counts."
- THIRD** — The indorsement of **Spedolene** users is the most convincing testimony regarding the high efficiency of this lubricant. Purchasers of **Spedolene** praise this lubricant in the most enthusiastic terms.
- FOURTH**—**Spedolene** positively eliminates gear noises. **Spedolene** does not run out or throw out at the gear cases. **Spedolene** lubricates under any temperature. **Spedolene** lasts longer than any other known oil, grease or compound, and has revolutionized the gear lubricating problem of the country in less than three years, and is unquestionably the greatest success in the shortest period of time, in the history of lubrication. You are actually overlooking **economy, efficiency and real gear lubrication** if you do not use **Spedolene**.

Let your car be the judge
Used extensively in foreign countries

DEALERS—write for quotations and other data you require. We need an agent in every town, city and state. Literature, descriptive of **Spedolene**, gladly sent you on request.

These Tires

Outsell Any Other

They cost you less than 16 other makes.

They make rim-cutting impossible.

They eliminate the cause of most blow-outs.

They reduce the loose-tread risk by 60 per cent.

They have the double-thick All-Weather treads—the ideal anti-skids.

These are exclusive features.

That's Why Goodyears Rule

For many years, scores of experts in our laboratory have worked to perfect these tires. Their efforts have cost us \$100,000 per year.

They have built a tire which marks the present-day limit in low cost per mile.

In this tire we embody four great features found in no other tire.

Men found these tires out and told others. The demand doubled and doubled, until this tire

became the most popular tire in the world.

Then the cost came down with this multiplied output, until these tires now sell below 16 other makes. Some are one-third higher.

These tires offer, at the lowest price possible, the utmost in a tire. You

will get that always in a Goodyear. And any dealer will supply you Goodyears when you tell him you want these tires.

There's no leak proof ring but the **LEAK-PROOF** Ring — insist

GUNS and Cylinders

The purpose of the explosion is the same. In the gun it drives out the projectile—in the cylinder it drives down the piston head.

To obtain the full effect of the explosion in the gun the projectile is held with a flanged metal band around the rear end. This prevents the escape of the expanding gases.

The piston ring is used for the same reason. To secure such exact fit of piston head to cylinder as will make any loss either of compression or explosion impossible. In addition, the really efficient piston ring must eliminate destructive friction and at the same time keep surplus oil out of the combustion chamber.

LEAK-PROOF Piston Rings

MADE BY MCQUAY-NORRIS MFG. CO.

comply fully with all these specifications.

The **LEAK-PROOF** Piston Ring is a two-piece ring—strong, simple, easy to adjust. Each half concentric and interlocking with the other—sealing all openings. Made of special metal possessing great and enduring elasticity. Finished to gage as accurately as constant and careful micrometer testing can make it.

LEAK-PROOF Rings obtain absolutely firm and equal bearing on all parts of the cylinder. Their use ensures perfect compression and full power—reduced carbonization—fuel economy and longer motor service.

Send for Free Booklet—

It tells all about piston rings and why you should equip your engine with the **LEAK-PROOF**. How it will pay you in fuel economy and prolonged motor life. Write for it.

"Ask the User"

Forming the Rings

The rings are formed and cut from the casting on this machine. The output of each machine is about 150 rings per day—a ridiculously small number until the care and exact measurements that must be applied to this operation are taken into consideration. The forming tools are watched very closely and the rings are made with a variation of less than a one-thousandth of an inch.

LEAK-PROOF Piston Rings are leak-proof because such exactness is made a principle in their manufacture.

2-A

for the name **LEAK-PROOF stamped on the Ring**

SOLOMON,

THE WISEST MAN IN THE WORLD,

built the temple at Jerusalem so that it was the wonder and admiration of all the surrounding tribes. This was appropriate to his day. In like manner there is now being constructed in old Germantown, Philadelphia, an automobile brake lining that is the wonder of present-day engineers as to its unusual durability and resistance power. It is made from highest quality, long fibre asbestos and brass wire, both fireproof and indestructible materials, **VERY COMPACTLY** woven on our own looms; treated through and through with a special compound, giving it the same coefficient of friction until entirely worn out, and at the same time making it impervious to the action of heat, water, oil or gasoline. It is then compressed to exact size under massive steel rollers.

S-M-C asbestos brake lining *has recently been improved*, and today we can conscientiously say it is the highest standard of brake lining it is possible to make. We strongly recommend it to the most critical trade, who are wise enough to want quality in preference to price. When properly used we absolutely guarantee it to give entire satisfaction in every instance; otherwise, we will refund money, plus 10% interest. Could we afford to offer such a guarantee on an inferior article? **S-M-C MUST** give satisfaction, **OR WE WILL.**

NEXT TO QUALITY, PRICE IS A BIG CONSIDERATION, but by comparison it will be found that prices on S-M-C are lower than on any other brake lining on the market today—quality and workmanship considered. If your dealer does not handle S-M-C, advise us his name and address and we will send you a trial order at less than wholesale price so that you may become familiar with the high quality of S-M-C. **WE HAVE A SPECIALLY INTERESTING PROPOSITION TO DEALERS.**

Would you give your tailor \$20 for making you an all-cotton suit; with only about \$5 real, intrinsic value, and never dependable? **WELL, HARDLY!** Then why pay a high price for equipping your car with an inferior brake lining when you can get the highest quality material for the same price, thus insuring yourself of constant safety? Is "**SAFETY**" worth anything to you? A little consideration should convince the most skeptical motorist, when he needs brake lining again, that he should get

"SOMETHING MOR'N COTTON"

Manufactured and guaranteed by

STAYBESTOS MFG. CO.,
Germantown, Phila., Pa.

1914.

THE NEW 1915 MAXWELL "25."

EXTREMELY IMPORTANT TO DEALERS IN AUTOMOBILES.

Between July 15th and August 1st we shall announce, - place upon display and exhibit our new 1915 Maxwell "25," to retail at \$750.

We shall begin the distribution throughout the country of this new 1915 "25" model by August 1st.

We confidently expect to be able to build 60,000 of these new 1915 "25" models retailing at \$750. within one year.

We shall do all that human endeavor and our immense factory facilities can do to build at least 60,000.

I confidently predict that this new Maxwell "25" retailing at \$750. will be the greatest sensation that the automobile world has ever known.

I base this prediction upon the car from the ground up - its chassis; its motor; the lines and size of its body; and the unexpected extra and additional features which will be placed upon this car.

Walter E. Sanders.

President,

and special mechanical features that made
the 1914 model a success the world over.**

The KING chassis has always been built to give many years of faithful, economical service. Now it comes with a body of a type pronounced by the majority of engineers to be the *ultimate* motor car design. In Model C you will be buying for a decade.
All stock of the KING MOTOR CAR COMPANY is owned by the active executives of the Company. These stockholders prefer solid, successful growth rather than large, immediate profits. To this end they insure careful, high grade manufacturing by including every employee in an annual distribution of profits. The KING was first to do this. With this painstaking and responsible manufacture, good materials of such high quality that only by cash buying and modest profits can such a price as \$1075 be made possible.

Multiple disc cork insert clutch.
True ventilating, rain-vision wind-shield.
Extra deep tilted cushions.
Silk mohair one-man top.
Option on two gearings.
Flush-top upholstery.
Gemmer steering gear.
Stromberg carburetor.
3 1/2" x 5" motor.
Extra heavy frame.
18" steering wheel.
Full equipment.

Dealers Should Not Delay

in arranging for territory yet unallotted. The KING'S 1914 success is about to be repeated manifold. A handsome, dependable, economical car of popular name and price, produced by a financially solid factory, and generously advertised, is a combination that will mean big 1915 profits.

King Motor Car Company

1300-1324 Jefferson Avenue, Detroit, Michigan
New York Agency and Showroom, Broadway at 52nd St.
New York Service Department, 244-252 West 54th St.

KING MOTOR CARS are operating efficiently and economically in England, Germany, Australia, India, Switzerland, Guatemala, Philippine Islands, New Zealand, Chile, South Africa, Uruguay, Java, Martinique, Colombia, Sweden, Brazil, Ceylon and Denmark

When Writing to Advertisers, Please Mention The Automobile Journal.

PUBLISHER'S AND READER'S PAGE.

Special Attention is directed to the advertising sections in this issue, in which are listed the latest devices making for comfort and convenience on the tour, as well as standard supplies and accessories. When writing advertisers always mention The Automobile Journal, as it will insure prompt attention.

The 1915 Models are being announced by the manufacturers. In keeping with its policy to keep its readers informed of the changes and improvements made in the new designs, The Automobile Journal will present in each issue descriptions of the late models. Manufacturers are invited to forward photographs and specifications for publication.

Always Consult The Buyers' Guide, on pages 170-178, inclusive, whenever in need of anything new in cars, accessories, supplies or fittings. It is an authoritative list of the reliable concerns in the industry. These are alphabetically arranged, making it an easy matter to obtain the name and address of the maker of the material desired.

Regular Departments of The Automobile Journal will be found on pages 99-166 inclusive. Special attention has been paid to the needs of the owner in preparing the motor car for the tour, and the suggestions made for obtaining the fullest measure of satisfaction, economy and efficiency from the machine are wholly practical. The novice will note many valuable hints for correcting minor troubles upon the road. The discussion upon carburetors and ignition have been compiled especially for to meet the need of those not familiar with these subjects.

As An Owner's magazine The Automobile Journal aims to present that which will not only meet with the approval of motor car users, but afford them every opportunity for becoming intimately acquainted with the products of the industry. Particular attention is called to the department for new owners, which is educational in its scope and explains in non-technical language the construction, operation, care and maintenance of the automobile. The subjects are well illustrated.

MULTIBESTOS Keeps Your Car Always "In Hand"

Safety does not depend merely on how fast or slow you drive, but on how well you have your car under control.

A speed of 30 miles an hour in a car equipped with Multibestos Brake Lining may be far safer than 10 miles an hour in a car with ordinary brake lining which grips a second too late or "grabs" or checks the two wheels unevenly, causing a skid.

There is no question of the best brake lining. This point has been absolutely settled by engineering authorities who are impartial and unprejudiced. Let us send you signed reports of comparative tests showing that Multibestos has greater resistance to heat than any substitute.

This efficiency, which has never been equalled, is based on the firm, tight weave of purest long fibre asbestos and brass wire. When you want maximum power and flexibility, insist on Multibestos.

Write for Booklet

"Safe in the Grip of Multibestos"

It's of vital interest to every user of brakes.

The Enjoyment of Your Tour Depends on Your Ignition

If your ignition system does not give you maximum results, if you experience that continual missing that racks engines and puts nerves on edge, if you don't obtain the economy and efficiency that only can be obtained by using a reliable magneto and dependable spark plugs, you can't enjoy your tour—you will not be satisfied.

BOSCH MAGNETO AND BOSCH PLUGS

make up the most popular ignition system. It has a world-wide reputation for supplying and delivering continuous unflinching sparks at the precise moment and of such intensity as to assure the utmost efficiency and economy.

An additional point—one of paramount importance—is that you can place complete confidence in your ignition if supplied by the Bosch System—you will have freedom from delays, you will have no expensive repairs, you will have absolute reliability and every drop of fuel you buy will be made to produce its utmost power.

All the Better Cars Use Bosch—You Can Have Bosch Too, ask your dealer.

REDUCE THE HIGH COST OF RUNNING YOUR AUTOMOBILE

By Buying Supplies at Less Than Manufacturers' Prices From the Original Price Wreckers and

WORLD'S LARGEST DEALERS

Following is a list of a few of our especially good values. It is not a complete list of our stock. Do not hesitate to call on us if you are in the market for anything not listed.

Schebler Carburetors, 1 1/4-in., model "D" and "L".....\$7.90
Holley Carburetors.....2.50
Rayfield Carburetors.....6.50
Kingsdon Carburetors.....2.50 to 4.00
Slide Oil Lamps, per pair.....2.75
Electric headlights, regularly \$25, our price.....8.00 per pair
4 and 6-cylinder Gleanol imported magnetos, high-tension, regularly \$100 to \$150, our price.....15.00 and 20.00
Bosch low-tension magnetos.....3.00
Remy magnetos, model "S".....9.00
Splitdorf dual outfits, complete.....25.00
Magneto coils.....4.00 up
4 and 6-cylinder Connecticut coils.....12.00
Storage batteries.....8.00 up
Steering columns complete with wheel.....13.50
Stewart-Warner and Jones speedometers 12.00
Velvet shock absorbers.....10.00
Mondex shock absorbers, per set of 4.....12.00
\$40 Disco starters.....5.00
Open and closed Ford delivery bodies.....25.00 and 50.00
Racing seats, regularly \$50 per pair our price.....15.00 each
1914 Ford runabout bodies.....40.00
Roadster bodies.....30.00 each
Peerless 7-passenger bodies.....35.00
5-passenger fore-door bodies.....85.00 each
Axles complete, front and rear.....40.00 up
Ford radiators, new.....17.00
Radiators—Cadillac, Pierce, Knox, Stevens-Duryen, Fiat, Warren, Olds and a hundred others.....17.00 to 35.00
Ball bearings, all sizes. Less than one-third
Round gasoline tanks.....6.00
Square gasoline tanks.....2.50
Prest-O tanks.....13.50 complete
Continental rims, 30x4-1/2.....3.00
Dorian rims, all sizes.....2.50 and 3.00
Universal joints.....5.00
Rear tire holders, 1 or 2 tires.....1.75
Electric horns, complete.....1.95
\$25.00 trunks.....5.00
Tire covers.....0.75 and 1.00
\$25.00 windshields.....12.00
Mohair dusters.....3.50
Chaufeurs' dusters.....1.00
Storm fronts and side curtains.....1.00
Applico Lighting System, complete, regular price \$75.00.....32.50
Brown-Lipe transmissions.....50.00
Top covers.....2.50
Tire gauges.....0.35
Rollers, all sizes.....1.75 up
Single, double and triple action pumps.....0.75 up
Steering wheels, \$2.50 to \$3.50. Fenders, all sizes, \$1.50 up. Tops, Runabouts and Touring, \$15 up. Lavigne rollers, \$5 to \$7.50. Ford Oilers, 5c. Tool Boxes, all sizes, \$1 up. Jacks, 65c up. Tool Kits, \$1.25 up. Goggles, 20c up.
A 1 Tires and Tubes—
28x3 casings \$6.25 Grey tube \$2.25
30x3 casings 6.45 Grey tube 2.35
30x3 1/2 casings 9.55 Grey tube 2.95
32x3 1/2 casings 9.65 Grey tube 3.20
33x4 casings 13.80 Grey tube 4.00
34x4 casings 14.65 Grey tube 4.10
36x4 casings 14.85 Grey tube 4.40
36x4 1/2 casings 19.70 Grey tube 5.55
Truck tires, all sizes.....\$12.00 to \$25.00 each
Springs, all sizes, at less than factory prices.
Motor driven electric horns.....7.50
We also have such goods as Klaxon horns, Weed chains, Splitfire Sootless spark plugs, and, in fact, everything for the automobile. Consult us before buying anything in the way of automobiles or supplies and send for our free price wrecker.

Make Every Stroke Count

Save your time, save your labor, economize your tires, and insure your comfort

Apex Three-Cylinder Pump
Price \$4.50

Tire Damage Is Certain

TIRE LEAKAGE means greater wear or destruction unless you keep the pressure at the standard.

A few strokes in time will save hundreds of tire miles and minimize your expense for shoes.

Zenith Two-Cylinder Pump
Price \$2.50

The APEX pump is the best in the world, and will inflate an average tire in 30 seconds. Will operate twice as fast as any other pump and very easily against full tire pressure. Gives a constant flow of air.

Length over all, 22 inches; three cylinders, $1\frac{1}{4}$, $1\frac{1}{4}$ and $\frac{3}{4}$ -inch 20-gauge seamless brass tube; Bessemer steel plunger rods, with "B" leather plunger washers; base heavy gray iron, gold finish.

It is fitted with 24-inch five-ply hose and quick operating nipple connections.

The ZENITH pump is the best two-cylinder pump made. Perfectly designed, with two inches longer stroke, it will fill any tire in a minute or less.

Length over all, $22\frac{1}{2}$ inches; two cylinders, $1\frac{1}{2}$ and $\frac{3}{4}$ -inch 20-gauge seamless brass tube; Bessemer steel plunger rods, with "B" leather plunger washers. Base heavy gray iron, gold finish.

It is fitted with 24-inch five-ply hose and quick operating nipple connections.

The APEX and the ZENITH are the most efficient hand tire pumps built. Their efficiency is nearer to that of power compressors than is that of any other form of hand pump. They are constructed of the finest materials and will give years of service. They are compact and easily carried. They can be efficiently operated by a woman or a boy.

■ The APEX pump is constructed for the owner who wants the best that can be made and UNDERSTANDS THE VALUE OF QUALITY. It costs no more than pumps of inferior qualities.

The ZENITH pump sells for a lesser price, but it has QUALITY EQUAL TO THE DESIGN that is found in the APEX pump. It costs no more than pumps of inferior qualities.

Sold by dealers generally, or direct by the manufacturer.

A worth while contract for exclusive New England distribution to a well established trade can be made by a representative concern. This is a proposition that can be made to develop large profits.

KEY TO ROUTE INDEX.

AS EXPLAINED elsewhere, the itineraries listed in this Eighth Annual Touring Number have been prepared with a view to connecting all sections of the country, so that it should be possible to start from any point and reach any other point. The several routings presented below indicate the manner in which the itineraries in this number may be utilized in planning additional tours. Obviously, it would prove impracticable to list more than a very small proportion of the possible tours which might be arranged in this manner, and it is assumed that with this guide the tourist will have no difficulty in making his own plans as he desires. However, The Automobile Journal is prepared to lend every assistance upon request.

It should be understood that routes marked "R" are to be followed in a REVERSE direction.

\$4.50; 11-29, \$7.50; over 29, \$15. Driver's and chauffeur's licenses, \$2 or \$4, according to the horsepower. Reciprocity governs non-resident provision. **New Mexico**—Fees, 12 hp, \$2; 12-20, \$4; 20-30, \$6; 30-40, \$8; 40-50, \$10; over 50, \$12. **New York**—Fees, 25 hp, \$5; 25-35, \$10; 35-50, \$15; over 50, \$25. **North Carolina**—25 hp, \$5; 25-40, \$7.50; over 40, \$10. **Oregon**—Fees, 26 hp, \$3; 26-36, \$5; 36-40, \$7.50; over 40, \$10. **Pennsylvania**—Fees, 20 hp, \$5; 20-50, \$10; over 50, \$15. **Rhode Island**—Fees, 5-20 hp, \$5; 20-30, \$10; 30-40, \$15; over 40, \$25. **Virginia**—Fees, 20 hp, \$5; 20-45, \$10; over 45, \$20. Non-residents are exempt for two periods of seven days each. **Washington**—Lights required during hours of darkness. **District of Columbia**—Ask for copy of police regulations covering speed limitations and streets on which automobiles are not permitted, as well as other special provisions.

The above table and the accompanying notations are held to present the essential features of the motoring laws in the various states as applying to tourists, although several of the states permit local ordinances and regulations. Practically all laws now provide for good and efficient brakes, suitable horn or other signalling device, and that the rear lamp shall display a red light toward the rear and a white light illuminating the number plate. Connecticut, Maryland, Massachusetts, Minnesota, New Hampshire, New Jersey, Pennsylvania, Rhode Island, Vermont and Washington forbid the use of the muffler cut-out. Tire chains are not permitted on certain surfaces, unless the roads are in a slippery condition, in Delaware, Michigan and New Jersey, while Montana expressly requires their use when the road surface is in an unsafe condition.

Eighth Annual Touring Number.

CONFIDENT that it will meet every possible requirement of the touring motorist in America, The Automobile Journal presents this, its EIGHTH ANNUAL TOURING NUMBER, as the most complete routing guide and reference book ever published.

Eight years ago it was considered quite sufficient to provide routing directions for a small portion of the New England States. Little touring was undertaken elsewhere in America. Each season the routing information has been revised and amplified until this present number covers every state in the Union and enters Canada at eight different points.

The itineraries in this Eighth Annual Touring Number cover more than 40,000 miles of the best roads in America, and these highways would occupy the time of a motorist for exactly one year if followed precisely as laid out herein. The endless number of combinations possible, since each tour has been prepared with the view of connecting with all others, thus enabling the motorist to start from any one point and reach any other section of the country, supply routing data sufficient for a lifetime of touring.

The information relative to the various sections of the country covered in previous numbers has been very carefully revised and brought up-to-date, and many new tours have been added, while itineraries embracing nearly 4000 miles—3999.1, to be exact—are presented here for the first time in any publication. The Automobile Journal not only was a pioneer in supplying its readers with authentic touring information, but it continues to be the first to enter districts heretofore deemed impracticable for the motor car.

Particular attention is directed to the various transcontinental tours, since it is anticipated that many eastern motorists will desire to make the trip to the Panama-Pacific exposition of 1915 in their machines. In the preceding pages may be found some suggestions for combining the itineraries listed so as to make it possible to reach any section desired. Eight different transcontinental journeys are indicated there, but the list of combinations covering this subject is by no means exhausted at that point.

While too much emphasis cannot be laid upon the value of routing directions, and the method followed in presenting them, there are other features of almost, if not quite, equal importance. Considerable space has been devoted herein to the presentation of mechanical articles on subjects of vital interest to the touring motorist. They have been prepared with a view to affording exactly the advice required, when it is needed the most. With the possession of a modern car and the information contained in these discussions no motorist should hesitate to undertake a long distance tour of substantial proportions.

It would be impossible to overlook the splendid illustrations with which this number is so plentifully supplied. The Automobile Journal is indebted to a large number of parties for courtesies extended. So far as possible an attempt has been made to give credit in each instance, but a list of those who have rendered valuable assistance in this and other respects would include the leading railroad companies of this country and Canada, the boards of trade and chambers of commerce in practically all of the cities of the West and Pacific Coast, many automobile clubs and individuals.

RAYFIELD

CARBURETORS

A Better Carburetor For Every Car

No matter what the car—

No matter what carburetor now on it—

We will absolutely guarantee, on a money-back basis, that the Rayfield will show a consistently better performance than the carburetor now being used.

We will take any six cylinder car built, from the heavy gasoline-eater giving five or six miles to the gallon—to the light Sixes, and guarantee to save the owner enough in gasoline economy to make the cost of the carburetor only a trifle. The same offer holds good for fours and sixes of every type and size.

We know that the Rayfield on every count—for economy, get-away, speed, power, flexibility, and for all five qualities together—is the best carburetor built. And we stand ready to prove it to all comers.

Don't put up with gasoline waste and carburetor inefficiency any longer. Get in touch with the Rayfield immediately.

FOLLOWING THE LINCOLN HIGHWAY.

Detailed Itinerary of the Route from New York City to San Francisco Which Eventually Will Be Surfaced Throughout with Concrete.

SHORTLY after the Seventh Annual Touring Number of The Automobile Journal made its appearance, the Lincoln Highway Association made public the route over which it contemplates the expenditure of some \$10,000,000 in the construction of a concrete roadway from New York City to San Francisco. In this Eighth Annual Touring Number The Automobile Journal offers a detailed itinerary of the Lincoln highway, this being the first time

Elsewhere in this issue will be found detailed itineraries which may be used in combination with each other and with this route, to afford every opportunity to make a transcontinental journey meeting with the desires of the individual tourist. However, from the fact that a large number of motorists are contributors to the Lincoln Highway Association, and that the proposition has received extensive publicity among motor car owners and users, it is anti-

miles to Philadelphia at the south, before starting westward, although The Automobile Journal has furnished an itinerary leading across the state almost directly westward to Buffalo. The Albany-Buffalo-Chicago route undoubtedly will be retained by New England tourists until such time as the concrete roadway is completed, there being a difference of 65.5 miles in its favor, with Boston as the starting point.

The road from New York City

Where the Lincoln Highway Enters the Rocky Mountain District—Beginning the Winding Ascent of the Emigrant Gap Route.

the route has been presented in this manner.

The route announced by the Lincoln Highway Association is subject to some slight changes here and there as future conditions shall deem necessary. However, it is the intention of those in charge of this work to secure, as far as possible, the co-operation of state, county and municipal authorities in working out the original plan, so that the main points from coast to coast will undoubtedly remain unchanged as the work progresses.

pated that by far the majority of transcontinental tourists will select this route, albeit some time must necessarily elapse before the concrete surfacing is completed from the Atlantic to the Pacific.

The most direct route from New York City westward would lie across the southern portion of New York State to the northeastern corner of Pennsylvania. Certain topographical conditions make this impractical, and it has been deemed necessary to make a detour, either some 150 miles to Albany at the north, or some 100

across New Jersey to Philadelphia is a portion of the trunk line to Washington and the South. The Philadelphia-Gettysburg section is almost as well known. Thence the way leads over the mountains to Pittsburg, and until very recently this portion was a serious argument against the selection of this route, but state highway work planned and in progress will eliminate all objection on this score.

After leaving Pittsburg the Lincoln highway enters Ohio, crossing that commonwealth over state

Pleasant Combination of River and Mountain Views, Characteristic of Eastern Pennsylvania.

roads, some of which already have been concreted for some years. The Albany-Buffalo-Chicago itinerary is reached at South Bend, Ind., and from that point to Julesburg, Col., the so-called northern transcontinental route becomes the Lincoln highway. This condition virtually exists to Salt Lake City, although the plans permit of a detour between Julesburg and Cheyenne, visiting Denver.

From Salt Lake City the Lincoln highway is made to coincide with work recently undertaken by the State of Utah, following the so-called Midland trail on the line of the Pikes Peak transcontinent-

al route across Colorado, from St. Louis and Kansas City. This trail leads across Nevada to Reno, where two choices of route are permitted, each visiting the wonderful Lake Tahoe country.

It will be noted that a greater portion of this route lies over ways that have been utilized for a number of years by transcontinental tourists, and therefore may be expected to meet with every indorsement from the motoring public. The section between Pittsburg and Chicago is receiving much attention from the highway authorities this year, large sums having been voted by the citizens to carry out the plan as suggested.

That portion between Salt Lake City and Reno, or Austin, Nev., probably offers the greatest difficulty of the entire trip, since much of the way is over desert land. It is believed, however, that this route, when completed, will offer particular advantages over the circuitous one around the northern shores of Great Salt lake.

It should be added that, of course, the object of the association has not been solely that of providing an ideal transcontinental route for motorists, although this is believed to have been accomplished, but to provide a great natural artery of traffic serving the greatest number of people. Careful study of the map will reveal that the Lincoln highway reaches the more important centres of the country, and, therefore, more population, and the several itineraries presented in this number will indicate that it has many lateral connecting roads leading to points of interest.

While the work of charting this route has been under way for less than a year, large portions of it have been marked by the official, copyrighted sign of the association. This is 21 inches high, painted on posts, etc., and consists of a strip of red three inches wide at the top, a band of white 15 inches wide and a strip of blue at the bottom three inches in width. On the white band appears the letter "L" and the words "Lincoln Highway". Transcontinental motorists should have no difficulty in following the route from coast to coast by watching for and attending to these signs.

ENCIRCLING THE NEW ENGLAND STATES.

A Nine-Day Tour Through the Housatonic Valley, the Litchfield and Berkshire Hills, Green and White Mountains and Famous Rangeley Lake District.

IN NO other section of the country is it possible to combine so much that is rich in natural beauty and historic associations as in New England. While it may be regarded as the original touring ground of the American motorist, the charm of its mountains, lakes, rivers and valleys is such that visitors come again and again, apparently finding it impossible to exhaust its resources. It has proven the mecca for tourists from all parts of the Union, even from those sections noted for their scenic grandeur. A large proportion of those who come from a distance will find it desirable to enter this district through New York City, and this has impelled the preparation of an itinerary practically encircling the New England states, starting from and returning to that centre. Other tours will be listed herein, giving optional routes, and as each itinerary may be used in connection with any other the reader will be able to arrange his plans as best meets his wishes, or the time available.

Leaving New York the first day, the route lies through the metropolitan residential suburbs of New Rochelle, Larchmont, Mamaroneck, Rye and Portchester to Greenwich, Conn., which, with its many splendid homes, is also a suburb of New York. At Stamford, a pretty little city with handsome drives, the tourist turns northward into the Litchfield foothills. Ridgefield is well known to New York people as a summer place. It gains its name because of a lofty ridge, called by the Indians Caudatowa. In May, 1777, a little band of militiamen here cost Gen. Tryon 170 men before he was able to capture the defense. On the way to Danbury, is to be seen the monument raised to Gen. Wooster, the commander of the Continental forces, by the Masons, who have a particular regard for his memory, because of the fact that he instituted the first lodge in the state, Hiram of New Haven.

Danbury is the home of the hat industry, the first American hat factory being located here in

1780, when Zadoc Benedict, with three men, was able to produce three hats a day. The town was destroyed by Gen. Tryon in his memorable raid of May, 1777, and with it a large quantity of army supplies stored there by the colonists. The road now makes a descent into the Housatonic valley.

At Brookfield, north of Danbury, hills, high and steep, characterize the landscape, and this condition continues for some distance. Above New Milford, the hills and mountain ranges recede from the river on either side, and the river bottoms broaden into the most delightful intervals and meadow lands. Beyond New Milford lies Kent, having all the dignity of a respectable New England village, besides a great deal of scenic beauty and fine natural situations that are not always found in connection with dignified and eminently respectable towns, even in New England.

West Cornwall is the gateway to a wild and picturesque region traversed by the Cornwall range.

Lake Mahkeenac as Seen from Shadow Crook, Lenox, Mass.

Curiously tumbled about, rocky and broken, are these mountains and they possess a charm all their own. Lime Rock is sufficiently suggestive of the region in its neighborhood, for here ledges of the whitest limestone, seamed with lines of gray and black, show gleaming in the sunlight, or as white and gray patches among the shadows of the woods.

At Falls Village, the Housatonic takes a series of tumbles from a primeval rock dam, extending almost across the river bed, as a beginning of the descent, thence over a succession of natural terraces, alternating at no great distance, rushing and foaming and boiling among thickly strewn boulders, until it has fallen 130 feet. The falls not only form one of the most picturesque scenes on the whole trip, but furnish power for extensive manufacturing operations.

At Great Barrington, a side trip may be taken to Purgatory, a curious rock formation. Monument mountain is on the way to Stockbridge. On the east side is a white quartz cliff of considerable depth, detached from which is Pulpit rock. On the north side of the mountain is the Profile. A short distance beyond Stockbridge is Lake Mahkeenac, a beautiful calm sheet of water, surrounded by hills, with the village and spires of Curtisville peering over the trees toward the south.

Stockbridge and Lenox are known for the singular purity of their air. Many summer homes of wealthy people are located in this

immediate vicinity, and add their beauty to that of nature. From Bald Head is gained a splendid view of the Berkshires and the well known Housatonic valley.

Pittsfield, the Heart of the Berkshires, is the first night stop. It commands a view of the Lebanon valley which is unsurpassed. Balanced rock, near by, is one of the Berkshires' greatest natural curiosities. Its height is 18 feet and its estimated weight 150 tons. Resting upon one square foot of surface, this immense boulder is so evenly balanced that it may be swayed readily with a lever or by a man's weight. A number of interesting lakes are in this vicinity, including Pontoosuc, Ashley, Silver, Morewood and some others.

Pontoosuc lake is near Lanesboro, which is reached early on the second day. This town pos-

sesses beds of snow white granular quartz, used in the manufacture of superior cylinder glass. Variegated marble also is obtained here. Savage mountain and Constitution hill are picturesque heights a short distance away. Lanesboro was the birthplace of H. W. Shaw, known throughout the world as Josh Billings.

Midway between Mt. Greylock and Berlin mountain, is a pretty rural hamlet, South Williamstown, seat of the Greylock Institute for boys. Five miles further along is Williamstown, the reason for the existence of which is Williams College. The tour enters Vermont at Pownal, and approaches Bennington passing the famous battle monument on the way.

Beyond Arlington, the highway passes through the Sandgate notch, a remarkable cut in solid rock, 30 feet high, 800 long and 12 wide. Manchester is a quiet town at the base of Mt. Equinox. The sidewalks are of marble from the inexhaustible quarries on the mountains nearby. The route now enters a valley between the Green mountains on one side and the marble hills on the other, and slowly climbs up into the former. At Danby and beyond at Wallingford the lofty ridge of White Rocks is reached. Clarendon is passed on the way to Rutland.

The principal marble quarries and sawmills are at West Rutland, whence immense quantities of white marble are shipped to all parts of the world. Large gangs of saws, without teeth and cutting by means of sand poured in from

Mt. Greylock, One of the Highest Peaks of the Berkshires.

above, are constantly running. A little further along the tourist reaches Castleton, where there are extensive marble and slate quarries, and at which point an excellent imitation of marble is produced by coating the slate with marble deposit. Much of this stone is taken from quarries on the banks of Lake Bomoseen, a sheet of water eight miles long and from one to 2.5 in width.

At Hubbardton, an obelisk, near the Baptist church, marks the battlefield of July 7, 1777, soon after the evacuation of Fort Ticonderoga. Rich lake views are obtained from many points on the way past Lake Champlain, with glimpses of the Adirondacks in the distance. The night stop, as outlined, is at Burlington, the Queen City of Vermont. Here are several fine buildings, among them St. Paul's Episcopal church of blue limestone and with beautiful stained glass windows. The University of Vermont occupies a commanding position on a high hill, and near this is Green Mountain cemetery, in which lies the body of Ethan Allen, under a Tuscan column 42 feet high.

The way now leads along the valley of the Winooski river. Waterbury abounds with pleasant rambles and drives, with frequent glimpses of Camel's Hump and Mt. Washington, while Boston falls are near by. In the vicinity of Middlesex the river passes through a gorge 30 feet deep, 60 wide and 1300 long. Montpelier is the capital of the state and is situated on a plain near the river, surrounded by fertile farms. Under the portico of the State House are two cannons taken from the Hessians in the battle of Bennington in 1777, after a desperate struggle. The British got them back, but they were retaken by the Americans during the Canadian campaign and were presented to the state by Congress.

After leaving Montpelier, the route leads down into the valley of the Passumpsic, with its black, rock banks, which is crossed at St. Johnsbury. At the latter place considerable interest attaches to the works of the Fairbanks scales concern, particularly those which are made for use in Oriental countries, with their Chinese and Turkish numerals marked thereon.

From the hills in the vicinity of Littleton, N. H., may be had a fine

panorama of the White mountains, and a little later the tourist enters the White mountain region at Bethlehem. No more beautiful view of the entire range can be secured from any other point. To the north and west are the mountains of Lancaster, the Percy peaks, the Pilot mountains and the great Presidential range. The night stop is at Bretton Woods, the very centre of the entire district.

The fourth day gives ample chance to test the car on mountain roads, but if additional trials are

in three or four plunges over ragged granite ledges. The third fall has a nearly perpendicular drop of over 70 feet, and its roaring is heard at a great distance.

From this point the route enters the Maine woods on the way to Rangeley lakes, passing through Mexico, Dixfield, Weld, Webb and Madrid. Many summer camps and once in a while a farm house serve to break up the monotony of the continual forest, of which there are nearly 100 square miles in this region. The trip is by no means uninteresting, however, for

View of Little River as it Tumbles over Bolton Falls, Vermont.

desired it is possible to connect with the road to the summit of Mt. Washington at Cherry Mountain or Gorham. For river scenery, combined with the impressive mountain forms, the vicinity of Gorham surpasses all the other districts from which the highest peaks are visible.

The drive to Gilead, Me., is along the river, with ever changing hill scenery on either hand. This continues through Mayville, North Bethel and Newry to Rumford Falls. Here the descent of the Androscoggin is over 150 feet

something new in the way of scenery is being spread out before the tourist all of the time. The elevation of the lakes is about 2000 feet, and the pure air and sparkling water make it a most desirable spot in which to spend a summer's vacation.

During the fifth day, the tourist has many more miles of Maine woods before him. The route from Rangeley lakes to Skowhegan, by way of Dead River, Green Farm, Stratton, Flagstaff, North New Portland and North Anson, is somewhat better known by auto-

mobillists than that over which the tour reached Rangeley. The scenery, still that of the woods, interspread with numerous ponds and lakes, is fully as inspiring as any to be seen in New England.

After leaving Skowhegan, fine fishing country is visited on the way to Pittsfield and Newport, the latter being located on the shores of Lake Sebasticook, which is 15 miles in circumference and affords most excellent fishing. The night stop is at Bangor, in size the second city of the state, and the second lumber mart in the world. The approach to the city, by way of Etna, Carmel and Hermon, gives commanding views of the hills at head of navigation on the

Penobscot bay, with its views of Mt. Desert in the distance. Camden is a pretty little town, with the two Megunticook peaks and a number of other smaller mountains to complete a picturesque group. Hills continue to furnish the change of scenery through Rockport and Rockland, the latter situated on Owl's Head bay. Here ship building is carried on, but the chief industry is lime burning. The kilns should be seen at night, and make a splendid addition to the hill and marine scenery about the city.

Thomaston is located on a deep, narrow harbor, and is the site of the Maine state prison, established in 1824. This was the scene of

rebuilt in 1759. William Phips was born in this town in 1651, and was a shepherd on its rocky hills. Later he learned the art of ship carpentry and in 1687, he succeeded in locating a Spanish treasure ship near the Bahamas, recovering something like \$1,500,000 worth of jewels and bars of gold and silver. For this he was knighted by the king and received \$80,000 of the treasure.

Bath was once a wealthy city, until the decline in American commerce seriously affected its ship building industry. It has a fine harbor, rarely bothered with ice, and the Kennebec at this point is very beautiful. The river is half a mile wide, and is rapid and deep.

One of the Splendid Views of the White Mountains from Bethlehem, N. H.—Mt. Washington in the Distance.

Penobscot. The tributaries of this river penetrate the great Maine forest in every direction, and bear downward to this city immense quantities of lumber, work on which may be seen at numerous places on the route.

The river is quite as picturesque below Bangor. During the war of 1812, the British attacked Hampden, plundered and overran the town for three days. Between Winterport and Frankfort may be seen the granite quarries around the base of Mt. Waldo. Belfast is a handsome little city built on a declivity which slopes to the water, with wide shady streets.

The route now passes along the

a sharp naval battle in 1724, when a fleet of 24 vessels, composed for the most part of captured fishing boats, engaged the colonial relief ships, which were forced to retire, greatly damaged by the Indian artillery. The fort which was built in 1720 withstood all attacks and was still standing during the Revolution.

Warren, another ship building town, was settled by Scotch and Irish in 1736. Waldoboro was settled by 1500 Germans in 1753, and some of their descendants still remain. Woolwich was founded in 1638, its Indian name being Naquasset, but was depopulated by an attack in 1696. It was

Some of the best shipbuilding lumber is floated down from its head waters.

Brunswick is a prosperous town at the falls and the head of the tidewater on the Androscoggin. The river falls 41 feet in three pitches and furnishes power for numerous factories. The town is also the seat of Bowdoin College. The pine groves in the rear of the college buildings are widely known for their sombre beauty.

Portland is the night stop. The city is situated on a high peninsula at the southwest end of Casco bay. Its harbor is deep, well sheltered, and is defended by powerful forts, while its numerous islands

Leon Lake, One of the Small Bodies of Water in Rangeley Lake Region.

afford favorite resorts during the summer season. Portland has been devastated by fire several times. It was burned by the Indians and British, and several large fires have destroyed portions of it since.

Near Biddeford, may be seen the ruins of Fort Mary, built in 1708. A quaint old house of the 17th century is also of interest. Between Saco and Kennebunk the tour crosses the Saco river, and at Biddeford may be seen the falls, which furnish power for a number of towns in that vicinity. Several of the famed Maine beaches are passed as the tourist proceeds on his way to Portsmouth, N. H.

This is a quaint and pleasant old city, with some very remarkable examples of colonial architecture. The old Church of St. John is worthy of a visit, as well as the Gov. Wentworth mansion at Little Harbor. This latter is a large, irregular building, dating from 1750, and contains the old provincial council chamber, as well as many quaint relics of the past.

The tour is arranged to visit the beaches in this immediate vicinity, all of which are famed for their beauties. The old chain bridge, three miles west of Newburyport, is the second suspension bridge in the world and the first in America. The Newburyport silver mines, which were opened in 1875 and for a time yielded richer ore than those of Nevada, are also near the city. Newbury

was settled in 1635, and for many years was noted for the wealth and aristocracy of its residents.

Rowley is a town composed largely of salt marsh. It was settled in 1638 by a nomadic church, led by Ezekiel Rogers. In 1650, he died, leaving his library to Harvard College. The first cloth made in America was turned out by these early settlers. Ipswich was the home of Cotton Mather. The town was purchased from the sagamore Masconnet for \$100 in 1633 by John Winthrop, the first governor of Connecticut.

Wenham lake has a world-wide

reputation for its ice, which is shipped to remote parts. This ice is kept entirely free from snow and is harvested when about a foot thick, yielding about 1000 tons to the acre. Beverly was known as the summer capital during the administration of former President Taft. Other North Shore towns passed on the way to Boston, are Salem, home of Salem witchcraft, with its witch's hill, the East India Marine Hall, Plumber Hall and other historic associations; Lynn, with its first shoe factory in America, its Dungeon rock, where pirates are said to have held sway, and the home of Molly Pitcher; Revere Beach, a favorite summer amusement park; Somerville, one of the richest suburbs of Boston; and Cambridge with its Harvard University, Washington elm and Longfellow's home.

Boston is filled with points of interest, but a bare mention of some of them will suffice. These would include the Old South church, Paul Revere's home, the old State House, Faneuil Hall, the Public Gardens, the library, the Christian Science church, the Museum of Fine Arts, and other equally famous buildings and places. From this city to Providence the way is over macadam for its entire distance.

The wide streets of Dedham are over-arched with handsome elms, and the sidewalks are fringed with arbor-vitae. Among the points of interest may be mentioned St. Paul's church, a handsome Gothic

Typical View of the Rugged Character of the Sea Coast in Maine.

structure, and the ancient cemetery alongside it. The town has many old mansions in wide and pleasant grounds, and is considered by many as the most beautiful in eastern Massachusetts.

Wrentham is the home of Helen Keller. Much of her life has been spent there, and, although her sightless eyes are unable to view the many beautiful drives and walks in that vicinity, they are very dear to her. Lake Pearl is fast becoming a delightful summer resort for Providence and Boston people. North Attleboro is particularly notable for its fine homes, and it is one of the centres

memorials to him, and his body rests in North cemetery. There are many places of interest, including the State House, with its handsome portrait of Washington; the ancient First Baptist church, founded by Roger Williams; the Athenaeum, with its wealth of fine paintings; and the buildings of Brown University and others.

On the way to Apponaug, the tour passes Roger Williams park, given to the city by Betsy Williams, great-great-granddaughter of the man whose name it bears. It includes 100 acres of beautifully diversified land and the venerable gambrel roofed home of the donor.

edge of the pine and cedar swamp.

Narragansett Pier is one of the best known shore resorts in the country. It is at the height of its glory during the touring season, when its many large hotels are filled with prominent people. Then comes Wakefield, Charlestown and Westerly, the latter the home of the Seventh Day Adventists. If the tourist happens to reach this town on Saturday, he will find little business going on and the church bells ringing.

Of Stonington it was once written that it "suffers in religion because of its nearness to Rhode Island." However true that may have been at that time, it certainly suffers nothing because of being pleasantly situated with a fine outlook upon Long Island sound. Its quiet streets are embellished here and there by iron relics of 1814.

Near Mystic, is Pequot hill, the scene of the battle between the allied English and Indian forces against the Pequots. Upon arriving at the Indian fort the allies of the English at first declined to aid in the attack and the colonists decided to make the attempt alone. As they were kneeling in prayer, the sachem Wequash was so impressed with the sight that he became converted and preached Christianity throughout New England until he suffered martyrdom.

New London is the last night stop and there are several points of interest in and about the city, among which may be mentioned the only house still standing, which was left by Benedict Arnold when he burned the town during the Revolution; the building in which Nathan Hale taught school, now standing near "Ye Ancientist Burying Ground," and others.

The way back to New York, the last day, is over the so-called shore line route, along the Long Island sound. Lyme is a venerable hamlet, buried in foliage, its main street lined with old trees and historic mansions. At Saybrook Point was an old fort, built in 1635, which was destroyed in 1871 in order that the railroad might be cut through. It was in a fair state of preservation, and its long history should have deserved for it a more noble end. The new bridge over the Connecticut river at Saybrook makes it unnecessary to utilize the ferry as was formerly the case.

Winding Road Leading up East Rock in New Haven, Conn.

for the manufacture of jewelry in this district.

Pawtucket, R. I., was the scene of the total destruction of Capt. Pierce and his 70 men in 1676. Surprised by the Indians he was driven back to the river by a shower of arrows, and when help came not one man was left. It is the home of the first cotton mill in the country, a building which is still standing and may be seen above the falls of the Blackstone river in the centre of the city.

Providence was settled by Roger Williams, after being driven out of Salem. The city abounds with

At Wickford may be seen the curious old square Episcopal church built in 1707, the block house erected for defense in 1641, and the rolling rock, where Roger Williams and Canonicus signed their compact.

This is all historic country, and recent discoveries in the hieroglyphics on some of the rocks proclaim that it was at this point Norsemen first landed to communicate with the Indians hundreds of years before the discovery of America by Columbus. On the way to Saundertown are the ruins of the old Narragansett fort on the

Westbrook, Clinton and Madison are pretty summer shore resorts, still untouched by the trolley and lacking the noisy amusement parks of those nearer the Elm City. Guilford was the hiding place of the regicides for a time. Between Guilford and Madison is Sachem's Head, so named because during the extermination of the Pequots, Uncas, the Mohegan sachem, pursued and shot a Pequot chief, placing his head in the fork of an oak tree, where it remained for many years. Branford bay is dotted with the Thimble islands, on which many summer homes are located.

At New Haven the buildings of Yale University are of particular interest, and if time permits, the Art School and Peabody Museum of Natural History should be visited. The way then leads through several shore resorts of more than local importance, including Savin Rock and Woodmont, the latter being a borough and the first in Connecticut in which women had a vote for local officials. Bridgeport is termed the Park City, which is sufficient to indicate that time might profitably be spent in viewing some of its very fine park property. The outward route is reached at Stamford.

IN THE HEART OF THE MAINE WOODS.

Outlining a Week's Visit in Aroostook County and the Province of New Brunswick, with Return to Bangor by Way of the Coast and Washington County.

A FEW years ago Aroostook County, Maine, was an unknown wilderness. This applies in a measure to large portions of the district today, although the automobile has done much to overcome this, along the New Brunswick border. Not many sections of America, with the same population, area and conditions can muster more motor cars, and its roads are rapidly becoming such as to attract large numbers of tourists.

Beyond the fact that this is the very centre of the Maine woods, and that it is famed for the finest potatoes in the world, most motorists know little of Aroostook county. It follows from the above statement that not all of the district is covered with woods, although doubtless these virgin forests will have their appeal for the venturesome tourist. Fishing and hunting may be considered as ideal, and the entire section has been noted for years as a camping ground for vacationists.

Tour No. 12 is designed to occupy seven days, leaving from and returning to Bangor, from which point connection may be made with itinerary No. 11. This feature will appeal to many tourists from sections outside of New England, since it will be possible to add this trip to any of the others presented in this number. The night stops are at Houlton and Fort Kent, Me.; Woodstock, Fredericton and St. John, N. B., and Calais, Me. Of course, it is possible to return to Bangor over the outward route, if preferred, reducing the necessary time very materially.

The way leads from Bangor along the Penobscot river to Veazie, the surface of the river being

covered with booms and immense rafts of timber, floated down from the Moosehead lake region and toward Mt. Katahdin, glimpses of which may be had from the distance. Accompanying the lumber in the river are the numerous saw mills along its banks. This is particularly true of Oldtown, but first, mention should be made of Orono, the seat of the University of Maine.

Oldtown is said to possess the largest lumber mill in the world,

that Maine became tributary to them by the Peace of Casco. The treaty of 1726 contains the substance of their present relations with the state. They own the islands in the Penobscot, and have a revenue of some \$7000 from the commonwealth. A ferry boat will take the tourist to their island home, and the visit is well worth while.

Leaving Oldtown, the route passes through a succession of thinly populated towns, Costigan,

View of Spencer Mountain from Lobster Lake in Central Maine.

where over 100 saws are at work turning the rude logs, which come in at one side, into planks, these being rafted down the river to Bangor. On an island near the town is the home of the Tarratine Indians, one of the three tribes of the Etchemin nation. Although the most powerful and warlike of the northern tribes, the Tarratines rarely attacked the colonists. After a series of wrongs and insults, however, they visited the settlements and inflicted such terrible damage

Olamon, Passadumkeag, Lincoln and Winn, to Mattawamkeag, a small village at the confluence of the Penobscot and Mattawamkeag rivers. Most of the inhabitants of these towns are engaged in lumbering. The last named village offers quite the best view of Mt. Katahdin, of volcanic origin, and Maine's chief claim to mountain scenery. From its rugged top may be seen all the lakes, rivers and woods of northern Maine, spread out like a map below. It

Mt. Katahdin, Maine's Highest Peak, as Seen from Kidney Pond.

is in the centre of the best moose country of the state, and a peak about which very little was known until quite recently.

From this point the tour passes through the heart of the Maine woods, abounding in spruce, cedar, hemlock, yellow and white birch, and maple. Splendid mills are to be found nearly all of the way, and particularly at Haynesville. Several important ponds are within easy access of the road, and the many streams throughout this district plunge on their way to the Atlantic over a succession of beautiful falls.

The night stop is at Houlton, the principal city of the county and noted for its beauty, its splendid homes and its hospitable people. Besides being engaged in the lumber business, Houlton is one of the principal markets for the famous Aroostook county potatoes. The soil in and about the city is wonderfully fertile, and the product is justly considered the finest in the world.

Presque Isle is the centre of the rich farming lands, which cover 500,000 acres. There also is good fishing and plenty of interesting scenery in the vicinity. Many Swedes have settled north of Presque Isle, as may be gathered from the name—New Sweden. Another extensive lumbering estab-

lishment is located at Van Buren, and lumbering also is carried on at Grand Isle. Madawaska was settled by the French, who were expelled from Arcadia in 1755. Twelve miles distant is New Fairfield, a famous starch centre.

Fort Kent, the second night stop, is the most northern town in the United States. It is located at the confluence of Fish river and the St. John. Five miles away is Eagle lake, and dozens of other handsome bodies of water are in the immediate vicinity. All of these, as well as the many streams,

are filled with big, gamy trout, and many salmon are caught in their season.

The return trip follows the outward itinerary to Van Buren, thence across the border into Grand Falls, N. B. Still other descendants of the Arcadians will be found in this vicinity. Here also the St. John river is contracted into a narrow gorge between lofty cliffs and plunges over a succession of rocky steps, the first in the series being a sheer drop of 40 feet.

Woodstock, the third night stop, is the shire town of Carleton county, New Brunswick, and is pleasantly situated on the banks of St. John river, 150 miles from its mouth. From this point it is possible to connect with the outward route at Houlton, Me., if desired, but the tour as outlined contemplates a visit to St. John, the way leading down the valley, so far as practical, with splendid mountain and lake views on either side.

Fredericton is a small city, beautifully situated on the river, and distinguished because of being the political capital of the province. The Government house is a plain and dignified stone building in extensive grounds just north of the city, and the Parliament house is a modern structure near the deserted barracks. The

Grand Falls, Webster Stream, One of Many Cataracts in Northern Maine.

University of New Brunswick has fine buildings on a commanding hill near the city.

From this point the St. John river is very picturesque, and a number of other streams empty into it at various points, adding to the charm. The way is very nearly all down grade. Numerous islands are passed, and the road crosses many rich intervals. At one or two places may be seen abandoned forts, which were the centre of long sieges 200 or 250 years ago. Just before reaching St. John the river enters a narrow channel between pallsades, and below is the suspension bridge over the famous reversing falls. The tides in the Bay of Fundy are well known throughout the world, and these falls, over which the river dashes through a narrow gorge at low tide, have the ap-

tion work begun in 1912 is sufficiently well advanced to permit of its use. The longer route outlined is the main line taken by most tourists from the provinces to the States, although the new road, when completed, will save a number of miles.

Calais, the night stop, is well known as the border town. The people of Calais and those of St. Stephen, across the river, in New Brunswick, always have lived on the most fraternal terms. They formed and kept a compact not to engage in the war of 1812. It is possible to make this region the basis for an extended stay in eastern Maine, spending some time about the Grand lakes, and a pretty little side trip to Eastport may be taken if desired.

Dennysville is a picturesque country village on the shore of

drives along the bay. Cherryfield, attractively situated on the picturesque Narraguagus river, is in the midst of several noted fishing ponds, and many well known woodcock covers are near here. The way next leads along the coast with its many indentations, and consequent fine marine views, through Steuben, Gouldsboro, etc., to Ellsworth, where connection may be made with Mt. Desert Isle and Bar Harbor, for automobiles are at last admitted to portions of the island.

It may be added in this connection that there is a much shorter route from Calais to Bangor, this running in almost a straight line between the two cities and covering a distance of practically 99 miles. The road is somewhat rough, however, grass growing between the wheel tracks in many

Inspiring Shore Scene Near Scarborough, Me.

One of the Fishing Lakes in Eastern Maine.

pearance of flowing up hill as the tide rushes upward through the gorge far above the river level.

St. John is the metropolis of the province and it is possible to make connection here for a number of pleasant trips through Nova Scotia, across the bay. Ample time should be available to take advantage of many interesting drives about the city, particularly that to the heights of Carleton; over Marsh bridge to Red Head, or to the cemetery and Loch Lomond.

The return trip to St. Stephen and Calais is along the coast, with splendid views all of the way. This is known as the St. George road, but care should be taken at Lepreaux that this old way is not followed between that town and St. George, unless the construc-

tion of the Dennys river, which flows between high banks wooded with evergreens and through gorges with rocky sides. Marion is in the heart of a splendid partridge country. Deer are also plentiful in this section. At East Machias may be seen one of the oldest Masonic lodge rooms in the country, the lodge having been instituted Sept. 10, 1779.

Machias is an historic old town, noted for its many business enterprises. The town is located on both sides of the Machias river at tidewater, and up this river, reached either by canoe or automobile, are numerous lakes, and a hunting and fishing territory embracing over 300,000 acres. Harrington, one of the prettiest little villages in Washington county, has a number of desirable

places. The country is of particular interest because of the virgin forests, and many excellent views are to be obtained.

Wesley is the first town of prominence to be reached, and is noted for the number of bears which have been shot within its confines. It does not follow that the tourist will see a bear if he takes this route, although he is pretty certain to find the woods well filled with deer in the immediate vicinity.

The covers about Beddington, 22 miles from Calais, are particularly well supplied with partridges, and there are a number of splendid camping sites to be found readily. Connection may be made here with the main route outlined, the distance between Beddington and Cherryfield being about 20 miles.

TOURING THE MOOSEHEAD LAKE REGION.

Itinerary Also Includes Stop at Old Orchard, Portions of the Rangeley District and Some New Roads in the Heart of the White Mountains.

UNTIL a few years ago the ways leading into the wooded sections of Maine were little more than trails in many instances. The influence of the automobile has been just sufficient to change these trails into passable roads, without detracting from the pristine wildness of the sections through which they wind their way. This is particularly true of the Moosehead and Rangeley Lake regions, into which the accompanying itinerary leads the tourist.

Leaving Boston, the first day, the route takes the so-called short line to Newburyport and Portsmouth, and while the roads are not quite as ideal as those which skirt the North Shore, they are largely of macadam and good time can be made. The remainder of the distance into Old Orchard is over ground which is somewhat new to the present day tourist. Previous to 1907, when a disastrous fire visited this well known watering place, it was conceded to be one of the prettiest beaches in the country. Of late the automobile has helped it to regain its old time popularity in a measure.

Old Orchard comes into view long before it is reached, because of the long shore line which must be skirted. The beach itself extends from Saco river to Pine Point at the mouth of the Scarborough river, a distance of about 10 miles, with a breadth of 300 feet at low tide. The sand is very hard and smooth and affords an admirable driveway, as has been evidenced by the successful automobile races conducted thereon in 1911 and 1912. Because of the absence of the undertow, surf bathing is held to be perfectly safe. Near the hotels is a beautiful forest park of 30 acres, with pleasant paths, arbors and rustic adornments, while at Foxwell's brook is a picturesque waterfall 60 feet high. The beach derives its name from an old apple orchard, the last tree in which died before the Revolution.

The second day finds the tourist in Portland for the beginning

of the trip across the state into the Moosehead lake region. Brunswick was first settled as Pejepscot in 1628 and was three times destroyed by the Anasagunticooks before the present name was given it in 1737. It is the seat of Bowdoin College, and if time permits the Bowdoin gallery of paintings should be visited by all means. The falls of the Androscoggin at the head of tide water also are worthy of interest.

The immense ice houses on the banks of the Kennebec at Gardiner will attract attention, and it may be mentioned that the view

reconstructed for the most part for the use of motorists, and a splendid new garage has been erected at Greenville Junction, where the steamer meets the tourist for the journey to Mt. Kineo. Moosehead lake is famed in prose and poetry for its immense size and its scenic loveliness. It is the largest and best fishing ground in America. Deer and moose abound in great numbers in the vicinity. The lake itself is 40 miles long and from two to 18 miles wide. It contains many bays and beautiful islands, which add to the charm and fascination of the scenery.

View of Moosehead Lake from the Base of Mt. Kineo.

from the Common, which contains five acres and is situated on Church hill, 125 feet above the river, is superb. Hallowell is noted for its quarries of white and light gray granite. Augusta is the capital of the state and contains much of interest. The night stop is Waterville, the seat of Colby College, founded in 1813. The city is built along rambling streets on a broad plain above the river, near the Taconic falls, and has some very handsome residences.

The remainder of the distance to Moosehead lake is over ways

The surrounding hills are lofty and are covered with deep forests, while here and there a mountain towers above the green of the level woods, the whole forming a rare panorama of which the eye never tires. Grandest of all these is the famous Mt. Kineo, whose precipitous face looms up nearly 1000 feet above the surface of the lake, and whose western slope runs off into a level green-clad peninsula.

The route from Moosehead to Rangeley is through the Maine woods a greater portion of the way. The Rangeley lakes are five in

A Pleasing View of Kennebago Lake as Seen from Grant's Camp.

number, and have a total area of about 90 miles. All are interconnected by narrows and streams, making a continuous waterway of 56 miles. The Rangeleys are the source of the Androscoggin, which has its rise in Lake Umbagog, and emerges from the forest to find its way to the sea after turning scores of mill wheels. The farthest east is Lake Umbagog, conceded to be the gem of the entire chain and most often referred to as Rangeley. Its elevation is 2000 feet above sea level. Across the outlet is Bald Head, a mountain easy to climb, and an ideal spot from which to watch the sunrise. Mooselucmaguntic is the largest of the five. Separated but slightly from this and really a portion of the big lake is Cupsuptic. Then come Molechunkamunk and Wolokennebacock. The waters of all these are as clear as crystal and so large are the fish taken from them, it is an unwritten law that trout of less than three pounds shall be returned to their native element.

The fifth day takes the tourist into the White mountains, with night stop at Jefferson, N. H. The view of these peaks over the route selected is one of sublime grandeur, and it is maintained that the finest panorama of the Presidential range is to be found at Jefferson. It is held by some that this exceeds the view at Bethlehem, inasmuch as it is seen from one of the highest ridges of the entire district.

The return to Portsmouth is down the east side of the mountains over better known ways, past the famed Mt. Chocorua with its denuded peak, and several mountains of lesser note, as well as the beautiful Lake Ossipee and numerous other lakes and water ways, possessed of individual charm and beauty. While it is possible to utilize the outward route from Portsmouth into Boston, it is anticipated that the tourist will care to visit other scenes, and the route selected combines much of beauty and interest. The roads throughout this section are quite as good as well.

MOUNTAIN LAKES OF NEW HAMPSHIRE.

First Day's Route Follows Closely That Taken by Paul Revere—Tour Furnishes Rich Scenic Beauties with Views of White Mountains in the Distance.

TOUR No. 21 has Boston for its starting point, and is suggested to cover three days, with night stops at Keene and Plymouth, N. H. Like all the itineraries listed in this number, it is possible, through connections at various points, to extend the vacation very materially if desired. The route covers much interesting country, particularly in southern New Hampshire, and many pleasing views of the White mountains are to be obtained at various points. Several very pretty lakes are within easy access by motor

car, and all told the itinerary should prove especially attractive to those in search of a short tour among the lesser New England hills.

Leaving Boston by way of Cambridge, Arlington and Lexington, the motorist follows closely the road covered by Paul Revere on his famous midnight ride. At numerous points on the way monuments have been erected setting forth the progress of that trip as well as other interesting historical data connected with the Revolutionary period.

Groton was visited in 1646 by the sachem Monoco at the head of 400 Indians, and the town burned, with the exception of four garrison houses, in which the people successfully defended themselves. Monoco boasted that he was on his way to Concord and Lexington to reduce these towns, and later would march upon Boston. The following year saw him in Boston, but with a rope around his neck, marching toward the Common, where he was hanged.

The way then leads across country to Ashby and over

A Charming Bird's Eye View of Lake Winnepesaukee, One of the Best Known of the New Hampshire Lakes.

the border into Keene, N. H., through the pretty little New Hampshire towns of East and West Rindge, East Jaffrey, Jaffrey and Marlboro. In the northwestern part of Jaffrey is Monadnock mountain, with its high and rugged top rising 3186 feet above the sea. In this town, also, may be seen the ancient church, now secularized, which was erected on the day of the battle of Bunker Hill. Workmen thereon are said to have heard the cannonading. Numerous drives about the lakes in this region are worth taking, if time be available.

Keene is a pleasant city in the valley of the Ashuelot river. Its original name was Upper Ashuelot, and signified "the collection of

way of Newport, Guild, Sunapee and New London, the route lies toward the White mountains, with ever changing glimpses of the peaks in the distance. Entering the Pemigewasset valley, and passing Bristol, two miles further along, is Newfound lake, with Sugar Loaf mountain on the west shore and Crosby mountain on the east.

Plymouth, the night stop, is within easy view of the Franconia and White mountains to the north. Mt. Prospect, 2072 feet high, is a little to the northeast. It possesses a number of interesting features, notably the Miser's cave, the Avalanche, the Cold and the Boiling springs. Osceola and White Face are toward the northeast,

carved the initials of the chiefs of the Colonial survey of 1652, and with the words, "John Endicott, Gov." The waters of the lake reflect the shadows of several bold mountains and surround nearly 300 islands, large and small.

The Weirs is best known as a summering place, but at this point is located a large flood gate, so arranged that the flow of the waters from the lake into the Merrimac river is controlled for manufacturing purposes throughout the entire Merrimac valley to Newburyport, Mass. The return to Boston is through this valley as far as Lowell.

Franklin was the birthplace of Daniel Webster. Concord is the

Lake Sunapee, N. H., in the Midst of Romantic Scenery, and the Home of Gamy Bass.

many waters." Two miles north of the city are the Beaver Brook falls, where the brook flows over a stair-like succession of ledges 40 feet into a deep pool.

The second day finds the tourist approaching Lake Sunapee, 1104 feet above sea level, and nestling among the hills of Sullivan and Merrimac counties. The lake is about 10 miles long, indented with enticing bays and coves, and ranges from one-half to three miles in width. A short distance from its shores is the majestic Mt. Sunapee, which adds not a little to the beauty of the scenery. Connections may be made here with tour No. 31 for a visit to the White mountains, rejoining this itinerary at Plymouth.

Skirting this body of water by

and just below Squam range to the east, is Squam lake, island dotted and very pretty. This is only a partial list of the lakes and mountains to be seen from Plymouth, most of which are located within a few miles' drive.

Connection may be made here with tour No. 22, which may be followed in the reverse direction to Bethlehem and thence to the Bretton Woods, or as planned, reaching the White mountain region at Conway and visiting the Maine woods, returning to Boston by way of Portland.

The third day visits Meredith on the way to Lake Winnepesaukee and The Weirs. Near the latter, on the banks of the lake, is Endicott rock, which is about 20 feet around, and on which are

capital of the state, and an abundance of shade trees gives it a pleasant embowered appearance. A splendid view may be obtained from the dome of the State House, and a number of the public buildings are worthy of attention.

At Manchester, the Amoskeag falls on the Merrimac river have a descent of 47 feet, with rapids above, and afford a fine sight. A short distance from this city is Lake Massabesic, which has 31 miles of shore with some beaches of remarkably white sand. The Fairy Cave and a curious sulphur cave, Devil's Den, are often visited by tourists, while in this vicinity. Nashua is the last New Hampshire town to be visited, and at this point may be seen some of the largest carpet mills in America.

Majestic Mt. Kearsarge as Seen from Intervale, N. H.

The water power is taken from Mine falls on the Nashua river, pleasing views of which are to be noted from time to time as the tour progresses. The Pawtucket falls, at Lowell, were a favorite fishing ground of the Indians. The Pawtucket canal extends from the head of the falls to the Concord river, below the city, and affords excellent water power, having a fall of 30 feet.

The outward route is rejoined at Arlington, after passing through Billerica and Burlington, although there are numerous methods of reaching the centre of the city from this point, practically all of them over excellent macadam roads.

THE WONDERS OF DIXVILLE NOTCH.

Itinerary Includes the Northern Portion of the White Mountain Region and Affords Splendid Opportunity for Scenic Grandeurs.

TOUR No. 22 is planned to start from Augusta, Me., and visits the White mountains. It is suggested as another three-day vacation, but can be continued indefinitely, by combination with other tours at various points on the way. The night stops are at Dixville Notch and Center Harbor, N. H., while a very pleasing alternative may be obtained by joining tour No. 21 at Plymouth, N. H., for Boston. The entire journey from Augusta to Boston by both of these outlines used in combination could be made to occupy not more than five days, if desired, and would afford a fine vacation.

Leaving Augusta on the first day, the tour visits the Belgrade lakes, without doubt the finest bass fishing grounds in the country. The water of the lakes is very clear and the bottom decidedly rocky, making an ideal haunt for bass. The shores of both lakes are well wooded and some excellent views are to be obtained along the roads skirting their edges.

The itinerary as outlined leads into the Maine woods in the vicinity of the Rangeley lakes, through Hanover, Newry, Grafton Notch and Upton, into New Hampshire at Errol. On the way several lakes are passed, included among which are: Mollychunkamunk, Allegundabagog, Wellocksebacook and Umbagog, the last named being at Upton.

At Errol, the tourist finds himself in the heart of the White mountains. On every side, there are to be found signs of nature's handiwork on the way to Dixville Notch. Among these may be mentioned Table rock, reached from the road by a rude stairway of stone blocks known as Jacob's Ladder. The view is very extensive from this point, and amply repays for the strenuous climb. The rock is 561 feet above the road, 2450 above the sea and is a narrow pinnacle only about eight feet wide at the top, with sharp, precipitous sides.

The notch itself has high columnar sides, frowning at each other across the narrow chasm. These cliffs of decaying mica slate present a scene of ruin, transition and shattered strength, that is mournful and almost repulsive. The Notch is not a mountain pass, but a wonderful ravine among high hills. It has its flume, its cascades, its profiles, its snow cave,

than that which was left behind so recently, and divided from it by the Twin Mountain and Field Willing ranges. The Franconia region has two great natural wonders, either of which would make any other section famous. Twelve hundred feet above the lake, starting out from the blue crest of the mountain, stands a sculptured likeness of a giant Titan; the

View in the Flume at Dixville Notch in New Hampshire.

and its cold springs of the purest water known to science. Altogether it is a sight not to be missed, and well worth the climbing to which the car is subjected in reaching it.

The second day, the tourist again passes through this two miles of palisades on his way to Colebrook, where a detour may be made to Connecticut lake, at the head of the Connecticut river, down the valley which he will drive through for a time. At Littleton, connection may be made with itinerary No. 11, which may be taken in either direction.

This tour now enters the Franconia range, scarcely less grand

profile of the Old Man of the Mountain. The Flume, located some miles below, is a rock fissure 700 feet long and 60 deep, with fern decked granite walls from 10 to 20 feet apart; in reality a miniature canyon.

Continuing to Plymouth, where connection may be made with tour No. 21 for Boston, this tour turns eastward to Center Harbor, on Lake Winnepesaukee, for the night stop. The next morning, the journey will take the tourist up the eastern side of the White mountains, affording still more wonderful views. Chief among these is that of Mt. Chocorua with the lake of the same name near its

Charming View of the Crawford Notch as Seen from Willey Station.

base, also reached by tour No. 14.

At Conway the route leads away from the White mountain district and re-enters Maine at Fryeburg. A little later it visits the region of Lake Sebago and the well known resort at Poland Spring. Auburn and Lewiston, separated only by the Androscoggin river, are the last cities of importance passed on the way to Augusta. Lewiston falls, where the river breaks over a ledge of blackened gneiss, is worthy of note at this point. Lewiston is also the seat of Bates College, with its commodious buildings.

Near Winthrop is Lake Maranocook, the chief picnic ground of central Maine. It is a lovely winding lake, nine miles long, and about one mile wide, dotted with picturesque islands. West of the village is Mt. Pisgah, from which views of the White mountains are obtained.

NEW ENGLAND'S MOST HISTORIC SECTION.

Along the South Shore to Plymouth and Provincetown, the Land of the Pilgrims, and Return to Boston by way of Newport, the Home of the Norsemen.

TOUR No. 23 offers a decided change from those heretofore outlined. Like them it is planned to occupy three days, and is so arranged that it may be utilized in combination with any of the others presented herewith. It starts from Boston, and Provincetown, Mass., and Newport, R. I., are the night stops. The tourist returning from the Maine woods by itinerary No. 11 may enter upon this tour at Boston, rejoining his original schedule at Narragansett Pier, R. I., by ferrying across the lower end of Narragansett bay from Newport. It will add at least two days more to the trip, but it will be found to be time very well spent.

The route lies along the south shore from Boston, through Quincy, Hingham, Cohasset and Kingston, all filled with summer homes of Boston people, to historic Plymouth. In fact the entire trip during the first day from this point is over historic ground. At Plymouth, the tourist will wish to see Forefathers Rock, on which it is said that the Pilgrims first set foot in making their landing in America; Burying Hill, with its graves of Miles Standish, John and Priscilla Alden, and others only a little less known; Pilgrim Hall, with its museum of Pilgrim relics; the plot of ground where the dead were buried during that first winter, and their graves sown with grain the next spring to keep the Indians in ignorance of their death, and many other noted scenes. The sites of interest to the tourist are clearly marked, and it is possible to determine with a fair degree of accuracy just where each of the central figures lived and moved during those early days which followed closely the year 1620.

The route lies along the north shore of Cape Cod, through a number of small towns, distinctive in their original quaintness, to Provincetown, in the harbor of

which the Mayflower was brought to anchor, while the members of the little band drew up their compact and signed it with their life's blood. The tourist goes over the route in the reverse direction from that in which the Mayflower sailed from Provincetown to Plymouth, but after a night on the tip end of Cape Cod he returns over a portion of the trip,

in giving to that section permanent highways, which will serve long as a memorial to him.

New Bedford and Fall River are large commercial centres in southeastern Massachusetts, the former having been for a number of years the home port of an extensive whaling fleet. The latter has an excellent harbor, and the numerous streams emptying into

Newport Beach, Now Operated as a Municipal Summer Shore Resort.

before shifting to the south shore.

From Chatham to Onset, the tour visits a number of towns, which have furnished numerous sailors for America's merchant marine, as well as the navy. Cape Cod has an individuality unlike that of any other section of the country. Connection may be made for Wood's Hole and Martha's Vineyard at West Falmouth. Buzzard's Bay is well known as the summer home of the late Grover Cleveland, while President.

Fairhaven was the home of the late H. H. Rogers, and the very excellent highways of the town practically were a gift from him. For years he was superintendent of streets in Fairhaven, but many times the salary voted by the town was expended by Mr. Rogers

it afford abundant water power for numerous manufacturing enterprises.

Newport is reached by the way of Tiverton and along the island of Rhode Island. It is famed the world over for its magnificent summer homes of wealthy people. Opportunity should be taken to visit a number of these. The cliff walk, leading for several miles along the shore and through many of the estates, is also of interest. Aside from the summer homes, Newport has much of historical value, and among these features may be mentioned the Old Stone Mill, found standing on the highest point in the city when the settlers first cleared away the underbrush, and supposed to have been erected by the Norsemen, hundreds of years before the

visit of Columbus to America. The United States naval training station, navy yard and torpedo station also are located at Newport.

The third day finds the tourist skirting the east shore of Narragansett bay, after crossing from the island of Rhode Island to Bristol by ferry. From Bristol may be seen Mt. Hope, where King Philip congregated his anti-English allies for the attack upon the Narragansett fort in 1675.

Itinerary No. 11 is reached at Providence, over which the return to Boston may be made, if desired. This tour follows the Blackstone valley to Worcester, Mass., and re-enters Boston over

IN THE GREEN AND WHITE MOUNTAINS.

Outward Trip Is Along the Connecticut Valley, Thence to Lake Champlain and Northward to Canadian Line, and Return by Way of Lake Sunapee.

A TOUR that is outlined to occupy five days and to visit the Connecticut valley, Lake Champlain, the mountains of northern Vermont and the White mountain region, is that outlined in itinerary No. 31. The start is made from Springfield, Mass., crossing the Connecticut river into West Springfield, where it is possible to view the old Day house, built in 1754, and the home of Capt. Day, who was active in organizing the so-called Shays' rebellion. The way then leads along the west bank of the river, past a number of large truck farms, into Holyoke, where opportunity may be had to study the paper producing industry.

Just beyond Holyoke is Mt. Tom, one of the highest peaks in that section, and a little further along, Mt. Holyoke raises its head across the river. Northampton is the seat of Smith College for girls, and there are a number of interesting drives in and about this city. A little further along is Sugar Loaf mountain, the scene of some of the bloodiest tragedies of the King Philip and later Indian wars. King Philip is said to have directed the movements of the western Indians from his headquarters on this mountain, and Table rock, a beetling cliff on the east side, has a seat cut in the side, which is called King Philip's chair.

In the northern part of South Deerfield is a monument on the Bloody Brook battlefield. Sept. 18, 1675, Capt. Lathrop and 84 men were conveying a train of grain wagons from ruined Deerfield to Hadley, and as they passed this brook they halted to rest and pick some luscious wild grapes which hung in clusters over its waters. While they were thus engaged 700 Indians fell upon them, and but seven men escaped.

Deerfield was sacked and burned and then abandoned shortly before this battle. Later it was settled again by a number of younger men, and in 1694 it was again attacked, although ably defended by the settlers, headed by their

pastor, Rev. John Williams. Feb. 29, 1704, a third attack was made, and this time the village was destroyed again, only one house remaining. One hundred and twelve captives were taken to Canada, where they were held for ransom. Memorial Hall contains an excellent collection of historical relics.

Soon after passing Greenfield, the route crosses the river again into East Northfield, the seat of the Moody School for girls, and of other institutions organized and perpetuated by Dwight L. Moody. Mt. Herman School for boys is situated only a short distance away.

Entering Vermont at Vernon is noted the magnificent dam across the river, which furnishes Brattleboro with a splendid lake front. The electricity generated at this dam furnishes light and power for numerous towns in northern Massachusetts, as far distant as Worcester. Brattleboro is naturally very beautifully situated and is the business centre for a large area in both Vermont and New Hampshire. The Estey organ works here are of especial interest.

In Putney are long strata of roofing slate, and the rare mineral, fluor spar, of a rich emerald green. In 1775, a strong timber fort was erected, which protected the settlement until the conquest of Canada made it unnecessary.

Bellows Falls was a favorite Indian resort, because of the large number of salmon and shad near its rapids. A short distance above the old bridge at this point are a number of hieroglyphics, which Schoolcraft decided were the records of an ancient battle. The river falls 42 feet within half a mile of the village, forming a white and impetuous rapids.

Charlestown, N. H., was settled by Massachusetts people and was originally named Number Four. Between 1746 and 1760, it was repeatedly attacked and conducted a defense so admirable that the enemy decided at last to abandon the conquest. During the later French and Indian wars it was a military station. It is situated between two broad, rich meadows, and has a long, wide, well shaded street.

Ascutney mountain comes into

When a Summer Breeze Stirs Up the Waters in St. Albans Bay, Vt.

One of the Many Gorges Worn by the Winooski River in Vermont.

view just above Claremont, and the river is recrossed into Vermont at Ascutneyville. At Windsor, during a heavy thunderstorm and with the news of the fall of Fort Ticonderoga ringing in their ears, the deputies of the Vermont towns adopted the state constitution, July 2, 1777. Ascutney, the name of the mountain, which is easily reached from Windsor, was Indian for Three Brothers, and is supposed to refer to the three singular valleys which run down its western slope. Early settlers claimed they often saw a curious light overhanging the peak at night. White River Junction is the night stop, at the union of the White and Connecticut rivers.

The second day, the route follows the picturesque White river for a time, branching off to climb the Green mountains toward Montpelier. Joseph Smith, founder of Mormonism, was born in Sharon. At Royalton, occurred the last attack by the Indians on New England in October, 1780. Two hundred redskins plundered and burned the village, as well as Sharon, and captured 27 of the people.

Bethel is a busy manufacturing village among high hills. A little further along is the famous Williamstown gulf, through which it is seldom indeed that cool breezes do not blow. The view from this point to Barre and Montpelier is most superb. The route from the capital of the state to Burlington is a reversal of a portion of tour No. 11.

Near Winooski is the romantic canyon on the river, and at High

Bridge, the impetuous stream has cut a gorge through the solid rock 90 feet deep and 70 feet wide. St. Albans is the night stop, located on an elevated plain, three miles from Lake Champlain. A neat park of four acres in the centre of the city, is surrounded by hotels and numerous public buildings. A Norman-towered Episcopal church of red sandstone is most noteworthy. A magnificent view may be had from Aldis hill, about a mile to the northeast.

The third day takes the tourist first to Sheldon, near which are

located the famous mineral springs. That near the Missisquoi falls has had an enviable reputation. From Dunton's hill, a vast panoramic view of the Green mountains is obtained, while the silver waters of Lake Champlain, the Adirondacks and the spires of Montreal are to be included in the scene. At Richford, Jay peak rises to an altitude of over 4000 feet.

Newport is located at the upper end of Lake Memphremagog, and from the edge of the town rises Prospect hill, from which excellent lake views may be obtained. The lake is 30 miles long, and two-thirds of it lies in Canada. Barton Landing was the scene of much smuggling during 1810-15. At Barton, may be seen Crystal lake and the Flume, where a brook flows through a natural passage in the granite rock, 170 feet long, 10 wide and between 20 and 30 deep. The granite walls are smooth and perpendicular. In 1810, the people of Barton determined to widen Barton river by turning Long pond into it. They barely had completed a channel, when the waters burst through with tremendous force and swept down to Lake Memphremagog, wrecking everything in their path and causing immense damage. The bed of Long pond is now dry and

Where Mt. Cannon Overshadows Profile Lake at Its Base.

Enchanting View of St. Albans Bay, One of the Most Attractive Points on Lake Champlain.

is known as Runaway pond.

Numerous rare plants are to be found along the sides of Lake Willoughby, a magnificent sheet of water on the way to Lyndon and St. Johnsbury. Tour No. 11 is followed again for a short distance to the night stop at Bethlehem. The fourth day, return is made to Littleton, with its far-viewing heights, and then the tourist turns toward the Connecticut river, visiting Lisbon, somewhat noted for its gold mining, Bath with its picturesque glen, and Woodsville, on the way to Wells River, Vt.

Near Bradford is Devil's Den on the side of Wright's mountain, where one Wright, who claimed to be a prophet, lived the life of a hermit in a dismal rocky cleft. Fairlee is a hilly town abounding in pretty lakes, one of which is nearly three miles long. Mt. Cuba and Mt. Sunday cast their reflection upon these waters. Cuba falls and the perpendicular cliffs of gray granite on Sawyer's mountain are worthy of special notice.

North Thetford produces much copper ore, which is sent overland to Portsmouth, N. H., thence to Baltimore by ship. Below Thetford distant views of Moosilauke and Bald mountains are to be had. Hanover is the seat of Dartmouth College, founded in 1770 as a school for Indians. At first it had 24 students, domiciled in huts built of green logs, situated in the midst of a vast wilderness. At West Lebanon is the Tilden Ladies' Seminary, whose fine buildings are seen on a hill.

In the vicinity of Mascomy lake,

near Enfield, is a community of Shakers, which has furnished much fine wood and wooden ware for the market. Lebanon is a pretty manufacturing village on an elevated plain near Mascomy falls. Croydon is noted for its splendid granite quarries.

The night stop is at Sunapee, and the morning of the fifth day finds the tourist reversing a portion of tour No. 21 to Keene. On the way to Hinsdale a splendid outlook over the new dam of the Connecticut River Company is afforded. After crossing the state line into Massachusetts the Moody schools at Northfield and East Northfield, may be visited. Then comes the Massachusetts Agricultural College at North Amherst and Amherst College at Amherst. Just above Moody's Corner the road enters a narrow gorge be-

tween two mountains of the Holyoke range, and from this point the views of Mt. Holyoke and Mt. Tom are such as to hold particular interest.

Time should be taken at South Hadley to visit the campus of Mt. Holyoke College for gifts, concerning the fantastic beauty and sublime majesty of which much has been written. The surroundings at the college are especially pleasing, and the grove frequently is utilized as an outdoor theatre for the presentation of Shakespearian plays and similar productions.

Chicopee, at the confluence of the Chicopee and Connecticut rivers, is the home of the Ames foundry, in which the superb bronze doors of the United States Senate chamber at Washington, were cast during the Civil War.

THREE DAYS IN THE DOMINION OF CANADA.

Outlining a New Route Between the States and the City of Quebec, with a Splendid Trip up the Valley of the St. Lawrence to Montreal.

THE three-day trip outlined in tour No. 32 is a substitute for the better known route between Quebec and the States by way of Jackman, Me., and is suggested as a continuation to itinerary No. 52 at Montreal. The starting point is at Newport, Vt., and the night stops, Quebec and Montreal.

The customs formalities must be arranged at Stanstead, a short distance from Lake Memphremagog. Several picturesque lakes are viewed on the way, including Massawippi, near the town of that name; Noir, near Marbleton; Weeden, near Weeden; Aylmer, at Garthby; Francis, at D'Israeli; Clapham and Marie, between Thetford Mines and Robertson. Marbleton is noted for its marble quarries and lime pits, while at Thetford Mines are located the largest asbestos deposits in the world. Bell mine has an area of several acres and is 150 feet deep.

The final portion of the drive into Quebec is exceedingly picturesque. Beyond Leeds, Parkhurst and St. Giles, the road winds along the bank of the Beauvoir river to the St. Lawrence. The city is entered over the magnificent Quebec bridge, which is said to be the largest single span bridge in the world, and the tourist is thus spared the necessity for using the ferry, which was utilized for so many years.

Quebec is filled with historic in-

terest. In many respects it is the most quaint and picturesque city on the American continent. Of the many side trips, the following may be mentioned: Ste. Anne de Beaupre, where thousands of pilgrims annually visit the relics for miraculous cures; the falls of Ste. Anne and those of Ste. Fereol, still further to the east; Lake Beauport, Indian Lorette, and Cap Rouge.

The view of Quebec from the St. Lawrence in the early morning is said to be a sight never to be forgotten. Above the city the river

flows between the Laurentian mountains. Then the tour passes Lake St. Peter, where the St. Lawrence broadens out on the lowlands. Among the features of this body of water are the lumber rafts on which are carried the rude huts of the lumbermen. At various points along the route, quaint old towns are passed, in which the people, like those during the previous day's drive, speak French for the most part, and many old-world characteristics are noted.

Montreal is the metropolis of

General View of a Portion of Quebec Overlooking the St. Lawrence.

Mt. Hor Raises Its Head Above Willoughby Lake, West Burke, Vt.

the Dominion of Canada and is termed "the Queen of the St. Lawrence." It is one of the most beautiful cities on the continent of North America, and has a history dating from 1535, in which year Jacques Cartier visited the triple-walled Indian village of Hochelaga and ascended the lofty hill beside it, which from the beauty of its view he named Mount Royal.

Chambly, reached early the third day, was fortified by the French in 1711, and in 1775 it had a strong stone fort, erected by the British. The town is situated on a lake-like expansion of the Richelieu river, known as the Chambly basin, and the Chambly rapids are nearby. Knowlton is at the foot of Brome lake, with Brome mountain about 10 miles distant, although in full view. At South Bolton, the tour goes through the Bolton notch, with excellent views along the way. Customs arrangements may be perfected at Man-

sonville. The return to Newport from this point is along the shore of Lake Memphremagog with excellent views of Owl's Head.

TOURING AMONG THE BERKSHIRE HILLS.

Itinerary Gives Two Routes Between Boston and Albany, Affording Connection with New England from the West—Particularly Attractive in the Autumn.

THOSE who enjoy the beauties of touring in the autumn, with all the kaleidoscopic colorings in the foliage of hill and dale, will appreciate the itinerary outlined herein. It is designed to connect Boston and Albany over two distinct routes, one of which, the outward trip, offers some slight deviations from the beaten path, while the other presents

some of the best roads in the country in combination with many rich views of the Berkshires and the Connecticut valley. It is anticipated that the tourist will be on the road four days, with night stops at Greenfield, Mass.; Albany, N. Y., and Springfield, Mass.

After passing through Watertown, the site of the Massachusetts arsenal, and Waltham, the

home of the Waltham watch, the tourist enjoys a pleasant drive through Maynard and Stow, and emerges from this first glimpse of country beauty to visit Fitchburg, another manufacturing city of importance. At Gardner is the largest chair factory in the world. Excellent automobile roads lead through Otter River, Baldwinville and Athol to Orange, and

then the descent into the Connecticut valley is begun. At Millers Falls, Mt. Toby and its base, and Lake Pleasant divide attention with the river. Greenfield is the night stop.

Soon after leaving Greenfield, the second day, the way leads up Shelburne mountain, and then into the valley of the Deerfield at Shelburne Falls, the early home of William Cullen Bryant, Charles Dudley Warner and several other people of note. At Charlemont, a view of the \$20,000,000 Hoosac tunnel is obtained, and while the shorter distance to North Adams is over Hoosac mountain, a detour is made at this point, entering Vermont, through most interesting scenery, albeit, the roads are far from ideal in places. It is anticipated, however, that the tourist will find less difficulty in covering these country ways than in climbing the mountain and descending the many winding curves and heavy grades on the other side.

North Adams is in the shadow of Mt. Greylock, and about a mile north of the city is the famous natural bridge over Hudson's brook. The cascade in Notch brook is another pretty little spot half hidden away in a glen. After leaving Williamstown, the seat of Williams College, the way leads back into Vermont, through Pownal, and thence into New York State at North Petersburg, passing near Walloomsac, where was fought the battle of Bennington. A few country villages, with their quaint old houses are next passed, and the road descends into the valley of the Hudson on the way to Troy and Albany.

Albany, the capital of New York, is full of interest. Chief among the buildings of prominence is the state house, built at an enormous cost and filled with relics of all the wars. Two other structures of note are the Catholic and Episcopal cathedrals. Van Rensselaer Manor House and its park, on the site first occupied by Killan Van Rensselaer, patroon of Beverwyk, also should be visited for its historic associations.

On the return trip the road leads over the hills to Pittsfield, passing through the Lebanons, a series of Shaker settlements. Pittsfield is admirably situated among the Berkshires, with a

number of little lakes and several interesting mountains nearby. Lenox is described as "a gem among the mountains," and is the summer home of numerous people of prominence.

Lee was settled in 1760, and was named for one of the Virginia Lees. It is famed for its wonderful white marble, of which some \$1,000,000 worth was employed in the erection of the capitol at Washington. Becket has several lakes, from one of which the Farmington river flows down into Connecticut. The route to Becket is over the famous Jacob's Ladder, now placed in excellent condition, through agitation aroused by motorists.

Chester, Huntington and Rus-

Springfield, the night stop, is known as the City of Homes. It is a centre from which a number of motoring trips may be made in all directions. From the United States armory on State street it is possible to secure a view up and down the valley, which is unequalled anywhere in this country, and which is considered by many to be superior to the like views afforded in European countries.

From Springfield to Boston the road is macadam nearly all the way. Palmer also is famous for its scenery, combining woods and hills, the lesser mountains, lakes and rivers. Warren is a pretty manufacturing town amid roundling hills. Of West Brookfield it

The Mirror in the River at South Londonderry, Vt.

sell are all pretty Berkshire towns, and then the way dips down into the Connecticut valley, through the Indian domain of Woronoco, settled in 1660 by the English and called Streamfield. The Little River water works of the City of Springfield are near this town.

Late in King Philip's war the people of Westfield were ordered to evacuate and concentrate with those of the other settlements in the valley at Springfield and Hadley. An angry refusal was returned and for a time negotiations were under way looking toward a union with Connecticut. Later the legislature found it desirable to cancel the order.

is stated that it produces apples and boots, and the orchards are of particular interest in the fall of the year.

In Brookfield time should be taken to visit the garrison house, in which for three days the settlers held out against a superior force of Indians. As a last resort the redskins backed a load of blazing flax and straw near it in an effort to burn it down. A sudden shower put out the flames, and the incident was regarded by both sides to the conflict as miraculous.

Spencer was the native town of Elias Howe, Jr., the inventor of the sewing machine. Then

Pleasing View of the Berkshires on the Way from Pittsfield to Lenox.

comes Worcester, the Heart of the Commonwealth, well and favorably known by motorists. The remainder of the distance into Boston is through Shrewsbury, Northboro, Marlboro (the so-called "boro" towns), Wayland and Weston.

Shrewsbury was the birthplace of Levi Pease, who started the first line of mail stages between Boston and New York in 1784, previous to which fortnightly mail was carried between these two cities in saddle bags. Northboro is devoted to cattle raising. Marlboro was the site of the Christian Indian village of Okammakemessitt. Each is filled with particular interest to the tourist.

In every respect this itinerary offers an ideal autumn tour. The Berkshires are at their very best during this season, and the two routes through them leave nothing to be desired. For those who have ample time at their disposal it would be possible to make North Adams, Pittsfield or Becket the headquarters for a more extended stay in their environs, with plenty of opportunity to enjoy nature at its prettiest.

VACATION SPOTS ON LONG ISLAND.

Tour First Visits Litchfield Hills and Housatonic Valley and Contemplates a Whole Day Among the Beauties of the Island Before Returning to Hartford.

FAMED as are the mountains, lakes and rivers of New England, it must not be denied there are numerous vacation spots in these states that are not so well known as their beauty would warrant. The same will hold true with respect to Long Island. And while this latter ground is more or less familiar to tourists from New York City, there are many motorists who have never taken the time to explore its resources.

In the accompanying itinerary, it is anticipated that three days will be devoted among the lesser known portions of this section. The start is made from Hartford, Conn., and the tour first reaches the Litchfield hills, and crosses Long Island sound for a day on the island itself, before returning to the capital of the Nutmeg State over ways perhaps somewhat better known.

Leaving Hartford, Farmington is the first interesting place reached. The town occupies a beautiful situation on the banks of the river of the same name. A broad and shaded street two miles long, practically composes the village. It was settled in 1640, and it was here that the village pastor preached to the Continental army on its march to Boston in 1775.

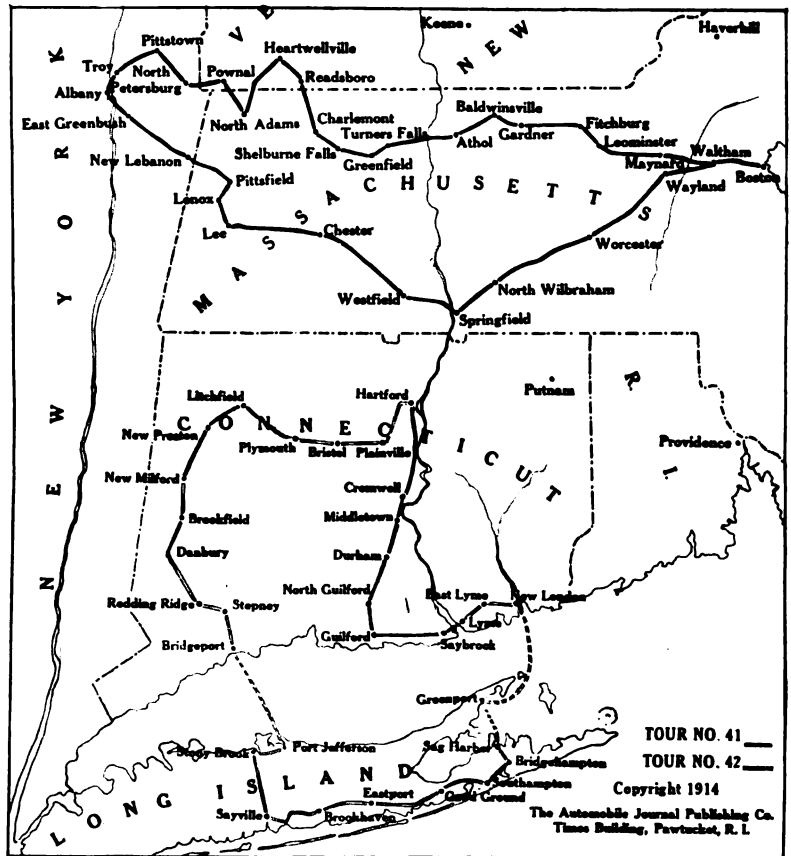

Plainville, with its macadam ways, Forestville, and Bristol follow in quick succession. The tourist is now in the centre of the original clock making industry in America. Eli Terry began the manufacture of these goods in a small shop in Terryville, but the business very soon spread to Bristol and Thomaston, both of which have been producing clocks for many years. Just before reaching the latter town, the route leads

down a very steep hill, practically one mile long, although a detour may be taken if deemed advisable.

Northfield is a knife making centre, much of the cutlery being hand forged; the material is imported steel from Sheffield, Eng., whence many of the employees came. The road from this point

district known as Litchfield hills.

Litchfield occupies an interesting place in history. The first law school in America was opened in a small building which is shown visitors with justifiable pride. During the summer months, the hill top is the favorite home for many New York people, and Bantam lake, only a few miles distant, and

to Litchfield is nearly all up grade, and as the hills are climbed new scenes unfold themselves in rapid succession, and while the so-called mountains are small of stature the car finds much less difficulty in making the grades than would be the case in other portions of the

distinctly visible from many points, lends an added charm.

This lake is passed on the way to Bantam and New Preston. Just beyond the former town the road takes a dip between two high hills, one of which is known locally as Mt. Tom. New Preston commands

a pleasing view of the surrounding country and easily explains the attractiveness of the section. Here, time should be taken to drive about Lake Warramaug, a splendid boulevard making this possible without difficulty.

New Milford is near the junction of the Housatonic and Aspetuck rivers, with a wide verdant park and well shaded trees. Nearby is a silver mine, which was worked prior to 1790, and the town is one of the centres of the tobacco trade in the valley. The way then leads along the Housatonic to Brookfield and beyond,

The harbor at the latter place is conceded to be one of the most beautiful on the sound. The town is built up on terraces, which extend back from the water's edge in pleasing array, the many hued trees lending their charm to the situation.

The second day soon finds the tourist at St. James, in which is located the summer estate of the late Mayor Gaynor of New York City, Deepwells. A drive through pretty woodland leads to an arm of Lake Ronkonkoma, the terminus of the Long Island Motor Parkway. About this lake are

shore of the island at Bayport. The way turns eastward along this shore to Sag Harbor and Greenport. Boats leave Sag Harbor for New London at 6 in the morning, at 12:30 in the afternoon, and Greenport at 6:30 and 1:40. The tourist has the option of remaining on the island or crossing to the mainland, depending largely upon the time he arrives at these places.

The third day leaves New London behind to enjoy the beauties of the Connecticut shore. The route is over the main line to New York for some distance, crossing

In the Naugatuck Valley, Near Thomaston, Conn., with the Litchfield Foothills on Either Side.

and finally reaches Danbury, the home of the hat industry.

From this point to Bridgeport the road is most direct. Stop may be made to visit Putnam Park, established in memory of Israel Putnam. If desired the boat across the sound may be taken in the evening. The ferry is operated only twice daily, at 1:30 and 6:30 in the afternoon. Should the tourist elect to remain over night in the Park City, abundant opportunity may be had to explore the vicinity before taking the first boat to Port Jefferson the morning of the following day.

numerous little coves and streams which form a perfect outline of a pair of spectacles. The lake itself has baffled government geologists in their efforts to learn why this body of fresh water should have a tide which rises and falls every seven years. It has no direct connection with the sound, the ocean or any other tidewater, and its actual depth is not known.

Then comes Bread and Cheese hollow and the headwaters of the Nissequogue river, the happy hunting grounds of the Long Island Indians. And finally the motorist finds himself on the opposite

the Connecticut river on the new bridge between Lyme and Saybrook. Of course, the return to Hartford may begin at Saybrook, following the better known Connecticut valley road, but it is anticipated that the trip will be undertaken for the purpose of exploration, and the itinerary as outlined from Guilford will be found fully as enjoyable.

Lyme is a venerable hamlet, half buried in foliage, its Main street lined with old trees and historic mansions, among the latter being Black Hall, the home- stead of the patrician Griswolds.

Distinctive Beach Scene on the Connecticut Shore of Long Island Sound.

Westbrook and Clinton, are two quiet towns on the shore, much frequented by summer people, because of the absence of the trolley and other disturbing seaside factors. Madison is almost equally known in this respect.

Guilford was settled in 1639 by four immigrants from Kent and Surrey, England, its former Indian name being Menuncatuck. During the extermination of the Pequots by the Mohegans, a few years previous to this time, the sachem, Uncas, had his headquarters at this point and numerous battles were fought in this vicinity. In 1781 the regicides were hidden in an old house which still stands. Three frigates landed a force which marched through the streets during this period, but the rapidly gathering militia drove them off, before the fugitives were located.

North Guilford is somewhat isolated from the surrounding country and offers abundant opportunity to witness the quaint and beautiful. The sound may be seen at intervals, but the motorist's attention is much more likely to be taken up by the interesting bits of woodland scenery, which continue through Bluff Head, from which point pleasing outlooks upon the Connecticut river may be had. Middletown is the seat of Wesleyan University and the view from the tower of the old chapel is considered by many as unequalled

throughout this district.

After leaving Middletown, the road follows the river through Cromwell, Rocky Hill and Wethersfield. This is a favorite drive for Hartford motorists and is almost too well known to need comment. Rocky Hill is so named because of its trap rock and sandstone ledges, and commands an interesting view of the river toward the north, clear weather making it possible to discern the outlines of Mts. Tom and Holyoke on either side of the Connecticut river valley, in Massachusetts, many leagues away.

Connecticut Valley Supplies Beautiful Mountain and River Scenery.

A Glimpse of the Mountains on the Way to Manchester, Vt.

romantic pass known as Stratton gap.

The state seal of Vermont had its origin in Arlington, in which town are the West and Red mountains. The way leads down the valley of the Battenkill to Cambridge, N. Y. This river is crossed at Greenwich, and then the country becomes more flat and uninteresting on the way to Saratoga, the night stop.

Saratoga Springs, once one of the foremost summer resorts in America, still retains its many health giving springs which won for it at least a portion of its wide reputation. The village is situated on a plateau a few miles

west of the Hudson river, and may be made the headquarters for a number of pleasant drives about the lakes in the southern end of the Adirondack region. Lake Luzerne, 22 miles north of Saratoga, is a particularly picturesque sheet of water, and one that is easily reached, despite the grades. Saratoga lake is about four miles from the village and is reached by a favorite drive termed the Boulevard.

Good roads are offered for the trip between Saratoga and Albany by way of Mechanicsville and Waterford. Below Albany is Kinderhook, where may be seen a number of ancient buildings, among

them being the Van Alen mansion built in 1721 and the Van Schaack mansion erected in 1774. Two miles below the village is Lindewald, the home of Martin Van Buren, and before that the home of Peter Van Ness. The return to New York is via Poughkeepsie.

TOUR NO. 50
Copyright 1914The Automobile Journal Publishing Co.,
Times Building, Pawtucket, R. I.

NEW YORK'S MOUNTAINS AND LAKES.

A Visit to the Adirondacks Region by Way of the Catskills and the Thousand Islands and Return Through the Berkshires and Croton Lake District.

A TOUR that combines much of interest and splendid scenery is that presented herewith as No. 51. It is outlined to occupy six days, starting from and returning to New York City, and while some of the daily mileages are large the tourist undoubtedly will be able to readjust the night stops to accommodate his fancy and the length of time it is desired to remain away from home.

The first day's route runs along the Hudson on the east shore until after passing Poughkeepsie, and soon after reaching Kingston turns into the Catskills for the night stop at Highmount. The Catskills are famed throughout the world for their beauty as well as the scene of Washington Irving's tale of Rip Van Winkle, and it is presumed that the tourist will find a single night hardly sufficient to explore their resources.

The Grand Gorge is reached early on the second day, after which the way leads into James Fenimore Cooper's country, turning north through Richfield Springs and Utica. The last named city is pleasantly situated in one of the most beautiful sections of the Mohawk valley and has a number of fine automobile roads. A particularly interesting view is to be obtained from the summit in Roscoe Conklin park. Seven miles west is the Revolutionary battlefield of Oriskany. A little to the east is the splendid Masonic home, which cost more than \$1,000,000.

The way from Rome to Watertown is over a state road with several stretches of macadam in Turin, and thence along the Black river valley. The third night stop is at Alexandria Bay. If possible the tourist should arrange to remain over here at least one whole day, as there is so much of interest to be seen that it cannot well be covered even in a much longer time. A steamer ride among the Thousand Islands in the St. Lawrence river gives some idea of the distinctive beauties of the region, but subsequent trips to other islands will indicate that each has features which are possessed by

none of the others, giving it a charm peculiar to itself.

Ogdensburg is a pretty little city at the confluence of the Oswegatchie and the St. Lawrence, the former of which affords abundant power for various manufacturing establishments. It is known as the Maple City, because of the magnificent maple trees which line its principal streets. Between Ogdensburg and Massena the tourist has opportunity to view the rapids of the St. Lawrence. The Gallops are a little less turbulent than the Rapids du Plats, but are almost as interesting. At the latter the dark

the distant ones being veiled in an exquisite violet hue. Rivers winding in and out among the green forests look like ribbons of silver, while amidst it all lies the peaceful Lake Placid, and separated from it by only a wooded eminence is Mirror lake.

Rich lake views, with occasional glimpses of Lake Champlain, are to be found on the way to Elizabethtown. Below Port Henry, at Crown Point, are the ruins of the old French Fort Frederick, the ramparts of which are brilliant with red thorn apples, in their season, a tree which is found nowhere else in the state and which

In the Midst of the Beautiful Lake Country of the Adirondacks.

swirling waters make a beautiful sight as they dash and tumble over each other in their haste.

From Malone to Lake Placid the tour traverses the Adirondacks region, with plenty of temptation to tarry. Lake Placid is perhaps the best known of all the Adirondack resorts, and is surrounded by high mountains. At the northern end the scenery becomes bold and imposing. Hoary old Mt. Whiteface raises its head 4780 feet high above the rest, cleaving the clouds in its solitary grandeur. All of the Adirondacks' gaunt peaks are in sight,

is said to have been brought here from France. An interesting drive along the lake from Ticonderoga brings the tourist to the ruins of Fort Ticonderoga, crowning a high hill near the steamboat landing.

The way then leads into Vermont, but only for a little time, then back and forth across the line, through country that is rich with inspiring views and over roads that are exceptionally good, until Hoosick Falls is reached. Near this town is the battlefield of Walloomsac, where occurred the conflict which has gone down in

At Left, View in the Vicinity of Richfield Springs; at Right, Island Dotted Lake in Catskill Foothills.

history as the battle of Bennington, fought on New York soil instead of in Vermont.

The last night stop is at Pittsfield, Mass., the Heart of the Berkshires. The way then leads through Lenox and Stockbridge, well known for the singular purity of their air. Many summer homes of wealthy people are located in this immediate vicinity and lend their beauty to nature.

The northwest corner of Connecticut is crossed before passing into the Empire state.

One of the distinctive features in the vicinity of Dover Plains is Chestnut ridge, which extends north and south for about three miles and forms a part of the watershed between the Hudson and Housatonic rivers. The small streams from the western hills

have worn deep ravines and in several places have formed beautiful cascades. A few miles from the village, one of these streams flows down the mountains in a succession of rapids, and at the foot of each fall smooth rounded holes, called wells, have been worn in the rocks to a considerable depth. Near this, and a little higher up in the mountains, is a stream which has worn a remarkable channel in the rocks, forming a cavern with a gigantic Gothic arch, known locally as "the old stone church".

THE ADIRONDACKS AND CANADA POINTS.

Visiting Mountains and Lakes of Northern New York, Crossing the Border to Montreal, Ottawa and Toronto, and Returning by Way of Niagara Falls.

COMBINING some of the most interesting touring ground in the Dominion of Canada with the Adirondack region and a portion of the transcontinental route through central New York State, this itinerary contemplates that the motorist will start from Albany. The route the first day is along the Hudson for a time, until the falls of the Mohawk are reached north of Cohoes, and then away from the river to Saratoga.

For years Lake George has been a favored resort of those who love the beautiful in nature. The lake itself is 35 miles long and in some places four miles wide. The hills and vales of the neighborhood, as well as the waters themselves, witnessed many fierce engagements during the French and Indian, and Revolutionary wars. A few miles distant is Loon lake, one of several by that name in this region, although not so well

Considerable road work has been accomplished in the Keene valley and the motorist should have little difficulty in making Cascade Lake for the night stop. There are two of the lakes, and the scenery about them is held to be unsurpassed. Those who desire may spend some little time in this section, the roads now being in condition to permit of reaching many of the camps by automobile. The tourist is now in the Adi-

Beautiful Schroon Lake in the Foothills of the Adirondacks and Surrounded by New York's Historic Ground.

While Saratoga Springs is not the resort it once was, the mineral springs have lost none of their interest. There are still many handsome buildings and the city is by no means deserted. A short distance further along is Glens Falls, intimately associated with recollections of Uncas, the last of the Mohicans, so graphically portrayed in Cooper's romance. It was also the scene of a decisive battle between the French and English in 1755.

known as that other in the extreme northern part of the state.

Schroon lake is indeed a pretty sheet of water, 10 miles long and at an elevation of 807 feet. The valley of the Schroon river is next followed until the low divide is crossed, and the route then lies along the Pleasant valley to Elizabethtown. The way becomes rough and more mountainous at this point, albeit the views are among the best to be found in the entire Adirondack region.

ronrack foothills, and may visit the famous Ausable Chasm, with its grand succession of cascades and gorges, early the third day. Keeseville, on the lake near the Chasm, is the turning point toward Canada, which is entered by way of Plattsburg and Chazy, at Rouse's Point. Here the customs regulations will have to be observed, licenses, customs bond and numbers being secured at a reasonable fee, as well as the necessary papers for readmission of the

Brant Lake Vies with the Mountains in Tempting the Tourist.

tourist to the United States.

At St. Johns, Que., a chain of forts existed for years, extending along the Richelieu river from Sorel to Lake Champlain. It was the scene of a 45 days' siege by the Americans in 1775, at the end of which it fell and was destroyed. The St. Johns of today boasts of some excellent hotels and fine shops, as stores are termed on that side of the line, and also possesses a large barracks and military school. Across the river is Ilerville, in which there is a curiously constructed church tower, reminding the tourist of the Turkish mosques, from the turrets of which the Moslems call the people to prayer.

Montreal is replete with the historic and the interesting, both as the result of nature and man's handiwork. It has been successively under French and English rule, and was for a time in the hands of the Americans. In 1776, the commissioners of the Continental Congress, Benjamin Franklin, Samuel Chase and Charles Carroll, held council in the Chateau de Ramezay. The city was the scene of many battles between the Indians and white men, French, English and Americans and is filled with historic tablets and monuments.

The third day takes the tourist from Montreal to Ottawa. The road is of clay and in wet weather is practically impassable. Should the tourist happen to reach this point under such circumstances, he is earnestly advised to ship his car by way of boat to Kingston, and rejoin the route at that point. A somewhat better road lies along the shores of the St. Lawrence river joining this route at Prescott,

but if conditions are favorable it will pay the tourist to make the trip to Ottawa, as originally planned.

The way leads across Montreal Island, thence across the Isle of Jesus and along the shores of the Lake of Two Mountains to St. Andrews East on the River du Nord. It then lies to Carillon and across the Ottawa river to Point Fortune, following the south shore of this river to Little Rideau and L'Orignal. At this point it turns away from the river to Alfred and Plantagenet, and back again to the Ottawa at Wendover, skirting the river again to Clarence, Rockland, Cumberland and Orleans.

Ottawa is of interest because of its being the seat of the Canadian government, the buildings of which are situated on a picturesque bluff 150 feet high, overlooking the Ottawa river. They

comprise three blocks of departmental buildings, the House of Parliament occupying the fourth side of the square. The famous Chaudiere Falls, where the river dashes over a ledge of rock 1260 feet high, are located in the west end of the city and furnish power for extensive lumber operations as well as lighting and street railway plants.

The fourth day finds the tourist on good roads once more, turning back toward the States. The St. Lawrence is reached at Morrisburg and is followed to Prescott, opposite Ogdensburg, N. Y., where the boat may be taken to Niagara-on-the-Lake. Just below Prescott is the famous Patriot's Windmill, the scene of a bloody conflict in the uprising of 1837. The old mill is now a lighthouse. In making the water trip from the Thousand Islands to Montreal, passengers change at Prescott for smaller boats, more suitable for shooting rapids, some of which are passed on this tour.

The route follows the north shore of the river to Brockville, from which point there is a ferry to Morristown, N. Y. The road now turns away from the St. Lawrence for a time, though within sight of the beautiful Thousand Islands, which are seen still better at Gananoque. The Rideau river is crossed at Kingston, the night stop.

Kingston is a quaint, attractive city and will reward amply a few hours' sight-seeing. The fine busi-

Anthony's Nose and Rogers' Rock on the Banks of Lake George, N. Y.

ness blocks and public buildings offer a pleasing contrast to the old forts and other evidences of early occupation. Among the interesting places to visit are Fort Henry, the Royal Military College (Canada's West Point), Queen's University and St. George's Cathedral.

The fifth day's route skirts the north shore of Lake Ontario all the way into Toronto. Many splendid views of this immense inland lake are afforded, as the road follows the shore line for many miles. None of the towns en route are

numerous summer resorts, and Toronto is the centre from which these may be reached. If visited in the first week of September, the annual fair is worthy of a couple of days' stop.

The sixth day ends at Niagara Falls, one of the greatest wonders of the American continent. The tip of Lake Ontario is rounded at Hamilton, and from that point the roaring of the mighty cataract begins to penetrate above the humming of the motor. The approach to the falls from the Canadian

easily to be available. The trip to Queenstown Heights and Brock's monument is advised, especially. The short 20-mile drive to Buffalo can be made comfortably in the cool of the evening.

Buffalo may be considered the gateway to the immense touring country from the West. Similarly, it might be added, that the tourist could so plan an extension of his vacation to include portions of the Middle West before returning.

The return trip from Buffalo is almost too well known by motorists to need extended comment. There should be little trouble except in the so-called Montezuma swamp between Montezuma and Port Byron, and then only in wet weather. Among the points of interest on the way may be mentioned the home of Joseph Smith, the founder of Mormonism, at Palmyra, where he claimed to have discovered the golden plates of the Book of Mormon. Nearby is the village of Hydesville, the home of the Fox sisters, who were instrumental in establishing Spiritualism. Three miles north of Oneida is located the famous Oneida Community, founded in 1847. South of this town is the Oneida Indian reservation, from which excellent views of Oneida lake may be obtained. The last portion of the tour is along the Mohawk valley.

THE LAKES OF CENTRAL NEW YORK.

After a Day in the Vicinity of James Fenimore Cooper's Home, the Tourist Reaches One of America's Most Interesting Groups of Inland Lakes.

FOR those who delight in the romantic, somewhat off the beaten paths, no section of the East contains more charm than the lake district of central New York. Fortunately the towns in the vicinity early recognized the advantages of cultivating automobile touring, inasmuch as they are not a little neglected by the railroads. Their delightful scenery is such as to merit wide attention on the part of the tourist and the motor car has done much to bring these beauties within easy reach.

Leaving Binghamton the morning of the first day, the tour follows the valley of the Susquehanna river for some distance, skirting the foothills of the Catskill

mountains, particularly as the route nears Oneonta. Numerous small lakes and pretty little trout brooks divide attention with the hills and mountains in the distance, but it is not until Coopers-town is reached that it may be said the lake region is entered.

Cooperstown, the home of James Fenimore Cooper, is on the shore of Otsego lake, and this entire region has been so touched by his genius as to be familiar ground to those who revel in his works. In a park at the centre of the town is a boulder surmounted by the figure of an Indian, which marks the spot where Cooper lived. Fairly good roads encircle the lake, and time might be spent

profitably in catching numerous glimpses of its remarkable beauty on this side trip.

The night stop is at Richfield Springs on Canadago lake, better known by the name of Schuyler. No more inspiring views are to be found anywhere on the American continent than in this vicinity. It is extremely doubtful if the tourist will be satisfied with a night stop at this point, but other lakes still further along offer other charms, and it will be hard for the motorist to decide just how much time he may allow himself away from home.

The second day's run enters the Mohawk valley, which is followed into Syracuse, not forgetting to

Pine Grove Drive, a Pleasing Scene Near Richfield Springs, N. Y.

mention Cazenovia, a summer resort of considerable repute situated at the foot of a pretty little lake, which empties into Lake Oneida. Time should permit of taking the pleasing little drive about the shores of this sheet of water. After leaving Syracuse, the main route through central New York is followed for a time, practically into Geneva.

Auburn is on Cayuga lake, which may be skirted if it is desired to extend the tour beyond the three days originally planned. This additional mileage will amply repay, as there are many attractions within easy driving distance. Among these may be mentioned Taghanic falls, at the end of a gorge a mile long and 400 feet deep, where the water takes a sheer drop of 250 feet, higher than Niagara.

Geneva is on Seneca lake, which is reached along the banks of the Seneca river from Seneca Falls, after the Montezuma marshes are passed. This lake is considered the most picturesque of the entire group. It is 38 miles long and from two to six miles wide. Steamers may be taken from Geneva to Watkins, if more time is desired for exploring portions of this district. This route anticipates making Penn Yan, on the shores of Keuka lake, the night stop.

Penn Yan is some 900 feet

above the level of Seneca lake, and the road from Geneva is a gradual rise, although it can be made practically all of the way on high speed. Possibly it will be well to continue the journey about two miles south of the city itself for the night stop, as here opportunity is afforded to spend the night on the banks of the lake in a new hostelry, which is famed throughout this district for treatment accorded to motorists.

The third day finds the tourist

between the two arms of the lake on his way to Bluff Point, 700 feet above the surface of Keuka, which is 900 feet above the level of Seneca. From this elevation an extensive view of the surrounding country is obtained, a clear day affording glimpses of four counties. Looking down upon the lake itself, the visitor is surprised to see what appears to be a toy steamboat, and finds it hard to believe it is one of the large lake steamers with a capacity of 400 to 500 people. Immediately below a reflection of glistening oars and little specks on the water, not unlike a school of minnows, prove to be full sized rowboats filled with fishing parties.

Keuka lake is in the centre of the rich grape country, and the district is famed for its wines and champagnes. None the least of the pleasing pictures from Bluff Point are the vine clad, ravine broken hills, many of which will be visited on the trip from Bluff Point to Hammondsport, but first the tourist must turn north to get around the lower end of the other arm of the lake at Branchport.

From Branchport to Hammondsport is a steady drop, with the lake level lost to view. On either side are to be seen the vineyards, and at Hammondsport, 300 feet above the surface of the lake, the tourist finds a view to the northward, which for breadth, distance and picturesque

One of the Many Interesting Trout Streams in the Foothills of the Catskills.

beauty is to be equalled nowhere.

Hammondsport is the home of Glenn H. Curtiss, and his plant for the manufacture of aeroplanes. A visit to this industry will offer a pleasing diversion, as many of the Curtiss aviators are continually testing out new machines in the vicinity of the city. Recent activities have been in connection with the perfection of the hydraeroplane, and the waters of the lake are utilized by the United States naval students of aviation as well as the Curtiss instructors in exploiting the latest inventions.

Sometimes the cut is no more than 10 feet wide, while at others it broadens out into vast amphitheatres, in which the echo of the tourist's voice sounds wierd and almost supernatural. This chasm penetrates the hills for three miles, winding and curving abruptly, and presenting an almost infinite variety of rocky and picturesque scenes.

The return to Binghamton is over the divide into the Susquehanna valley. The country is still picturesque, although by no means as romantic in its beauty

Turning eastward again, the way leads past Lake Wauneta, between Weston and Wayne, and then on to Watkins, at the southern end of Seneca lake. Here, time should be spent in visiting the famous Watkins Glen, one of the most remarkable of nature's wonders, now a state park.

During the ages the small stream, in making its way from the hills to Seneca lake, has worn a deep gorge in the soft rock at this point, until now the water tumbles over a series of gorges, some of them nearly 200 feet deep.

as that which has occupied the tourist for the greater portion of three days. The road is excellent, while not of macadam, and good time can be made throughout this portion of the trip.

ITINERARY NO. 53.

Night Stops—Binghamton, Richfield Springs and Penn Yan, N. Y. Three Days, 372.1 Miles.

POCONO MOUNTAINS AND SUFFERN HILLS.

Itinerary Covers Northeastern Pennsylvania, Delaware Water Gap, Northern New Jersey and the Wallkill Valley in New York State.

TOUR No. 54 has Binghamton, N. Y., as its starting point, with Delaware Water Gap, Penn., and Suffern, N. Y., as night stops. It covers northeastern Pennsylvania, northern Jersey and the Wallkill valley of New York, and makes a number of connections with other tours outlined herein.

Crossing the Pennsylvania line, the first town of importance is Hallstead, rich in Indian traditions. The tiny gravel point in the middle of the Susquehanna at this place was once an island, around which the savages used to race in canoes, the prize for the swiftest being the honor of chief of the funmakers for the day. High upon the cliffs above the river, at a point seemingly inaccessible, was once a picture of a red chief in full war paint. The picture gradually faded, but the red remained, giving to the cliff its present name of Red Rock.

Scranton is situated in a pocket among the mountains and on the banks of the beautiful Lackawanna. The outskirts of the city are marked by a number of culm banks and coal breakers, bearing eloquent testimony of the unceasing search for coal.

The tour then begins the climb to Mt. Pocono, and descends to Stroudsburg, the views presenting panoramas of waving pine, mountain laurel and rhododendron, which grow in endless profusion along the walks and driveways in this section. The night stop is at Delaware Water Gap.

The second day's run enters New Jersey, climbing into the Schooleys mountain region, and visiting the interesting district about Lake Hopatcong. The roads will be found to be good for the most part, with occasional stretches of macadam. The views of mountains on either side, combined with those of the fertile valley, make this an ideal trip. The night stop is Suffern, N. Y., from which point connection is made with tour No. 61 for the New England states.

Goshen is in the midst of

a famed stock producing country. Middletown is the centre from which the famous Orange county milk and butter is shipped to New York City and other points. Highview is located on the eastern slope of the Shawangunk mountains, and as its name implies, affords a broad and extensive view of the valleys and the Catskills.

ous trout streams, making this town deservedly popular as a fishing ground.

At Ferndale the road crosses the east branch of the Mongaup river, the scenery around which is wild. Liberty falls, nearby, have an added interest. Lake Ophelia at Liberty is a pretty sheet of water, and the highlands about

Eastman's Glen in the Vicinity of Livingston Manor, N. Y.

Mamakating is on the other slope of the same mountain, and near this is Mamakating park on the banks of the lake by the same name, a beautiful body of spring water covering 100 acres.

Connection is again made with tour No. 61 at Wurtsboro, on its return from New England points. Within 1.5 miles of Rock Hill are six lakes, besides numer-

this region form a chain of foothills extending to the Catskills, 20 to 40 miles distant, although in plain view, from the broad plateau on which the town is located.

Parksville is in the heart of an immense trout country. Livingston Manor, at the junction of the Willowemoc and Little Beaverkill rivers, is situated in a wide valley, and the surrounding hills lend

Chestnut Point at the Head of Lake Hopatcong, N. J.

much to its attractions. Among the points of interest are the celebrated Eastman, Marguerite and Woolsey falls, near the highway.

It is said to be worth 10 years of city life to spend a week among the trout haunts in the vicinity of Cook's falls. At East Branch the Beaverville pours its spring waters into the Delaware, and bass fishing is said to be the best in the state. The remainder of the distance into Binghamton is by way of Hancock, Rood's Creek, Deposit, Damascus and Windsor.

One of the Pretty Lake Scenes at Laurel Springs, N. J.

CROSSING MOUNTAINOUS PENNSYLVANIA.

Part of the Transcontinental Route from Philadelphia Westward to Pittsburg, Thence to Lake Chautauqua and Buffalo and Return Over the Poconos.

CCROSSING and recrossing the mountains of Pennsylvania, the itinerary outlined as No. 60 will make its appeal to those who enjoy rich scenery and are not adverse to testing the merits of the car. The start is made from Philadelphia, and it is possible to utilize portions of this itinerary in making a transcontinental tour from almost any point in the East.

Philadelphia is left by way of the beautiful Fairmount park. Bryn Mawr is the seat of Bryn Mawr College for girls. Paoli is the scene of an American defeat in 1777. Fine views of the Chester valley are obtained a little later. Lancaster was the state capital from 1799 to 1812, when it was removed to Harrisburg. The Susquehanna is crossed at York, which is noted for its slate quarries and old sulphur springs.

Gettysburg is the most elaborately and accurately marked battlefield in the world, having more monuments and memorials than all other battlefields combined. The National Cemetery is a beautiful spot and the night's stay in this historic environment is none too long. It is possible to locate the points at which the different detachments of the opposing forces made history in the memorable conflict. Seminary ridge, guarded here and there by guns; Cemetery hill, with its earthworks still intact; Culp's hill, with its battle scarred trees; Cemetery ridge, with its long line of monuments; Devil's Den, with its bullet marked boulders; the Peach Orchard, the Whirlpool of Death and the Bloody Angle, are all spots that every American desires to visit.

Splendid mountain scenery compensates for the poorer roads leading to Bedford. Chambersburg was the site of Lee's camp, when he decided to march on Gettysburg, and the second day's route thus reverses that taken by the Confederate general after destroying the stores at Chambersburg. Near Bedford are the famous Bedford springs, and some excellent drives are to be enjoyed in this

vicinity. Most tourists will desire to make this the night stop, proceeding to Altoona in a separate stage.

The road to Altoona is gradually being turned into macadam. While it is possible to make direct connections with Pittsburg from Bedford, it is more desirable to take the longer itinerary outlined herein. The way leads along the Alleghenies for the entire length. Beyond Altoona the roads are by no means the best in the country, although the rich mountain views obtained amply repay the tourist for visiting the section.

1897. Here may be seen Phipps Conservatory, ranking among the finest in America; the Carnegie Institute and the Carnegie library. In Pittsburg itself is located the Allegheny county court house, the main tower of which is 420 feet high and commands a splendid view of the valley.

The road to Sheffield and Warren is through the oil fields. There are some charming mountain views on the way to Butler, after which the tourist will find plenty to occupy his attention in studying the oil wells. After leaving Warren the next point of interest

One of the Many State Monuments on the Gettysburg Battlefield.

Pittsburg is best known as the Smoky City, and is famous for its steel works. It was settled in 1753 by the French, who built a line of forts along the Ohio and Allegheny rivers, that at this point being named Fort Duquesne. This was destroyed in 1758, and later was succeeded by Fort Pitt. The history of Pittsburg as such dates from 1765. Its commercial advantage is gained through the fact that it is in the centre of the richest coal district in the world.

Across the river is Allegheny, formerly a separate municipality, but incorporated with Pittsburg in

is Lake Chautauqua, one of the most remarkable sheets of water in western New York. The lake is nearly 20 miles long and although but seven miles from Lake Erie, is 720 feet above its level and its waters flow into the far-away Gulf of Mexico.

Several well known resorts are located on this lake, but perhaps the best known is that of Chautauqua. This is the home of the world renowned Chautauqua literary and scientific circle, where summer after summer, students from all over the world assemble, in the midst of surroundings

Washington's Headquarters at Valley Forge, as It Appears Today.

which cannot help but stimulate, and pursue their studies of the languages and scientific subjects.

Jamestown, at the eastern extremity of the lake, is only a short distance from Celoron, which resembles very much a seacoast resort. Excellent opportunity is offered for fresh water bathing, boating and fishing. All of the various resorts on the lake are connected by steamboats.

The route from Westfield to Buffalo is a portion of the main transcontinental route from East to West, or vice versa. At Buffalo the tour turns back toward Philadelphia, touching at Silver Springs, near Silver lake, practically the most western of the chain of small lakes in central New York.

Portage has a history dating back to Indian days. The settlement was so named because of the fact that the Indians were compelled to carry their canoes around the falls of the Genesee river. At this point the river makes three separate falls, at some little distance apart, and offers a pleasing sight. A splendid railroad bridge now replaces the portage at a considerable height, giving a view of all three.

Dansville is in the centre of the hop growing country, and for miles the fields appear on either side of the road. A little later the tour enters the grape country, in the valley of the Canisteo river, and during the remainder of the distance into Elmira luscious fruit tempts the tourist on every hand. Incidentally, it may be stated that this district is some-

what noted for its wine cellars.

Beyond Bath is Corning, with its cut glass factories. Then comes an excellent macadam road, along the Chemung river into Elmira. This night stop first became a permanent settlement in 1788, and was incorporated as the village of Newton in 1815. The name was changed to Elmira in 1828. It is now the seat of Elmira College and other institutions of learning. Perhaps it is best known as the site of the state reformatory. Its chief industries are rolling mills, railroad car shops, steel bridge works, automobiles, etc.

For the first 20 miles beyond Elmira the tour lies along the Pennsylvania line, before it finally crosses it at Athens. From this point mountains begin to make their appearance. The route is along the Susquehanna river and

affords some excellent scenery all of the way. The Lehigh Valley railroad here winds its way among the peaks in a manner almost miraculous and adds its share to the general picturesqueness. Perhaps the view is at its best at Tunkhannock, but the tourist will find sufficient cause for rejoicing all the way.

The night stop is at Wilkesbarre, located in the Wyoming valley. This is the shipping point for the rich and extensive anthracite coal beds in this valley. It was founded in 1769 and occupies a commanding position in upper Pennsylvania. A short distance to the west is Eagles Mere, or the "Lake of the Eagles." This is situated 2200 feet above sea level and is embedded like a brilliant emerald among the virgin forests. It is 1.5 miles long and one mile wide, and in many places 60 feet deep. Excellent opportunity for bathing is afforded, the beaches being covered with clean, sloping white sand.

More mountains are encountered on the way back to Philadelphia, these being known as the Poconos, one of the groups which go to make up the Blue Ridge. They share with the Catskills and the mountains of West Virginia and North Carolina, an average altitude of 2000 feet, with heavily wooded slopes, through which brightly rushing streams leap from crag to crag. The end of the journey is over better known ways in the Delaware river valley over the latter portion of the route from Delaware Water Gap as listed in itinerary No. 61.

Colonnade and Pergola at Point Chautauqua, N. Y.

OVER THE HILLS INTO NEW ENGLAND.

An Itinerary Outlined to Connect with Philadelphia and the South by Avoiding the Heavily Congested Traffic in New York City,

IN RESPONSE to the growing demand for an itinerary connecting New England with the South without the necessity for crossing New York City, that outlined herein has been selected as presenting features which will win instant approval. Many tourists, particularly women, find driving in the Metropolis to be a severe test of their nervous temperament. Tour No. 61 may be used in combination with any of the itineraries connecting these

two sections of the country.

Leaving Philadelphia, the way leads first to Camden, N. J., thence to Burlington, where Howe defeated Washington in 1777, resulting in the British occupancy of Philadelphia. Near here the Pennsylvania state fleet of 27 gunboats bravely fought the British squadron as it attempted to ascend the Delaware.

Bordentown was selected by Joseph Bonaparte, a brother of Napoleon, who made him king of

Naples, as a refuge after the disaster at Waterloo. He purchased an estate of 1400 acres, just north of the city and lived there until 1832. Later the state purchased the property and it is now known as Bonaparte park.

Beyond Trenton, the state capital, is Princeton, the site of Princeton University, founded in Elizabeth in 1746, and removed to this city in 1757. The battle of Princeton was one of the early and signal successes of Washing-

ton's campaign against the British. Nassau hall was utilized as a barracks for a time during the war and later the Continental Congress held sessions there.

The night stop is at Suffern, pleasantly situated among the Suffern hills, more of which are traversed the second day on the way into the valley of the Hudson, which is crossed by the Nyack ferry into Tarrytown. The route then leads across Westchester county into Connecticut.

Near Greenwich is an old cemetery where stood the church around which Gen. Israel Putnam and his band of 60 men fought off the British as long as possible, and then, since leaving by the highway would expose him to danger, he drove his horse down a flight of stone steps. The next day Gen. Putnam made a successful attack upon the enemy at Stamford.

This tour continues along the so-called shore line to Bridgeport and New Haven, passing a number of pleasantly situated seaside resorts, thence by way of North Haven with its many brickyards to Wallingford, famous for the part its silversmiths have played in the industrial history of the country. The hanging hills are passed on the way to Meriden, also well known in the silver business. West Peak, near by, commands a view extending from Hartford on the north to New Haven and over Long Island sound on the south.

Berlin is accredited with being the birthplace of the tin making industry in America, the first tinware having been produced here in 1775. For many years it was the home of a large number of tin peddlers who traversed the entire country from Mobile, Ala., to Montreal, Que.

The route from Hartford, the state capital, northward to Springfield, Mass., is on the east side of the Connecticut river, and the return is on the west side, thereby affording ample opportunity to enjoy the splendid roads and the particular beauty of the rich tobacco country. After the return to Hartford the tour turns westward along the Farmington river, through Satan's Kingdom with its wild tumbling waters, and into the Naugatuck valley at Winsted.

Then begins the ascent to Norfolk and Canaan, over some of the highest land in the state, and

with a sweeping view of the Berkshire hills to the north and the Litchfield hills to the south. Many caves of unknown extent are to be found in these hills, which overlook a number of pretty little lakes. At Salisbury, the iron mines will attract deserved attention. Lakeville shelters an interesting summer colony of New Yorkers. More iron mines are passed on the way to Sharon, and the tour then enters New York State, for the night stop at Poughkeepsie, the seat of Vassar College for young ladies.

Crossing the Hudson the itinerary enters some of the most inter-

many charming views of the section. Ellenville is located right under the shadow of the Shawangunk mountains, which rise to a height of 2500 feet and are crowned with castellated, massive bluffs, stretching for miles along their crest. Summitsville overlooks the entire length of the Mamakating valley.

Wurtsboro was first settled by the Dutch in 1660, and is surrounded by a number of lakes, which furnish excellent fishing grounds. The same may be said for Westbrookville and Cuddebackville, on the way to Port Jervis. The last named may be re-

Mts. Tammany and Minsi in the Delaware Water Gap.

esting country in the vicinity of the Catskills. New Paltz, on the west bank of the Wallkill, was settled by Huguenot refugees from France in 1683. Many of its old stone houses, with high, steep pitched roofs, remain today much the same as when they were erected over 200 years ago. The surrounding country, with its smiling, well tilled fields and vine clad hillsides, still bears the imprint of the thrifty Frenchmen, who reclaimed it from the wilderness.

Napanoch is a favorite resort of artists, who take particular pleasure in transferring to canvas the

garded as the hub of the summer resort region. It is at the junction of three states—New York, Pennsylvania and New Jersey—this point being on a rock at the confluence of the Never Sink and Delaware rivers. Other points of interest are the old Barrett toll bridge and the Indian fort in the northern part of the town. Pretty drives may be taken into the Never Sink valley, Hawk Nest road and Saw Kill falls.

Dingman's Ferry is near Dingman's falls, the prettiest in Pike county. These are four in number, the highest being Soap-

Westchester County's Splendid Roads at Briarcliff Manor, N. Y.

Trough, while Silver Thread has a sheer drop of 150 feet. A thick growth of forest completely arches the falls, forming a sort of natural tunnel, up through which one may see only a scrap of blue sky.

At Delaware Water Gap, the Delaware river flows between two high mountains. That on the Pennsylvania side is named Minsi, but that on the Jersey shore has the more commanding cognomen of Tammany, although it goes without saying that such has not always been the case. The tops of these peaks are each over 1600 feet from the bed of the river.

Bethlehem offers much of historic interest, as well as considerable picturesque scenery, notably the very old Moravian school and cemetery, the latter with the grave of Uncas, mentioned in more detail elsewhere. Splendid views reward the tourist throughout the remainder of the distance into Philadelphia.

ENCIRCLING THE STATE OF NEW JERSEY.

Following the Coast Line from New York to Cape May, Thence Along the Delaware Bay to Philadelphia and Return Over the Main Trunk Line.

SINCE New Jersey lifted the ban against non-resident automobile owners, motorists have found it rich touring ground. The itinerary presented herewith offers opportunity for visiting the entire coast line from New York City to Cape May, thence along Delaware bay to Philadelphia, and back to New York over the main

route across centre of the state.

The outward journey crosses Staten island and enters New Jersey at Perth Amboy. Red Bank, on the Navesink river, is a famous yachting resort. Long Branch is one of the best known watering places in the United States and derives its name from the "long branch" of the Shrews-

bury river near by. During President Grant's administration Long Branch was the summer capital, and President Garfield died in the cottage at Elberton.

Asbury Park is another popular seashore resort, adjoining which is Ocean Grove, once covered with the tents of the Methodist Association, but now the summer

Where the Delaware River Has Worn Its Way Through the Kittatinny Mountains at Delaware Water Gap.

headquarters of bishops and deacons. No intoxicating liquors are allowed on the grounds and on Sundays all traffic of whatever nature is prohibited.

Lakewood, in the heart of the pine woods, is a winter as well as a summer resort, and there are numerous drives in the pine forests of that section. Georgian Court, the summer residence of George Gould, with its famous Italian gardens, etc., is within easy driving distance.

Atlantic City is situated on Absecon island, a sandy strip separated from the main land by salt marshes. Perhaps it is the best known seaside resort in America and hundreds of thousands of tourists visit it annually. It has nearly 1000 hotels, with accom-

routes between the two cities, and offers a pleasant alternative to that given in itinerary No. 61 for those who desire to reach the New England territory and do not object to the congested traffic of the Metropolis.

Atlantic City Possesses One of the Best Known Bathing Beaches and Recreation Spots in America.

modations for over 300,000 guests. Besides the famous board walk there are five piers extending into the ocean from 500 to 3000 feet, these being plentifully supplied with amusement pavilions, theatres, etc.

Cape May lies at the extreme southern end of the state, and was named for a Dutch navigator, Carolus Jacobsen Mey, who rounded the headland in 1623. Like Atlantic City, it has its board walk and piers, although on a somewhat smaller scale. The route from Cape May to Philadelphia lies through the rich market gardening country, which supplies the produce for that market.

The return to New York is over one of the most frequently used

CROSSING THE MASON AND DIXON LINE.

A Three-Day Tour Designed to Afford Connections Between Washington, Philadelphia and Gettysburg, and Between the North and South.

OFFERED as the connecting link between the South and the North, itinerary No. 63 starts from Washington and visits Philadelphia and Gettysburg. It thus provides two means of communication between these two sections of the country, either of which may be followed with profit by the tourist who enjoys interesting scenery and good roads.

As outlined, the route from Washington to Philadelphia follows the main trunk line through Baltimore, Md., and Wilmington, Del. Good macadam marks a major portion of the way. Baltimore is one of the chief oyster packing centres of the world. It is a manufacturing city of importance and has a number of fine public buildings. Druid park, a 700-acre plot, with varied native forests, is beautifully laid out and contains a number of fine drives.

At Havre de Grace, the Susquehanna river is a full mile wide. At Perryville the road crosses a long railroad span, which has been transformed into a highway. Wilmington is noted for its parks, one of which is located in the Glen of the Brandywine, a name which is familiar to students of the Revolution, and another is Rockford park, where a handsome statue of Thomas F. Bayard is to be seen. Here also are to be found the famous Dupont powder works. The old Swedes Church was built in 1698 by the first Swedish colony to locate in America.

The route from Philadelphia to Gettysburg is identical with that offered for the first day in itinerary No. 60.

Emmitsburg, just across the Mason and Dixon line, is the seat of Mt. St. Mary's College, a Catholic institution, which was founded in 1808, and which has a reputation that is world wide. The Mother House of the Sisters of

Charity is two miles distant.

Frederick, laid out in 1745, is in the centre of a rich limestone plain near the Catochin mountains, thus accounting for Whittier's "Green-walled by the hills of Maryland," in "Barbara Frietchie." The city was the terminus of a railroad opened in 1830, the grading work for which was done by Charles Carroll of Carrollton, then the only living signer of the Declaration of Independence. It was at Frederick that Lee established himself after defeating Mc-

Clellan in 1862 and called upon the people of Maryland to rise against the Union. The people refused to obey and McClellan was able to dislodge him with 70,000 men. Francis Scott Key, the author of "The Star Spangled Banner," is buried in Mt. Olivet cemetery.

The remainder of the trip into the National Capital is over good macadam road and through interesting historic country.

DELIGHTFUL TOURS IN THE SOUTHLAND.

Washington-Atlanta-Tuscumbia-Nashville-Louisville-Cincinnati-Wheeling-Pittsburg-
Washington-Atlanta-Savannah-Jacksonville-Tuscumbia-Memphis-New Orleans.

ROAD conditions in the South have improved decidedly since the running of the 1911 Glidden tour, and it must not be forgotten that the Atlanta-New York tours of 1909 and 1910 did their full share to bring the value of improved ways to the attention of the people in this district. The main itinerary outlined herein, No. 100, combines a portion of the 1911 Glidden tour along the Atlantic seaboard, with a portion of the 1910 Glidden in Tennessee and Kentucky. It is anticipated

100, the remainder of the route will be found to afford what is regarded as the best means of getting into Jacksonville by automobile. While some of the roads are not to be considered ideal, it may be suggested that there are drives in and out of Jacksonville which are the equal of those in any section of the country. Itinerary No. 102 takes the tourist to New Orleans and the same thing holds true of this in a measure. The Louisiana cities hold much of interest for the tourist passing

ITINERARY NO. 100.

Night Stops—Washington, D. C.; Richmond, Va.; Henderson, Winston-Salem and Charlotte, N. C.; Greenville, S. C.; Atlanta, Ga.; Birmingham and Tuscumbia, Ala.; Nashville, Tenn.; Mammoth Cave and Louisville, Ky.; Cincinnati and Zanesville, O.; Pittsburg, Penn.; Cumberland, Md. Sixteen Days, 2150.2 Miles.

The National Capitol Building at Washington, D. C.

that the tourist will take up this routing at Washington, D. C., and return to that point by way of the Middle West. It may be added that this itinerary furnishes connecting links in two transcontinental tours.

Itinerary No. 101 is given for those who desire to reach Jacksonville, Fla. The start may be made from any point in the North, or any other section of the country for that matter. After reaching Atlanta over itinerary No.

through that section of country.

Respecting the main tour, it may be added that the route lies through some of the richest historic sections in the South, with splendid views on the way to Atlanta from Washington, and again in Tennessee and Kentucky. The return to Washington from Louisville follows somewhat closely the old national highway in places. There ought to be little difficulty experienced in making the daily mileage as outlined.

ITINERARIES COVERING THE MIDDLE WEST.

Buffalo to Chicago and Return by Way of Detroit and Canadian Points--Detroit to Cincinnati, Indianapolis and South Bend--Chicago-Indianapolis-St. Louis.

WHILE the Middle West does not perhaps offer the scenic grandeurs of New England and the East or the Pacific Coast and the Far West, there is abundant reason for outlining the itineraries presented herewith, aside from the desire to present additional routings which may be utilized in making transcontinental tours. An effort has been made to include in these itineraries a section of the country which not only will appeal to those who are making through tours, but those who are searching

amount of damage to some of the roads over which this tour passes, it is understood that most of these have been placed in first-class condition. The route between Cincinnati and Indianapolis may be utilized as a portion of the transcontinental journey if desired.

Itinerary No. 153 offers the transcontinental tourist two options. Going from east to west, Indianapolis may be reached by way of Pittsburg and Cincinnati, utilizing other itineraries mentioned herein. The connection be-

for good roads and plenty to divert the attention.

Itinerary No. 151 is outlined to connect Buffalo with Chicago over the so-called main transcontinental route. The return offers an option, with opportunity to visit some of the interesting centres of the industry, including Detroit, and a decidedly picturesque portion of Canada. The roads, both going and returning, are of such character as to leave no room for criticism.

Itinerary No. 152 connects Detroit with the South, and while the disastrous floods of the early spring of 1913 did an immense

tween Indianapolis and St. Louis is that utilized by the Indiana Manufacturers' Association in 1913. Those who desire may follow main transcontinental route to Chicago and then go to St. Louis by reversing the latter portion of this itinerary.

THE FAR WEST AND THE PACIFIC COAST.

Suggestions for Transcontinental Touring, Reaching the Great Northwest, Traversing the Coast Line, the Rocky Mountain Districts and Canadian Points.

WITH the interest in good roads which has been manifested by the people of the Far West and Pacific Coast regions during the past few years, and the steady improvement in the construction of the automobile, it is not entirely true to state that any road in the United States is impracticable. However, it goes without saying that some roads are much better than others, even in the mountainous districts and desert portions of these sections.

It is anticipated that many eastern motorists will plan transcontinental tours in visiting the Panama-Pacific exposition in 1915. For this reason, The Automobile Journal has sought to offer additional information of this character in this Eighth Annual Touring Number.

Itinerary No. 201 may be used in combination with other tours previously outlined, as an alternative for the Lincoln highway. The roads from St. Louis to Salt Lake City have been almost entirely rebuilt during the past two or three years, and the way from Salt Lake City to Reno is over the better known transcontinental route, which has now been supplanted by the Lincoln

highway. Much road work also has been done on the so-called southern transcontinental route, listed as itinerary No. 202, from Memphis to Los Angeles.

Itinerary No. 203 is offered for those who have been requesting detailed information concerning a northwestern tour leading from Chicago to Seattle. The Automobile Journal's routing car found this very bad in places, particularly in western Montana, across Idaho and in eastern Washington. This applies, of course, to the mountain ways, since the roads in the vicinity of the cities visited have been improved. It may be suggested that a much better route is to be found by using itinerary No. 208, connecting with either the Lincoln highway or the Pikes Peak transcontinental route at Salt Lake City. However, modern automobiles can negotiate any route listed herein.

The Winnipeg-Galveston route, listed as itinerary No. 206, will be found to have received very careful attention on the part of road workers, and throughout most of the distance good roads will be encountered. This year, as well, Vancouver, B. C., is included in the listings, and it is under-

stood that much road work has been done over this section. The other routes included herein are somewhat well known to transcontinental tourists.

ITINERARY NO. 201.

St. Louis to San Francisco.

VEEDOL CHART.

The Platt & Washburn Refining Company, 7 Broadway, New York City, manufacturer of Veedol motor oil, refined from Pennsylvania paraffine petroleum, has made an exhaustive study and experimentation of the lubrication requirements of internal combustion engines. The company has compiled a chart as the result of its scientific research, and a copy will be mailed free to owners and the trade. It contains lubrication information that will be of decided value to automobilists.

WOODS MOBILETTE.

The International Cycle-Car and Accessories Company, with executive offices at 1109 Security building, Chicago, has been organized for the general distribution of the cars and parts manufactured by the Woods Mobilette Company, Chicago.

The policy of the new company will be to give absolutely dependable service. Every dealer will be dealt with directly to the satisfaction of himself and the car manufacturer, insuring economy, speed and efficiency of the work.

WALLACE ABSORBERS.

The Bresler Wallace Sales Company, 1031 Dime Bank building, Detroit, is marketing the Wallace shock absorbers for

the model T Ford car. They replace the usual spring shackles and look like nothing so much as the logical spring hanger. The Wallace shock absorbers lie in direct line with the path of shock impulse and move with it. The maker points out that even the slightest shock is transmitted directly to the spiral springs, and that no part of it is taken up by friction in other moving parts. The Wallace device is moderately priced.

NATIONAL HOSE.

The Staybestos Manufacturing Company, Germantown, Penn., manufacturer of the well known S-M-C asbestos brake lining, is marketing the National radiator hose, which is constructed of the same high grade material and workmanship for which the products of this concern are noted. The hose comes in 50-foot lengths, but is supplied in multiples of five-foot lengths.

MOSLER SPARK PLUGS.

To obtain maximum efficiency from the motor it should be equipped with spark plugs, the points of which are properly located in the combustion chamber. A. R. Mosler & Co., New York City, maker of the well known Spit Fire spark plugs, is issuing a booklet containing much valuable information on ignition. Each standard make

of car is listed, and the proper type of plug to use with it is described and illustrated. The booklet will be mailed free upon request.

RAYBESTOS.

The Royal Equipment Company, 1378 Bostwick avenue, Bridgeport, Conn., is manufacturing the well known Raybestos brake lining, the friction material with the "Silver Edge". This lining is made in conventional widths and thicknesses and sold with a liberal guarantee. The company invites motorists, when in Bridgeport, to inspect its factory.

MOTOR TROUBLES.

The Vacuum Oil Company, Rochester, N. Y., has prepared a pamphlet on the construction, operation and lubrication of the automobile engine, in which are described motor troubles, their cause and remedy. The pamphlet will be mailed free upon request.

SE-MENT-OL.

The Northwestern Chemical Company, Marietta, O., is marketing Se-ment-ol, a chemical preparation for stopping leaks in the radiator. It comes in powder form and is poured into the radiator, and dissolving in the water, effectually stops leaks without injury to cooler.

TOURING ENGLAND AND THE CONTINENT.

Scenic Beauties and Historic Places of Interest Easily Reached by Motor Car, and Suggestions as to the Best Plans for Enjoying the Foreign Trip.

BY ALL means, the American tourist should "See America First", but this is no reason why the scenic beauties and historic wonders of the Old World should not be enjoyed. And the automobile has done its full share to make this possible, even for those of moderate means.

In other years it has been deemed advisable to include in the Annual Touring Number of The Automobile Journal detailed information as to shipping the car abroad, and much other data which can no longer be regarded as of especial value. Undoubtedly there are those who will prefer to take their own machines with them, but to those it is only necessary to say that the shipping companies will supply every requirement, even to procuring the driving licenses and all other papers needed.

The tourist of moderate means, however, will do quite as well to arrange with one of the numerous American concerns maintaining foreign offices, for the rental of a machine while abroad—or, more properly speaking, for the rental of machines, since it will be found advisable, if the stay is to be of some length and it is desired to visit a number of countries, to provide for several cars, as they are needed. Circumstances will enter very largely into the consideration of this phase of the situation.

In Great Britain, for instance, it would prove advantageous to make London or Liverpool the headquarters, leaving one point or the other for a tour of England, Scotland and Wales. The car may be rented in one city and left at the other, upon the completion of the tour. It probably will be necessary to rent a machine in England, and have it shipped across the Irish sea, if it is planned to visit the Emerald Isle, and, as will be indicated later, it is strongly recommended that this be included in the itinerary.

In many portions of France and Germany, as well as some of the other continental countries, it is possible to do considerable touring in taxicabs. The initial charge for a private taxicab in Paris is 85 centimes, as compared with 75 for the public cab. This permits

a drive of 1300 meters, and, thereafter, the charge is the same for both, 10 centimes for each 300 meters. A centime is three-fifths of a cent and a meter is 3281 feet, so that the initial charge is 17 cents for the first .8 mile and two cents for each .18 mile thereafter. It would be possible to visit the chateaux district from Paris at a taxicab charge of \$20, for instance.

It may also be suggested that it is possible to purchase a car abroad, and sell it upon returning to America, and in many instances it will be found that this method works out very favorably as compared with the expense and inconvenience of shipping one's own machine. Many Americans follow this plan.

Great Britain.

Because it is possible to cover so much ground in such a little time, Great Britain undoubtedly is the chief goal of American tourists. To many of them, it is still the "Mother Country", although their forebears may have come to the New World several generations since. The similarity of the customs and the identity of the language have done much to foster this condition. It may be added, as well, that the advent of the motor car has helped Americans to discover the many rich beauties of this island empire.

London, besides being the largest city in the world, possesses an untold wealth of historic interest. Trafalgar square is the starting point for all tourists, since it is the centre of the hotel district. The National gallery, with its superb collection of paintings, including the new

wing with its 2000 historical paintings of national celebrities from the days of the Plantagenets down through those of the Tudors, the Stuarts and the Guelphs, is on the north side of the square. Leading westward is Pall Mall, the centre of club land, and at the Green park end of the Mall is an irregular brick building, St. James' palace, where, although the British royal family no longer occupies it as a residence, is held the court of St. James. Marlborough house, now the town residence of Dowager Queen Alexandra, is separated from this building by a narrow car-

Hotel de Ville, or City Hall, Brussels, Belgium.

Windsor Castle, Home of the British Royal Family.

riage drive, and across Green park, is Buckingham palace, the London residence of King George.

Going down Victoria street, the campanile of Westminster Cathedral is seen at the left. This is held to be the most important addition to the architecture of London since Sir Christopher Wren built St. Paul's. At the top of Victoria street is Westminster Abbey, the first church of which name is said to have been erected on this spot by Sebert, the Anglo-Saxon king, on the site of the ancient temple to Apollo. At that time it was an island in the middle of the Thames. That church was destroyed by the Danes, and was rebuilt by Edgar, only to be destroyed by fire soon after its completion under Henry III. The present structure was built by Edward I, although his immediate successors added their portions, and is said to be one of the most perfect Gothic structures in existence.

On the opposite side of Parliament square is the Palace of Westminster, officially known as the Houses of Parliament, built in 1840-67. The original building on this site, which was the royal residence for hundreds of years, is said to have been occupied by King Canute, and is known to have been of a very ancient date. Opening out of Parliament square, through the short Parliament street, is Whitehall, where are now situated all the principal executive offices of the British government. Whitehall opens into Trafalgar square from the south. To the east leads the Strand, which joins Fleet street nearly a mile away, at Temple Bar, where the King is met by the Lord Mayor of London, upon each return to the city proper.

Space does not permit more than a mention of the other points of historic interest in this immediate vicinity, but they include the Bank of England, or the "Old Woman of Threadneedle Street", founded as a private institution in 1691, and in-

corporated as a state bank three years later; London bridge, and the Tower of London, with which few buildings in the world can compare for a history of tragedy and suffering.

England.

Assuming that London is made the starting point for a tour of England and Wales, it is probable that the short trip to Windsor will first engage the attention. Windsor is known as the royal borough, and for eight centuries it has been the private residence of the English sovereign. It is held to be the finest royal castle in Europe, and when the royal family is not present, it is open to tourists Tuesdays, Wednesday and Thursdays.

Oxford and Cambridge are too well known as university towns to need special comment, although it is interesting to recall that Oxford University is undoubtedly the oldest in the world. The exact date of its foundation is unknown, but it was incorporated in 1244. No American should leave England without a visit to Stratford-on-Avon, the home of William Shakespeare, and also of John Harvard, the founder of Harvard University.

England is rich in cathedrals and baronial castles dating back for centuries. Near Salisbury is Stonehenge, the mysterious Druidical remains, the exact meaning of which never has been learned. But no part of the country is so full of legendary record as Cornwall. A start for this district may be made from Bath, the oldest and best preserved of the Roman settlements in England. Plymouth was the last point touched by the Mayflower on its famous voyage to the new world. The Scilly Isles are held to be the much sung Hesperides of the Greek poets, and the ancient legendary kingdom of Lyonesse. It is a matter of historic record that the Phoenicians came to this portion of England to secure tin long before

One of the Typical Structures in the Chateaux District of France.

Aberfeldy Falls, Scotland.

offers mountain scenery quite as entrancing as the Alps, although not so lofty. The walls of Chester are hoary with age, and one should by no means miss the ancient timbered "Rows". Wrexham has a peculiar interest for Americans since Elihu Yale, founder of Yale University, lies buried there. Wrexham tower is one of the seven wonders of northern Wales, the other six being Snowdon, Pystyll Rhaiadr, St. Winifred's well, Overton church yard, Gresford bells and Llangollen bridge.

For such a small district no portion of England can please the tourist more than the lake district, the home of Wordsworth. The sylvan glades of Windermere are as different from "sweet" Ullswater as the mountain grandeur of the district around Derwentwater.

Scotland.

Scotland is the most romantic country in Europe, and, although the heroic warriors of the Middle Ages have passed away, the charm of those unforgettable days still hangs over the mountains and the burns. It was in the seventh century that Edwin built his burgh, or castle, around which has since been built

Harwarden Castle, Gladstone's Home.

Julius Caesar thought of crossing the channel on his mission of conquest.

Wales.

In the Wye valley of southern Wales are Hereford, the ancient capital of Pomonia, with its grave of St. Ethelbert; Simond's Yat, said to be the most beautiful spot in Britain; Monmouth and its old world air, the scene of Shakespeare's "King Lear"; Tintern Abbey, with its ivy-clad walls and luxuriant orchards, and Chepstow, with its giant fortress, built by Caesar on an edge of a precipice overlooking the river.

across the Forth bridge, in Dumferline, where Bruce's body is buried, is the home of Andrew Carnegie.

Robert Burns was born at Alloway, two miles from Ayr, near the "banks and braes of Bonnie Doon". From Ayr it is a quick run to Glasgow, the second city of Great Britain and the third in the empire. From Glasgow it is possible to make expeditions to the Firth of Clyde and Oban, the capital of the Highlands. Time also should be taken to visit the wonderful lochs of this region and the vale of Glencoe, where the rays of the sun are said to never penetrate.

Ireland.

There was a time when visitors to the Emerald Isle were wont to first make their wills and then commit themselves to the hands of Providence, so dangerous was the undertaking believed to be. But for a hundred years or more tourists have been singing their praises of this beautiful spot. It is only within the past few years that motoring has been considered at all possible. Great Britain has been expending large sums in road work, particularly in the north of Ireland, and motor touring is now coming to be very popular.

Americans generally have the first opportunity to land at Queens-

town, from which point it is only a short run to the Lakes of Killarney. Valencia Island is termed the "next county to America", and is rich in verdant tropical palms and fuchsia glades. Kenmare is a picturesque old town and one of the landmarks of the old Kerry coast road.

And the north of Ireland is quite as interesting, but in a somewhat different way. The mountains and

the wonderful city of Edinburgh. It is but a short drive to Abbotsford, the home of Sir Walter Scott; Dryburgh Abbey, where he is buried, and Melrose Abbey, where, under the altar, lies the great heart of King Robert the Bruce. And

Kenilworth Castle, Kenilworth, England.

Benny-Gloe Pass, Scotland.

Old Roman Baths at Chester.

great art centre, the capital of science; a city with magnificent buildings, enshrined in historic settings, with museums rich in priceless masterpieces, churches steeped in the romance of the Middle Ages, magnificent boulevards, theatres, operas, the finest shops, exquisitely dressed women, the most joyous pleasure loving populace, and the most brilliant capital in the world.

As brief as this description must be, it is impossible to omit reference to the environs of Paris, some of which have had a share no less important than the city itself in the making of world history. Versailles was the favorite residence of Louis XV, and the park was the scene of the famous, though no less scandalous, revels of the monarch and his courtiers. It is in this palace that the president of the French republic is

now elected by the two chambers sitting as one. Fontainebleau, on the other side of Paris, was erected by Francis I, and was the favorite residence of Napoleon. It was here that he kept Pope Pius VII a prisoner for two years, among the priceless art treasures stolen from Rome. The forest is the most beautiful in France and covers 42,500 acres.

France.

Paris is the one city which all Americans wish to visit when setting out on a continental tour. It is the oldest city of the northern empire, a

It is replete with picturesque glades and gorges, poetical ponds and wonderfully carved rocks, although it has been ravaged several times by fires.

Orleans and the chateaux district, in the valley of the Loire, is a section which is best visited by motor car for it is dotted with mediaeval towns and chateaux, the homes of many of the princely families of France. Orleans itself was made famous by Joan d'Arc. Vichy was a popular spa of the Roman days and is

Raglan Castle, Near Tintern.

still one of the most frequented watering spots in France. Nimes is the site of an interesting Roman theatre, not quite as large as the Colosseum at Rome, but in a much better state of preservation. Another amphitheatre is to be seen at Arles on the Rhone, an important station in the time of the Romans.

Fifty miles south of Avignon, where for 72 years a rival series of popes ruled in opposition to those at Rome, is Marseilles, the principal seaport of France. This city was originally founded in 600 by the Phoenicians and always has been a port of considerable importance. From Marseilles an excellent motor road follows the coast to Toulon, the chief naval port of France, and the Riviera, which, as every motorist knows, begins at the Islands of Hyeres and extends to the Italian

Conway Castle, in Wales.

Monastery La Grand Chartreuse.

frontier. The marvelous beauty of this district, with its splendid winter climate, its luxuriant foliage and the opulence of some of the better known resorts, is too well known to need extended comment.

Italy.

Crossing the Italian frontier from the Riviera, the first city of importance is Genoa, marvellously situated at the end of a wide gulf, the banks of which are

Coldes Aravies, in Haute Savoie.

crowned with olive clad hills. Its striking position, the beauty and number of its palaces, and the picturesque-ness of its streets make Genoa of especial interest. A little further along is its greatest rival, Pisa, once located on the shores of the Mediterranean, but now about eight miles inland. The leaning tower, or campanile, at the east end of the cathedral, is 179 feet high and 13 feet out of the perpendicular. Near Pisa is the royal summer residence of San Rossore, where the King of Italy breeds camels.

From this point the country is extremely uninteresting until the dome of St. Peter's betokens the approach to Rome. The Eternal City is undoubtedly the most absorbingly interesting city in the entire world. Unlike Thebes, Athens and Babylon, Rome has continued to be a supreme force in the culture of the world and a treasure house of the marvels of the ages. For 26 centuries, as republic, empire, chief city of the Christian religion and, finally, as the capital of united Italy, it has held its sway.

The Roman Forum, with its gigantic ruins, continues to tell its story of the grandeur of Imperial Rome. Here may be found traces of the temple of Castor and Pollux, the tomb of Romulus, the house of the Vestals, the palace of the Caesars and the famous Golden House of Nero. The scene of the martyrdom of the Christians was Nero's circus, now the site of St. Peter's, the largest church ever built.

Naples is the city of glorious sunshine, although the older portion is a knot of twisting streets, flights of stairways leading from one terrace to another, and narrow alleys. The new Naples is a city of broad streets, spacious squares and majestic hotels. From the heights of Camaldoli a wonderful view of the bay may be had. Other cities of prominence which should be visited are Messina, Florence, Turin and Venice, the last named being the "Queen of the Adriatic", once mistress of the commerce of the world. It is built on 146 islands and the most interesting portion is that along the banks of the Grand canal.

The Italian lakes are best visited from Milan. The enchanting scenery of these lakes has been told in

story and on canvas for centuries. Como, on the shores of the lake of that name, is considered by many to be the most beautiful spot in all Italy. A splendid motor road leads to Como, along the shores of the lake.

Switzerland.

Switzerland is known as the "Playground of Europe". Geneva is the largest town, and is situated on the southern shores of Lake Geneva. Its interest lies chiefly in its historical and literary associations and in the beauty of the surrounding country.

Chamonix is the most famous of the mountaineering sections, and is located at the foot of Mont Blanc. It is reached from Geneva, over a splendid motor road, through the French Alps. The ascent of the mountain takes two days, and a visit may be made to the Mer de Glace, the largest glacier in Europe.

Aix-les-Bains is termed the "Queen of Resorts and the Resort of Queens". It is on the border of the little Lake Bourget, and is reached over one of the prettiest of motor roads in the very heart of the wildest mountain region of the Haute Savoie. Other points of interest reached from Geneva are Fribourg and Berne.

From the latter city the tourist should visit the old world town of Thun, and Inter-laken, the jewel of the Oberland, near the green foothills of the giants of the Swiss Alps. By a general concession of opinion, Interlaken is at the head of the Swiss health resorts.

Berlin, the capital of the German empire, is no longer slighted by the tourist. The social and official life centres around Unter den Linden, which runs from the royal palace to the Bradenburger Tor. Other German cities which will attract and retain the attention are Hanover, with its fine old palaces; Hamburg, an important commercial centre; Munich, the Athens of Germany; Heidelberg and its universities; Bremen, Lelpsig, Dresden and Cologne.

A continental tour would hardly be complete without visiting Belgium, Holland, Norway and Sweden and Austria-Hungary, but space does not permit any detailed description of their many individual attractions to the motorist.

The Valley of Gavarnie, One of the Many Scenic Beauties of the Pyrene Mountains, Between France and Spain.

MOTOR POSSIBILITIES IN SOUTH AFRICA.

AFTER 22 weeks' absence, devoted to a study of motor conditions in South Africa, C. H. Dunlap, export manager of the Hupp Motor Car Company, Detroit, states that there is an excellent field for automobiles in that section. Due to the lack of transportation facilities other than railroads, the ox cart is still the chief vehicle in use, save for the motor car, which is making splendid headway. Commercial travellers, mine operators and Boer farmers are taking to the automobile.

The colonial government has appropriated \$5,000,000 for the construction of good roads and the improvement of existing ones, the bulk of which are very poor, so that in sections remote from the principal cities motorists are often forced to drive across the veldt. This plan, together with excellent agricultural prospects for this year, is bound to render South Africa a great motor market for 1915.

SPEDOLENE TRUCK STARS IN PARADE.

Alex Warrell Rides Through Worcester at Occasion of Inaugural Exercises.

One of the most striking features of the parade, held in conjunction with inauguration of the Worcester, Mass., White Way, illuminated by the new city lighting system, was the decorated truck of the Continental Asbestos Corporation of that city, manufacturer of asbestos lubricants and Spedolene. This lubricant is composed of the finest grades of mineral ingredients, so compounded as to make the product especially adapted to the needs of gears, transmissions, differentials and bearings. Spedolene, the maker states, positively eliminates gear noise and lubricates under any temperature.

Alex Warrell, the inventor of Spedolene and president of the company, is seen in the centre of the accompanying illustration. Frank L. Backus is vice president of the company, J. H. Savery treasurer and manager, Geo. H. Warrell secretary and

sales manager, Ed. J. Cross and John J. Pollard directors.

RUSSIA TO HOLD MOTOR CONTEST.

Winning Makes to Receive Huge Orders for Imperial Army.

In order to determine what type and make of automobile is best suited to the requirements of the Imperial Russian army, an endurance run will be held in August under highest auspices. The run will cover 2500 miles and the winning make will receive an order of 250 cars for the army, the second one for 150, the third for 100 and the fourth for 50.

TRAVELS 838 MILES FOR \$5.86.

Detroit Men Make Trip to Indianapolis and Return in Car-Nation.

As an indication of successful competition between automobile and railroad travel, with the success on the side of the motor car, it is worth while to note the experience of N. T. Brotherton and D. D. Thurber of Detroit, who went to Indianapolis sweepstakes races and back, covering 838 miles in a Car-Nation at a total cost of \$5.86.

Motor Truck of Continental Asbestos Corporation, Manufacturer of Spedolene, Which Was Among the Most Impressive in the Worcester Parade.

FASHIONS FOR THE SMART TOURIST.

Every Requirement of Motorists Has Been Anticipated by the Creators of Touring Apparel---Styles Are Simple, Pleasing and Practical.

AUTOMOBILING in inappropriate attire reduces the pleasure of motoring to something considerably less than what it might be. This holds true of driving and riding in all seasons, but most especially in summer, when the car owner starts on his or her vacation tour. The problem of just the right clothes is not half so simple as the tyro might think; in fact, it would be quite intricate, were it not for the fact that during recent years the manufacturers of apparel have devoted their loving attention to the needs of the motorists, more specifically the tourists, and by planning and experimenting have arrived at the present state, when the owner need only enter a large city store to find everything in the line of apparel which he requires.

There, if he reviews the offerings of Dame Fashion, he finds all his dreams of comfort realized, all his imaginings of stylish smartness combined with practical usefulness. And how could it be otherwise, after thousands and thousands of men in a score or more of industries have outdone themselves in the desire to serve him?

Most of this year's styles are, generally speaking, simple, but tasteful, light and easy, but intensely practical. This applies both to men's and women's clothing.

One of the most impressive coats offered to "Miladi" is a novelty Russian cape coat, Fig. 5, which is a two-color stripe pattern on a pale tan ground. This color scheme alone, striking and reserved at once, lends a smart air to the coat, which is increased by the clever cut. The wide English revers harmonizes remarkably well with the sweeping lines of a roadster or speed car and

Fig. 1—Long Poplin Folding Duster. Fig. 2—Khaki Duster with Leather Cuffs and Button for Cool Touring Regions.

no less with the greater luxury of the comfortable touring machine. Fancy velvet buttons and collar add to the quiet elegance of this piece of apparel. The waistline is accentuated by a short, neat belt, fastened in the back by four buttons. This coat has special attractions for the lady tourist, driver or passenger, who travels in rather cool, mountainous regions, although it is undoubtedly comfortable anywhere when driving at fair speed.

A simple, light and easy dust coat of smart cut is shown in Fig. 4.

This duster is made of a very good quality of gray mohair. The raglan sleeve ends in a turned-up cuff without buttons, which gives a very pretty effect and can also be slipped easily into the upper part of the driving gauntlet if one is worn. The plainness of the design is obviated by the shape of the large patch pockets and the belted back, which helps to bring out the figure without in the least degree discomforting the wearer. The coat is extremely lightweight, but most effective in preventing dust from reaching the ordinary apparel of the tourist.

Of course there are a number of mohair duster styles differing only in small details and in color. Blue and dark gray seem to be favorites this year, although the tan coat is naturally preferred by motorists intending to travel in hot or dusty regions. All of these dusters have the turned down collar, comfortable sleeves—kimono and raglan sleeves share the field—and black, self or pearl buttons, leaving but little range for variation in cut. One blue mohair duster, which is a fair representative of the average type, with cuffs and pockets, is illustrated in Fig. 6.

Dusters made of linen are coming into vogue, or rather would be if they had not come already. As a fine specimen of this type of coat, reference may be had to Fig. 14. This dust coat is what tailors abroad would term an intensely American style, being distinctive, practical and impressive at the same time. Certainly there are few shades more advantageous to the stylish looking lady motorist than is that of natural linen setting off the pure sheen of the pearl buttons which close the coat in front and adorn the large size patch pockets. The kimono sleeve and beltless back make this style as comfortable as it is attractive in appearance, and considering that dust does not show on natural linen, this assuredly is an ideal coat for the lady who goes on a long distance tour.

A natural linen motor coat of rather English cut is the model seen in Fig. 7. This coat adheres more closely to the body, being held together by the belted back, giving it a trim look. The raglan sleeve makes, of course, for comfort and renders this coat a desirable style for the lady who drives herself when touring. A feature of the sleeve is that it has no cuff, but a neat tab fastening, which holds it fairly tightly in place and permits the driving gauntlet to slip easily over the sleeve end. The self buttons, four of which show in front and one on each of the large pockets, are in keeping with the modest elegance of the style.

A clever little hat which might supplement the above-described cape coat in an admirable manner is the straw seen in Fig. 6. This model is a chartreuse hat, with a bronze wing fastened to one side, a feature which is in excellent harmony with automobile luxury and speed. The crown is of moire, the top of white silk, giving a pleasant and consonant color scheme equally favorable to blondes and brunettes.

Somewhat simpler in form, but fully as pretty is the white hemp braid hat, Fig. 3, the only ornament of which is a white fancy ostrich pom-pom. The hat is small and secure once it is in place. The lady with a dark coiffure could hardly find a headgear better suited to her personal color scheme.

In Fig. 7 a white silk tailored hat of faille is seen. The design is very simple, a stick-up being the only trimming, which gives the hat that air of style which a high plume would lend to it, yet without entailing the fragility of a feather.

To the lady tourist who does not care for a hat, the Balmacaan cap of black and white checked silk serge, Fig. 4, should have its attractions. The wide visor protects the eyes, as might the rim of a hat, but the cap is of much lighter weight than a hat and, when crowning a round or girlish face, is by all means the non plus ultra of motor headgear.

Goggles are of substantially the same design

Fig. 3—White Hemp Braid Hat with Fancy Ostrich Pom-pom. Fig. 4—High-Quality Gray Mohair Duster with Raglan Sleeve and Balmacaan Black and White Checked Cap; the Latter Is a Favorite This Year.

Fig. 5—Three-Color Russian Cape Coat with English Revers and Belted Back. Fig. 6—Blue Mohair Duster and Chartreuse Hat with Bronze Wing and Silk Top.

Fig. 7—Linen Coat with Raglan Sleeve and White Silk Tailored Hat.

as they were last year, save for one type which has small shields hinged to the glass adjacent to the points where the temples are secured to them, so as to protect the eyes from side draft.

The photographs above described were obtained by the courtesy of The Outlet Company, 176 Weybosset street, Providence, R. I.

As for men's apparel, no small selection is proffered to the automobilist. Dusters of various materials are preferred in general, principally because this kind of attire is the most comfortable, constituting, at the same time, a perfectly water and dust proof covering, provided the right material is

chosen for the coat. With regard to this point, it may be stated confidently that never before has such a variety of fabrics been used for men's dust coats as this season, and it will be hard to find a motorist whose requirements cannot be filled from the following array of motor wear, which is by no means an exhaustive one,

but illustrates merely a selection from a large line of goods.

A novelty which is bound to meet popular taste is the folding duster illustrated in Fig. 1. The material is poplin, a very thin and cool fabric, which looks like silk and is on a par with it as to ability of being condensed in a very small space. The cut is wide and comfortable and the general appearance of the coat is very simple; there are no buttons, but hooks and eyes are used instead. The back of the duster is plain, without belt, so as to offer no obstruction to rolling when the coat is being folded. In the latter state the duster forms a small bundle of hardly four inches diameter and not more than one foot length, as shown in the illustration, where the man holds a folded up coat by a handle sewn to its inside.

Another new style is the Irish linen duster, Fig. 10, which comes in white and also in black and white, with cuffs and pearl buttons. This material is light, but entirely dust and water proof, and hence very practical for the gentleman driver. The same style can be obtained in mohair, silk or gabardine.

Gray linen crash dusters have the advantage that they stand rough usage very well, and to this fact their growing popularity is due. Fig. 8 illustrates a dust coat of this class, being quite a simple cut, yet one which will please many motor enthusiasts with whom comfort and practical shape are prime considerations.

A comparison of the various dusters reveals a considerable similarity of design among them. In fact, all the variation comes in by way of belted or beltless backs, cuff or no-cuff sleeves, plain or patch pockets. The variety lies, as has already been remarked, in the choice of materials, which, however, determines not only finish and color, but also to a great extent, the lines in which the material falls, thus having a notable influence on the general effect.

In Fig. 9 a silk pongee duster for the man who knows styles is shown. This material is one of the finest available for motor dusters; still it is very serviceable and many men will not consider any other for the touring outfit. The coat here shown is cut with a belted back, giving a

Fig. 8—Gray Linen Crash Duster. Fig. 9—A Very Stylish 1914 Covering: Silk Pongee Duster with Belted Back. Fig. 10—Irish Linen Duster with Pearl Buttons, a Novelty Which Comes Also in Mohair, Silk or Gabardine.

relatively close fit, together with the comfort of a light cover.

A departure from the general design is illustrated in Fig. 11. The dust coat here shown is a double-breasted style, with pearl buttons. It is made of gray mohair and presents a very distinguished appearance, being especially suitable to men of years.

What is known as a Balmacaan coat of Palm Beach material and considered to be one of the foremost men's styles of the year, is shown in Fig. 13. This style includes the kimono sleeve with cuff strap, making for smart appearance, which is true also of the pearl buttons trimming the coat. This duster is a very light one and extremely desirable for southern touring.

For driving in regions where cool weather is the rule, a khaki duster with leather cuffs and collar is the equipment of the wise motorist. Fig. 2 shows this type of motor coat. It closes tightly around the neck and gives excellent protection to the arms. Bone buttons are used.

There is little change in driver's equipments. One suit, made of khaki material and cut with high collar, consisting of breeches and Norfolk coat, is seen in Fig. 12. Canvas leggings are quite in favor as supplements to the outfit, which is also used frequently by motorcyclists. Gauntlets with lisle ventilating back, which have been favorite summer wear for some time past, go very nicely with this sort of suit. This outfit may be obtained in olive, brown and mauve shades of khaki, and the coat comes in belt and beltless styles.

The principal novelty in headgear is the "Holtite" cap, made of mohair, silk or gabardine, which is made to fit closely to the head by an elastic which lines the material inside. This cap is shown in Fig. 1.

Some caps this year are fitted with oil-treated silk, which forms a lining impermeable to perspiration, and shielding the material of the cap proper.

Another innovation in men's hats is the silk model shown in Fig. 11. The hat is of ounce weight and made in skeleton finish, combining lightness with style in a way which should give satisfaction to the hardest to please of automobile tourists.

We are indebted to Brown-
ing, King & Co., 212 West-

minster street, Providence, R. I., for the facilities offered us in viewing and photographing men's motoring goods.

Of course the apparel here shown and described does not include all classes of automobile wear used by motorists. Only the principal styles which are in almost universal demand have been taken up. To mention others, there is the mackinaw, which is a favorite throughout the year with sportsmen driving their own roadsters or speedsters, and among college men the tennis jacket is quite widely used. This type of covering is also favored by the fair sex, and alike with some other perennial styles, is sure to present a fine appearance. Many girl drivers are fond of middie dresses for touring, and such generally prefer blue fabrics to white, which it is next to impossible to keep clean on an automobile tour. In respect to footwear, this year shows hardly any change over the past year or two; in fact, there are scarcely any exclusive motor styles worthy of special notice.

Fig. 14—Natural Linen Duster with All Buttons Made of Pearl.

Fig. 11—Double-Breasted Gray Mohair Duster and Skeleton Finish, Ounce Weight Silk Hat. Fig. 12—Driver's Suit of Khaki, Available in Several Shades. Fig. 13—Balmacaan Model of Motor Coat, of Palm Beach Fabric.

CARING FOR THE LEAD STORAGE BATTERY.

IN PREPARING the motor car for the tour the storage battery should not be overlooked, as it is important that it be in the best of condi-

Type of Hydrometer Syringe Utilized for Testing Electrolyte of Storage Batteries.

tion if efficiency is to be obtained from the lighting and motor starting equipment. Properly cared for, the lead storage battery gives good service and proper maintenance is obtained by adhering closely to the instructions of the maker.

Those who rely upon the service station should have the battery and all wiring connections examined, and the same holds true of the lighting dynamo. It is very probable that the generator will require lubrication or that some slight adjustment may be necessary, this, of course, depending upon the time the system has been in service.

The owner who cares for his battery will find explicit instructions in the book accompanying the lighting and starting equipment, and if the book be missing the maker of the battery will supply one free of charge upon the receipt of a letter or postal card.

If the car has been in service for some time it is suggested that the battery be removed from the container and the last-named member thoroughly cleaned. Ammonia will neutralize the effect of the acid used in the electrolyte, and the battery box should be wiped clean and dry. Clean all terminals and connections and coat with vaseline. Examine all wiring for loose connections and inspect each lead to make sure that the installation is not chafed. If a worn spot be found, either renew the wire or wrap it well with friction tape.

It is a good plan to carry extra bulbs in case one becomes burned out or damaged. Consult the instruction book or note the type of lamp used, and carry at least one extra bulb for the headlight and side and rear lights. A special container for storing the bulbs is not expensive and there is a variety of these marketed.

As the services of battery experts are obtainable in practically every city listed in the touring section, it will not be necessary to include a hydrometer or distilled water in the touring equipment. The owner is cautioned, however, to make sure that nothing but pure water is used to bring

the height of the electrolyte up to the predetermined level. Do not allow acid to be added by any garageman while en route and, if the battery gives trouble, have it inspected by an expert.

Those who desire to economize in preparing the machine for the tour should purchase a syringe hydrometer and distilled water for battery service. The hydrometer is easily used, as the electrolyte is drawn separately from each cell. The reading on the graduated stem of the hydrometer at the point where it emerges from the solution is the specific gravity of the electrolyte. After the reading the fluid is returned to the cell.

If the cells are in good condition the gravity will test about the same or within 25 points of each other. Gravity below 1.200 indicates that the battery is less than half charged and it should be used sparingly until the gravity is restored to at least 1.250. When it is below 1.150 it indicates a completely discharged condition and should be given a full charge. The gravity should be between 1.275 and 1.300 when the cells are fully charged.

If the battery fails to hold a charge, it is best to take it to the service station, where it generally can be restored to an efficient condition by a long,

Showing Construction of Conventional Type of Lead Storage Battery—The Arrow Indicates Proper Level of Electrolyte.

slow charge; but this cannot be done overnight, as it may require considerable time, depending upon the condition of the cells.

PREPARING THE CAR FOR THE TOUR.

Components Requiring Attention and Suggestions for Completing the Work--- Steering Gear and Brakes Should Be in Perfect Condition.

NOTHING detracts so much from the pleasures of touring as to experience trouble on the road. Frequently the tourist meets with mishaps through lack of attention to small details and invariably the trouble develops in the most undesirable locality and where the services of the expert repairman are not easily obtained. It follows, therefore, that the owner must take every precaution to insure proper operation of each and every component.

Regardless of whether the tour is to take one over state highways or through rural districts, the car should be placed in the best possible condition, for it will be subjected to stresses not generally encountered in daily service or on week-end trips. It should be remembered that in driving over strange roads the use of the low gear and brakes will be more frequently resorted to than when the driver is familiar with each hole and gully, and that steep or long grades will test the efficiency of the motor.

The labor and expense involved in preparing the machine for the tour will depend on its age and condition. A practically new car may not need any other attention than the grinding in of the valves, the removing of carbon and a general inspection for loose nuts and bolts. On the other hand, an old machine may require a complete overhaul and the replacement of worn parts. It should be borne in mind that the motor car which appears satisfactory to the owner may develop weaknesses when subjected to the severe service de-

manded of it in the mountains, etc., and the inspection of all components should be very thorough. Avoid all makeshift repairs, for such may prove decidedly costly in the end. If you are not thoroughly familiar with the part, have the expert pass upon its condition.

If the motor has been in service for some time, it should be given a thorough overhaul. It is best to begin the work by cleaning out the cooling system, by flushing it with clean water or utilizing a soda solution to displace the sedi-

Part Sectional View of Conventional Design of Motor with Parts Lettered to Simplify the Work of the Overhaul.

ment caused by using hard water. Some advocate cleaning a radiator by using water under pressure, but care must be taken to have all petcocks open. Old radiators should be handled very carefully, else damage is likely to result.

The use of the oxygen process makes easy the removal of carbon deposits, or the work may be done by hand, which generally requires taking off the cylinders. After the valves have been ground in and their seats tested, go over all motor bearings. As different bearing material is

Clean and Adjust Fan Bearings.

replacing the valves, check up the timing by the flywheel or the method recommended by the maker, correcting any faulty opening by adjusting the valve actuating mechanism. Check each valve separately and go over them a second time to make sure the timing is correct.

As carburetion and ignition are treated elsewhere in this issue, as are batteries, lighting systems and tires, these subjects may be dismissed from this discussion. Before leaving the motor, make sure that its supports are firmly anchored and that the radiator is properly mounted. Clean the lubricating system very thoroughly and refill the sump or reservoir with fresh oil. Inspect the pump and repack if necessary, clean and lubricate the fan bearings, and adjust the tension of the fan belt. All components lubricated by grease cups should be cleaned by passing a wire through their openings and the cups filled with fresh lubricant. Wipe the cups clean to prevent road dust from gathering.

The type of clutch utilized will determine to a large extent the work of the overhaul, as that employed with the planetary transmission will require but little if any attention unless badly worn. The adjusting of the high-speed member, low and reverse, is easily made where bands are utilized. The lining of the cone clutch should be examined and, if it has been slipping and does not yield to the usual treatment, it is best to fit a new leather.

The multiple-disc type will require cleaning, which is easily accomplished by draining out the old oil and refilling with kerosene, engaging and disengaging the clutch several times; thereafter it should be re-

filled with the lubricant recommended by the maker. It is possible that the discs will require some slight adjustment.

Coming next to the transmission, remove the old lubricant and wash the gears and bearings with gasoline or kerosene. Drain off the fluid and wipe the parts dry, examining every crevice for foreign elements. With the gearset clean, the bearings can be inspected for play and the mesh of the gears tested. It may be possible that the shifting forks will require adjustment. Clean the tube through which the shifting rod has a bearing and lubricate. The gears should mesh easily and properly; if they do not, the fault should be corrected. Any component that binds or sticks, and which does not yield to the cleaning and lubricating treatment should be examined and the trouble remedied. If the gears, that is, their edges, are badly worn, it may be best to fit new ones.

Universal joints are very important and

Components of Leather-Faced Cone Clutch Requiring Attention in the Overhaul.

should be cleaned and inspected. If too much lost motion is present, it may be cured by fitting bushings, but generally, if the parts are badly worn, it is cheaper to purchase and install a new joint. If packed in leather boots, renew the lubricant after the overhaul is completed.

The drive shaft and differential may not require any other attention than cleaning and the renewal of the lubricant, but it is possible that the position of the driving and driven gear may need correction and that the thrust bearings should be readjusted. The adjusting of the driving and driven gears of the differential requires skill and in each instance the instructions of the maker should be carefully followed. While working on the differential, it is an excellent plan to test the bearings for side play. Generally, means are provided for eliminating lost motion, and if

Valve Adjusting Mechanism.

the axle is of the floating type not much trouble should be experienced in adjusting the bearings. Care should be taken, however, to make the same number of turns to each bearing, else the position of the driven gear will be altered in respect to that of the pinion.

As the tour may take the owner over roads that will subject the wheels and bearings to severe stresses, it is important that they be in good condition. Since it will be necessary to displace the wheels to examine the brake linings, it will afford an opportunity to go over the bearings, keyways, locking mechanism, etc. Ball bearings should be packed with a non-acid grease and care should be exercised in the adjustment so that the bearings will not be too tight. Loose wheels and axle bearings are frequently the cause of faulty operation of brakes or undue friction.

Too much emphasis cannot be laid upon the importance of having the brakes and their link-

Important Members of the Front Axle Requiring Careful Attention.

tem, search for loose rivets in the housing and make sure that all nuts and bolts are tight.

Coming next to the springs, it will pay the owner of a used car to purchase a spring-spreading tool for opening the leaves of the springs. Displace all rust and foreign elements and lubricate the bearing surfaces with graphite and oil. Use as much of the dry, powdered graphite as possible. It will be surprising how much easier the car will ride after this treatment.

If the owner is to do nothing else, he should thoroughly overhaul the steering gear and its linkage, replacing any worn part by a new one and performing the work of adjustment very carefully. Provision is made in the modern steering gear for eliminating end play, as well as lost motion of the worm and gear.

The drag link and tie rod connections are generally the cause of lost motion and this may be displaced by fitting new bushings and bolts. In overhauling the steering gear, the bracket supporting the column or tube should not be overlooked. The bearings of the front wheel will require cleaning and adjusting and in performing this work a worn bearing should not be mistaken for play of the wheel, as a worn spindle may be the cause of the undesirable lost motion.

The Inspection and Adjustment of the Steering Gear Is the Most Important Work of the Overhaul.

age in the very best of condition, as they will be severely tested on the tour. If the linings are worn, renew them. Clean and lubricate all parts subject to friction and test the rods and equalizers for binding. The springs employed to prevent the linings from contacting with the drums should be examined carefully. If they have lost their tension, stretch or renew them. It is surprising how much power is required to overcome the friction set up by the linings dragging.

Torsion, radius and torque members are important factors in the drive of a machine and one cannot be too careful in giving these components the attention they deserve. If the rear axle be provided with a truss or strut rod, test these members for looseness, and if any play exists, remove same. They should be set up snug, not too tight, the locking members being set up hard and cotter pinned. Before leaving the rear sys-

Examine the Brake Linings and Renew if Worn.

TIME AND LABOR SAVING TOOLS.

THE tools required for the overhaul of the car will depend upon the age of the machine, condition, etc. Generally the work may be ac-

C. P. Improved Valve Lifter.

complished by supplementing those tools supplied by the car maker with a valve lifter, socket wrench set, S wrenches, etc. Supplies such as a valve-grinding compound, cotter pins, lock washers, gaskets, taper pins, nuts and bolts, etc., are inexpensive and are generally found in the garage where the owner attends to his own repairs. By picking up one or two tools at a time the equipment can be made complete enough to do ordinary work.

Lack of space prevents listing and describing other than general tools needed. In selecting a valve lifter, it is suggested that the owner purchase one that can be carried in the tool box on the tour, as it may be possible that a valve will

Leak-Proof Piston Ring.

have to be removed. There is a wide variety of these devices, and one should be chosen that will fit the motor. Some valve lifters are universal; that is, are adaptable to practically any engine. Two practical designs are shown in the accompanying illustrations, the C. P. improved, made by the Clinton Machine Works, Clinton, Mass., and the Utility, marketed by the Morgan Manufacturing Company, Newport, R. I. Both these types can be locked, permitting the workman to use both hands to remove the retaining key of the valve spring.

Morgan Utility Tool.

Company, Worcester, Mass., is a universal favorite with repair men, as it is constructed to withstand severe service. It is produced in varying lengths and is moderately priced.

Socket wrench sets are invaluable and, if included in the tool equipment for the tour, will make it possible to dispense with a number of individual wrenches, as well as to reach nuts and bolts not easily accessible with ordinary tools. The Frank Mossberg Company, Attleboro, Mass., markets a very practical equipment, which is shown in an accompanying illustration, and one of its features is the ratchet wrench. Double-end and pipe wrenches are included, also cotter pin extractor, etc. The Bay

Morgan Spring Opener.

Coes All-Steel Monkey Wrench.

State Autokit, made in several sizes by George A. Cutter, Taunton, Mass., is another practical, complete and inexpensive socket set wrench.

If it be found in the overhaul that the piston rings are worn, and that new members are required, the Leak-Proof, made by the McQuay-Norris Manufacturing Company, St. Louis, Mo., will be found efficient. The practicability of the construction is shown in an accompanying illustration.

Assuming that the owner is to undertake his first complete overhaul, he will find a vise very useful, and the larger the opening of the jaws the better. Other practical tools are the breast drill, pliers, chisels, punches, files, hacksaws, etc.

Mossberg Wrench Set.

PERFECT VALVE LIFTER.

Winton L. Smith, 78 Clinton street, Newark, N. J., is market-

ing the Perfect valve-grinding set, which is made especially for the model T Ford motor. The outfit includes a valve spring lifter, valve-turning tool, wrench socket, abrasive, gauge and complete instructions. As shown in the illustration at the right, the springs are compressed by rotating a nut on a threaded bolt integral with the lifter. The equipment comes neatly packed and is moderately priced.

MOSSBERG WRENCHES.

The Frank Mossberg Company, Attleboro, Mass., specialist in wrenches, is manufacturing a number of useful tools for the model T Ford car. Those shown herewith include single and double-end members and are employed for removing the cylinder head nuts, not easily accessible with ordinary tools. The single-cylinder wrench is known as the No. 620, the double as No. 625. Both wrenches have handles of such length as to provide a considerable leverage, and the openings are accurate, preventing damage to the nuts. The hub cap wrench is a particularly well de-

signed and constructed tool and like the wrenches is made of a high-grade material and yet is inexpensive. The Frank Mossberg Company issues a catalogue illustrating and describing its tools for Ford cars, which will be mailed free upon request.

GRAND RAPIDS BENCH.

While those who are handy with carpenter's tools can build a work bench for the private garage, those not proficient in wood working will be obliged to have the work done for hire or purchase a ready-made bench. The Grand Rapids Hand Screw Company, Grand Rapids, Mich., has brought out a work bench especially adapted to the private garage and for the needs of the

owner who does his own repairing. It is well constructed of wood and has drawers partitioned off for the storing of nuts, bolts, screws and small material. The top is of hard wood, is protected by galvanized iron and is perfectly level.

A vise is included in the equipment, it having a continuous screw. The bench is 48 inches long, 24 wide and 36 high, and is constructed to withstand hard service. The lower section is provided with a shelf having a back rail, and this arrangement makes it possible to store car parts during the overhaul. At one end of the bench is an extension for tube and tire repairing, and at the other is a wire basket for holding waste, sponges, rags, etc.

FIBRE CLEATS.

In renewing the wiring in the overhaul of the car, it is a good

plan to utilize fibre cleats, and these may be obtained from the American Vulcanized Fibre Company, Wilmington, Del., which concern produces a large variety of vulcanized fibre cleats, some of which are shown in an accompanying illustration. That shown in the centre is for retaining high-tension cables. The company produces cleats in shades to make them inconspicuous in places where appearance is considered.

MOSSBERG GRINDERS.

The Frank Mossberg Company, Attleboro, Mass., is marketing two types of valve grinders for the model T Ford motor. That shown at the left in the illustration is the No. 600 and is designed after the repairman's favorite method of grinding valves, that of utilizing a rolling motion between the flattened hands. The No. 605 grinder is constructed to permit of swinging a 90-degree circle and has pins which engage with recesses in the valve heads. The tools are constructed of high-grade material and are guaranteed in every particular.

PRACTICAL TIRE EQUIPMENT FOR TOURING.

Small Devices Which Create Comfort and Security When Travelling in the Motor Car—Little Care and Cash Save Much Trouble.

FULLY four-fifths of road troubles, untimely stops, discomfort, superfluous expense and what other ills are known to motorists are due to tires. Tourists have become accustomed to this condition and many consider that it is one we must bear up to—"grin and bear it". But this is quite untrue. Of all tire troubles that come up, from 80 to 90 per cent. are avoidable. How? asks Mr. Tyro.

The answer is simple enough. There is a reason for every mishap on the road, and in nine out of 10 cases, however technical its name may sound, the true reason of the disgusting situation is carelessness on the part of the car owner or driver, whoever takes care of the automobile. If a nail passes through the shoe and pierces the inner tube, causing a puncture, could not care in driving have avoided the nail from being picked up, or care in the garage removed it be-

when there is less than the specified amount of air in them to balance the outside impact than when the tires are properly inflated.

There is only one way of keeping your upkeep bill down to the minimum: Be careful. Inspect your tires regularly and, since in a way they do the roughest work of all parts on the car, more frequently than other parts. Pump them up to full pressure every morning and your tire troubles will be reduced by two-thirds. Depend on the tire gauge every time. After 100 miles stop to test the pressure, and if it is low, get it right. Every minute thus spent saves 15 in the long run. After getting to the garage in the evening, jack up the car and inspect the tires for nails and other possible causes of future trouble.

Indiscriminating economy is out of place in this field. If you are too frugal to buy a tire

CORRECT INFLATION PRESSURES FOR VARIOUS TIRE SIZES.			RISE OF AIR PRESSURE IN TIRES DUE TO DRIVING HEAT.		
Diameter, Inches	Max. Weight Per Wheel	Pressure in Tire	Pressure When Cold	Pressure When Warm	Increase Due to Tire Work
2.5	225	50	71.1	88.2	17.1
3	350	60	85.3	105.8	20.5
3.5	600	70	99.6	123.5	23.9
4	750	80	113.8	141.9	28.1
4.5	1000	90	128.0	158.6	30.6
5	1000	90	142.3	176.4	34.1

fore it entered deeply into the casing? Or, if the puncture was caused immediately upon striking the nail or stone, is this not a proof that the casing was thinner and more worn out than it should have been, and that a repair made with a little vulcanizer could have saved the loss of time and the expense of repair caused by the puncture? And if a puncture results in a blowout, does not this, too, prove lack of careful inspection on the driver's part? And so on, ad infinitum.

Whether you drive on a bad road strewn with sharp stones, trying only to get over it as quickly as possible without caring how, or whether you run your tires up against a curbstone, makes very little difference, except that in the latter case the process of destruction is somewhat swifter than in the former. Likewise, it is much the same if, with the tires otherwise equal, you drive them fully inflated over a bad road or at half or even less pressure over a good one, a much slighter unevenness putting your tires out of business

pump which makes inflation easy, you will pay four times its price in bills for inner tubes and repairs to casings; if you think it too much trouble to carry a small vulcanizer on the car, the repairman will thank you for enhancing his profits. The most experienced and most economical motorists are always on the look-out for new devices which will make their original equipment more efficient; these accessories save money. It is in a large measure due to modern accessories that automobiling is today in the reach of the million, while eight years ago it was the sport of a select few, of the wealthy.

Who would not laugh at a business man refusing today to use a typewriter, or at a farmer arguing that modern agricultural implements increase expenses without bringing a proportionately higher return? We know that they both simply cannot do without up-to-date equipment. The motorist who does things in a careless way is as foolish and improvident as either.

STEVENS TIRE VALVE.

A tire valve consisting of but four parts, containing no spring

and constructed in such a way that inflating is made easy even for a child pumping with one hand, is made by the Stevens Manufacturing & Supply Company, Fisher building, Chicago. This valve consists of a hexagonal brass barrel with a thread cut on the small end, which fits any standard pump connection. The other end screws onto the valve stem and has a channel through the entire length of the barrel for the passage of air.

CALNAN TIRE REMOVER.

Many car owners have found themselves helpless in the face of a tire rusted on the rim, and it must be admitted that without the proper tools this situation is indeed troublesome. A very practical tire remover is made by James P. Calnan, West Union, Mass. This tool fits all sizes of tires because its grip may be modified by turning the crank-operated screw working in the nut formed in one end of the bracket shaped tool. By applying the tool to the casing as shown and compressing the bead by turning the handle, the shoe is wrested from the rim. The tool is operated from the

front of the wheel and locks automatically, permitting the operator to use both hands, if necessary, in turning the handle.

STANDARD PROTECTOR.

A tire protector which reinforces the walls of a casing and thereby shields the tube from nails, etc., is the Standard, made by the Goodyear Tire & Rubber Company, Akron, O. The device, which is built up of several layers of cotton fabric covered with a rubber layer much in the same way as a tire, is really a separate tread which is designed to be applied to the outside of a tire casing and after having been put in place it is held there by the inflation pressure in the inner tube. This,

of course, is a great advantage, as it does away with the need of fastening the protector to the tire. Furthermore, it is stated that this course is superior to the vulcanizing of an outer cover to the tire casing, as the heat of vulcanization at this point can hardly improve those qualities of the tire which make for efficient service. By using this type of protector the manufacturer claims that tires can be used for a considerable time after the original tread is worn out, when the sides of the rubber-covered fabric are still in good condition. In this way the tire bill is materially reduced and this is of special importance where large tires are used which otherwise are considered good for the scrap heap when the treads are worn out.

STEVENS TIRE GAUGE.

Although for more than a decade tire makers and dealers

have been emphatic in pointing out to the user the necessity of measuring the pressure inside the tube by means of gauges, there is still a great multitude kicking against the casing instead of gauging the air pressure according to the rules of the craft. Many motorists would buy testers and use them if they knew how many dollars are saved by such little instruments as the Stevens gauge, made by the Stevens Manufacturing & Supply Company, Fisher building, Chicago.

HOLDEN TIRE TOOLS.

The tire tool made by the Holden Manufacturing Company, St. Paul, Minn., comes in a standard form and a Ford model T type. The tool which is here illustrated locks by turning the handle outward just past dead centre; thus the bead is held inward, facilitating the removal of the tire from the rim if the latter is split crosswise. The standard tool is designed for tires from 3½ to five inches diameter, finished in aluminum and weighs two pounds. The Ford tool is made in two sizes.

NURINKLE VULCANIZER.

A compact, portable vulcanizer heated by gasoline is the

Nurinkle, made by R. E. Stevenson, Muncie, Ind. As the manufacturer states, the construction of the device is such and the instructions are so simple that improper use, that is to say, over-vulcanization, is rendered practically impossible. The amount of gasoline to be used is indicated by a cup made integral with the burner, and the correct quantity of fuel maintains the steam at the right heat.

BROWN IMPULSE PUMP.

If tire inflating is no pleasure, automatic tire pumps are blessings. A very popular type is made by the Brown Company, 130 Bellevue avenue, Syracuse, N. Y. The pump being fitted into the spark plug hole after the plug has been removed, is operated by the suction and pressure in an engine cylinder. The pump is fitted with a spark plug, recording gauge and self-opening valve connection; it is made of gray iron, the same material as the cylinders, and equipped with 12

feet of hose. A smaller type is made for Ford cars and other low-powered automobiles. The pump, which cannot overheat, is of simple construction, its cylinder containing a piston which is reciprocated by the pressure inside the engine cylinder.

WIZARD VULCANIZER.

A portable vulcanizer for owner's garage or road repairs is the Wizard, made by the National Motor Supply Company, Cleveland, O. It is of the automatic steam type. The water is carried in a hollow body filled and sealed at the factory. In

the bottom of the vulcanizer, beneath the boiler, a fire box with asbestos packing is cast, which packing absorbs the fuel—gasoline or alcohol—a certain quantity of which is poured into the receptacle. Air being supplied by a number of draft holes in the chamber, the fuel absorbed by the packing burns with a blue, smokeless flame. The temperature is automatically controlled so that the device, once lighted, requires no further attention. The face of the vulcanizer is six inches long and three inches wide and curved to fit the face of the tire casing, while for inner tubes a flat plate is used.

POSITIVE VULCANIZER.

The Positive vulcanizer, made by the Positive Supply Com-

pany, Davenport, Ia., is so constructed that the heat produced by a flame of alcohol or gasoline in the fuel receptacle cannot injure the face of the tire tread. To gain this end a small compartment filled with water is interposed between the fuel container and the face plate contacting with the tire, so that the heat vaporizes the water.

HANS TIRE PUMP.

One of the automatic tire pumps now on the market is made by the Hans Motor Equipment Company, La Crosse, Wis. It is made of brass and is designed to be fitted into the spark plug tap of the engine cylinder. The pump chamber proper has two check valves in it, drawing in pure air only and preventing any gases to enter from the engine. The tire pump is equipped with 12 feet of high grade flexible hose and a gauge for inflation pressure. The pump is said not to overheat.

KELLOGG TIRE PUMP.

The Kellogg Manufacturing Company, Rochester, N. Y.,

manufactures a four-cylinder tire pump, cooled by air or water; the latter type is preferred for use in connection with air starting systems. There is a double check valve in each cylinder, and the pistons are operated by eccentric cams set at 90 degrees to each other on the same shaft; the material of the pistons is a special anti-friction metal, lubricated by splash and insured against leakage by a cup packing construction.

TRI-PHOON TIRE PUMP.

A three-cylinder tire pump, the Tri-Phoon, is sold by the Green & Swett Company, 737 Boylston street, Boston, Mass. Each pump cylinder contains a piston; the three pistons are worked by a common reciprocating cam driven by a gear from the crankshaft. The pistons are operated from the cam surface by roller bearings of the best grade of hardened and ground steel. Metal rings of special construction are used to

insure tightness around the piston. When driven at 800 rpm, the pump delivers a steady flow of air, the pressure of which, according to the statement of the maker, is equal to that of air emerging from a tank charged at 115 pounds per square inch. The drive of the pump may be taken off the crankshaft, camshaft, magneto or pump shaft.

NATIONAL TIRE PUMP.

The National Telescope pump is manufactured by the National Motor Supply Company, Cleveland, O. This pump is of the spark plug type, that is, it is at-

tached to the engine of the car by unscrewing a spark plug and putting the pump, which is fitted with the proper connection, in place of the plug. Compression and suction inside the engine cylinder act to raise and lower the pump piston and as the latter reciprocates, the stem attached to its upper end and projecting through the casing of the pump moves up and down. The entire device is only five inches high, but it is claimed to be very efficient. The pump is equipped with the ordinary accessories and a wooden handle, for screwing it in place.

SMITH TIRE PUMP.

Smith Perfection tire pump, made by Smith Motor De-

vices Company, Dodgeville, N. Y., consists of two cylinders made of high-grade brass tubing tested to withstand a pressure of 400 pounds per square inch. The cylinder heads are made of special steam bronze so as to reduce heating to a minimum. The crankcases are of aluminum. An eccentric drives the bronze connecting rods.

KELLOGG SHIFT PUMP.

Among the different types of tire pumps made by the Kellogg Manufacturing Company, Rochester, N. Y., there is the design illustrated below. While constructed on the same principle as the type afore-described, this model differs from it in the method of the drive, which is obtained through the means of a spur gear which is in constant mesh with a pinion on a half-time shaft of the motor, and by moving the lever here shown, the collar carrying the spur gear is shifted to engage and drive the camshaft of the pump.

FOR EASY RIDING ON ALL ROADS.

HARTFORD SPRING.

The cushion spring which is made by Hartford Suspension

Company, Jersey City, N. J., consists of two spiral springs arranged cylindrically within each other and attached to the rear shackles. While offering no resistance to normal spring action, they prevent extreme deflection of the springs upon the return to their average position.

TRUFFAULT-HARTFORD.

The shock absorber made by the Hartford Suspension Company, Jersey City, N. J., is too well known to require detailed description. The device operates on the principle of two pairs of faces secured to one inner

arm and a double outer arm respectively, which have inclined planes formed on them. These planes are brought into frictional engagement when the relative position of the arms and the discs to which they are attached is altered, and the resistance thereby obtained counteracts excessive spring movement.

J. H. S. ABSORBER.

After having manufactured for years the well-known Sager equalizing springs, the J. H. Sager Company, Rochester, N. Y., is now marketing a shock absorber of the enclosed coil spring type, which is here illus-

trated. The twin cylinders of this device contain pistons which work in harmony with the coil springs in the casings so as to destroy the shocks caused by travelling over rough roads. The absorber is made specially substantial, very strong material being used and great exactness having been exercised in its construction. Both pistons work on a common wristpin, namely, the under spring shackle, while the upper shackle forms the connecting pin between the tops of the twin cylinders. The Sager company feels that this product is bound to give excellent service and for this reason has designed an unusually broad guarantee.

JOHNSON ABSORBER.

A two-spring coil shock absorber, the Johnson, is made by

the Triple Action Spring Company, 55 East 25th street, Chicago. This device consists of a strong outer coil spring, the ends of which are bent in loops secured to the upper spring shackle and an inner coil held at pressure between the top and bottom of the absorber casing.

ELY DEVICE FOR FORDS.

A coil spring shock absorber of simple and rugged construction for Ford cars is sold by the Donnelly Motor Equipment Company, 1785 Broadway, New York City. The Ely device consists of a high-grade tempered spring, a carrying iron and a perch. The spring is inside of a brass cover made oil tight so as to render the use of lubricant possible. The guaranteed device can be fitted easily.

HERZ SHOCK ABSORBER.

Herz & Company, 245 West 55th street, New York City, is

manufacturing a novel type of shock absorber, operating on an original principle. An arm moving through a cast iron box filled with a specially prepared substance, by overcoming the resistance of the latter's viscosity, expends the energy of the shock imparted to the spring. The box is secured to chassis and connected to the spring.

COX SHOCK ABSORBER.

A shock absorber consisting of two twin cylinders is made by the Cox Brass Works, Albany, N. Y. The device here shown is attached with its bottom cover to the chassis, while the stem of a piston compressing a coil spring between the latter and the casing bottom is attached to the spring shackle. Deflection of the car spring

causes expansion or compression of the coil spring of the absorber. This device is easily installed and adjustable. For this latter purpose the cap of the casing is made to work on a thread and turning it down depresses the absorber piston and compresses the coil spring, so that the shock absorber is adjusted to take the load.

BLACKLEDGE ABSORBER.

The Velvet shock absorber, made by the John Blackledge Manufacturing Company, Chicago, and sold by the Boice-Perrine Company, 601 Boylston street, Boston, consists of two

pairs of coil springs, each pair enclosed in a cover and surrounding steel studs. The upper spring ends bear against the cover holder, which is secured to one spring shackle, and the lower ends against the bottom plates fastened to the studs by nuts; the studs are connected to the top block or the device attached to the other shackle. The coil springs are so proportioned and tempered that they oppose no resistance to normal spring action, but if the springs are deflected beyond normal their rebound is checked by the action of the shock absorbers. The use of four small springs for each car spring, is understood to make for easy riding.

CONNECTICUT-FORD.

A set of three shock absorbers to be used on Ford cars is made

by the Connecticut Shock Absorber Company, Meriden, Conn. This device operates on the following principle: One arm is integral with the case containing a triangular set of springs and the other arm is attached to a three-faced cam which turns between the springs. The absorbers are so set that the springs are slightly deflected, which permits of unrestricted motion of the cam, but only in one direction.

J. M. SHOCK ABSORBER.

The J. M. Shock Absorber Company, 210 South 17th street, Philadelphia, makes the device here illustrated, in which compression of a coil spring by a piston is utilized to equalize the shocks created by the automobile striking road inequalities. This device has been on the market for years, so that no detailed description is required.

REVIEW OF MOTOR SIGNAL DEVICES.

WALTZ SEMAPHORE.

The Waltz automobile semaphore, made by the Irwin-Waltz Interests, City Hotel building,

Elwood City, Penn., is designed to indicate the direction taken by the car. It consists of three compartments, each of which contains an electric bulb enclosed in a case. The latter is covered with a celluloid plate bearing the license number in the shaft of a double-headed arrow set in an opaque background. Pushing proper buttons lights the compartments.

CELLO SEARCHLIGHT.

The Cello Wireless searchlight is made by the A. S. Campbell Manufacturing Company, 284 Commercial street, Boston, and in order to prevent short circuits the light is constructed without the use of wires. A high-grade reflector is included in its make-up and the device may be easily and quickly installed. A highly polished flush socket makes connection to the batteries and the push button A controls the lamp, giving a flash

when pressed down and steady light if given half a turn. B is the flexible cable and C the hinge joint. Nut D locks the deck swivel, F being the deck socket connecting with the main wiring below, while E is the bronze contact spring; G is a positive, self-cleaning contact.

STANDARD SIGNAL.

The signal device here shown, and manufactured by the Standard Signal Lamp Company, Sanford building, Bridgeport, Conn., is a neat, semi-cylindrical housing of three compartments, each of which is fitted with a tungsten bulb, con-

trolled separately or in combination. The "Left" compartment is red, the "Stop" black and the "Right" green. This makes reading of the indications very easy. Below the "Stop" plate there is a tail light, which also illuminates the number plate of the car. The plate is attached to the device by means of two brackets formed on the ends of the rods extending downward from the sign. The correct wiring, moreover, presents no difficulties, full information regarding this point being obtainable from maker when purchasing the outfit. The current required for illuminating the tail light and the three indicating bulbs may be taken from dry cells or storage batteries, or the electric equipment of the car.

UNIVERSAL TAIL LAMP.

To give ample illumination of the rear number plate without a glare making reading difficult

is the function of the product here illustrated of the Combination Tail Light Company, 954 Tremont street, Boston. This lamp is fitted with a special device throwing a soft, strong light over the entire surface of the number plate; it can be attached or detached in a very short time, so that a damaged bulb may easily be replaced.

PASCO SIDE LIGHT.

An electric side light designed for cars not fitted with electrical equipment is sold by the Portland Auto Specialty Company, Portland, Me. This lamp is so installed that the arm holding it is turned upward, so that a maximum of illumination is obtained from the bulb. The light is projected by a parabolic reflector. All the wiring is concealed, as it is carried inside the substantial bracket.

LITTLE GIANT LAMP.

An ingenious device recently placed on the market by the

Harding Specialties Company, 755 Boylston street, Boston, and 1339 Michigan avenue, Chicago, is the magnetic trouble lamp styled Little Giant. The current sustaining the lamp magnetizes a coil strong enough to support the lamp by attraction on the surface of a steel or iron body, such as the mudguard in the illustration. This increases the usefulness of the lamp. The magnet is strong enough to lift ordinary tools.

SMITH DUPLEX LAMP.

A trouble hunting lamp, attached to the dash instead of being carried in the tool box, is the Smith Duplex, made by J. W. Andrews & Company, Chicago. Its design makes it possible to use this lamp in place of the ordinary dash light. In order to give a pleasing appearance and also have the lamp always ready for using it around the car, the long, silk-wound cable, to the end of which the bulb is attached, is wound around a spool contained in the box, which is

mounted in front of the dash, the lamp itself being held in a socket and projecting through the dash, so that it may be pulled away from the spool at any moment. The equipment is sold with complete and lucid instructions as to mounting.

C-S FORD HEADLIGHTS.

Remembering that the fly-wheel magneto of the Ford car produces an abundant amount of electricity and that many owners of model T Ford cars would be glad to use this surplus of energy for electric lights on their machines, the Culver-Stearns Manufacturing Company, Worcester, Mass., has placed on the market a simple outfit which makes it possible to

convert the lighting system of such cars to electricity without much work. The C-S patented lighting outfit consists of one pair of reflectors which are heavily silver plated, a pair of bulbs, Ediswan connectors, the necessary wiring, switch and whatever else is required to install the system on the car. Since the current is taken directly from the flywheel generator, the equipment may be put in place in a short time and without in any way disturbing the rest of the mechanism of the automobile. For easy removal the bulb is held by a patented device in the back of the reflector, so that, by loosening a knurled nut and rotating bulb holder slightly, a burned-out bulb may be quickly replaced.

J-M LOBSTER EYE.

An unusual, but very practical, headlight design is manufac-

tured by the H. W. Johns-Manville Company, New York City, known as J-M Lobster Eye. It is attached to the top of the front mudguard in such a way that the vertex of the conical lamp container points to the rear of the car. The mouth of the cone contains the suitably shaped reflector which has a diameter of six inches and in the centre of which the bulb is located. It is made in two styles.

CUNO INSPECTION LAMP.

The Cuno Engineering Corporation, 80 South Vine street, Meriden, Conn., sells the Cuno inspection lamp, which has a black enamelled wooden handle with a special Ediswan socket. The 10-foot extension cord is attached to a hard rubber connector and the bulb is protected by a bronze spring guard projecting from the socket mounting; when not in use, it is shielded by a brass tube sliding over bulb and guard. Regulated by the tube, the light emitted by the bulb is concentrated or diffused. The wire cord is wound around a reel attached to the tube.

CLEANING AND ADJUSTING THE MAGNETO.

Outlining the Construction and Operation of Components, and Suggestions for Remedying Ignition Troubles—Value of Maintaining Proper Gap of Contact Points.

(By C. P. Shattuck.)

ONE of the most important factors to be considered in the preparation of the motor car for the tour is the ignition system. The magneto of the new car will not require any attention except lubrication and a general inspection of the plate, magnet and other screws to insure that they have not

Fig. 1—Men Magneto.

worked loose through motor vibration.

The placing of the magneto in first-class condition can be done by the owner, although many motorists prefer to have the work performed at the service station or by an ignition expert. The average automobilist fears to touch the magneto, viewing it as a mysterious instrument, but it is simple and easily understood if one grasps the principles involved. This does not necessarily mean that one must know how to disassemble the instrument, for the motorist is advised against tampering. Dismantling the construction generally means that the magneto will have to be shipped to the factory for repairs. Aside from cleaning, adjusting and oiling, the instrument should be left alone.

Fig. 2—Model R L. Remy Magneto.

Some owners, believing that they can improve the operation of the motor, attempt to change the timing. It should be borne in mind that the engineers of the factory have, after exhaustive tests, as-

certained the best timing for the magneto, and if the proper gaps of the contact points and plugs are maintained, there is no reason why the instrument should not be as efficient as when the car left the factory. It is the experience of magneto experts that much of the trouble credited to the instrument is due to other components of the ignition system, such as faulty wiring connections, and too large a gap at the points of the spark plug, etc.

Lack of space prevents taking up in detail the construction and operation of those magneto components which may be cared for by the motorist, but as the principles of the conventional types are similar these will be discussed.

Both the low-tension and true high-tension

Fig. 3—Front and Rear View of Model A Splitdorf Magneto.

magnetos include means for interrupting or breaking the primary current. This is the timing of the spark, the break in the primary current supposedly taking place when the piston of the cylinder is in a position to obtain the maximum energy from the explosion.

The principle is similar to the commutator or timer utilized with the battery and coil system of ignition with which a large number of motorists are familiar. When the primary current is interrupted by the breaker mechanism, the electricity generated by the magneto is built up or transformed into a high-tension current, that is, one having sufficient energy to bridge the gap at the spark plug points.

The proper maintenance of the breaker or

contact points has been referred to, and at Figs. 4, 6, 8 and 14 are shown conventional designs, that at Fig. 6 depicting the components lettered. This breaker mechanism is utilized on the Bosch magneto. It will be noted that two contact points are provided, one a fixed and the other a movable member. Both are secured to and revolve with the armature shaft, and the construction is enclosed in what is termed the circuit breaker housing. The last named member is circular in shape and has two steel segments diametrically opposite each other.

How Break Is Caused.

It will be further noticed that the movable contact point is carried on an extension of the interrupter lever, and the latter also has a fibre block. This interrupter lever is pivotally mounted, and in the drawing the fibre block is shown just making contact with a segment. In this position the contact points are together, but upon the armature shaft being moved slightly the fibre

Fig. 4—Eisemann Type E M Magneto with Distributor and Circuit Breaker Covers Removed.

block will be moved inward, causing the contact points to separate or break. As two segments are provided, there are two breaks to each complete revolution of the armature shaft.

Types of Breakers.

The Eisemann type E M magneto, a true high-tension instrument, has a breaker box in which the timing lever is provided with two fibre cams and the interrupter lever a fibre block, as will be noted by reference to Fig. 4. In the Splitdorf type E U 4 true high-tension magneto, several views of which are shown, the breaker mechanism revolves with the armature shaft and the break of the contact points is accomplished by a roller coming in contact with two metal segments. The Splitdorf model A differs from the E U in that the circuit breaker mechanism does not revolve with the armature shaft and the break is secured by cams practically integral

with the armature shaft. The model B and other similar Splitdorf magnetos utilize a similar arrangement.

The breaker used in the Mea magneto is actuated by a fibre roller in connection with a cam disc, which is provided with two cams and located inside the breaker, being secured to the field structure. In revolving with the armature the roller presses against the spring-supported part of the breaker whenever it rolls over the two cams and in this manner a break of the primary current is obtained twice during each revolution of the armature. The construction of the Remy magneto breaker mechanism is simple. The breaker housing is termed a cam house and carries a pivotally mounted lever, also a fixed contact screw. The movement of the lever is obtained by a double-pointed cam on the armature shaft. The Simms magnetos employ a revolving breaker mechanism, the interruption of the primary current being by means of a fibre block contacting with segments in the breaker housing. The break of the primary current in the Connecticut magneto is accomplished by cams on the armature shaft extension, contacting with a roller and actuating a movable semi-circular lever. The National employs a cam construction, as does the Pittsfield. The K-W true high-tension magneto also utilizes a cam.

The armature of the magneto is driven at crankshaft speed with four-cylinder, four-cycle

Fig. 5—Simms SUW 6 Magneto.

Fig. 6—Components of Conventional Type of Circuit Breaker Mechanism.

Fig. 7—Removing Splitdorf Distributor Cover.

will be easily understood if the operation of the four-cycle motor be considered.

The function of the distributor is to provide a passage for the high-tension current to the wires leading to the spark plugs. A distributor mechanism is shown at Fig. 4 and it will be seen that the distributor proper is provided with a brush through which the high-tension current flows. The distributor cover (shown displaced) has as many segments as there are cylinders, and as the distributor brush revolves, it makes contact in succession with each segment. This contact is made upon the break of the primary current or timing of the spark.

When the car is new the break of the points is correct. For example: In the Splitdorf it is 1-32 inch. After considerable service natural wear will increase the space affecting the operation of the magneto much in the same manner as too large a spark plug gap is responsible for ignition troubles experienced with batteries.

Fig. 8—How to Use Wrench on the Splitdorf.

motors, and at $1\frac{1}{2}$ times crank shaft speed for six-cylinder, four-cycle engines, but the distributor makes but one complete revolution to two of the armature. The reason for such an arrangement

in adjusting and cleaning the contact points, the breaker box illustrated being that utilized by the Splitdorf Electrical Company, maker of the Splitdorf magnetos and electrical apparatus.

To adjust the points, remove the breaker box by slipping the retaining spring to one side. It is shown removed at Fig. 10. Next crank the motor until the roller makes contact with a segment, fully separating the contact points. Then take the wrench and loosen the locking nut of the fixed platinum contact screw as indicated at Fig. 8. With this screw loosened the platinum screw may be moved in or out, as required, by using the wrench as shown at Fig. 10.

Fig. 10—Adjusting Splitdorf Contact Screw.

Fig. 9—Truing the Contact Points.

If the points are pitted they should be smoothed up, using a fine jeweller's file, as shown at Fig. 9. The smoothing of the points requires extreme caution. In the first place, care must be exercised to file evenly and not to take off more material on one point than the other. Secondly,

platinum is expensive and the replacement of spoiled points through carelessness is not desirable. By utilizing the file as shown at Fig. 9, or making a jig, true points can be obtained.

The testing of the gap is the next step. With the points fully separated, insert the gauge as indicated at Fig. 11. The blade should be a snug fit. If not, turn the adjusting screw until the desired gap is obtained, then set up the locking nut on the screw.

Do not exert undue pressure on the nut, as it is not necessary to lock it securely.

To clean the breaker mechanism, use a soft camel's hair

Fig. 11—Using Splitdorf Gauge.

brush dipped in gasoline. Waste or cloth is not recommended, as particles of lint may lodge on the working parts, affecting their operation. The brush is also suitable for cleaning the distributor.

In replacing the dust cap or circuit breaker cover and distributor, make sure that they are located correctly. They will fit easily and without forcing. Do not try to improve the tension of the brushes, as undue wear of the carbons, etc., will invariably result. In replacing the breaker box cover spring, make sure that it occupies its original position, especially if the instrument be of the dual type, one employing dry cells as a source of current for starting, etc.

If the magneto has been in service for some time, it is a good plan to go over all screws such as the magnet, plate, etc., to insure they are tight. It is important that the screws securing the magnets to the pole pieces be tight, for with some types of magnetos loose magnets invite the en-

Fig. 12—Loosening Locking Nut on Bosch D U 4 Magneto.

trance of oil, which seriously affects the operation of the instrument.

Relative to lubrication, it is best to comply with the instructions of the maker. Do not over lubricate, nor use oil in the breaker box of magnetos utilizing fibre rollers, cams or blocks. In the overhaul of the power plant cover the magneto to exclude foreign elements, and if the instrument is so mounted that it is exposed to considerable road dust, fit a leather cover to it. The last named article is well worth the investment, as it will prevent the instrument being flooded with water by a careless washer.

All wires and connections should be carefully inspected, and if the leads are old or the insulation frayed, it is economy to purchase and fit new. With true high-tension magnetos it is important that the wire leading from the breaker box terminal to the switch, thence to ground, be in good condition. Fit new if the wire is old and solder all terminals.

When the magneto is of the dual type and the system includes a transformer coil, examine all connections to note if they are tight. If the

magneto is to be removed during the overhaul, tag each wire, unless in possession of the wiring diagram.

In timing or resetting the magneto the exact location of the piston for the firing position is determined by the engineers of the manufacturer of the car, and there are two methods, one by the position of the piston and the other by the fly-wheel or crank circle. In connecting the driving member to the armature shaft in the event, for example, of the magneto having been displaced from its base, the coupling is so made that the break and spark will take place as determined by

the designer of the motor. The firing order and timing of magnetos of 1914 motor cars was published in the Feb. 25 issue of The Automobile Journal.

After replacing the magneto, do not attempt to start the motor until each wire is connected. It is equally important that a secondary cable be not removed from the distributor with the motor running or the safety spark gap trifled with. In replacing the secondary cables it should be borne

Fig. 14—Adjusting Contact Screw and Using Gauge on Bosch Z R 4 Magneto, Providing Dual Ignition.

Fig. 15—Wiring Diagrams of Four-Cylinder Magneto: At Left, Magneto Running Clockwise and Firing Sequence 1-3-4-2; Centre, Armature Rotating Clockwise and Firing Sequence 1-2-4-3; at Right, Magneto Running Anti-Clockwise and Firing Sequence 1-3-4-2.

in mind that the distributor rotates in a direction opposite to that of the armature shaft, and that the firing order of the motor must be observed.

Locating Troubles.

The following suggestions for locating ignition troubles, as well as for the proper method of oiling, are made by the makers of various types of magnetos:

Bosch.

Assuming that the spark plug gap is correct and plugs in an efficient condition, examine the secondary cables and all terminals to make sure that no ground exists. If these be in good condition and the fault is not eliminated, disconnect the ground wire, also the secondary wires, then crank the motor briskly and note if sparks bridge the safety spark gap. If sparks are noted the magneto is operating properly. If not, remove the circuit breaker cover and with some one turning the motor note if the contact points separate and see that the gap is correct. Oil or dirt on the platinum points will affect the operation of these members. If the motor stops suddenly, it is generally due to a short circuit in the grounding wire leading from the circuit breaker. This may be tested by disconnecting it. In the examination of the circuit breaker mechanism, especially with new instruments, note if the interrupter lever moves freely. Carbon dust in the distributor is sometimes responsible for erratic operation. Two or three drops of oil should be placed in the cups, the covers of which are marked "Oil", once in about every 1000 miles of service.

Connecticut.

In case of faulty condition make sure the trouble is with the magneto and not with the plugs, carburetor, valves or motor. Examine all connections and the breaker box to see that the contact lever moves freely and that the contacts open and close properly. To test the transformer coil, remove the wire leading to it on the rear end of the magneto. Having the distributor brush in contact with a segment, follow the cable leading from this segment to the plug. Remove the plug, laying it on the motor in such a way that the cable terminal is not in contact or near metal. Take six dry cells and connect one wire from the battery to the frame of the magneto and with the other wire make a quick and sharp passing contact with the back terminal of the coil. This should result in a spark. If it does not, the coil

should be returned to the factory. Use a few drops of oil in the three oil holes about every 1000 miles.

Elseman.

The Elsemann type E M magnetos are lubricated by a few drops of oil in the reservoirs marked "Oil" and the supply should be renewed once in about every 1000 miles. The same general remarks made of high-tension magnetos will apply to this instrument.

Mea.

Practically the same tests as used with other true high-tension magnetos can be employed with the Mea magneto. The use of a few drops of oil about every two or three weeks, depending upon the service, is recommended.

Remy.

Adjustment of the contact points of the Remy magnetos is made from the outside of the cam house, a knurled contact screw being provided. By rotating this member a notch at a time, in or out, the gap is decreased or increased respectively. By regulating this contact screw the adjustment can be made with the motor operating. If the engine misses when running idle or pulling light, the spark plug gaps should be increased. If the motor misses when pulling heavy, particularly at slow speed, the gaps should be decreased. Two oilers are provided, one at the rear of the magneto and the other just back of the top of the distributor. Use three or four drops of oil in about every 1000 miles of service.

Splitdorf.

With the Splitdorf true high-tension magneto failure of the motor to start or stop will generally be found to be due to the grounding wire leading from the breaker box to the switch. This may be tested by displacing the wire, but to stop the motor it will be necessary to short circuit the primary circuit, which can be accomplished by using the blade of a screw driver and making a connection with the metal from the terminal to some metal part of the motor or frame. In the event of other trouble examine the circuit breaker mechanism to see that the contact points open and close properly.

The other Splitdorf types utilize a transformer coil for building up the primary current. If the motor fails to start on the batteries, and the cells are in good condition, go over the connections to make sure they are tight. The brush in the breaker box cover should make contact with the armature shaft and should not be grounded with the metal of the cover.

Fig. 16—Wiring Diagrams of Six-Cylinder Magneto: A, Magneto Running Clockwise and Firing Sequence 1-4-2-6-3-5; B, Armature Rotating Clockwise and Firing Sequence 1-5-3-6-2-4; C, Same Direction with Firing Sequence 1-3-2-6-4-5; D, Magneto Running Anti-Clockwise and Firing Order 6-3-5-1-4-2.

SPARE WHEELS AND RIMS SAVE TIME.

INVOLUNTARY stops on the highway certainly have an annoying element in them. To

be forced to stand still after a glorious 40 or 80 miles' ride and use screw driver and hammer or special tire tools, is certainly exasperating. Especially on a hot summer's day, all the effect of two or three hours' airing is lost in a very short time under such circumstances. But troubles will occur, and the best course is to be ready for them, so that they can be overcome as quickly as possible. Next to an inexplicable motor stop, the necessity of a tire change is about the most unpleasant operation known to the motor tourist. This was realized a long time ago and demountable rims were designed to transfer the "dirty" work of tire changing to the garage and reduce the work on the road to jacking up the car and turning a special wrench a few times.

A further step ahead has been achieved by the introduction of wire wheels, which are detachable by unlocking their hubs from the axles on which they are mounted. These wheels permit of extremely speedy change of tires and are carried as easily as spare tires or de-

mountable rims. Many automobiles of high quality are now fitted with carrying apparatus for a spare tire, rim or wheel.

While still in its infancy in America, the wire wheel is undoubtedly making remarkable progress, as the last New York show indicated where there were 10 times as many makes fitted with wire wheels as in 1913. The time when the value of wire wheels was a point of dispute is practically past now, when a number of leading car manufacturers have taken them up as regular equipment and when leading makers of demountable rims include them in their line. Hence scepticism is a meagre virtue in this field today. The strength and durability of wire wheels are matters of fact.

HOUK WIRE WHEEL.

The George W. Houk Company, 1700 Elmwood avenue, Buffalo, N. Y., manufactures the Houk detachable wire wheel here illustrated. This wheel is manufactured under the patents of the Rudge-Whitworth Wire Wheel Company, Ltd. It is of the triple-spoke lacing design and is equipped with the positive automatic locking device,

changing can be made quickly and reliably. It is claimed by the makers of this type of wire wheel that its installation on a car reduces the tire bill 25 per cent. and adds to the easy riding qualities of the automobile.

CHESTER-FORD RIM.

Demountable rims for Ford cars which may be mounted without changing spokes, felloes or other parts of the wheel, are being manufactured by the Chester Demountable Rim Company, Fall River, Mass. This rim is of such simple construction that no bolts which can work loose on the felloe are used; all rings and levers are eliminated and only five nuts are utilized to hold the rim in place on the felloe. The demountable rim is fitted on the clincher rim, which remains undisturbed, and since no changes have to be made, the new equipment may be attached to the wheels within 20 minutes. The retaining construction D is easily mounted on the old rim, as shown at C. The demountable rim which is illustrated at A has spot welded edges and slips over the old rim as shown at B, being secured on the retaining members

which insures the wheel staying in place after having been attached to the axle, so that

by locking nuts. A double socket wrench for removing and replacing the rims is included.

BAKER DEMOUNTABLE.

In order to make the Baker rim applicable to Ford model T

cars, the City Auto Tire & Supply Company, 1200 Huron road, Cleveland, O., has placed on the market an equipment consisting of four wheels fitting Ford hubs and including demountable rims, the set comprising the four rim-equipped wheels and a spare rim. To install the new wheels in place on the axles, the nuts and bolts of the old members are removed and the hubs driven out. The hubs are then inserted in the Baker wheels.

CROWN PRINCE WHEELS.

A pressed steel wheel, claimed to be three times as strong as a wooden wheel of its size and at the same time lighter, is made by Max Bacham, 845 Jefferson avenue, Detroit. The wheel is demountable, being held to the hub by five bolts, and the maker states that a wheel can be changed within one minute. Another claim is that this wheel will increase the life of tires mounted on it; it comes fitted with either clincher or quick de-

tachable rims. Of course the strength of the wheel insures it against collapsing, and where other wheels might break in consequence of a collision, this steel wheel will merely be bent.

MOTT WIRE WHEELS.

Recognizing the many advantages of wire wheels which have been demonstrated by many manufacturers' tests, as well as racing events, the Mott Wheel Works, Utica, N. Y., has come to the conclusion that the great army of Ford motorists in this country would be interested in this modern type of equipment which permits of a greater tire economy, as well as reduced

car weight, and hence lessened fuel consumption. The low weight of the Ford automobile makes it possible to build a satisfactory wire wheel set for it at a relatively low price, and the accompanying illustration shows the design which was adopted by the Mott concern after a considerable amount of experimenting and testing. The design is simple and strong, and the wire wheels may be easily mounted on the Ford hubs, their installation taking only a short time. The principle utilized in the construction of these wheels is the same as in the successful products of the great European manufacturers.

STANWELD-FORD.

The Standard Welding Company, Cleveland, O., has de-

signed a Ford wire wheel which may be installed, utilizing the old wheel flange and bolts. The hub of the wire wheel is made as a steel stamping, the spokes are arranged according to the triple-spoke method and reinforced at both ends. The entire wheel is finished with a double coat of baked black enamel. The equipment is sold ready for installation on the car.

CAMERON WIRE WHEELS.

One of the several companies that have taken up the manufacture of wire wheels for Ford T automobiles is the Cameron Wire Wheel Company, 47 Adelaide street, Detroit. The wheels are easily mounted, detachable, and designed to carry 30x3 1/2-inch tires. Special studs serve to lock it securely on the hub, and these studs take the places of the old bolts which are used with the wooden wheels.

BIG INCREASE IN AUTOMOBILE EXPORTS.

THE total exports of automobiles, motors, tires and other automobile parts for the 10 months ending April 10, 1914, aggregated \$30,060,043, while during the corresponding period one year ago the amount was \$29,317,044.

The April exports included 3291 cars, valued at \$2,833,154, while a year ago 2766 cars, valued at \$2,904,224, were shipped to foreign countries. The significance of this fact lies in that while the average value of the automobiles exported during the 10 months ending with April, 1913, was \$1049.97, during the same period a year later it was only \$874.55.

While during the earlier period 666 automobiles, valued at \$1,540,127, were imported, the imports of the following year's 10 months totalled 260, aggregating in value \$569,835. This gives an average car value of \$2312.59 for 1913; the average during the second period was \$2191.73.

Exports of automobiles during May, 1914, comprised 1834 cars of a total value of \$1,477,449, or an average value of \$696.42; during the previous year's corresponding period, 1707 cars, valued at \$1,510,782, giving an average value of \$881.05, were sent abroad.

NORTHROP-ROSE.

Well Known Figure in Industry Becomes a Benedict at Block Island, R. I.

At the home of Mr. and Mrs. Almanza Rose, at Block Island, R. I., took place, June 27, the wedding of their daughter, Miss Jessie Almeda, and Richard David Northrop of South Framingham, Mass., the event being attended by a considerable number of friends and relatives. Mr. and Mrs. Northrop are now absent on a wedding journey and will shortly take up their residence at South Framingham.

Mr. Northrop is widely and favorably known, especially to those engaged in the automobile industry and trade, from the fact that he is connected with the Standard Woven Fabric Company, formerly of Worcester, but now of South Framingham, as advertising manager and assistant sales manager. This company manufactures "Multibestos", and Mr. Northrop's activities are directed toward making known the qualities of and marketing its products. He has been extremely active and his work has been singularly productive, and the trade mark of the company

is recognized as one of the standards of the industry and the trade.

Mr. Northrop was born at Middletown, Conn., and was graduated from Wesleyan University. He was associated with several well known banking concerns before engaging with the Standard Woven Fabric Company. Mrs. Northrop's family is one of the oldest of Block Island.

REDDEN TRAVELLING IN EUROPE.

Maxwell Sales Manager Appointing British and Continental Agents.

Charles F. Redden, general sales manager of the Maxwell Motor Company, Inc., sailed recently for Liverpool and London, whence he will travel through Great Britain to appoint a number of district managers. The same will be done in France, Germany, Italy and Russia, which countries Mr. Redden will visit to study the automobile situation.

The Maxwell company, having now completed its first year of successful business, is determined to make every effort to create a big international market for the line of cars which it manufactures.

Charles F. Redden, General Sales Manager of Maxwell Motor Company, Inc.

EVER-READY'S NEW FACTORY.

A 200 by 300-foot factory, to be occupied by the American Ever-Ready Company in February, 1915, is under construction in Long Island City, N. Y. The plant will have 500,000 square feet of floor space, employ 2000 workers and is to be made the main factory of the company, the production of which was \$5,000,000 last year.

DIMMING AND ANTI-DAZZLING DEVICES.

AS MANY cities prohibit the use of glaring headlights, tourists whose lighting equipment does not include means for

conforming with the law will do well to give the subject consideration. In several cities the ordinances governing the use of headlights are being strictly enforced. Numerous non-glaring devices are being marketed and some of these are discussed herein. A common form is the frosted globe, such as the Gray & Davis lamp, shown in the accompanying illustration.

NODAZ.

An electrically operated device for eliminating the glare of the electric headlights is the Nodaz, made by the Ward Leonard Electric Company, Bronxville, N. Y. One of the qualities of the design is that the full candlepower of the lamps may be utilized in the city without conflicting with the ordinances. It comprises two pairs of translucent wings which are opened

and closed by magnets in the cover of the lamp, and are operated by a button convenient to the driver. With the wings closed the glare is eliminated. The Nodaz may be attached to any headlight. It has been approved by the Chicago authorities.

ROFFY LAMPS.

The Roffy lamp, made by the Roffy-Grace Corporation, 1926 Broadway, New York City, presents a number of interesting features, among them being the elimination of glaring effects. The lamp is very compact and

light, and is attached to the radiator by two small bolts. The locking method is held to prevent injury to the cooler. Glare is eliminated by the use of a conically shaped achromatic light beam with sharply defined edges, so projected that the upper boundary is parallel with the ground. This light is rectified for chromatism, aberration and diffraction, producing an even field of white light. It is stated that the rays will illuminate for about $1\frac{1}{2}$ city squares, and since the upper edge of the light beam is never more than $4\frac{1}{2}$ feet from the ground, there is no glare in the eyes of the persons on the highways.

BROWN.

The Brown Company, Syracuse, well known maker of tire

pumps, is marketing the Brown deflecting headlight, which eliminates the glare of the electric lamps by a semi-dome metal reflector or shutter. This shutter is operated by a little electric motor, and when regulated as shown the upward and horizontal rays are deflected downward and ahead, eliminating the glare without reducing the efficiency of the rays. The motor is operated by a button.

LEGALITE.

The Legalite, made by the Legalite Reflector Company, 1503 Bryant avenue, Bronx, New York City, eliminates glare by projecting the rays in such manner that the top of the beam is parallel with the ground, while the bottom of the beam strikes the ground close to the car. This is obtained by the use of the auxiliary reflector.

GRAY & DAVIS.

Gray & Davis, Inc., Boston, makers of lighting and starting

systems, lamps, etc., is producing an electric headlight which conforms to the laws of various states. It comprises the conventional headlight with a small bulb mounted at the top of the reflector and in such manner that it does not impair the efficiency of the centre or regulation bulb. The small light is used in the cities and is controlled by the switch, being lighted when the button is moved to the "Side and Rear On".

SERVUS.

The Servus Equipment Company, Newark, N. J., is manufacturing the Servus headlight controller for cars equipped with electric lighting. It is constructed to enable the driver to dim, extinguish or brighten the lights without leaving the seat. The device comprises a coil of special resistance wire divided into 10 sections with contact

points so arranged as to allow all, any part or none of it to be brought into circuit. When the lever is placed at the "low" point, the lights will burn dimly. Moving the lever to other points increases the strength of the current and proportionately so. There is also an "off" position.

CHANNEY.

The dazzling effect of electric headlights is eliminated in the Chaney headlight dimmer, made by the L. F. Chaney Company, Springfield, O., by a simple, compact switch arrangement shown in the accompanying illustration. One of the qualities of the design is that the lights may be regulated to meet all re-

quirements. The device is easily installed by the owner without a knowledge of electricity, for, as will be noted, the wiring is very simple. The dimmer is mounted on the dash and, being equipped with a kick type of switch, the driver can move the last-named member to each of the four positions provided. Placing the lever to "Low" effectually dims the lights, eliminating glare. Medium and high positions are included, also an "Out". The Chaney dimmer is installed by boring three small holes in the dash to retain the plate, and a fourth opening is made for the shaft.

MULCHAHEY.

The Mulchahey dimmer, made by Howard F. Mulchahey,

Providence, R. I., consists of the glass of the electric headlight being frosted to a point just below its centre. This eliminates the glaring effect by softening the rays, but does not impair the efficiency of the light, as the lower half of the glass is untreated. The process is said to be inexpensive and the regular glass can be treated.

J-M LENS.

One of the qualities of the J-M lens, an anti-glaring device, marketed by the H. W. Johns-Manville Company, New York City, is that it can be attached to any standard electric headlight. The J-M lens is made of a high-grade annealed glass, hemispherical in shape and frosted over its entire face, with the exception of an oval area, three by five inches, below the centre.

CARBURETION TROUBLES AND THEIR REMEDY.

Presenting Standard Types of Carburetors and Directions for Cleaning and Adjusting— Suggestions for Obtaining Economy and Efficiency.

CARBURETOR makers have so perfected their product that it rarely gives trouble. The dash and steering control of the air and

Fig. 1—Sectional View of Model A Rayfield Carburetor, a Water Jacketed Type.

fuel, the use of heated air and the mounting of the carburetor in a higher position, eliminates many difficulties formerly experienced when the carburetor was more or less exposed to the weather. Improvements have been made in the devices for preventing the entrance of water and other foreign deposits in the fuel, and if the motorist will occasionally empty these filters and insist upon all gasoline being strained, he is not likely to experience trouble on the road.

A knowledge of the parts utilized for adjusting a carburetor is important in the overhaul of the motor and it will be of service on the road, particularly for owners of machines not provided with dash control devices. Carburetors are not so complicated as some imagine and a little study of the design utilized should enable one to adjust the carburetor so as to obtain an efficient as well as economical mixture. Views of standard makes are presented herein with their components lettered, which will prove of service in making adjustments or cleaning.

In addition to cleaning the carburetor, the tank should be given attention, especially if the car has seen considerable service since the last overhaul. If the container is located under the

front seat, its fastenings may have worked loose, and if they are not tightened a leaky tank is apt to result. Many times failure to obtain maximum mileage a gallon of fuel is due to minute leaks. Care should be exercised in soldering not to expose any vapor to a flame. Repairing tanks is best left to the tinsmith. Clean the tank thoroughly, as well as all pipe lines, and make sure that all connections are tight. If the pressure fuel system has been giving trouble, go over all connections, etc., with soap suds. If any leaks exist, they will be noted readily by the bubbles produced.

Rayfield.

The Rayfield carburetors, made by the Findeisen & Kropf Manufacturing Company, Chicago, are made in several types, two of which are illustrated. Fig. 1 shows the model A, a new design, which is water jacketed. The model B is similar, being constructed without water jackets. The new model has many improvements, among which is the method of float control. Instead of a weight on the needle itself in a chamber beside the float, fulcrum levers are utilized directly above the float as indicated in the sectional drawing at Fig. 1. The two fulcrum levers control the needle valve, the stem of which extends through the brass float. As the last named member rises, the arms lift, and the fuel supply is restricted proportionately to the upward movement. The fuel inlet is now below the float chamber. A quality of the new design is the fitting of an efficient strainer trap, so constructed that the fuel connection may be turned by simply detaching and attaching the fuel line, etc. A large water and sediment pocket is provided with a conventional draining cock. The throttle arm stop has a positive locking device.

Features of the Rayfield types are the constant, mechanical and automatic air valves. The fixed one supplies air at all speeds, the mechanical one works in conjunction with the throttle and the automatic at varying speeds, supplying air when called upon by the motor.

Fig. 2—Model D Rayfield with Components, Utilized in Adjusting and Cleaning, Lettered.

The adjustment of Rayfield carburetors is simple. The low speed (see Fig. 2) is set first by turning the low-speed screw to the left until the arm member above it and slightly to the right just breaks contact with the cam above that. Next turn the low-speed screw $1\frac{1}{2}$ turns to the right, open the throttle about one-quarter, prime the carburetor and start the engine. Close the throttle until the motor runs slowly without stopping, then turn the low-speed screw to left, cutting down the fuel, and do this one notch at a time until the motor idles smoothly. The desired speed may be obtained by the adjustment of the screw in the top arm to the left.

Open the throttle slowly until wide open. If the motor backfires, turn the high-speed adjusting screw to the right, a half turn at a time, until all cylinders fire evenly. Should the motor not backfire, turn the high-speed screw to the left until it does, then to the right until it runs smoothly. This makes for economy of fuel and efficiency.

The novice in attempting his first adjustment of the Rayfield is apt to make the mistake of cutting down on the fuel, or in other words, obtains too lean a mixture, making it sensitive to climatic changes. The low speed should not be touched in setting the high, but, should the motor backfire with the throttle about one-quarter open, the automatic air valve adjustment should be given a turn or two to the right to decrease the tension of the spring and decreasing the amount of air slightly.

When touring in very high altitudes the air valve should be so adjusted that it seats a trifle lighter, and the maker also recommends cutting down slightly on the low and high-speed fuel adjustments. It should be borne

a r m s o r

pointers on the dials. Set the intermediate speed first, moving between the figures 1 and 3, and advance spark and open throttle, noting results. Moving the arm towards 3 enriches the mixture. The high-speed arm is set with the throttle wide open. The auxiliary air valve should seat lightly.

In setting a carburetor the odor of the exhaust should be noted. When properly adjusted it will have a sweet smell. Too rich a mixture is indicated by dense clouds of black smoke and a pungent odor.

Stromberg.

But two adjustments are utilized with the Stromberg carburetors and these are not difficult to set, being shown at N and L N at Fig. 4. The low speed is set first by turning the nut N up or down until the spring S 1 seats the valve A V lightly, just sufficiently to retain it in its seat. The high speed is adjusted with the throttle open and spark advanced, rotating the nut L N up or down to obtain the desired results. The height of fuel in the float chamber and proper size nozzle is determined at the factory.

MOLINE-KNIGHT MOTORS ON MARKET.

Engine Department of Company's Plant to Turn Out 20,000 Motors.

The Moline Automobile Company, Moline, Ill., will hereafter manufacture Knight motors for the market, thereby expanding the working field of its motor department, which last year turned out 18,000 motors. At the same time, Moline automobiles will continue to be equipped with Knight

sleeve-valve motors. The four by six model tested several months ago for 336 continuous hours in the laboratory of the Automobile Club of America, will also be built for the open market.

Fig. 4—Sectional View of Stromberg Carburetor.

Fig. 3—Model L Schebler Carburetor Having Three Fuel Adjustments.

in mind that the automatic air valve must be seated when the motor is idling. Starting is made easier if the throttle is advanced but one-quarter way open.

Zenith.

The Zenith, made by the Zenith Carburetor Company, Detroit, is another type that requires little if any attention from the motorist after it has been installed. One of the features of the construction is the compound nozzle. A quality of the Zenith emphasized is that the mixture is practically constant at all motor speeds. Efficiency is claimed at high as well as low altitudes, and there is but one adjustment to be made by the owner, the low speed, regulating the supply of air. Moving the low-speed screw in enriches the mixture, while the opposite adjustment provides a leaner mixture. As previously stated, the setting of the Zenith carburetor is the selection of the proper size of choke or venturi tube and gasoline jets and secondary well, factors determined at the factory.

Schebler.

Several types of Schebler carburetors are made, these including F, L, O and R. F and L have single jets and provision is made for the adjustment of high, low and intermediate speeds, and both have the lift type of needle, providing proportionately more fuel with the speed of the motor increasing. The model L is adjusted by screwing in the low-speed needle valve, Fig. 3, until it seats, then opening about $1\frac{1}{2}$ turns. With the throttle about two-thirds open the motor is started and the needle valve adjusted until the engine runs smoothly. The intermediate and high speeds are adjusted by the

Fig. 5—The Zenith Carburetor Has but a Single Adjustment.

FUEL ECONOMIZERS, LOCKS AND FILTERS.

HANS TANK GAUGE.

The Hans Motor Equipment Company of La Crosse, Wis.,

maker of fuel gauges, is manufacturing the design shown in the accompanying illustration. It is mounted with its float chamber directly in the tank, the dial case being the only part visible. This design is for machines where the fuel container is very accessible. The hand, which moves over a calibrated dial, is operated by a magnet.

R. O. C. SUPERHEATER.

The R. O. C. superheater, marketed by the National Economic Supply Company, 1777 Broadway, New York City, is a device for raising the temperature of the fuel before it reaches the carburetor, and consequently while in a liquid state. The heat of the exhaust gases is utilized to raise the temperature of the fuel, the superheater being connected to a branch

line of the exhaust. The advantages claimed for the device are rapid vaporization of the fuel, a more homogeneous mixture, in that precipitation is prevented, greater economy and less carbon. It is stated by the maker that low grades of fuel may be successfully used without carbonization.

SECURITY AUTO LOCK.

One of the most practical methods of preventing use of the car by others than those intended is to lock the fuel supply. The Security Auto Lock Company, 1733 Broadway, New York City, is marketing the Se-

curity auto lock, an ingenious device, which is placed in the fuel line between the supply and the carburetor. Being located on the dash, it is convenient to the driver. It comprises four valve members in a row, each having a passage for the fuel. The gasoline enters and flows as indicated by the arrows in the illustration, but it can pass only when the valve mechanism is set in a certain position. The failure of one of these valves, of course, locks the device. The lock is operated by a small wrench key, and a large number of combinations are possible.

THE VOTEX.

The Votex, made by the Sireno Company, 20 Rose street,

New York City, is fitted in the intake manifold between the carburetor and the cylinders. It is held to be automatic in its action, delivering a certain amount of air to an imperfect mixture, and as required. The maker claims that the device not only provides a perfect mixture, but makes for a very flexible motor.

AUTO-VALVE SAVER.

The Auto-Valve fuel saver, marketed by the Crary Company, Detroit, differs from the conventional types in that a manual control is provided, as well as the automatic one. The dash control enables the driver to close the automatic member when starting. After the motor has become warm the automatic valve controls the supply of air. A priming cup is also included, located near the intake manifold.

PEERLESS FUEL SAVER.

The Peerless fuel saver, manufactured by the Peerless Motor

Specialty Company, Inc., New York City, for which the Harding Specialty Company, Inc., 755 Boylston street, Boston, is sole distributor, utilizes heated air, but in a different manner from conventional practise. A flexible metal tubing is connected with the saver, which is tapped into the intake manifold as shown. The heated air is injected and controlled automatically, and is supplied according to the demands of the motor.

J. & B. FUEL SAVER.

The J. & B. fuel saver is manufactured by Jones & Buckoke, 1413 Michigan avenue, Chicago, and economy of fuel and an efficient mixture are obtained by admitting air automatically and according to the speed of the engine. The device is fitted to the driver's side of the dash and is connected to the intake manifold by a flexible tubing. When the motor is running slowly, the

automatic valve is closed. The principle involved is that of admitting atmosphere when it is supposed that too large a quantity of gasoline is emerging from the jet of the carburetor in proportion to the air, when the motor attains high speeds.

TRIO FILTER.

The Trio Manufacturing Company, 1206 Bellevue avenue, Detroit, is marketing the Trio, which is a combination sediment trap and gasoline reserve supply device, which is intended to eliminate the necessity of carrying extra fuel. It is designed especially for those machines not equipped with auxiliary fuel tanks, and the maker of the Trio states that it not only insures a reserve sup-

ply, but provides a rigid tank connection.

A sediment trap for catching all foreign elements and a shut-off valve to the carburetor are included in this device. Fuel for priming purposes, etc., is obtainable by means of a petcock. As shown by the illustration the valve is in a closed position. When the lever is moved to a forward position, the reserve supply is obtainable. With the lever turned half-way over to an opposite position, the tank may be drained. The valve is of large dimension and is ground to a gasoline tight fit.

ALDERMAN PRIMER.

The Alderman Manufacturing Company, Rochester, N. Y., is

introducing the Alderman primer and power magnifier. The primer is constructed to be operated from the seat or in front of the car, and the fuel is sprayed into the intake manifold. The power magnifier mixes superheated air in the proper proportion with the vapor from the carburetor, the heat of the exhaust being utilized and the air being carried through a special tube to the device.

JUNIOR GASOMETER.

The Junior gasometer, made by Oliver C. Ritz-Waller, 538 Clark street, Chicago, is a smaller form of the Ritz gasometer, designed for large cars. The device is a circular, dial-like member; the principle employed is that of a pneumatic control of the indicator. Figures are shown denoting the supply.

HORNS TO MEET THE NEEDS OF MOTORISTS.

KLAXON HORN LINE.

The pioneer among electric horns, the Klaxon signal is

one with which every motorist in this country is familiar, and with the name of which a definite idea of shape and sound has become associated. The accompanying illustration is of the original type, the Klaxon proper, there being three models of this class of horn, Klaxon, Klaxet and Klaxonet.

REXO II SIGNAL.

The Garford Manufacturing Company, 2506 Olive street, Elyria, O., has brought out this year a very low-priced electric vibrator horn, designed on the same principle as the original REXO and utilizing the same high-grade material and workmanship in its makeup. The cheapness of the new model is due, the company states, to the tremendous quantity production planned, the output being scheduled at 100,000 horns. The horn produces the signalling sound by means of a diaphragm vibra-

brated through the action of a coil, the armature of which makes and breaks an electric circuit if the push button controlling the operation of the horn is pressed by the driver. The REXO II is finished half in black, half in nickel or brass.

CLERO ELECTRIC HORN.

Made by the Fitzgerald Manufacturing Company, Torrington, Conn., the Clero electric horn has been placed on the market recently. This horn is of the vibrating diaphragm type; the actuating principle is an electromagnet, the armature of which carries a hammer, which strikes against a steel diaphragm

at great speed and with great force, so that a very loud and very striking sound is produced. The horn is made dust, rain and fool proof, and, therefore, serviceable under practically any condition. The installation of the horn is extremely simple and can be made in a few minutes. The horn is secured to the dash or any other suitable part of the car by means of screws, and is connected to the dry cells by attaching one pair of cable ends to the two terminal screws projecting from the interior of the horn and the other ends to the terminals of the cells. The price of the horn is moderate. It comes in several styles of finish.

MAXI II SMALL HORN.

One of this year's products of the Garford Manufacturing

Company, 2506 Olive street, Elyria, O., is the Maxi II electric horn, a signal of small size, specially suited to the requirements of the motorcyclist and small or cyclecar owner. This horn has a short projector finished in black baked enamel, and is operated by a push button switch of the lever type, mounted on the handle bar close to the grip.

CABLEPHONE HORN.

A new horn recently announced by the Automobile Supply Manufacturing Company, 220 Taaffe place, Brooklyn, N. Y., is the Cablephone, here shown. This horn is of the hand-operated class, but is not worked, as is the conventional practise, by means of a push lever, but by a cable, the end of which is mounted on the dash or steering wheel, and which, if slightly pulled by the driver, actuates the signal. The horn is sold with a complete set of fittings for installing it.

KLAXON HAND SIGNAL.

As an addition to its line, the Lovell-McConnell Manufactur-

ing Company, Newark, N. J., is now making a small type of hand-operated Klaxon signal, which is substantially the same as the original hand-actuated type, except for its size. This makes it specially desirable for small vehicles, motorcycles, etc., where the strength of the Klaxon sound is desired without the volume of the sound produced by the larger signals.

HOLTZER-CABOT HORN.

The Reacto horn, made by the Holtzer-Cabot Electric Company, Chicago, and Brookline, Mass., is of the simple hammer blow type and is stated by its maker to have no wearing parts. The heavy armature or hammer strikes the diaphragm squarely and rebounds with such speed as to give unrestricted vibration. It is said that this principle has the effect of producing a clear, consonant tone. Condenser protected platinum

contacts are used. The horn is constructed so simply that there is hardly a chance for it to get out of order. The Reacto has been on the market for a considerable time and given general satisfaction, so that this year's model is practically the same type as was offered before, save for minor refinements.

EAGLE EXHAUST HORN.

Many automobilists prefer the exhaust type of signal to the electric or hand-operated styles, principally because this sort of horn gives or can give a musical note coupled with great strength, while the electric apparatus vibrating a diaphragm produces, in practically all cases,

an effective, though harsh signal sound. One of the popular types of exhaust signals is here illustrated, being the Eagle whistle, which is attached to the exhaust pipe at the rear of the muffler and controlled by a pedal and wire rope. Pressing the pedal closes the by-pass valve, which ordinarily permits the exhaust to flow unrestrictedly from the cut-out into the atmosphere. The passage of exhaust gases through the horn, produces a deep, musical chime. The material of the horn is not liable to attack by the exhaust gases. The device is made by the Bi-Motor Equipment Company, 177 Portland street, Boston, Mass.

AUTO PARTS HORN.

The Auto Parts Company, Providence, R. I., is marketing

an exhaust horn of simple construction, which is here illustrated. The horn is attached to the muffler end, and if the cable is pulled, the mouth of the horn is brought up against the muffler, the gases taking the path through the latter and producing the signalling sound, lasting until the cable is released.

TREMO FORD SIGNAL.

An exhaust signal specially designed for Ford cars is the Tremo, made by the D. Henry Bonner Company, Cambridge, Mass. This horn is so constructed that it cannot clog, or hum when no sound is desired. No coupling is required to install it, as the horn shank clamps directly over the end of the exhaust pipe. The sound of this device is equally full and strong at high or low engine speed. Its price is within the means of every Ford owner.

CARE AND MAINTENANCE OF GAS TANKS.

BECAUSE of the simplicity of acetylene light, users of the Prest-O-Lite tank do not always obtain that efficiency and economy possi-

The Prest-O-Lite Gas Tank.

ble with this system of illumination. When the proper size burners are used, the flame maintained at the correct height, the lamps set and focussed correctly and the supply line gas tight, an efficient, economical light is assured. These conditions may be obtained by the owner without involving expense, and for the benefit of those not familiar with the proper operation of the Prest-O-Lite system the suggestions for its care and maintenance will be of value.

The Prest-O-Lite system consists of pure, clean acetylene stored and controlled in a seamless steel cylinder filled with asbestos discs. These discs are saturated with a liquid chemical which has the property of absorbing and dissolving acetylene, making possible the storing of a large quantity of gas in a small space.

One end of the cylinder is provided with a gauge, indicating the supply, and the three styles utilized are shown in an accompanying illustration. One registers the pressure in atmospheres (marked ATM), another pounds and the third both atmospheres and pounds. The pounds pressure of the atmosphere tank can be readily estimated by multiplying the pressure in atmospheres by 15, since the tanks are charged to a pressure of 225 pounds, approximately 15 atmospheres.

Attaching Tank: At Left, Proper Method; at Right, Wrong Way.

Some users of the Prest-O-Lite tank believe that some tanks are sent out not fully charged, especially in the winter time. This is incorrect, as the pressure varies according to the temperature. The cylinders are filled at 60 degrees Fahrenheit and in

cold weather the gauge may show only 135 pounds (nine atmospheres) or less, which is lower than the word "full" on one style of gauge. During warm weather the pressure in a fresh cylinder may be as high as 315 pounds (21 atmospheres), causing the indicating hand to pass out of sight beyond the word "full". This leads some to imagine that the tank is not fitted with a needle.

The variation in the readings caused by different temperatures in no way affects the contents, which are determined by weight, not by volume. If desired, the motorist may demonstrate this change in readings by taking a tank from a warm into a cold place, or vice versa.

Some owners in installing a tank place the valve in the wrong position. It should be placed uppermost, as shown in an accompanying illustration, providing a free and unobstructed flow of gas. If improperly attached, as it has been seen by the writer on several cars, the liquid chemical

Gas Tank Gauges: At Left, Indicating Atmospheres; Centre, Pounds and Atmospheres; Right, Pounds.

in which the acetylene is dissolved may escape into the pipe line, checking the flow of gas and discoloring the flame. The motorist is cautioned to make sure that the garage attendant places the tank with the words "This side up", on top.

The Prest-O-Lite Company states that a tank should not be placed underneath the running board or frame, near the muffler or artificial heat, or mounted where it will chafe against metal, etc. Leaks should be guarded against, for minute leaks are largely responsible for inefficiency. When rubber tubing is employed it should be inspected from time to time, as it is affected by the elements, becoming hard and full of tiny cracks. Brass or copper tubing, unless rigidly mounted, will chafe.

If it be suspected that maximum service is not being obtained from a tank, that is, it is not giving sufficient lighting hours, prepare a heavy soap suds and smear it all along the pipe lines, joints and connections. Any leaks will be noted easily by the bubbles given off. Never use a flame to detect a leak. The company markets an

inexpensive special pipe-line tester, or its use may be obtained at any of the numerous service stations maintained.

The height of the flame is important. It should be as high as possible without blowing and as nearly level across its top as possible. The practise indulged in by some owners of turning the flame down so low that the points do not meet is not recommended, as it tends to carbonize the burner openings, clogging them.

Frequently, gas is wasted by the use of too large a burner for a certain size of reflector, a tendency confined principally to the smaller sizes of lamps. The following guide will be found helpful:

With reflectors five inches in diameter and less, use $\frac{1}{2}$ -foot burners; with reflectors five to six inches in diameter, use $\frac{5}{8}$ -foot burners; with reflectors six to $6\frac{1}{2}$ inches, use $\frac{3}{4}$ -foot burners; with reflectors $6\frac{1}{2}$ inches and larger, use $\frac{7}{8}$ -foot burners. In view of the many varieties of lamps, there is bound to be a slight variation, but the above will be decidedly useful in testing to find the correct size.

The proper focus and correct angle of a lamp

Sectional View of Prest-O-Lite Gas Tank.

are important. With the properly sized burner the flame and mir-

ror lens should be properly located in relation to each other. To test the focus, hold a white sheet of paper three or four feet in front of the lamp. If the focus is correct a clear, white field of light will be obtained, and in addition, a clear, inverted picture of the burner and the flame will appear on the sheet. If, in making this test, a round or crescent shaped dark spot should appear in the field of light, the lamp is out of focus, and the burner or mirror should be moved backward or forward, as needed, until these dark spots disappear.

The proper angle of a lamp is important. The face of the lamp should be perpendicular, and if tilted up, the light goes too far in advance of the car. If tilted down, the rays strike too near the machine. The position of the lights is easily tested with a plumb line (a string with a little weight attached), to see if the face is perpendicular.

In some instances where the lights are mounted unusually high, the lamps will have to be tilted slightly downward, and in all installations the

principal beam of light should strike the ground about 30 feet ahead of the car. The adjustment recommended by the company is obtained by directing the right lamp very slightly to the right and the left lamp to the left. A straight-edged board extended across the face of both lamps will serve as a guide, and the inner edge of each lamp should be brought forward about $\frac{1}{4}$ -inch further than the outer edge. This will obtain a diffusing beam, lighting the side of the road. If it is necessary to bend the lamp

The Proper Height of Flame.

brackets, two wrenches should be employed, one holding while the other is utilized to do the twisting, etc.

Users of the gas tank are cautioned against opening the valve too wide when lighting the lamps. The valve should be turned slowly with the key, and the flame should never hiss or tremble when the match is applied. Too high a flame spells waste of gas and in addition a mirror is likely to become damaged.

Many motorists have fitted the Prest-O-Lite automatic reducing valve, which relieves the owner of the necessity of regulating the supply. The valve is easily attached, inexpensive and provides the correct pressure at all times, whether the tank be full or nearly empty. With this valve one person can turn on the gas and light the lamps with a minimum of effort, and economy is also obtained. If acetylene side and tail lights are desired, the reducing valve will control the supply to these members.

JOHNSON IS DIXON'S CHICAGO HEAD.

Dudley A. Johnson, who for a number of years was the assistant of the late Sam Meyer, has succeeded the latter in the position of Chicago branch manager of the Joseph Dixon Crucible Company. After having been connected with P. F. Pettibone & Company and the Holyoke Envelope Company, Mr. Johnson entered the service of the graphite company in 1898; not long after he assumed charge of the crucible and black lead department of the company's Chicago branch.

Automatic Reducing Valve.

PRACTICAL TOURING EQUIPMENT.

SMITH TIRE VALVE.

A device for facilitating the proper inflation of tires is

being manufactured by the Smith Tire Valve Company, box 1965, Boston. It is easily attached to the valve stem, the plunger of which is removed, as the Smith device replaces this member. One of the qualities of the Smith device is that the largest sized tire may be inflated with a minimum of effort with a hand pump. Another feature that will appeal to motorists is that the Smith valve opens with a slight pressure. The Smith tire valves come in sets of four.

MABEY LAMP.

Mabey's Electric & Manufacturing Company, 940 North Pennsylvania avenue, Indianapolis, Ind., is marketing a novel type of inspection lamp which presents several practical features. It is called a combination trouble and spot light, is shaped similar to a cigar, and is very compact. The bulb is protected by a wire cage when used as an inspection lamp and when not in service is prevented from being broken by a telescopic joint. The last-named

member provides the spot light feature referred to. Suitable length of cord is provided. The Mabey lamp is low priced.

KITCHENETTE.

A compact, practical cooking equipment, termed the Prentiss kitchenette, is being marketed by the Prentiss Manufacturing Company, Racine, Wis., specialist in cooking outfits for tourists. The one illustrated is the No. 1 or six-party outfit, containing a full set of dishes with the necessary knives, forks, spoons, and, in addition, containers for coffee, sugar, salt and pepper. There are also frying

and baking pans and other cooking utensils. The dishes are made of the best white enameled ware.

The case is constructed of No. 22 gauge steel, nicely finished in black, and adjustable leg supports are fitted to the outer leaf of the table. All openings are felt lined to exclude dust and foreign elements. The case measures 28 inches long, 17½ high and 12 wide. The net weight is 75 pounds. Gasoline is employed as a fuel with the folding stove, which has three burners, two of which are for cooking, while the other supplies heat to the oven.

ROHE CAR BLOCK.

The Rohe motor car block, marketed by the Rohe Traction

Block Company, Kenmare, N. D., is designed to extricate the machine from mud, etc., when ordinary methods fail. The block is approximately 30 inches long and is put in place, as shown in the accompanying illustration, with a chain attached to a strap. When the power is applied, the wheel in revolving draws the chain and block under it, thus providing a tractive surface.

THE LOCK-ALL.

The H. P. B. Electric Company, 500 Fifth avenue, New York City, is manufacturing the Lock-All, a device for controlling the lights, ignition and electric horn. It is a switch and lock combined and the lock is a Yale. The central knob of the device controls the lights and is of the kick type. It is stated that the lights may be locked in any of the various combinations.

A. A. A. FORD CAPS.

The A. Auto Appliance Company, 114 West Exchange

street, Providence, R. I., is marketing two designs of radiator caps for the model T Ford car, one a plain style, and the other with an initial. One of the qualities of the designs is that they are cast, not stamped. They are constructed of bronze and aluminum, and have scalloped edges, which not only add to the attractiveness of the design, but facilitate removal and replacement. Two finishes are supplied, polished nickel and black and nickel.

EASYBAK CUSHION.

The Easybak cushion, marketed by the Holden Manufacturing Company, St. Paul, Minn., is constructed to support the back, thereby eliminating the strain upon the muscles when operating the clutch and brake pedals, as well as when undertaking long drives. The device is also of value to other occupants of the car. The Easybak fills the vacant space, and, supporting as it does the entire back, permits one to sit with the muscles relaxed even when

traversing rough roads. It is made of a strong water proof fabric in a dark gray or subdued brown to match the slip covers and in imitation or genuine leather. It is stated that the design will fit all makes of cars. It is moderately priced.

SPARK-NO LOCK.

The H. W. Johns-Manville Company, New York City, is marketing the Spark-No automobile lock, an ingenious device for locking the ignition system of the machine and preventing the use of the car by others than those intended. It is attached to the dash and the hands shown in the accompanying illustration are moved over a calibrated

dial by means of two little knobs. These are employed for starting on the battery and running on the magneto, and one of the qualities of the device is that it is impossible for any one riding with the driver to discover the starting combination. The action of the device is similar to a combination lock, but differs in that the combination operates a switch, and this switch cannot be closed to obtain current unless the hands are properly set on the dial. If any one attempts to steal the machine, not only is the ignition cut out, preventing starting of the motor, but an alarm is sounded by a bell. The signal is also sounded if any one tampers with the lock. The device is easily installed.

SECURITY ENAMEL.

The D. Henry Bonner Company, Cambridge, Mass., is mar-

keting Security tire enamel, which is a specially prepared liquid paint made from a pure rubber combined with selected pigments. It is employed for protecting and preserving tires, mats and other rubber articles exposed to the action of the weather. The maker claims it will fill cuts, preventing moisture penetrating to the fabric, etc. When applied it dries quickly, imparting a beautiful gray appearance.

WILSON GOGGLES.

T. A. Wilson & Co., Inc., Reading, Penn., is marketing the Night and Day goggle, which includes provision for eliminating the glare created when meeting cars equipped with powerful headlights. It possesses the desirable features of a day goggle and, in addition, has an extra segment in the top of each lens. The smaller or lower section is of light amber, and the vision through this portion is for ordinary driving. The top lens is dark amber in color.

CENTURY LIGHTER.

The Century cigar lighter is marketed by Mabey's Electric &

Manufacturing Company, Indianapolis, Ind., and is designed to operate on a six-volt storage battery or dry cells. The switch is of the push type, and included with the equipment is seven feet of silk cord. The dimensions of the lighter are one by two inches. It is finished in black leather, with all trimmings nickel plated. The company recommends running the cord from the battery up through the floor at the back of the front seat so the lighter will be convenient for all passengers.

HICKS BRUSH.

The Howard W. Hicks Brush Company, Denver, Col., is marketing the Hicks fountain brush, designed for owners who wash their cars. One of the qualities of the brush is that the washing may be accomplished without the operator wetting his hands or clothing. The brush parts are made of aluminum, the handle is of steel and 18 inches long; it is equipped with a rub-

ber grip. The connection is standard, permitting of attachment by means of a cut-out.

LIEBSON STARTER.

The Liebson Self-Starter Company, Macon, Ga., is manufacturing a mechanical type of motor starter which weighs less than 10 pounds and is stated to be applicable to any make of gasoline car. It differs from conventional types in that it is operated by compression and explosion, the principle involved being practically the same as that of an internal combustion engine. A lever operates a small pump, to which is attached a specially constructed carburet-

or. Moving the lever backward draws fuel into the pump, and at the completion of the suction stroke the proper amount of air is mixed with the gasoline. Another movement of the lever forces the mixture into a distributor having as many outlets as there are cylinders. An arrangement of valves actuated by cams makes for proper distribution of the gas, which is ignited by an electric spark. A feature of the starter is that in forcing the charge into the cylinder there is sufficient pressure to start the crankshaft revolving, and the ignition is so timed that the explosion takes place after this movement has begun.

In selecting accessories, tools, supplies or fittings, always consult The Buyers' Guide, found elsewhere in this issue. The concerns listed are thoroughly reliable and worthy of your confidence.

LATIGO FAN BELT.

The Perkins-Campbell Company, 626 Broadway, Cincinnati,

O., manufacturer of specialties for the Ford car, is producing the Latigo fan belt. It is constructed of genuine Latigo leather, which contains no mineral or material employed in tanning. It is claimed to be the strongest leather known and impervious to the action of heat, oils or water. Special emphasis is laid upon its non-stretching qualities. The boots marketed by the company for the steering linkage of the Ford machine come in sets of three. They are constructed of the best grade of water proof leather, and are of the lace type.

PYRMA HEEL PLATES.

The Metallic Automobile Matting Company, Rochester, N. Y., is manufacturing the Pyrma aluminum heel plates for the model T Ford car. One of the qualities of the design is that the use of screws, rivets, etc., is eliminated when attaching the plates to the matting. The Pyrma is fitted with corners, which are inserted in slits in the matting and bent to clinch the last-named material.

WIZARD WASHER.

The Wizard washer, made by the Century Foundry Company,

Syracuse, N. Y., is designed to enable the owner to wash the car without rubber boots, aprons, etc. One of the qualities of the washer is that the hands do not come in contact with the water. A ball bearing turbine motor forces the water through a nozzle and around a rapidly rotating brush, so that all deposits are removed from the machine without injury to its finish.

S. & M. LIGHTER.

The S. & M. gas lighting equipment, marketed by the S. & M. Manufacturing Company, Salem, O., is an electrical device for controlling the lights from the seat. The gas is turned on at the dash, a diaphragm regulator preventing it from being turned on too high, by controlling the pressure from the tank. Ignition of the gas is effected by an electrical circuit, which starts at the rear spark plug and runs to one terminal of the controlling valve switch. From the other terminal a wire is led to the right hand burner, which is wired across to the other headlight and grounded. Special burners are necessary with the S. & M. lighter,

and are included with each equipment.

DANN SPRING INSERT.

The Dann Oil Cushion Spring Company, 2246 Indiana avenue, Chicago, is marketing the Dann oil cushion spring insert, which insures constant lubrication of the leaves. As will be noted by the accompanying illustration, the insert is provided with a large number of apertures, which are filled with a lubricant. Being inserted between the conventional leaves the latter are always lubricated, and one of the qualities of the design is that the insert will provide lubrication for a considerable period. It is pointed out by the

maker that an ordinary spring having a number of leaves of graduated lengths contains an enormous area of surfaces, which means that considerable friction is present if the surfaces are not constantly lubricated. The Dann insert provides this desired lubrication, eliminating squeaks as well as minor vibrations. It is easily installed.

TOURING EQUIPMENT.

The following concerns issue free catalogues, which will be of decided value in selecting practical, as well as useful equipment for the tour: The Walte Auto Supply Company, 81 Exchange place, Providence, R. I.; Alsten & Goulding, Worcester, Mass.; BI-Motor Equipment Company, 182 Massachusetts avenue, Boston; Auto Parts Company, 50 Exchange place, Providence, R. I., and the American Auto Supply Company, 1741 Broadway, New York City. The catalogues are well illustrated.

KERN CIRCULATOR.

The Kern water circulator, made by the Pittsburg Manufac-

turing Company, Pittsburg, Penn., is designed for the model T Ford motor to augment the flow of the cooling fluid. The device comprises a simple propeller incorporated in the lower pipe shown in the accompanying illustration. The propeller is actuated by a pulley driven by a belt. It is estimated that the device will circulate eight gallons at 500 revolutions a minute and 18 gallons at 1100.

CLARK WINDSHIELD.

A. N. Clark & Son, Plainville, Conn., is manufacturing the Clark adjustable tonneau windshield and, as the name implies, is designed to protect the occupants of the rear seats from draughts, rain, etc. One of its qualities is that it may be adjusted as desired, and another feature is that it may be folded when its service is not required, as in warm weather. It is made with a variety of bases to fit any car, and is attached to the seat under the cushion, coming up between the seat arm and the cushion. One windshield is used on either side of the machine as shown herewith.

SPRING SPREADER.

Chas. E. Miller, 97-103 Reade street, New York City, is mar-

keting the Knowlson spring-leaf spreader, which is easily operated and adjustable to any size of spring. One of the qualities of the device emphasized is that it is not necessary to loosen the spring clips. To use it, the points are inserted between the leaves and the screw member is rotated. This forces the leaves apart, enabling the introduction of the lubricant. A feature of the tool is that it can be employed to make a temporary repair to a broken spring. It is moderately priced.

DOVER MEASURE.

Among the specialties marketed by the Dover Stamping & Manufacturing Company, Cambridge, Mass., is the Dover Duplex combination measure and funnel, which possesses several practical features, the most noticeable of which is a pouring lip with a centre channel. This permits of pouring fast and in quantities. It also has a funnel, which points slightly upward, so that when the measure is set down all lubricant runs back into it instead of outside; this construction makes

for economy. The handle is placed on the side for convenience in pouring. Like all Dover measures, it is of correct capacity and conforms with the laws of the various states.

NYCO SWITCH.

The New York Coil Company, 340 Pearl street, New York City, manufacturer of ignition apparatus, including devices for the model T Ford car, is marketing the Nyco two-system switch for the machines equipped with a master vibrator. One of the qualities of the Nyco is that the conventional coil may be utilized without removing the means for shunting the primary circuit. With the

Nyco the switch or controller may be moved to the vibrator side or to the coil side as desired. In the latter position the regular coil is brought into service. This is a distinct advantage, in that it permits the operator to use the vibrators to locate a missing or faulty cylinder. The lever or controller is of the conventional kick type, easily operated. The Nyco is supplied with flexible wire connections of different colors and of proper length to connect to the master vibrator and those of the coil. The wiring of the car is not changed and the Nyco may be fitted to the dash and wired in 10 minutes by the most inexperienced person. The device is compact and is constructed of high-grade material.

PRICE SWITCH.

An ingenious device for preventing the operation of the

electric horn or lighting system when the motor is not operating is the Price automatic cut-out switch. It utilizes the pressure or suction of the intake manifold to actuate it. As will be noted by the accompanying illustration, it is a simple electric switch operated by the suction referred to, and the switch is closed when the motor is operating. When the engine stops the electrical circuit is interrupted.

CARBONOX.

The Northwestern Chemical Company, Marietta, O., is marketing a carbon remover called Carbonox, a fluid which is injected into the cylinders. The preparation does not dissolve the carbon, but attacks the charred oil that holds the flakes of carbon to each other and to the cylinder, piston head, etc. One of the qualities of Carbonox is that it provides an inexpensive method of keeping the cylinders free from carbon, as it costs but a few cents a cylinder.

AMERICAN CARS AT DISADVANTAGE.**Poor Positions for Makers of Nationalities Not Represented in I. U. A. M.**

In order to secure space at the coming Paris salon, on an equal footing with automobile manufacturers in other countries, American makers must join in a body the International Union of Automobile Manufacturers, nations not included in the same being allowed spaces in the gallery only. French and other European exhibitors will draw lots for the good positions at the salon. America has never become a member of the union.

The automobile salon will open on Oct. 16 under President Poincaré's auspices and will close 10 days later. Space applications are said to be received until July 10.

SPEDOLENE.**Lubricant Prepared Especially for Gears, Transmissions, Differentials, Timing Gears, Etc.**

Spedolene is termed "The Lubricant That Kills Heat", by its maker, the Continental Asbestos Corporation, Worcester, Mass. It is designed especially for gears, transmissions, differentials, timing gears, bearings, etc., and is a mineral compound, containing no animal matter, fats, acids, lye, soda or water. It is non-corrosive. Spedolene is made from the finest grades of material, and each process of manufacture is carefully and thoroughly tested. Absolute uniformity is guaranteed. The maker states that it positively eliminates gear noises, does not run or throw out of the housings, and will give maximum service under all conditions. It is adaptable for pleasure and commercial vehicles.

DEALERS WIN SEPARATOR CASE.**New York City Council Favors Elimination of Ordinance Requiring Equipment.**

Because of expert opinion obtained by the New York City dealers to the effect that oil separators as prescribed for use in garages by the municipal code are of very slight value, the welfare committee of the City Council reported favorably on the resolution of New York dealers and repairmen that the section providing for the use of these appliances be eliminated.

This decision gained by the Gotham trade is due in a large measure to the work of Charles

Thaddeus Terry, who waged the fight for the New York Garage Association, the Automobile Dealers' Association of New York City, the Brooklyn Garage Owners Board of Trade, the American Automobile Association and the Brooklyn Motor Vehicle Dealers' Association.

GAME ON WILLYS-OVERLAND DAY.**All Employees Get a Half Holiday to See Athletics and Cubs Play.**

On Overland Day, which John North Willys gave to his employees on June 23, he engaged both the regular teams of Athletics and Cubs to play an exhibition game before the 10,000 workers. Each team received \$2000; \$500 was paid for the park and a full day's wages to all the workers, though they got a half holiday. Headed by Mr. Willys, the 10,000 men marched from the factory to Swayne field, where the game was played. The score was: Cubs, 8; Athletics, 7.

BIG DEMAND FOR ROADSTERS.**Empire Company Forced to Change Schedule Because of Large Call for Open Cars.**

According to Cecil E. Gibson, general manager of the Empire Automobile Company, Indianapolis, a most notable feature of this season is an unprecedented demand for roadsters. Although anticipating a landslide in favor of this type of car and regulating its schedule accordingly, the above-named company has been forced to change its production scheme several times to meet the unusually great demand for the two-seater type of car.

SELECTING A MOTOR CAR.**National Motor Vehicle Company Tells How to Do It in a Neat Booklet.**

"How to Select a Motor Car" is the title of a neat little booklet just published by the National Motor Vehicle Company, Indianapolis, Ind. The text matter has been prepared with a view to presenting such information about National cars as will enable the prospective owner to make his selection wisely, and is well illustrated with photographic reproductions of the various models produced by this concern. Special chapters are devoted to the matters of comfort, performance, reliability, speed, the meaning of the name, etc.

SMALL CAR MOTOR STARTING SYSTEMS.

DURING the past six months a number of motor starting systems for the model T Ford have been placed upon the market, these in-

Boston Starter Installed.

cluding electric, mechanical and those operated by compressed air. The low initial cost, ease of installation and minimum attention required with the mechanical types has made them popular with the owners of the Ford machine. The starting of the engine from the seat appeals to the owners of this type of car, and those contemplating the purchase of a motor starter will find the following descriptions, of different types, of interest:

Boston.

The Boston starter, marketed by the Automatic Appliance Company, 172 Columbus avenue, Boston, is of the mechanical type and is operated from the seat by a convenient handle. One of the qualities of the design is that it starts the motor with the same certainty as though the crank were spun. Another feature of the design is that it does not interfere with the operation of the usual starting crank. Damage to the starter mechanism and motor is prevented by an automatic release, and as a further precaution the spark is automatically retarded.

The maker states that the Boston can be installed easily and without interfering with or changing the appearance of the machine, as the equipment, with the exception of the starting handle, is fitted under the hood. The handle is connected with the starter mechanism by cable, as will be noted by referring to the accompanying illustration, which depicts the simplicity of the design. Due to the leverage obtained the motor is spun easily.

Universal.

The Universal is a mechanical type and is marketed by the Universal Manufacturing Company, Racine, Wis. It is a simple design, very efficient and practical, and is easily installed without necessitating any alterations on the car. The starter mechanism proper is attached to the crankshaft of the motor in such manner that it does not interfere with the cranking of the engine by the usual starting crank, which is not disturbed.

Kellogg Air Starter.

Considerable energy is imparted to the crankshaft by the Universal and the maker states that a child can spin the shaft easily, as but a slight pull of the starting handle is required. The last-named member is fitted in the toeboard, convenient to the operator. The Universal includes a device for preventing injury to the motor or other mechanism in the event of a back fire. One of the qualities of the starter is that it may be installed in a short time and the equipment is most complete. The maker guarantees the Universal to turn the motor past the compression and firing stroke every time.

Kellogg.

The motor starter produced by the Kellogg Manufacturing Company, Rochester, N. Y., employs compressed air and comprises in combination a pump and starting mechanism, storage tank, gauge, starter button and pump control. The system installed is shown in an accompanying illustration.

The unit comprises a cylinder, the piston of which is actuated by air entering from tank. A chain connected

with the piston operates a drum in the housing mounted at the front of the car. This chain makes one complete turn around the drum. The fan-belt pulley is replaced with a combination pulley sprocket for driving the pump and a clutch which automatically engages with the motor when the starter is operated. The application of the air is gradual, but the power developed during the balance of the piston travel is sufficient to spin the motor. A spring returns the drum, preparing for a second application of energy. Control of the pump for storing compressed air is by a button and a similar member operates the starter.

Showing Starting Handle of Universal.

The application of the air is gradual, but the power developed during the balance of the piston travel is sufficient to spin the motor. A spring returns the drum, preparing for a second application of energy. Control of the pump for storing compressed air is by a button and a similar member operates the starter.

Housel.

The Housel starter, manufactured by the Century Foundry Company, Inc., Syracuse, N. Y., is of the mechanical type and is operated by depressing a pedal. Pushing the pedal actuates a flexible steel cable connecting with the starter mechanism, causing the crankshaft of the motor to be rotated rapidly. The cable runs through roller bearing pulleys, and the maker states that their arrangement is such as to obtain a downward pull, providing great leverage. Danger of damage to the mechanism or motor by a backfire is automatically eliminated. The Housel is mounted back of the radiator, is easily installed, and permits of the use of the ordinary starting crank.

Perfection.

The Perfection Auto Starter Company, Denver, Col. is manufacturing the Perfection, which is a mechanical design, operated by a pedal. Provision is made to prevent injury by a backfire of the motor.

FEATURES OF HARTFORD ELECTRIC BRAKE.

A SMALL Hartford electric reversible motor, with a worm and worm wheel attached to a drum connected by a steel cable to the equalizer arm, constitutes the new electric brake of the Hartford Suspension Company, Jersey City, N. J. This invention of Edward V. Hartford is

Edward V. Hartford, the Inventor of the Hartford Electric Brake Giving a Push Button Stop.

controlled by a two-point switch encased and secured to the steering post. If the control lever is moved to the first point the motor is supplied from the battery with enough energy for service braking, while pushing the lever to the second point draws more electricity and brings about an emergency stop. The motor is series-wound and draws current from a six, 12 or 24-volt battery. It takes 40 amperes in two-fifths second to produce a pull of 1000 pounds. When running idle the motor turns at 10,000 rpm. The worm at the end of the armature shaft drives a gearing operating the drum which carries the steel cable, and the reduction between worm and gear is 100:1, and between the latter and the internal gear of the drum 4:1, giving a total ratio of 400:1. The cable transmits the pull directly to the brake. The motor is capable of applying 1000 pounds pull as quickly as through the emergency lever. This pull exerted, a slipping clutch prevents further pull and a ratchet the slipping off of the brake. Because of the intensity of the cable pull, the emergency brakes,

The Small Motor and Cable Drum, Weighing Only 35 Pounds, Can Be Mounted Wherever Desired.

If the control lever is moved to the first point the motor is supplied from the battery with enough energy for service braking,

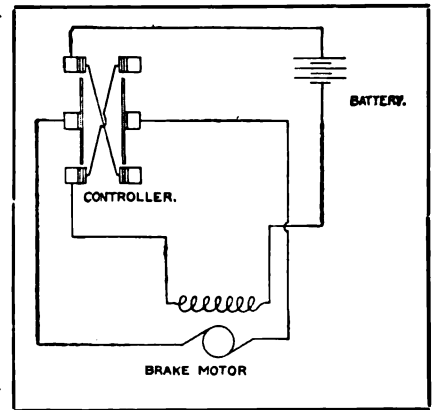

which the cable operates, are run in oil; thus the application of brakes must squeeze

a film of oil from between the brake shoes and drums so that the car is slowed down and the brake becomes more effective as the oil is displaced from between the contacting parts.

The inventor states that he can drive a car at 50 miles an hour up to 35 feet of a right angle turn, taking the latter at 15 miles. One of the most important advantages of the new brake is that as its effect is gradual, it slows down a car on a wet pavement without locking the wheels and causing the automobile to skid. This alone is a very strong point in the favor of the new device.

By connecting the Hartford brake to the emergency set, the foot brake is left for the driver's use as before. But the installation on the car of a device which can be depended on for practically infallible action provided the battery is charged, is a very valuable addition to the equipment, reduces the car's chances of accident and lends a feeling of security to driver and passengers. The device weighs 35 pounds, or indeed less, as the emergency lever and part of the linkage may be removed after its installation.

The high standard maintained in other Hartford products characterizes this brake.

The Method of Connecting the Hartford Brake to the Battery Is Extremely Simple, as Here Shown.

The Control of the Hartford Electric Brake Is by Means of a Two-Point Switch Control Encased and Attached in Any Position Suiting the Driver.

DUESENBERG WINS SIOUX CITY SWEEPSTAKES.

Rickenbacher Covers 300 Miles at 78.6 Miles an Hour—Wishart a Close Second—Nine American Cars and One French Car Finish.

AFTER driving steadily for 3:49:02, Eddie Rickenbacher, in his Duesenberg racer, finished first in the Sioux City 300-mile sweepstakes, having averaged 78.6 miles an hour on the local two-mile dirt track. Spencer Wishart in his Mercer was a close second, Cyrus Patschke in a Marmon was third and Gil Anderson's Stutz fourth. Billy Knipper's Delage, fifth, the winner of this year's Indianapolis sweepstakes, was the only foreign machine which finished. Ralph Mulford, having relieved Tommy Alley, was sixth in another Duesenberg; the Gray Fox, driven by Wilcox, was seventh. Chandler in a Braender Bulldog, Shrunk in a White and Wetmore in a Chalmers followed in the order named. There was a total field of 17 starters, 11 cars being American and six foreign; all but one of the latter dropped out, while all the American cars with one single exception finished.

With the 75th lap (150 miles) completed, the race was reduced to a speed duel between Rickenbacher and Wishart, who took the lead alternately, the final winner gaining on the turns, which he took at full speed, while the New York millionaire overtook him on the straightaways. When separated by a very small lead at the completion of the 286th mile, Eddie Rickenbacher was discovered to be four laps ahead of Wishart,

the correction being made by Fred A. Wagner, who had started the race and now superintended the timing. This discovery naturally placed victory in the hands of Rickenbacher, who finished with "eclat", as the French call it, by exploding a tire while crossing the tape. Wishart, who had intended to give the Duesenberg a hard tussle on the last seven laps, protested against the decision, claiming the time was not kept correctly. Other car owners followed his example.

When the starting gun was fired, Bob Burman jumped to the lead in his Peugeot and succeeded in holding this position for more than 20 miles. Then, when Wishart had gained on him and was a close follower, the French car was crippled for a very short time, sufficient, however, to let Wishart assume first place. In the meantime, Mulford, who was driving another Peugeot, tried to pass Wishart, but never succeeded for a single second. Rickenbacher kept behind the Mercer, getting acquainted with the course in all its details and gauging the field, against which he won afterward. At the same time, Patschke and Knipper took desperate chances on the turns, but never got above third position, save for an instant when Wishart had stopped, at the completion of 90 laps, to replenish his water and fuel supply. Then Knipper over-

took him, only to be reduced again to third place when the Mercer re-entered the course and renewed its fight against the Duesenberg. Once more, after 190 laps were completed, it looked as though he might still take the lead, but a stop for water during the 171st lap eliminated his chance.

For a time it seemed as though the other Duesenberg might win. Between the 60th and 75th lap, Tommy Alley held first position, but he could not keep up the pace, and with 150 miles completed, he dropped to third, Wishart leading Rickenbacher by one mile. Pushed by

Rickenbacher and His Duesenberg, the Combination That Won at Sioux City.

Patschke and Knipper, Alley soon was reduced to sixth position. When the leaders had circled the course for the 100th time, many of the drivers in back positions retired, as they saw no chance of winning, leaving at one time only nine cars on the track. Then several cars were disabled, but when the finish came into sight, several machines returned to the track and at the close there were 10 automobiles in the race, each of which received a share of the prize.

A total of \$25,000 had been hung up, and Rickenbacher got \$10,000, while the rest was distributed among the other drivers, who had stayed in the race. Including the winner, seven cars were timed for the entire 300 miles, the time being as follows:

Car	Driver	Time
Duesenberg	Rickenbacher	3:49:02
Mercer	Wishart	3:49:50
Marmon	Patschke	4:02:10
Stutz	Anderson	4:02:56
Delage	Knipper	4:03:34
Duesenberg	Alley and Mulford	4:31:07
Gray Fox	Wilcox	4:42:32

This order, however, was arrived at only after 18 hours' deliberation and conference by the board of officials, due to the threat of several owners of complaining to the A. A. A. Originally, Mulford's Duesenberg car was timed to have finished third, Patschke had been fifth and Knipper sixth. Naturally, the managers of the local speedway association were much disappointed that any misunderstanding should have arisen concerning the timing, as the officials had been selected on account of their past experience in similar contests.

The Peugeot cars, which had been expected to make a good showing, dropped out relatively early. Mulford's car had its oiling system broken after 32 miles; Stringer's machine was disabled by a crash through the fence, its engine dying just when the car shot towards the judges' stand; Burman dropped out after having covered more

Top—Cyrus Patschke and His Marmon, Which Finished Third. Bottom—Spencer Wishart, Who Was Second by a Close Margin.

than half the distance of the race. Mulford relieved Alley when the latter was seriously burned by gasoline catching fire while his tank was being replenished. All other accidents were slight.

Oldfield's Stutz, which had its radiator broken, and Babcock's Sunbeam, suffering breakage of a valve, forced these two competitors out of the race. Wetmore, a local driver, continued to drive his Chalmers after it had gone wrong, and he finished 10th, succumbing to the heat after the race was over.

To the great disappointment of the spectators, a Moon car, driven by Ely Caillouette, and two Chevrolets, steered by Le Cain and Jessop, respectively, which were claimed not to have been timed correctly in preliminaries the day before the race, were disqualified because their trial lap times were from five to seven seconds too slow.

On July 3, the day before the race, throngs of Iowa and South Dakota enthusiasts reached

Lining up the Competing Cars Before Sending Them Away. (Left). Burman Passes Shrunk—One of the Many Thrills of the Race. (Right.)

Sioux City by train and automobile. Many cars were driven up to the course on the eve of the race to assure the owners of good positions for the event. The following morning several hundred cars were driven into the oval parking space for automobiles. When the gates were thrown open to the public at 7 a. m., Independence Day, the multitude made a rush for the grandstand and all other points of vantage. The attendance was considerably in excess of what had been expected; according to a statement of the speedway association, 47,000 persons had paid to view the race.

Equipment Utilized.

All of the cars that started in the race were fitted with Bosch magnetos, and Bosch spark plugs were used by all save two of the 10 machines that won places and prizes. Rayfield carburetors were equipment on Spencer Wishart's

SAXON REACHES SAN FRANCISCO.

Small Car Finishes Coast-to-Coast Run on Independence Day, Averaging 30 Miles a Gallon.

After a final burst of speed whereby the Lincoln highway Saxon small car covered the 290 miles between Reno, Nev., and San Francisco in two days, the transcontinental tourists reached the latter city, into which they were paraded by an escort party that had travelled out 25 miles to meet the little machine. Thus the trip of 3389 miles was completed on schedule time. The Saxon is the first automobile which travelled over the Lincoln route from one end to the other, maintaining its schedule exactly, while its path led over roads and hills of every kind and grade. M. A. Croker and Fred Wilkins drove alternately. The total consumption of fuel was 113 gal-

lons, giving 30 miles to a gallon of gasoline, while the oil consumption was one quart for 150 miles of travel.

For 30 consecutive days before the start on the transcontinental trip, the Saxon car was driven 135 miles a day in Detroit, giving a total travel of 4050 miles, which, together with the 3389 miles of the Lincoln highway trip, aggregate 7439 miles, which were covered in 60 days. Upon reaching San Francisco Driver Croker drove the front wheels of the Saxon into the Pacific ocean so as to make the trip literally an ocean-to-ocean run. He also emptied water, carried from the Atlantic, into the Pacific.

FISK REDUCES TIRE PRICES.

The Fisk Rubber Company, Chicopee Falls, Mass., on July 1 reduced the prices of tires of certain sizes. The reduction applies to all sizes of non-skid tires, but on the plain tread tires to the three and 3½-inch sizes only, while there is no change in the price of tubes. The increase in non-skid tire production during the past two months was 200 per cent.

Following is a tabulation giving a comparison of the old and new prices:

Tread	New Price	Old Price
30x3½ plain	\$16.55	\$17.00
30x3 plain	12.30	13.85
34x4 non-skid	31.60	36.60
36x4½ non-skid	42.65	46.35

Transcontinental Saxon Completes Tour from Atlantic to Pacific Ocean, a Distance of 3389 Miles—The Machine Is Shown Dipping Its Wheels in the Atlantic Ocean at the Start.

Mercer, as well as three other cars that were given places. The Marmon, Stutz and Chalmers cars that finished fourth, fifth and 10th, were lubricated with Monogram oil. Castor oil was used by eight cars.

Wire wheels were general equipment of many of the cars. Rudge-Whitworth wheels were on the cars finishing first, second and third, and Houk wheels on the car making fourth position. The Houk wheels are manufactured by the Geo. W. Houk Company, Buffalo, N. Y., under license from the Rudge-Whitworth Company, and differ in name only from the English production.

The promoters of the race were so well satisfied with the result that they purpose to make a purse of \$50,000 to be competed for July 4, 1915, and to improve the course, either by resurfacing or banking it.

METZ MAKES CLEAN SWEEP IN HILL CLIMB.

IT WOULD appear that the Metz Company, Waltham, Mass., is to capture the hill-climbing championship for 1914, judging from the performance of the Metz "22" in recent events. The latest victory to be scored by the gearless transmission machine of but 196 inches piston displacement, was a clean sweep of the second annual hill climb conducted by the Utica Automobile Club at Richfield Springs, N. Y., July 4. The Metz finished, one, two, three, both in the class A and free-for-all, making better time than any other car competing in the seven events.

The performance is all the more remarkable when it is considered that the Metz defeated a field of 12 cars, including several high-powered machines noted for their hill-climbing abilities. Some idea of the speed may be obtained from the time of 55½ seconds on a grade seven-eighths of a mile long. The other Metz entries in the free-for-all finished a second apart and the third car was but two seconds behind the winner. The time made by John Guiney was five seconds better than the best made by any other machine, excepting the Metz entries.

In class A, in which the Metz finished one, two, three, Arthur Roder was the winner in 1:05. with Guiney second in 1:07¼ and C. Walter Metz third in 1:09 2-5.

G. M. Francis, driving an Overland, won the class C in 1:10, while Stuart Foster and B. Roberts won first and second places in class E with Mercer cars. Foster finished third in the free-for-all, which was a clean sweep for the Metz entries.

A feature of the motorcycle events was the breaking of the amateur record for the hill by Howard Ainsworth of Utica, N. Y., who covered the grade in 55¾ seconds. Silver trophy cups were awarded the winners. The events, cars and drivers are as follows:

Class A—Won by Arthur Roder, Metz, time, 1:05; second, John Guiney, Metz, time, 1:07¼; third, C. Walter Metz, time, 1:09 2/5.

Class B—Won by Edwin J. Adams, Chevrolet, time, 1:13¼; second, H. C. Dalker, Maxwell, time, 1:14½; third, C. G. Senif, Maxwell, 1:17¾.

Class C—Won by G. M. Francis, Overland, time, 1:10; second, W. R. Hitchcock, Page-Detroit, time, 1:19; third, A. P. Howarth, Regal, time, 1:25¼.

Class D—Won by H. W. Skinner, Chandler, time, 1:09¼; second, F. E. Henabray, Oakland, time, 1:09½; third, Dr. H. M. Clapp, Cole and C. O. Jones, Cadillac, 1:13.

Class E—Won by Stuart Foster, Mercer, time, 1:00½; second, B. Roberts, Mercer, time, 1:03½.

Class F—H. W. Skinner, Chalmers, time, 1:00¾; second, Charles W. Gorton, Pope-Hartford, time, 1:06½.

In the motorcycle races, Walter J. Baird won

the single-cylinder event in 1:55. The race for twin-cylinder machines was won by H. Jefferson in 0:53¾, and the free-for-all by Stewart J. Baird in 0:56.

OIL PROVES EFFICIENT.

Salt Lake City Motorist Uses No-Karbon Eagleline Lubricant in 14-Mile Hill Climb.

Operating the motor for long periods on grades, necessitating recourse to the low and second speeds, is a severe test of the efficiency of the lubricant utilized. The Eagle Oil & Supply Company, 104 Broad street, Boston, Mass., received recently an unsolicited testimonial from a user of No-Karbon Eagleline auto oil.

C. R. Pearsall of Salt Lake City wrote the company as follows:

Some people think that your No-Karbon oil is too thin to be effective. I drove my car, a three-year-old model X Stevens-Duryea, up a 14-mile incline that has a very steady grade, amounting to 4800 feet in the 14 miles. It was moderately warm, but the water did not boil, nor did I lose a drop. I do not know of any other instance of any motorist in the city making the same trip without being compelled to replenish his supply of water from two to 50 times during the climb. I do not cite this believing that the oil was entirely responsible, as I know my motor is particularly well cooled, but it proves that No-Karbon oil does lubricate in the most trying circumstances, and some have doubted this.

TOURING EQUIPMENT.

Waite Auto Supply Company Offers Numerous Practical Accessories, Supplies, Fittings, Etc.

One of the best known automobile supply houses in New England is the Waite Auto Supply Company, 81 Exchange place, Providence, R. I. Motorists planning tours will find there many useful and practical accessories providing comfort and convenience, as well as material necessary in fitting the car for the road, including everything from a cotter pin to a power tire pump, etc. The company is distributor for Rayfield carburetors, Klaxon horns, Mea magnetos and many other well known products. In addition the Waite Auto Supply Company manufactures staple accessories, such as the Success dry cells, spark plugs, etc. The catalogue issued free by this concern is most complete, including as it does illustrations and descriptions of supplies, fittings, accessories and a full line of touring equipment.

MARMON'S POINTS: BODY AND EQUIPMENT.

WITH few mechanical changes, but very much amplified in its accessory equipment and considerably refined in details of many

Driver's Compartment, Showing Left Steer and Centre Control.

parts of the car, the Nordyke & Marmon Company, Indianapolis, Ind., offers its model 41 to the American public. Perhaps the most significant innovation is the introduction of a complete electrical Bosch equipment, consisting of three units, the lighting generator, the cranking motor and the magneto. The generator begins to operate at 12 miles an hour, and at once gives enough electricity to illumine all the lamps. The surplus current charges a Bosch-LBA storage battery of 50 ampere-hours capacity at 12 volts. The cranker is a 12-volt, series wound motor. The generator supplies the current required by head, side and tail lights, as well as the trouble hunting lamp, besides charging the battery for starting the motor. In starting, the generator supplies the ignition current, until the motor begins to operate, when the magneto cuts in and the cranker stops work. Also, if it becomes necessary to start by hand, the engagement of the starting crank automatically switches on the battery ignition, and after the motor has started, the magneto is switched on.

Excepting the minor changes necessitated by the new electrical equipment, the motor is the same as before, 4.25 by 5.5 inches, the cylinders being cast in two blocks of three. The pistons are slightly different this year; they are 5.453125 inches long and fitted with three compression

rings, all above the wristpin. The upper rings are concentric packing rings and the lowest a concentric oil ring with nine .125-inch holes drilled around the circumference at an angle of 45 degrees. The carburetor is a Stromberg type connected to a strangling and air adjustment on the steering column. Gasoline is fed by suction in the intake pipe to the auxiliary tank, whence it flows to the carburetor by gravity. The oil pressure is obtained by means of a gear driven pump in the bottom of the oil sump below the crankcase and driven off the camshaft. Another innovation is the casting separately of the case enclosing the timing gears and bolting it to the front end of the crankcase instead of casting it integrally with it. This permits more exact machining and absolute uniformity and alignment of the motor in the frame.

By locating the water pump below the fan, greater compactness is obtained and the need of running the magneto drive shaft through the pump overcome. Two chains drive this shaft, instead of one, giving more silent operation. The rear motor support carries the cranking motor.

The clutch is a cone type faced with Thermoid. Instead of placing the spring under the facing, five steel plates within the flywheel itself serve to engage the clutch easily. The three-speed selective transmission is mounted amidships at three points. The gears are made 3.5 per cent. nickel steel, the shafts of carbon chrome steel, tempered in oil; the gearshift lever slides on ball bearings, ensuring easy operation.

Exterior of Model 41 Marmon Six, with Streamlines, Plain Running Board, Rounded Radiator, Windshield Secured to Cowl, One-Man Top Attached to It and Spare Tire Carried in the Rear of the Car.

The drive shaft has a universal joint at each end; another one is situated between the clutch and gearbox, making a total of three joints.

Two sets of brakes, external contracting service and internal expanding emergency, are mounted on the rear wheels and faced with

Left Side of Motor on Which Magneto and Generator Are Carried.

asbestos. The latter is now of the cam instead of the toggle operated type.

The car has 132.5 inches wheelbase and the wheels are shod with 36x4.5-inch Goodrich Silvertown Cord tires. The suspension consists of three-quarter elliptic springs in the rear and semi-elliptic in front, where Truffault-Hartford shock absorbers are used.

A great deal of work has been done in making the body specially fine in appearance and this object has been realized by the use of streamlines, sloping hood, crowned fenders and a rounded radiator. The front doors open toward the forward edge, to give extra ventilation. The deep, soft upholstery is tufted more widely than before and the sides of the body are made higher. The body itself is of sheet steel. The graceful curve of the front mudguards sways into the straight, free running board, tools, etc., having been stored under the front seat and in other suitable portions of the body.

A one-man top has been introduced and is attached to the windshield when open. The shield has its pane divided for rain vision and ventilation purposes. Rods extending through the cowl of the body to its base support the shield, which is held underneath the cowl by a strong casting.

All models of the Marmon 41 are fully equipped with starting and lighting system, Warner speedometer, Hartford tire pump, one-man top, windshield and the complete line of accessories which the Nordyke & Marmon Company decided

this year are necessary to the operator of a high-class automobile. There are five models of the model 41 being offered to the public—a seven-passenger touring car, which lists at \$3350, while the five-passenger touring type, the four-passenger model, the speedster and the roadster model are all sold for the standard price of \$3250.

TOURING ABROAD.

Interesting Information Relative to Motoring on the Continent.

Wallace Nutting, who has a nation wide reputation as an artist, and who is especially well known in the New England states, writes of motor conditions on the Continent, where he and his party have been touring in a Stevens-Duryea for several months.

He emphasizes the fact that the tourist of the present time does not need to encounter the difficulties and annoying experiences that a few years ago seemed almost inevitable. Arrangements can be made to place the car in the hands of a high-class customs' broker at Boston or New York, who will attend to all matters.

As is commonly known, the roads on the Continent are generally in good repair. Tourists should not light the headlights in Paris. To do this is almost certain to cause arrest, but no one is ever arrested for speeding in or out of that city. Owing to the great speed of so many automobiles it is necessary to drive very cautiously. Mr. Nutting writes at the close of a recent letter:

You will be pleased to know that we have not spent

Right or Carburetor Side of Marmon Power Plant, with Both Manifolds and Cranking Motor Visible; Also Front End of Motor Showing Water Pump Mounting and Rear End Illustrating the Flywheel and Novel Clutch.

a cent on our car since leaving America. We have toured Italy and France, so far making 4500 miles, and after careful examination of the mechanism can find nothing to do, as it runs like silk, and not a nut or a screw loose.

STUTZ AND MAXWELL, TACOMA WINNERS.

EARL Cooper, driving a Stutz, was the most brilliant star in the Montamarathon speed festival, held at Tacoma, Wash., on July 4, win-

Earl Cooper in Stutz Won the 250-Mile Race.

ning as he did the 250-mile Montamarathon trophy race in 3:24:34.8, and finishing 12 miles ahead of the next car.

No less splendid work was done by Hughey Hughes, who on the day before won the Potlatch

Klein by 1:49.4. Besides these three drivers, Parsons in the Frantz and Taylor in the Alco were the only ones who finished out of 14 starters.

On July 3 the Intercity 100-mile race was run first and the trophy was taken by Parsons in the Frantz, who obtained, by this victory, which repeated his feat of last year, permanent possession of the Perpetual Challenge trophy of the Tacoma Automobile Club, together with a substantial sum of money. The Ray car, driven by Brock, finished 10 minutes later than the winner, Latta's Lozier followed after 1:10.8, with Staley's Studebaker fourth after a further 7:04.2. Croston's Chevrolet and Smyley's Hupmobile finished fifth and sixth respectively, but were not timed.

The second event of the first day was the 200-mile race, won by Hughey Hughes, who displayed more speed in his Maxwell than any other driver during the speed carnival, averaging 74.28 miles an hour. His wonderful performance and the gallant display of Klein, the driver of the King Oriole, constituted perhaps the finest racing spectacle ever beheld on the western coast.

CARS AND DRIVERS THAT FINISHED IN THREE RACES, AND THEIR TIMES.

POTLACH—200 MILES.			MONTAMARATHON—250 MILES.			INTERCITY—100 MILES.		
CAR	DRIVER	TIME	CAR	DRIVER	TIME	CAR	DRIVER	TIME

trophy in the 200-mile event in 2:41:32.4, driving at even greater speed than Cooper did in the longer race, and defeating Arthur King in the Klein by 4.4 seconds, or 160 feet. On July 3 the Intercity trophy was also raced for, and Parsons, in a Frantz, covered the 100 miles in 1:21:29.4.

Cooper's Clear Victory.

During the Montamarathon race, Cooper, from the very start, drove at such speed that when he had circled the two-mile speedway for the 42nd time, his victory seemed assured. Indeed, he never had his lead cut down by any of the other cars; interest, therefore, was directed toward these, and the contest between Ruckstall in the Mercer, Klein in the King and Dingley in the Ono, made the onlookers hold their breath until the last-named car overturned during the 124th of the 125 laps of the race. Dingley was slightly ahead of the other two when his car dropped out. In the meantime, Cooper had held his lead of 8:01 over Ruckstall, who in turn led

Hughes' time broke the 1913 record, established by Cooper, 71.07 miles an hour. The possession of the Challenge trophy and a prize of \$1500 were Hughes' reward. Earl Cooper was third, less than three minutes behind Klein, and Dingley came in 6:12.2 after Cooper.

Arthur Klein in King Did Splendid Work.

MERCEDES WINS THE GRAND PRIX.

Lautenschlager First in French Classic—Averages 65.54 Miles an Hour for 467.6 Miles—Germans Second and Third.

HAVING covered the 467.6 miles of the Lyons circuit in 20 laps, the Mercedes, driven by Lautenschlager, finished first in the race for the Grand Prix of the Automobile Club of France, after a running time of seven hours, one minute, 18.5 seconds, Wagner and Salzer being second and third respectively, in machines of the same manufacture, while Jules Goux, the winner of the 1913 Indianapolis 500-mile race, was fourth in a Peugeot car.

The Grand Prix was a most brilliant event this year, 41 cars making up the list of starters. Among these were 12 French machines, 11 Ital-

hour having been attained repeatedly in preliminary work, the shape of the track is such that few expected a higher average speed than 70 miles per hour to be made by the winner of the event. As a matter of fact, Lautenschlager's average time was 66.54 miles per hour.

Lautenschlager's Mercedes was equipped with detachable wire wheels, two of which were carried in a special open compartment in the rear of the seats. This arrangement made speedy tire changes easy.

Wagner's Mercedes, which came second, ran for 7:09:54, making its average running speed

Lautenschlager, the Driver of the Winning Mercedes, as He Appeared Before Starting in the Race for the Grand Prix of the Automobile Club de France.

ian, eight German, six English, two Belgian and two Swiss. Following were the makes represented: Delage, Peugeot, Alda, Th. Schneider, Mercedes, Opel, Sunbeam, Vauxhall, Nazzaro, Fiat, Aquila-Italiana, Piccard-Pictet and Nagant. Among the drivers popular in America were De Palma and Pilette, as well as Duray, Boillot and Chassagne, well known as Indianapolis contenders.

The Lyons circuit is triangular and has a total length of 23.5 miles. While some portions of the course allow very high speed, 105 miles an

65.4 miles an hour, and Salzer's Mercedes was timed 7:13:15, averaging 64.8 miles.

HOUK'S NEW YORK MANAGER.

The George W. Houk Company of Buffalo, N. Y., announces the appointment of H. M. Kiesewetter, formerly of the Michelin Tire Company, as advertising manager and manager of its New York branch, located at northeast corner of 58th street and Broadway, whence all Houk wire wheel business in greater New York is handled.

PRIZE OF \$10,000 FOR AMERICAN CARS.

United States Drivers to Be Encouraged—San Antonio Club Offers Prize.

To stimulate the interest of American manufacturers in racing, and to prevent a repetition of the victory scored by Europe in the last Indianapolis 500-mile race, the San Antonio, Tex., Auto Club, has inaugurated a movement for the establishment of a national \$10,000 trophy, to be offered the next American car winning the event.

HOYT MAGNETOMETER.

The Hoyt Electrical Instrument Works, Penacook, N. H., maker of the well known Hoyt meters, is marketing the Hoyt magnetometer, shown herewith. The device was designed expressly for the model T Ford car and is connected in circuit with the flywheel magneto for the purpose of indicating the condition of the current

Hoyt Ford Magnetometer.

generator. As will be noted by the illustration, the dial of the magnetometer is calibrated, the letters P, M, G and E, representing poor, medium, good and excellent respectively. With one of these compact little instruments it is possible to ascertain at a glance whether or not the magneto is operating efficiently, as well as its condition. It also saves time in locating ignition troubles credited to the magneto. The Hoyt Ford magnetometer is permanently attached to the dash, is but two inches in diameter and is inexpensive.

A PROGRESSIVE FIRM.

Remarkable Growth of Business of Alsten & Goulding Company, Worcester, Mass.

Indicative of what may be accomplished in the automobile industry is the remarkable growth of the Alsten & Goulding Company, Worcester, Mass., well known especially throughout central New England. This concern, consisting of J. A. Alsten and H. C. Goulding, began business in 1900 in a little store, 15 by 20 feet, devoting its efforts to bicycle repairing, mar-

keting supplies, etc. The owners foresaw the possibilities of the motor car and early engaged in repairing tires, and are stated to be the first concern in New England to vulcanize a single-tube tire. Today the vulcanizing plant of the Alsten & Goulding Company is one of the best in the country.

The present location of the company is not far from its original store, and today the entire block is devoted to accessories, parts and supplies, over 8000 feet of floor space being utilized. The company was incorporated in 1910 and is held to be the largest accessory concern in central New England. The territory covered includes Western Massachusetts, New Hampshire, Vermont, Northern Rhode Island, Connecticut and Maine. The catalogue issued is unusually complete, and the company is distributor for such well known lines as the Weed chains, Klaxon horns, Columbia dry cells, Rayfield carburetors, Michelin and Federal tires, etc.

ELLIS-WARD CO. TO HANDLE GAULOIS.

Two Men of Long Experience Will Open High-Class Tire Business.

The recently incorporated Ellis-Ward Company will handle the Gaulois tire in New England, temporary headquarters having been located at 817 Boylston street, Boston. Mr. Ellis, the president and manager of the concern, is among the best known men in the eastern field. As early as 1905 he was affiliated with the Angier company as manager of the Boylston street office, leaving it to become connected with Albert Champion, then an importer of spark plugs. Later on Mr. Ellis became sales manager of the Bi-Motor Equipment Company, leaving it to direct the sale of Batavia tires. Mr. Ward has been a member of the Seamless Rubber Company's sales department for several years.

The plan of the new company is to open one of the best equipped tire stores in the East, success being assured by the excellence of the product it handles and the broad acquaintanceship of its officers with the field.

Racing colors in the next Indianapolis 500-mile race, it is announced, will be uniform, so as to denote the nation which a car represents. German machines will thus be white, French blue, English green, Belgian yellow, Italian red, and American red and white.

KNOX MOTORS COMPANY FORMED.

H. C. Fisk and E. O. Sutton Head New Concern— Plant Operating Again.

Judge Morton, United States District Court of Massachusetts, has handed down a decision confirming the sale of the entire plant of the old Knox Automobile Company to the newly formed Knox Motors Company, Springfield, Mass., in the person of its treasurer, E. O. Sutton, who was one of the receivers of the old company, while H. C. Fisk was the other, and is now president of the Knox Motors Company. Mr. Fisk is widely known as the treasurer of the Fisk Rubber Company.

With the nucleus of a selling organization already formed in New York, Boston, Kansas City and Chicago, the Knox company possesses the most necessary channels for the distribution of

gave free public concerts in their respective parks, which enterprise met with the hearty appreciation of inhabitants everywhere. The accompanying photographs show the band, in which John North Willys takes great interest, with members uniformed and in working attire.

IGNITION SPECIALIST.

Motor Parts Company, Bosch Distributor, Maintains Efficient Service Department.

Specializing as it does in ignition apparatus, the Motor Parts Company, 182 Massachusetts avenue, Boston, official Bosch distributor, is exceptionally well qualified to give its customers prompt and efficient service. The company maintains a corps of ignition experts and is prepared to replace worn parts at short notice, as well as to correct ignition troubles. The labor-

its products, while the systematizing of the factory is already partially completed, so that production hereafter will be on a standardized basis.

Work has begun on the manufacture of a number of Knox-Martin tractors and several high-class dealers in various territories have applied for the agencies of the latest model touring cars, which are now practically ready for the market.

OVERLAND BAND TRAVELS SOUTH.

Trip Takes Workers to 18 Cities, Where They Give Public Concerts.

The Overland band, which consists of workmen employed in the factories of the Willys-Overland Company, accompanied the Rotary Club of Toledo, O., on its round trip through the South recently. The band visited 18 cities and

atories are equipped with the latest machinery and tools, enabling repairs, tests, etc., to be quickly made. The Motor Parts Company prides itself upon its service department, in which quality and efficiency are emphasized. The Motor Parts Company is distributor for a number of well known lines, such as the Zenith carburetor, Leak-Proof piston rings, Mohawk tires, Kemco fan type generator, etc.

NO LIGHTS ON FERRY BOATS.

Hereafter automobiles crossing the Hudson between New York City and Hoboken, N. J., on ferry boats owned by the Delaware, Lackawanna & Western Railroad Company, will not be allowed to be started or cranked until the boat has been made fast to the bridge. All lights of vehicles showing at the bow or stern of the boat must be extinguished or covered while crossing.

N. A. C. C. OPPOSES FREIGHT INCREASE.

THE National Automobile Chamber of Commerce, at a recent meeting of the official classification committee of the railroads held in New York City, opposed the following suggestions, which, if carried out, would increase automobile freight rates materially. One proposition relates to a projected packing requirement on polished sheet iron and steel, while the other is an effort to charge the weight of blocking used in fastening automobiles in freight cars at the rate applicable when a single automobile is shipped.

Strong opposition was made to the suggestion that polished sheet iron and steel, U. S. standard

Y., has purchased a Duplex driven Detroit electric car. The machine bought by Dr. Steinmetz is a stock model, equipped with wire wheels, full aluminum body, plate glass windows and patented double-ventilating, clear-vision windshield.

AUTOMOBILE EXPORTS INCREASED.

Most Industries Show a Falling Off When Compared with a Year Ago.

The exports of motor vehicles and parts have shown a consistent increase in valuation over last year, while most other articles manufactured ready for use show a marked falling off in exports and total exports for 10 months ended with April are \$59,000,000, or nearly 2.8 per cent. less than for the 10 months ended with April, 1913.

Most of the increases in exports have been in raw and partly manufactured materials. Only a few of the many articles exported ready for consumption show an increase. Among these are automobiles, motorcycles and aeroplanes.

Exports of wagons and carriages have fallen off 22 per cent., steam and electric railroad rolling stock 28 per cent., stationary, marine and other en-

gines, 32 per cent., motor boats 40 per cent., agricultural implements 17 per cent., all machinery and parts 10 per cent., breadstuffs 25 per cent., meat and dairy products two per cent. and wood and wood manufactures eight per cent.

MAXWELL PLANT FOR CHEVROLET.

The Chevrolet automobile will be manufactured at New York City and Tarrytown, N. Y., production being scheduled to begin about Jan. 1, 1915, according to W. C. Durant. Mr. Durant purchased the old Maxwell plant at the last-named locality a short time ago. The New York factory has a daily output of 20 Chevrolet cars, the Flint, Mich., factory makes 35 and the Tarrytown plant is to manufacture 50 a day.

Dr. Charles B. Steinmetz and His New Detroit Electric.

gauge No. 20 or thinner, must be packed in metal cases with wooden covers for shipment. The method of shipping this material has been to place a pile of sheets in each corner of a box car and hold them in place by proper arrangement of 2x4 timbers. If the railroads adopt the requirement that this material must be boxed for shipment, it is estimated that \$6 to \$8 per ton will be added to the cost to automobile manufacturers,

LIABILITY INSURANCE ON TOUR.

The ever-imminent possibility of accident quite beyond the control of any driver from carelessness of others, lightning, or quick and unforeseen exigencies, has impelled most motor vehicle owners to insure against liability and property damage.

When accident happens, claims for injuries or damage to property of others are almost certain to be made, regardless of fault, and damages are often collected, too, for it is well established that the average jury is hostile to the owner of a car. Such damages are generally heavy, and prudent owners, cognizant of this fact, provide insurance that not only protects them against loss, but also relieves them of the necessity of employing counsel and defending suits.

When on tour the need of such protection is most cogent, for then it is that unfamiliar roads must be traversed, long runs made, and unusual hazards encountered. The Massachusetts Bonding and Insurance Company, 75-78 State street, Boston, Mass., a company organized and doing business under the rigid insurance laws of Massachusetts, with ample resources, with representatives in all sections of the United States, specializes liability and property damage protection. Its policies are especially broad and liberal. The recommendation is made to those who might be inclined to take chances ordinarily to protect themselves while making tours.

MODEL STREET CLEANING DISTRICT.

Motor Truck Club Indorses Suggestion of New York Commissioner.

At its last New York meeting the Motor Truck Club of America discussed the plan of Street Cleaning Commissioner Fetherston for the establishment of a model district in New York City and specially indorsed the plan regarding the organization of an expert technical staff to insure the formulation, installation and operation of an efficient system, to be carried out along scientific and businesslike lines.

CONVICTS FOR ROAD WORK.

Osborne to Advocate General Use of Prisoners for Highway Construction.

Due to the results of Thomas Mott Osborne's work in Auburn prison, New York, the national committee on prison labor will accentuate its con-

tention for convict road camps and farms. Mr. Osborne voluntarily served a sentence to encourage by his self-sacrifice the prisoners who have organized a Mutual Welfare League. Since organization of this league the men have largely become responsible for their own discipline and such are the results that Mr. Osborne is convinced open-air life would improve conditions.

HEADS Y. M. C. A. SCHOOL.

Frank G. Westwood Take Charge of Automobile Department of Well Known Institution.

When W. C. Hosford resigned as head of the automobile department of the Boston Y. M. C. A., Frank G. Westwood, formerly in charge of the institution's garage, took his place as superintendent. The appointment of Mr. Westwood is due principally to his executive ability and complete understanding of every detail of the school administration, and he has assisted hundreds of school graduates in solving intricate problems arising during their course at the school. He will carry out many plans which originated under the previous management.

Frank G. Westwood.

TREES FOR LINCOLN HIGHWAY.

The General Federation of Women's Clubs, Chicago, is working on a plan whereby the 3400 miles of the Lincoln highway are to be lined with trees and shrubs. Mrs. E. E. Kemble, heading the conservation committee of the federation, directs the raising of funds.

Walter E. Holland has been appointed manager of the mechanical and research department of the Anderson Electric Car Company, Detroit.

FLYING BOAT AMERICA LAUNCHED.

Rodman Wanamaker's Transatlantic Flier, Made by Curtiss, Is Fast and Strong.

The transatlantic flying boat America, built by Glenn H. Curtiss for Rodman Wanamaker, was christened and launched on Lake Keuka, near Hammondsport, N. Y., on June 23. The following day Mr. Curtiss, Lieutenant John C. Porte and George Hallett made successive trial flights which showed that the new machine is a fast and strong flyer. Before starting on her projected trip across the ocean, however, auxiliary planes will be attached to the side of the hull of the boat.

The hydroplane America is 34 feet long; the

capacity of 312 gallons of gasoline, stored in seven tanks; 30 gallons of lubricating oil may be carried.

SPERRY-CURTISS DEVICE WINS.

Stabilizer Awarded First Prize of \$10,000 for Automatic Stability.

America scored a victory in aviation when the Sperry Gyroscope Company, New York City, was awarded the first prize of \$10,000 for a device to secure automatic aeroplane stability, by the Concours de Securite, Paris. The Sperry-Curtiss stabilizer was installed on a Curtiss hydraeroplane and the demonstration was made at Bezons on the Seine before the judges' committee.

Recent Events in Aviation: At Left—Demonstrating the Efficiency of Sperry-Curtiss Stabilizer at Bezons; at Center—Testing Rodman Wanamaker's Curtiss Transatlantic Flying Boat "America"; at Right—Close View of Automatic Stabilizer Operated by High-Speed Gyroscopes.

length of the hull is 30, its width four and its depth six feet; the cabin is seven feet long, four feet wide and five feet high. The spread of the upper wing is 74 feet, of the lower 47 feet, the gap between both being $7\frac{1}{2}$ feet. The weight of the empty flyer is 3000 pounds; with full load it weighs 5000 pounds. The speed for which the hydroplane is designed is 62 to 65 miles an hour.

Power is supplied by two 90-100 horsepower Curtiss motors of the model O-X type, mounted midway between the planes at a distance of nine feet; each motor shaft carries a propeller. While designed to fly at a speed of less than 1000 rpm, the motor may attain a speed as high as 1300 rpm. The machine has a total fuel carrying ca-

The Sperry device consists of four small gyroscopes actuated by as many small electric motors, current for which is generated by a little dynamo driven by the aeroplane motor. The gyroscopes rotate at 12,000 rpm. A small foot lever throws the stabilizer into or out of action, and while operating, it is claimed that the machine is practically proof against overturning. During the demonstration ride, Lawrence Sperry, the 21-year-old son of the inventor, stood up in the seat and threw up his arms, while his assistant walked out upon the wing of the device. The machine immediately adjusted itself to the new distribution of weight. The judges' committee decided that the device was the most perfect existing.

Tarvia

*Preserves Roads
Prevents Dust~*

How tarviated roads reduce upkeep—

Esplanade, Brighton Ave. to Abbington
Blvd., Kansas City, Mo., Con-
structed with "Tarvia X".

ORDINARY macadam is surfaced with fine screening, the durability of which is necessarily slight. These particles are readily dislodged by traffic and are constantly shifting and rubbing, forming dust which is washed or blown away.

After a little time this surface disappears, exposing the lower layers of coarser stone. The large stone of the lower courses, thus exposed, shifts under the weight of traffic and the road then begins to ravel hopelessly and requires an expensive renewal.

These larger stones, if they could be held in posi-

tion, are capable of giving more wear than the fine stone of the surface.

One of the many economies of the Tarvia treatment is that it is so efficient a binder that it permits the use of large stone clear up to the wearing surface, screening being used merely to even up the surface for the sake of smoothness.

In this matrix of Tarvia the larger stones take the direct wear of traffic. They cannot shift, and the road grows smoother with use and eventually becomes a mosaic of great durability. Very little care or renewal work is needed on such a road. It will stand heavy traffic without producing dust or mud. It is clean and attractive at all seasons.

*If you are interested in the good roads proposition, write
for the free booklet covering the Tarvia treatment.*

MAINE AUTOMOBILE ROAD BOOK.

The Maine Automobile Association, after a year's touring of all the highways of the Pine Tree State, has brought out its 1914 Automobile Road Book, in which 103 routes throughout the state are described with full detail, with right and left turns, intermediate mileage, land marks along the way, etc. Many splendid illustrations add to the value and interest of the work, which

has 352 pages and contains three new maps, showing the roads of Maine and most of New Hampshire. Furthermore, it gives a summary of Maine fish and game laws and forest fire requirements, as well as regulations for motorists entering Canada. The book is bound in cloth and is obtainable from the Touring Information Bureau, 12 Monument square, Portland, Me., on payment of a nominal charge, necessitated by the cost of preparing and printing the work.

Every FORD owner should learn what this instrument will do !

Many Ford Owners think that because their engine will run, the magneto must surely be working all right. But if you could realize what an improvement may often be made in the power of your engine and what a saving in fuel by simply restoring the magneto to its original efficiency, *you* would surely want to know the condition of *your* magneto. There is only one instrument that will show you--- it is

The Hoyt Magnetometer

It is located on the dashboard and shows the strength of the magneto at all times when running. By keeping your magneto in shape more current is generated, a stronger spark may be produced, and combustion is greatly improved. This livens up the motor and cuts down fuel bills. No Ford car should be without this wonderful little instrument.

Write today for free booklet No. 8, describing Ford magneto and ignition troubles and remedies.

Price of Magnetometer \$4.00, at garages and hardware dealers.

Hoyt Electrical Instrument Works, Penacook, N. H.

Announcement of Importance to the Trade

International Cycle-Car and Accessories Company announces its organization as general distributors of cycle-cars, cycle-car parts, assemblies and accessories.

It announces the entering into an arrangement with Woods Mobilette Company for the general distribution of Woods Mobilettes---America's First Cycle-Car---and for the general distribution of such other cycle-car parts as Woods Mobilette Company will manufacture for the trade.

It will also handle cycle-car accessories, and correspondence from manufacturers of same is invited.

The policy of International Cycle-Car and Accessories

Company will be strictly one of dependable service. It will deal direct with each dealer, thus insuring to the manufacturers represented on the one hand and to the dealer and consumer on the other, a service that is at once economic, speedy, effective, direct, efficient and satisfactory.

Price \$380, f. o. b., Harvey, Ill. Shield and Top, \$15 Extra.

THE CAR IS AN
AUTOMATIC SELLER
The guarantee of integrity
is valid.

Model No. 3.

WOODS MOBILETTE "AMERICA'S FIRST CYCLE-CAR."

Wheel Base, 102 in.; tread 36 in. Motor, Four Cylinder, 12 h. p., water-cooled. Transmission, Sliding gear type; two speeds forward and one reverse. Axles, Drop forged, 1850 lbs. capacity; rear axle full floating type. Every mechanical detail is of superior and proven worth.

SALESROOMS: 1509 Michigan Blvd.

J=H=S

**NO CAR OWNER CAN AFFORD
TO BE WITHOUT THEM**

They are the cumulative result of our nine years' experience in the manufacture of dependable spring suspension.

No matter how hard you inflate your tires, our absorbers insure perfect resiliency and save half your present tire expense. Unnecessary wear and tear on motor, transmission and other components is eliminated because they reduce vibration to a minimum.

The combined efficiency and durability of J. H. S. SHOCK ABSORBERS make them worth all they cost and more—they're the only kind leading mechanical engineers have considered fit to endorse.

For thirty days you can try them at our expense. J. H. S. are made for every known car.

The Alternative

NON-FLUID OIL

Which Will It Be, Mr. Motorist,
A Check to the Repair Man,
or a Check to Friction?

The question rests entirely with YOU. Care in the selection of the proper lubricant NOW will save you much money before the end of the season.
The constant use of

NON-FLUID OIL

on your car insures fewer repairs, least power loss, and least lubrication cost—thereby safeguarding the fine bearings and gears of your car against corrosion and wear.

"K-000 NON-FLUID OIL" is of proper consistency for use in compression cups on all bearings, for packing differential gears, steering gear knuckles, ball and roller bearings, etc. It lasts longer than any grease and is unaffected by temperature changes.

"K-00 SPECIAL GRADE" is softer than "K-000" and is designed for lubricating sliding gear transmissions. It cushions gear teeth, prevents abrasion and heating and insures smooth, quiet running.

Ask your dealer for the orange colored can bearing sprocket-wheel trade-mark shown above.

THE GREAT RIGHT WAY
 TO STOP RADIATOR LEAKS.

Pour it in ~ now.
 Finds the leak and
 fixes it in 15
 minutes.

SE-MENT-OL

Carry
 it in your
 car. It is
 always ready
 for use. No re-
 moving of radiator.
 No searching for
 trouble with torch and
 solder. SE-MENT-OL
 dissolves in the water. In
 passing thru the leak the cool
 air congeals it into a cement that
 effectually closes the cavity. Drain
 and refill radiator with fresh water.
IT'S A CINCH. ASK YOUR DEALER.

WARNING.

The growing popularity of VELVET ABSORBERS since their introduction in 1909 has flooded the market with an unusually large number of infringing devices—which we regard as inferior in material, construction and workmanship, but which are sometimes sold to unsuspecting owners and dealers at cut prices.

We are taking legal measures to protect ourselves and the trade as fast as possible, and in the meantime suggest that the trade look well into the merit of any cheap, "tinny," cushion type Absorbers that they may be asked to handle as well as obtain information as to whether or not it is infringing the original VELVET patent. Do not be fooled by imitation cushion type Absorbers consisting of a coiled spring enclosed by a tin can. Insist on the **ORIGINAL, SUCCESSFUL CUSHION TYPE ABSORBER**, with four years of efficient service behind it. Time has proved that VELVET ABSORBERS ARE BUILT TO LAST, not merely to sell.

NEW REGAL CAR HAS MANY REFINEMENTS.

FOR the season of 1915 the Regal Motor Car Company, Detroit, will produce one chassis, the model D, to which will be fitted two types of

shaft is employed, the front and centre bearings being 2.5 inches and the rear 3.5. The bearing material is die cast babbitt. The crankshaft material is a 40-point carbon steel, drop forged, ground and double heat treated. The diameter of the drop forged, case hardened and ground camshaft is .875 inches. It is supported in three phosphor bronze bearings and the cams are integral.

The pistons are accurately ground to size and carry three sets of three concentric steel rings above the wristpin, which is of steel tubing, hardened and ground. Three oil grooves at bottom of the piston insure proper lubrication and

prevent smoking. The connecting rods are drop forged from a 35 per cent. carbon open hearth steel, double heat treated, and the big end bearings are two by 1.625 inches. The wristpin end which oscillates has a bearing of .875 by 1.8125 inches.

The valves are located on the left and enclosed by a single sheet steel cover, easily displaced. The valves have a port diameter of 1.65625 inches, clearance of .002 inch, and the steel stems are electrically welded to the cast iron heads. The valve guides are cast integral with the cylinders and the tappets are of steel, hard-

Regal Two-Passenger Roadster, Having Long Stroke Motor, Underslung Springs and Noticeable for Many Refinements.

bodies, a two-passenger roadster and a five-passenger touring design. The new car differs in a number of respects from the 1914 line, which included two chassis, it being fitted with a long stroke motor, 112-inch wheelbase, three-quarter floating rear axle, Stewart carburetor and Atwater Kent automatic ignition system. The equipment is most complete and the price has been considerably reduced. No change has been made in the spring suspension, the Regal underslung feature being continued.

The bore of the motor is the same as was used in the models T N and N C, 3.75 inches, but the stroke has been lengthened to five inches, obtaining a piston displacement of 221 cubic inches. The S. A. E. horsepower rating is 22.5, but the motor has developed 39.4 at 1960 revolutions a minute. The maximum number of revolutions a minute is 2600.

The four L head cylinders are cast en bloc with the crankcase, and compactness and simplicity are noticeable in the design. The lower half of the crankcase is of pressed sheet steel, galvanized after forming, and the power plant is supported by three bearings, one at the front and two at the rear. A three-bearing, 1.625-inch crank-

Model D Regal, a Five-Passenger Car of Attractive Body Lines, and Completely Equipped.

ened and ground. They are adjustable by a set screw and lock nut. The spiral hobbled timing gears are cast of iron and steel, making for silent

The New Regal Motor Is Noticeable for Simplicity of Design and Accessibility of Components.

operation, and are enclosed in an oil tight aluminum cover.

Cooling is by the thermo-syphon system and all factors are large, insuring a proper working temperature under all conditions of service. The cellular type of radiator is so mounted as not to be affected by road stresses, and the filler cap is incorporated with the water manifold. The capacity of the cooling system is four gallons. Cooling is further aided by a three-blade, belt driven fan, located on the front of the motor and adjustable by a swinging arm support and clamp screw.

The lubrication system is a combined splash and pressure feed. A plunger pump, located on the left hand side of the motor, and driven by an eccentric on the camshaft, draws the oil from the sump in the lower crankcase, forcing it to the rear crankshaft and camshaft bearings, also to the outer timing gears. The overflow is collected in troughs into which the connecting rods dip, splashing the lubricant to the centre and front bearings, etc. The capacity of the reservoir is one gallon and all oil is filtered.

Carburetion is by a Stewart of the automatic type and ignition by the Atwater Kent automatic system having automatic spark control. The distributor is located on the timing gear cover, and the current supply is an 80 ampere-hour storage battery and set of dry cells. The distributor is driven by spiral gears off the camshaft, and is readily accessible.

The clutch is a leather faced cone, the easy engagement of which is emphasized. The gear-set is of the selective type, located on the rear axle and provides the conventional number of

forward speeds and reverse. The shafts are a 3.5 per cent. heat treated nickel steel and the one-inch face gears are cut from a similar material. Hyatt high duty bearings are utilized.

Drive is by a 1.1875-inch diameter high-grade steel shaft, and two universal joints are employed, one back of the clutch and the other just forward of the transmission on the rear axle. The torsion tube is supported by a fork at the centre cross frame member, and the radius rods are connected to the frame by brackets. The driving shaft is housed in a steel tube.

The rear axle is of the three-quarter floating type with housing material of malleable iron. The axle shafts are 1.25 inches in diameter, of a high-grade carbon steel, and Hyatt high duty bearings are employed for the differential and wheels. Nickel steel is employed for the pinion gear and carbon steel for the large gear. These gears are accurately cut and meshed and are noiseless in their action. Inspection is made easily by means of a large plate, as will be noted by an accompanying illustration. The frame is of carbon steel, .15625 inch thick, has a four-inch channel section and is 1.5 inches wide. Three cross members are utilized.

The underslung spring suspension, a feature of the Regal car, is continued. The front springs are semi-elliptic, two inches wide and have seven leaves. The rear members are three-quarter elliptic, and have eight two-inch leaves. The material is a special spring steel, carefully ground and polished, and durability, as well as easy riding qualities, are obtained by this method. The

A Removable Cylinder Head Simplifies Displacement of Carbon and Provides Easy Access to Valves in Regal Motor.

spring hangers are a steel drop forging. Self-lubricating bolts are employed and grease cups are provided at the ends of the rear springs.

The front axle is of the I beam section type and its dimensions insure a large factor of safety. The material is a drop forged 30-point open

The Regal Brakes Are Ample in Size.

hearth carbon steel, double heat treated, and the drag link is a steel tube, as is the tiebar, which is located at the rear of the axle.

The driver is placed at the left, with centre control, the H plate quadrant being flush with the floor. The steering column is set at an angle of 45 degrees and is surmounted by a 17-inch wheel, the rim of which is wood. The wheel spider is malleable iron, enamelled black. The steering gear is a Gemmer, of the worm and wheel type, and provision is made for adjustment and lubrication. The use of the automatic spark control eliminates the usual wheel lever.

The clutch and brake pedals follow conventional design, the former being located at the left and the brake member at the right. The accelerator is placed at the right of the brake pedal.

Two sets of brakes are employed, both operating on the rear wheels. The service member is of the external contracting type, and the emergency of the internal expanding design, operated by the usual hand lever. The diameter of the brake drums is 12 inches and the face 1.75, ample for the weight of the car. The brake material is Raybestos.

The wheels are of the artillery type, fitted with quick detachable, quick demountable rims and Goodyear 32 by 3.5-inch straight side tires. The wheelbase is 112 inches, and tread standard. 56. The body material is steel and the dash is integral with it. The fuel tank has a capacity of 10 gallons and is located under the front seat. The standard finish is Regal blue and the best grade of black leather is employed in the upholstery, which is deep and luxurious. The finish is in keeping with the high standard that has been es-

tablished by the Regal Motor Car Company.

The electric light and motor starting system is two separate units. The Rushmore motor starter is geared to the flywheel of the engine and the dynamo is driven by belt, a noiseless form of drive. The battery is an 80 ampere-hour member.

As is becoming general practise, the side lights are eliminated, the headlights serving for both city and country driving. The control units are conveniently mounted, and the body designs are noticeable for their streamline effect. The lines of the fenders and aprons blend harmoniously with those of the body, the latter being noticeable for its low centre of gravity, a feature of the Regal cars in the past.

The equipment leaves nothing to be desired, including a Stewart-Warner speedometer, Rands windshield, top, slip cover, tools, etc. The new Regal chassis is noticeable for the accessibility of its components, and many of the improvements make for economical maintenance. For example: The carbon may be removed from the cylinders and the valves ground easily, as the cylinder head is removable, as will be noted by an accompanying illustration. The Regal motor D will appeal to those motorists who desire a machine having ample power to meet all requirements of service and capable of being maintained at a minimum of cost.

The Miller Rubber Company, Akron, O., has purchased the land joining its plant at High street and Stanton avenue. A 2000-horsepower plant has already been laid out. After increasing

Showing the Sturdy Differential Utilized in the Model D Regal Chassis.

its floor space by 95,000 square feet a short time ago, the company is now about to further enhance its facilities in a material way.

Pipe Jig—O. B. G., Colorado Springs, Col.

How can the gasoline pipe be bent into a coil without kinking it? How are gears measured to obtain distances, holes, pitch, etc?

Fig. 1—Jig for Bending Tubing.

To bend the fuel tubing into a coil it is desirable to use annealed piping and to fill it with sand, resin, etc., to prevent its kinking. If a nice job be desired the jig shown at Fig. 1 will be useful. It is constructed from a piece of hard wood about three inches square and about eight long, although these dimensions can be changed to meet requirements.

One end of the plug is turned down to about $2\frac{1}{2}$ inches in diameter and the cut made about five inches from the end, although it could be made less, depending upon the number of coils desired. On the smaller portion is cut a deep thread, about 5-16 inch deep as shown, and a round nosed tool of the same radius as the outside of the pipe to be employed is best adapted for the work.

To use the jig, its square end is clamped in the vise. If the piping is hard, it should be annealed by heating to draw its temper. The section to be bent is then filled with resin. Next place the part of the pipe where the bend is desired in the first part of the thread, holding it down with one hand and with the other wind it carefully round the plug the necessary number of turns, finishing with the ends just opposite each other. The tube is then unscrewed and the resin melted out.

In measuring gears—for example, those of the spur, involute type—the factors to be considered are: Pitch, pitch diameter, outside diameter, face, hub diameter (if hubs are to be used) and hole.

Diameter, when applied to gears, is always understood to mean the pitch diameter. Diametral pitch is the number of teeth of each inch of the pitch diameter. For example: If a gear has 40 teeth and the pitch diameter is four inches, there are 10 teeth to each inch of the pitch diameter and the diametral pitch is 10, or in other words, the gear is 10 diametral pitch.

There is a difference between the pitch and outside diameter, as will be noted by reference to Fig. 2, which indicates the factors requiring consideration in the measurement of gears. It will be seen that the pitch diameter is slightly less than the outside diameter and this should be borne in mind when figuring the distance between the driving and driven gear.

The distance between the centres of two gears may be obtained by the following method: Add the number of teeth together and divide the sum by one-half of the diametral pitch. For example: If two gears have 50 and 30 teeth respectively, and are of five pitch, add 50 and 30, making 80, divide by two and then divide quotient, 40, by the diametral pitch, five, and the result, eight inches, is the centre distance.

Drilling Holes in Glass—Information, New York City.

What is considered a practical method of drilling holes in glass?

Holes of any desired size may be drilled in glass by the following method: Take a small three-cornered file and grind the points from one corner and the bias from the other and set it in a brace such as is employed for boring wood, etc. Lay the glass in which the holes are to be bored on a smooth surface covered with a blanket or some other similar material, and begin to bore the hole. When a slight impression is made on

Fig. 2—Measurements to Be Considered in Utilizing Spur Gears of Involute Form.

the glass, place a disc of putty around it and fill with turpentine to prevent heating by friction. Continue boring the hole, but be careful not

to press too hard upon the brace while operating the drill.

Charging Dry Cells—A. B. K., Portland, Me.

Can dry cells that have become exhausted be re-charged and what would be the cost?

Dry cells can be placed in a serviceable condition by different treatments, but the trouble and expense involved would not warrant the expenditure. It is cheaper and more satisfactory to purchase new batteries.

Lights and Master Vibrator—F. A. J., Waterbury, Conn.

Am a new owner and wish to install a master vibrator on a second-hand Ford, also wish to use electric lights. Will you please publish a wiring plan for the vibrator, also dry cells for starting and for running lights?

A wiring plan for a master vibrator, dry cells and lights is shown at Fig. 3. It will be noted that neither the secondary wires leading from the regular coil to the spark plugs, nor the leads from the timer are disturbed.

After fitting the master vibrator to the dash, short circuit or shunt the regular coil. This is done by either screwing down the adjusting screw of each coil unit or utilizing a piece of copper wire as shown in the drawing.

The vibrator is connected up by leading one wire from the battery terminal on the regular coil to the centre post on the vibrator. The right hand terminal of the vibrator is then connected to the magneto terminal. One side of the battery circuit is grounded to some metal part of the chassis, while the other wire is led to the left hand terminal of the vibrator.

By throwing the switch lever to the right, current will be taken from the magneto, while the left position will bring the batteries into service.

In installing the lamps, one side of their circuit is grounded as shown. The other wire is led to the lighting switch, and a connection made between it and the right hand terminal of the master vibrator. The switch permits of cutting in or out the lamps as desired when the motor is operating.

Battery Terminals—Constant Reader, Asbury Park, N. J.

Am driving a car which uses two sets of dry cells for ignition. I have experienced much trouble in the past by the terminals on the zinc or outside of cells breaking off when I attempt to tighten them up. What is the cause and what is the remedy?

The most common method of attaching the terminals referred to is to use solder. The terminals are slotted and fit over the metal shell, and are easily broken off unless one is careful in using the pliers. The remedy is to resolder the terminals and either use a type of connection that does not require pliers or be more careful in tightening the locking knurled nuts.

Fuel Savers—Information, Boston.

Noting a Ford car fitted with a fuel saving device, I am writing for your opinion as to the merits of these. The car in question had a petcock on the dash and a pipe led to the intake pipe just above the carburetor. The owner told me that by opening the petcock and admitting air he gets better power than ever. Why does the device improve the running of the car if it does?

While the writer has not operated a machine fitted with the device referred to, he knows of several owners who have installed similar fittings and all speak very highly of their operation, stating that considerably more power is obtained. This was demonstrated to the writer with the

Fig. 3—Wiring Diagram for Master Vibrator, Batteries and Electric Lights
—The Small Sketch Shows Method of Shunting or Short Circuiting the Regular Coil.

motor idling. With the petcock closed and open, the difference could be noted easily, the engine picking up when the extra air was admitted.

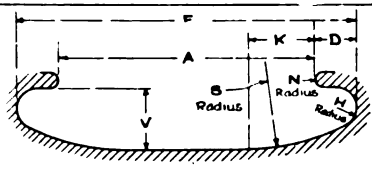

The principle involved is that the air drawn in by the suction of the piston breaks up any particles of fuel that have not been completely vaporized by the carburetor, and striking the mixture as it does, produces what might be termed a whirling motion. This tends to make a more homogeneous mass.

The New York Automobile Association is completing the organization of a bureau to prevent car thefts and recover stolen cars. Members of the affiliated clubs of the organization have been requested to telegraph full descriptions of their cars to the New York headquarters of the association the moment one disappears. A reward for recovery will be offered.

E. R. HALL CRITICIZES S. M. M. T. RIMS.

AMONG the papers read at the semi-annual meeting of the Society of Automobile Engineers, held at Cape May, June 23-26, was that

presented by E. R. Hall, experimental engineer of the Goodyear Tire & Rubber Company, on S. M. M. T. standard rims, which was as follows:

Ever since the clincher type automobile rim has become popular in Great Britain and Europe a very chaotic condition has existed in millimeter rim design. Each manufacturer of millimeter rims had his own so-called standard design to which he worked and the result was that rims marked the same size and supposed to take the same tire differed widely in design. The tolerances which the rim manufacturers allowed themselves were so gross that there was oftentimes considerable variation between two rims of the same size and manufactured by the same manufacturer. This condition prevailed in spite of the fact that it is ruinous to a beaded edge or clincher type tire, such as is in general use abroad, to be used on a rim which it does not fit exactly. A great hardship was thereby worked upon the tire manufacturers who had to make the bead of their tire small enough to slide into the smallest rim of its rated size on the market, and to

TABLE II.

Rated Rim Size	Tire Seat Circumference		Tire Seat Diameter

trust to luck for satisfaction in their product when used on the larger rims of its rated size.

The Society of Motor Manufacturers and Traders of Great Britain in June, 1913, standardized the millimeter clincher rim and later, in September, 1913, adopted a set of permissible tolerances to which the rim manufacturer should work. The society has produced a most complete set of rim checking templates, tapes and printed specifications covering their standard.

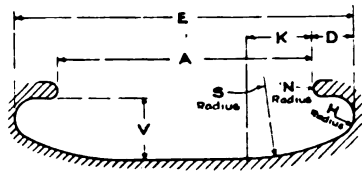

As far as we are able to determine, this standard, known as the S. M. M. T. standard, has been universally adopted abroad.

Although a very great step in the right direction and possibly the best that could be made at this time, the S. M. M. T. standard is open to criticism from the American viewpoint.

The S. M. M. T. standard is given below:

It will be noted that the two chief dimensions of the rim section are the width between clinches marked A and the depth of clinch marked V, and that the majority of the other section dimensions can be expressed in terms of these two. As a matter of convenience and record this feature is admirable. The width of the rim, dimension A, was apparently chosen arbitrarily, as it does not increase in increments corresponding to the increase in rated rim size. Between any two of the first six sections the increase in rated size of rim and tire section is exactly 15 millimeters, while the corresponding increase in width, dimension A, is respectively as follows: 13.0, 11.0, 5.0,

TABLE III

SIZE	WIDTH A	DEPTH V	EXTREME WIDTH, E A+1.4V	LENGTH OF HEEL, D .7V	RADIUS OF HEEL, H .326V	LENGTH OF SOLE, K 1.09V	RADIUS OF SOLE, S .326V	RADIUS OF SOLE ANCHORAGE, N
65 & 75	38	10	52.0	7.0	3.26	10.9	35.79	1.75
90	46	13	66.2	9.1	4.24	14.17	46.56	2.0
105	56	13	76.2	9.1	4.24	14.17	46.56	2.0
120	66	16	90.4	11.2	5.22	17.44	57.92	2.5
135	76	16	100.4	11.2	5.22	17.44	57.92	2.5
150 & 175	86	18	113.2	12.6	5.97	19.62	64.46	2.5

9.5 and 13.5 millimeters. The increase in rated size between the 150 and 175-millimeter rim is 25 millimeters, while there is no increase in width, dimension A. We would have preferred to have this increase in A a constant quantity, possibly 10 millimeters, between any two consecutive sizes from 75 millimeters to 150 millimeters, inclusive, and the increase between the 150 millimeters and 175 millimeters sizes be 0 as at present. This would certainly give a more uniform and logical step-up in tire sectional sizes, provided the tires were made any where near rated size.

Dimension V or depth of clinch increases by very small increments as the rim size increases, not more than two millimeters in any case. As these differences are so small, and in view of the fact that the tolerances prescribed permit them to entirely disappear and in some cases overlap (as will be noted below), we would prefer to see dimension V equal 13 millimeters for both 90 and 105-millimeter rims and 16 millimeters for 120 and 135-millimeter rims. This would give only four different inside rim contours instead of six as at present prescribed, making it necessary for the rim manufacturer to have only four sets of contour rolls instead of six, thus cutting down the forming roll equipment 33 per cent. (Difference in width between any two rims of the same contour can be taken care of where necessary by using blank spacer rolls in rolling). Under these conditions the rims should fit the tires exactly as satisfactorily as in the case of the present standard. With the changes as above outlined the table of standard dimensions of the

rim sections would appear as shown in table III.

Referring to the diameter and circumference table, table II, as standardized, there appears to be but very little difference (approximately 6 millimeters) between the 90 and 105-millimeter circumferences, comparing the 810x90 and the 815x105, the 870x90 and the 875x105, etc. It appears practicable to make these corresponding 90 and 105-millimeter rims of the same circumference, thus permitting over-size tire equipment with the regular standard size tires, enabling the use of an 815x105 standard tire on an 810x90 rim, etc.—a feature of untold value to car users. The differences in circumference are too great between the various other sectional sizes to allow of any further combination of this sort. We feel, however, that in the interest of reduction of the number of sizes the circumferences of the 900x150 and the 915x175 should be the same and the 1000x150 and 965x175 should be the same, even though the nominal sizes are very diversified, thus giving only two rims to take care of these four tire sizes.

It will be noted that these circumferences do not follow any law or direct relation to the tire section, as is the case with the American standard. As an example of American practise, take a 34x4 tire. The tire seat circumference of the rim is 81.682 inches, giving a diameter of 26 inches. This is equal to the nominal tire diameter (34 inches) minus twice the nominal tire section diameter (four inches).

$$\frac{81.682}{2} = 26 = 34 - (2 \times 4)$$

The S. M. M. T. standard could be very much improved if it were possible to lay it out to some such law.

SIZE M/M	MINIMUM THICKNESS L" IN/M
65 (or 75)	3.0
90	3.0
105	3.0
120	3.5
135	4.0
150	5.0
175	5.0

The above criticisms and suggestions are entirely from the American viewpoint. We must admit that the S. M. M. T. standard as it stands is a very great improvement over former conditions, and is probably the very best that could be attained under the circumstances. Credit is due the Society of Motor Manufacturers and Traders for causing the adoption of an admirable rim section contour comprising excellent proportions, bearing the same relation to each other in all sizes. In this particular their standard is certainly better than the American standard.

It is improbable that any of the improvements to the S. M. M. T. standard suggested above could be incorporated at this time. For this reason we favor its universal adoption in its present form, excepting tolerances (which see below).

The tolerances specified by the S. M. M. T. standard are so great that they almost entirely defeat its purpose from the American standpoint. Accustomed to rims manufactured with a very high degree of precision and to very close tolerances, the American tire manufacturer designs his tire to give an ideal fit on a rim exact to standard and he is sure the tire will fit practically as perfectly in a maximum or minimum rim of its size. If a tire is made to fit a correct S. M. M. T. standard rim as perfectly, the tire cannot be made to enter a minimum rim and will float around and be a very poor fit in a maximum rim.

The S. M. M. T. standard tolerances follow:

Combining table I and IV above we can compile table V, giving maximum and minimum section dimensions:

SIZE	A		V		D	
	MAXIMUM	MINIMUM	MAXIMUM	MINIMUM	MAXIMUM	MINIMUM
65 (or 75)	39.5	37.5	11	9	7.5	6.5
90	52.5	50.5	13	11	8.9	7.9
105	63.5	61.5	15	13	10.3	9.3
120	68.5	66.5	17	15	11.7	10.7
135	78.0	76.0	18	16	12.4	11.4
150	91.5	89.5	19	17	13.1	12.1
175	91.5	89.5	19	17	13.1	12.1

This table shows an overlapping of sizes in a number of cases. For example, for a 120-millimeter rim V maximum equals 17 millimeters and D maximum equals 11.7 millimeters, while for a 135-millimeter rim V minimum equals 15 millimeters and D minimum equals 11.4 millimeters. Yet in a properly designed 120-millimeter tire bead V is one millimeter less and D is 0.7 millimeter less than in the case of a 135-millimeter tire bead. In table IV above the circumferential tolerance is three millimeters or a total tolerance of six millimeters. This large tolerance would cause a hardship in the use of in-extensible bead tires similar to the majority of tires used in America in connection with quick detachable type rims to the S. M. M. T. standards. On a maximum rim the tire would be extremely hard to apply and on a minimum rim it would fit very loosely, having a tendency to creep, making it always necessary to use flaps to keep the inner tube from being pinched between the tire bead and the rim.

Below is a table showing a comparison between S. M. M. T. and American standard rim tolerances given in both inches and millimeters.

As will readily be seen there is a marked difference, the American tolerances being very much closer and correspondingly more satisfactory.

American rim manufacturers find it no hardship to work to these American tolerances and there are no rims applied to cars in America today which are not rigidly inspected and passed within these tolerances. The closer tolerances permit of more accuracy in tire design and result in better fit of the tire in the rim, which in turn results invariably in improved tire service—the ultimate goal in all rim standardization.

We see no reason why the American tolerances without change cannot immediately be adopted in connection with the S. M. M. T. standard and so make of it, to all concerned, a more real and much more valuable standard.

DIMENSION	S. M. M. T. STANDARD		AMERICAN STANDARD

PREDICTS EXTREMES IN CYCLECAR DESIGN.

AT THE recent meeting of the Detroit section of the Society of Automobile Engineers, W. B. Stout, chief engineer of the Scripps-Booth Company, read a paper on "The Future of the Cyclecar".

The author has been connected with the cyclecar industry since its inception, and it is evident that his investigations have caused him to modify the ideas he held during the early days of the cyclecar. Mr. Stout holds that economy is best obtained with the four-cylinder motor when a standard clutch and gearset are employed. His paper in part was as follows:

The cyclecar movement started with the desire for producing the cheapest possible motor vehicle. This desire still obtains throughout the industry, but it has been learned by cyclecar makers in their experience to date that what were first considered the cheapest constructions were not developed to a point which made them advisable as was thought for the construction which was first attempted.

The first makers of European cyclecars placed the weight at from 450 to 500 pounds and spoke of the extreme simplicity of the V motor, belt drive, together with tandem seating. This publicity started America along the line of similar development, for it was well known that the motors and transmissions named were fully capable of handling the 450 to 550-pound vehicle on the narrow tread.

Cars Exceeded Weight.

On building up the cars, however, the advertised weight of 450 pounds came nearer to 750 in actual fact, while some of the cars ran as high as 900 pounds, even on 36-inch tread. In spite of this fact the motors handled the work well, made high speed and covered long distances. The chief objection to the motor from the standpoint of the public was noise, and from the standpoint of the manufacturer, sales, while the manufacturer of cars objected very strongly to the prices which were demanded for these V motors. In theory the V motor is much simpler than the automobile motor, having fewer parts and somewhat less weight. On this theory it would be possible for makers of V motors to build these for less money than a four-cylinder—the fact of the matter is that one can buy a good four-cylinder of greater horsepower and more reliability, or less noise and of more flexibility, for less money, even including radiator and connections, than he can buy the usual first-class V twin.

Drives Compared.

The first makers using friction and belt drive have found that they can buy a complete gearset and clutch of standard construction for less money than the belt drives, while the sales cost with this standard construction is much less than with this newer drive, to which the public must be educated.

From the standpoint of the cyclecar enthusiast who has talked V motors and belt drives, one feels that something has been lost in that the makers have in so large a number left the seeming simplicity for more complication, but a close analysis shows that there is really less complication and trouble from a standard arrangement than has been enjoyed in the V motor and belt driven arrangement.

It would seem from all this that the cyclecar idea is being lost sight of, as so many predicted at the beginning of the movement, and that the smaller car movement only was being solved. This, however, is far from being the case.

Field for Light Car.

There is still the field of the ultra-light cyclecar, a field which as yet no manufacturer has seriously entered. This field is the one which is to produce the simplest possible car, and it may be with a V motor of new and

simpler design than has been offered, and with some simpler form of transmission than has been built to date, or it is possible that the car may be light enough and the motor powerful enough, so that the clutch and chain to the rear axle may suffice for all ordinary running of this car, which will sell for not over \$300. It is probable that this vehicle will be built to seat one person, like a motorcycle, but with an extra folding seat, which can be used for overland trips.

To Use Larger Motors.

The other class of car is going to a larger sized motor, so that most of the light cars will have motors around 95 cubic inches; treads 36-inch to standard, while all sorts of seating arrangements are to be used.

As to the cars which tried out tandem seating and narrow treads, nearly all of them are retaining this idea. A road quality has been discovered in this type of car which, so far as the writer knows, never has been equalled in any other type of road vehicle. There is a handiness about the car in city traffic which cannot well be imagined when one realizes that these cars slip through narrow places like a motorcycle, that they accelerate faster than big cars and stop as quickly.

The Cyclecar on the Road.

The cyclecar on the road does not run between the ruts, as has been claimed; as a regular thing it runs for the most of the time with one wheel in the rut and the other wheel on some good, smooth surface, which may be outside the left hand rut, or in the middle of the road, or even off to one side on a path smoother than the ruts themselves.

One of the angles of cyclecar development which must not be forgotten in designing the car is that of sales. The American public is generally a mechanically educated public; it knows construction, it knows what big car construction will do, and ignores the limitations of these constructions which have become common and which they are used to. A cyclecar owner will stand twice the trouble from a four-cylinder motor of standard construction than he will from an experimental or unusual type of engine, and this must be taken into account in cyclecar work.

Advantages of Cyclecar.

The man who can best understand the advantages of the cyclecar is that man who is now driving a high priced heavy car. He knows its limitations; he knows that money alone does not produce comfort and maximum speed. He wants to get to his business and back in the shortest possible time with the least possible effort and dirt. He knows that his big car holds him up in city work, and narrow tread cyclecars are showing him also that he is being held up in country work. As a result he is ready to buy a cyclecar when he can be shown one that has all the dignity of a big car, has all its lines and finish, has real equipment and is luxurious in its appointments.

Future of Cyclecar.

The future will see cyclecars of aristocratic construction, as well as the spidery four-wheeled motorcycle at \$300. It is very probable that within the next two, or three years cyclecars will be produced, costing as high as \$1000, which will sell in quantities on performance alone. As yet it is impossible to define the cyclecar, but the writer is of the opinion that the cyclecar will be sold as a vehicle of maximum road performance under all conditions for two or three-passenger service.

The Studebaker Six, in the second of its five 200-mile tours, averaged 15.3 miles to a gallon of gasoline. In connection with this, two quarts of oil and three quarts of water were used. The car carried six passengers and the run was through the foothills of the Alleghenies, over the rough roads and hills on the southern boundary line of the state, the exact mileage being 206.7.

Thermoid's Efficiency

remains until it is worn paper-thin and it contains as much material, and a half more than ordinary kinds. Neither heat, oil, water, gasoline nor dirt affects it.

Thermoid HYDRAULIC COMPRESSED Brake Lining-100%

Cut a strip of Thermoid open. Break open the ordinary. Compare their centers. You can see the difference in gripping power.

Hydraulic compression is the reason Thermoid has the most uniform gripping power. It explains why its density is fixed—why it is used exclusively by so many makers of foremost cars, such as the Peerless, Lozier, White, American, Fiat, National, Marmon, etc.

Thermoid represents 60% more labor and contains 50% more material, size for size, than the ordinary.

Our Guarantee: Thermoid will make good—or we will.

For more details see advertisements in Saturday Evening Post, Literary Digest, Scientific American, Collier's Weekly, Everybody's Magazine, American Magazine, and nearly all motor publications.

(When Writing to Advertisers, Please Mention The Automobile Journal.)

When Garros in his Bleriot aeroplane flew nearly three miles above the surface of the earth he used the standard carburetor of Europe—the Zenith—because the Zenith requires no adjustment, no thought—regardless of conditions—once it is properly installed.

The Birdmen There are scientific reasons which have lead many of Europe's foremost Birdmen to choose the Zenith for altitude, for distance and for speed. What Zenith, with its compound nozzle, can do for these daring aviators it will most certainly do for your motor car at any altitude or under any conditions. Ask Europe.

A Message to Car Builders. Three big factories in France, Germany and England are supplying over 150 leading makes of European motor cars with the Zenith; 125,000 of these famous devices are marking a new era in efficient economy on machines in every corner of the globe. Why is this so? What does the Zenith incorporate that is exceptional? That is the next step toward improving your product for 1915. Write us—The American Zenith—and ask, "Why?"

WHY USE INFERIOR PLUGS WHEN CENTERFIRE

can be bought at the same price? They overcome all Engine troubles, fire where others fail and Add Power to engine. Any length point desired made to order. Try them and you will use them—always. Make a trial and save money. \$1.00 each, 6 for \$5.00.

THE DAWN OF A NEW DAY

There is another epoch-making application of an old principle—the use of a pushbutton and electro-magnet to simplify and render safe the control system of the gasoline motor car.

So Simple

is the improved method of shifting gears by electricity that it places the most powerful gasoline car completely under the control of even a woman, and makes the operation of shifting gears as simple as the ringing of a doorbell or the clicking of a kodak.

Particularly When Touring

Motorists will appreciate the ease and rapidity with which gears can be changed. The Vulcan Electric Gear Shift relieves the driver of that feeling of nervousness with which all those who have driven in mountainous country are familiar—

a kind of dread of not being able to change gears *quickly* at critical times.

The Operation of

the Vulcan Electric Gear Shift is very simple and positive—*just press the proper button in the center of the steering wheel, push the clutch pedal all the way down, and Presto!—the whole thing is done—easily, quietly, instantly.*

It is with a distinct feeling of relief that the experienced driver, in operating the Vulcan Electric Gear Shift, realizes that, at last, the troublesome problem of gear shifting has been solved correctly.

That it is possible for him to sink back into the cushions and enjoy the scenery along the way with perfect confidence in his ability not only to meet conditions as they arise, but also to anticipate them and make his selection of the proper gear

to be used before the critical time arrives.

The Vulcan Electric Gear Shift Completes the Electrification of the Gasoline Automobile

The electric starter eliminated the starting crank, the bungle-some control lever now follows. *The Vulcan Electric Gear Shift will be the greatest acknowledged refinement on 1915 cars.*

A number of manufacturers have already incorporated it into their designs. Others are hastening to adapt it to their present models, both here and abroad. *No single improvement has ever created the widespread interest that this electric gear shift has. The increasing stream of letters pouring into our office attests this fact.*

Now is the time to investigate the Vulcan Electric Gear Shift.

Write for full particulars.

The VULCAN ELECTRIC Gear Shift

Treat your Engine like a Friend

Paying attention to the requirements of the engine in your car pays big dividends in comfort. Your engine needs only one thing to give you the best that is in it—a lubricating oil that exactly suits its lubricating system.

There are nine systems of lubrication in use in automobile engines. No one oil is made which will suit them all. Although your engine may seem to work all right at first, with an oil not suited to it, engine troubles are bound to follow and it will wear out before its time.

Veedol is not only highly refined and filtered from the best grade Pennsylvania petroleum, but its different grades have also been thoroughly tried out in each of the lubricating systems and the right one for each **proven best by actual test.**

The Veedol Lubrication Chart, the result of these tests, shows exactly which grade of Veedol is suited to your car. Drop in at your dealer's and see the chart, or write us for a copy of it. Then try Veedol—your engine will appreciate it.

Hartford

AUTO COMFORT

EQUIPMENT

THE HOME OF HARTFORD AUTO COMFORT EQUIPMENT

Automobile accessories of admitted excellence which contribute to the maximum enjoyment of motoring—each a quality product and a proven factor in promoting comfort, economy and safety.

Hartford Bumper

The strongest motor car bumper in the world—no other statement does justice to the Hartford Bumper. A veritable breastwork between car and passengers and the dangers of collision. The four-leaf friction-springs—an exclusive feature—completely absorb the shock and jar. Saves repair bills by preventing smashed headlights, damaged radiators, twisted mud guards, broken springs, etc. Beautifies the smartest car. Made of staunch metal tubing reinforced with a solidified cement-like composition, combining maximum strength with minimum weight. Attached to any car in 15 minutes. Four sizes—\$15, \$12.50 and \$10. Special Ford Type, \$10.

Truffault-Hartford SHOCK ABSORBER

The Truffault-Hartford Shock Absorber is the inevitable choice of motorists who give the three-fold problem of greater comfort, safety and economy, the study it deserves. For ten years this standard device has "made good" by making "Every Road a Boulevard." Today a quarter-million motorists enjoy constant comfort through its use. Twenty-five leading makers recognize Truffault-Hartford as "The Pioneer and the Best" by adopting it. Inventive ingenuity earned for the Truffault-Hartford the exclusive right to use the principle of Rotary Friction. Science and results prove that this is the only principle that actually absorbs shocks and vibration. Absolute comfort, lowered upkeep cost and greater safety are logical results. Prices—Five Models—\$60, \$50, \$35, \$16. Special Ford Type, \$16.

Hartford Auto-Jack

A bright spot in many a wayside stop for repairs is the easy, rapid, efficient work of the Hartford Auto Jack. This handsome tool lifts a heavy car with wonderful ease and quickness. No muscle needed, no back-breaking, perspiring labor—just a simple wrist-movement and up goes the car; a turn of the reversing lever and down it comes smoothly, without jerk. It's all in the gears, ingeniously devised to multiply energy. Made for the motorist willing to pay a little more for something very much better.

Price, \$6.50.

Hartford CUSHION SPRING

Hartford Cushion Springs insure the degree of flexibility which most automobile springs lack. These comfort-conserving devices increase flexibility and provide for easy riding on average roads just as effectively as Truffault-Hartford Shock Absorbers control excessive flexibility and provide easy riding on rough roads. In combination, these devices offer super-comfort on all roads under all conditions. Hartford Cushion Springs eliminate the continual annoyance and discomfort of travel over small ruts and bumps, car tracks, cross-walks, cobblestones, etc. They are compact and unobtrusive, of the finest material and workmanship, and easily applied to any car. Four Models, \$35, \$30, \$25. Special Ford Type \$16.

Guarantee: "Money back if not satisfactory." Under this broad policy all Hartford products are sold. Any article of our manufacture not proving satisfactory after 30 days' trial from date of purchase, can be returned and the purchase price will be refunded.

Spedolene is Revolutionizing Automobile Gear Lubrication

If it were possible to reach 100% efficiency in lubrication practice, automobiles would never wear out. **Spedolene** gives the highest efficiency possible to secure in gear lubrication, consequently it makes an automobile last longer and give better service than any other lubricant. From every standpoint, **Spedolene** has proved to be the ideal lubricant for all automobile gears.

Asbestos the Foundation of SPEDOLENE

A lubricant manufactured with asbestos is revolutionary in principle, chiefly because this idea is such a radical departure from ordinary methods. As employed in **Spedolene**, asbestos becomes the foundation of one of the most valuable lubricants ever discovered.

Investigation and trial, either by the engineering expert or the motoring amateur, are sufficient to convince anyone of the practicability, and the superiority, of this foundation. **Spedolene** has revolutionized the gear lubricating problem of the country in less than three years and is unquestionably the greatest success in the shortest period of time in the history of lubrication.

Those Who Are Using SPEDOLENE Find That It

- Will positively eliminate gear noises.
- Will not run out or throw out at axle drums or gear cases.
- Will not gum.
- Will keep the gears cool as well as lubricate them.
- Will last longer than any oil, grease or compound and
- Is not affected in any way by any degree of heat or cold.
- Has no corrosive action, no fats, grease, acids, lye, soda or water.

USED EXTENSIVELY IN FOREIGN COUNTRIES

WHERE YOU CAN GET SPEDOLENE—Spedolene is now sold by progressive dealers in many parts of the country. If you experience any difficulty in securing **Spedolene** from, or through, your regular dealer, we will see that you are supplied, without expense or inconvenience. Ask your dealer or write us.

DEALERS—We are rapidly extending our distributing organization and need an agent in every town, city and state. Write us to-day for full information. Every live automobile dealer and jobber can profitably add **Spedolene** to his stock.

CARE AND MAINTENANCE OF MACADAM ROADS.

Endurance and Economy of Bituminous Surfaced Highways When Constantly Maintained and Systematically Repaired—Methods Necessary for Complete Restoration and Apparatus Necessary to Do Construction and Repair Work.

THE most marked difference between the perfect English roads and American roads in the Northeastern section of the United

States is not the method of construction, but the method of maintenance. developments, the bituminous macadam and bituminous concrete.

Maintenance, on the other hand, tells quite a different story.

States is not the method of construction, but the method of maintenance.

Construction as carried on by the best road builders in the United States is fully as good, if not better, than English construction. This applies not only to the highest priced block and sheet pavements, but to the gravel, macadam and their modern

Columbia Street, Cambridge, Mass., Which Has Traffic of More Than 4000 Vehicles Daily—An Example of Tar Macadam, Built in 1908, and Maintained at Low Annual Cost with Surface Treatments of Tarvis B.

In England the roads have been built and in use for a long period of years. All the problems which arise in the care and maintenance of roads and highways have come up, have been discussed and their best solutions arrived at. Roads are being repaired which to an American seem to be in perfect condition. The Englishman has

Main Highway at Spencer, Mass., a Concrete Pavement Maintained with Surface Coatings of Refined Tar Since 1909.

learned through experience that it pays to replace the broken paving blocks to prevent its neighbor from breaking down; also that it pays to repair the small hole in a macadam in order to stop its enlargement to a big hole.

Americans Neglect Good Roads.

Americans on the other hand have been so busy building new roads that they have in most instances entirely neglected the roads already built. The result has been deplorable. Roads which should be in first class condition need entirely rebuilding at a cost far in excess of the amount that would have been required to keep them in order through systematic maintenance.

The evils of neglected pavements are too well known to need elaboration. The dangers of holes to life, limbs and springs, the gross offence to sight and smell of the collected filth, the more subtle dangers due to unsanitary conditions, have been of frequent note. It might even be said that a neglected street lowers the whole moral and aesthetic tone of a neighborhood.

Another phase of the problem seems to have escaped notice. The neglect of the low cost pavements leads to the demand for higher cost pavements than the

situation warrants or the people affected can afford. The building of high cost pavement also reduces the total mileage possible to build. To take a concrete example:

Governor Glynn of New York lately commended the building of expensive state roads, costing up to \$30,000 a mile, giving figures purporting to show the ultimate economy of this large expenditure. His figures are based, however, on an absurdly high annual maintenance cost for macadam and an equally absurd low maintenance cost for brick. A maintenance cost of \$1000 per year on macadam paving presupposes the previous neglect of the road, while a cost of \$50 per mile on brick neglects the actual costs determined through experience.

Cuyahoga county, Ohio, the home of the brick pavement, spends nearer \$1000 per mile for maintenance on brick roads, rather than the \$50 claimed by Governor Glynn.

A statement of the actual facts as they exist under New England conditions would be more nearly as follows:

	Brick Paving	Bituminous Macadam
First cost	\$26,400	\$8,000
Interest on investment, at 5%..	1,320	440

Union Avenue, Laconia, N. H.—Note the Manhole Cover Still Flush with the Surface After Three Years' Wear of Heavy Traffic Between Laconia and Lakeport—A Tar Macadam Maintained with Tarvis B.

A Clean Swept Road Is Absolutely Essential to the Successful Application of Thin Coats of Bituminous Material.

Replacement after 20 years.....	20,000
Resurfacing twice in 10 years....	8,800
Annual repairs	500	440
Annual replacement cost.....	1,000	440

In other words, the high cost pavement cost three times the expense of the low cost pavement to build. In the long run it costs as much for repairs, the replacement fund is twice as large, and the interest on the money invested is three times as great.

To look at it in another way, the tar bound macadam can be built at half the original cost, while the maintenance and the sinking fund for renewal can be taken care of by the interest on the difference in cost between the tarvia macadam and the brick.

To state it still another way: Three times the length of road can be built with the same money, and the cost of maintenance of the three miles will not be three times the cost of keeping up the more expensive road. When, in addition to the economic advantages, the aesthetic and practical advantages of a good bituminous macadam are added, it is little to be wondered that New England engineers and road authorities stick to the stone road and its descendents.

The macadam, properly built

and maintained, is pleasing to the eye, is easy to keep clean, is practically noiseless, makes a pleasant street to live upon and is the smoothest and most pleasant of all roads to ride and drive upon. These latter considerations often lead to the construction of bituminous bound roads, even where the difference in cost is not strikingly in favor of the bituminous pavement.

Much of the work in New England with bituminous bound roads has not been new construction from the ground up, but has been in the nature of resurfacing. The bituminous materials lend themselves admirably to this form of work and the many miles built by the state authorities of Massachusetts, Rhode Island and Connecticut

attest to the popularity and serviceability of this kind of work.

General Method of Reconstruction.

The general method of reconstruction of old macadam is to scarify the surface, carefully harrow it to level it and to bring all the stone to the surface. It is then rolled smooth again. Two inches of new stone is now added and rolled until solid. Considerable brains need to be mixed with this preliminary part of the

The Highest Type of Apparatus Developed for Applying Surface Coats of Bituminous Materials, an Automobile Truck Fitted with a Pressure Pump That Sprays Any Compound, Hot or Cold.

The Apparatus Used by Samuel Finley of Atlanta, Ga., for the Distribution of Refined Tar to Road Surfaces.

work. If the stones in the old macadam are badly pulverized and of little value they must be excavated and replaced with new stone.

Firm Base Necessary for the Stone.

On the other hand, the old stone may be so good that the new stone may be reduced very considerably in quantity. In any event, what is required is a good, firm base for the layer of new stone. Unless this is obtained, the new surface to be constructed will not endure to the best advantage. In this resurfacing work it is quite as true as in new construction work that the endurance of the surface of a road is to a large degree dependent on the foundation.

The two inches of new stone must be carefully placed. Merely dumping in piles and levelling them off will not be sufficient. In order to get a smooth riding and evenly wearing road every shovelful of stone must be rehandled from the piles on the road. If the pile is left where dumped, and merely levelled off, the stone that was in the bottom of the pile is more compressed and denser than that which has been knocked from the top of the pile. These differences in compactness show at once when the bituminous binder is sprayed on the road. The more open places drink

in the binder, while the compact places keep it on the surface.

Too much emphasis cannot be placed on absolute uniformity. Lack of it has too often led to a condemnation of the penetration method of constructing and repairing macadam roads. The condemnation should be heaped on the head of the careless and not on the method.

The two inches of stone are carefully compacted by the steam roller. A twelve-ton three-wheel roller is most often used. Great care must be taken to give a good shape to the road by careful rolling, beginning at the sides and working towards the center. The road, after the rolling is finished, should have not more than three-eighths inch crown to the foot.

Since a bituminous macadam road sheds water easily, more than this is unnecessary and tends to make the road slippery. Every stone should be locked into place, and yet the surface should be open to receive the bituminous coat.

Refined tar is most often used as a binder in New England and is put on in a number of different ways to suit local conditions. On small jobs the binder is melted in kettles and poured from hand pouring pots. Larger work calls for

Typical Break in a Bituminous Concrete Caused by a Burned Batch in the Mixer—If Not Repaired It Will Cause the Ruin of the Rest of the Pavement.

Portable Repair Outfit Used by the Massachusetts Highway Commission for Patching Bituminous and Bituminous-Coated Roads.

tank car deliveries and the application of the material from tank wagons or auto trucks. Much time and thought have been given to invention and perfection of devices for spreading bituminous materials. Auto trucks are now in use in the vicinity of Boston which deliver from a central plant up to a distance of 60 miles, and can spray on any amount, from a fraction of a gallon up to two gallons a square yard.

Whatever the method employed, a good penetration and absolute uniformity are essential to good work. A gallon and a half per square yard has given the best success. After the refined tar is spread a sprinkling of five-eighths inch stone is applied to the road and bedded into the surface with the road roller. Here, again, uniformity is essential to success.

The stone must be applied evenly and a quantity used just sufficient to thoroughly chink in the large stone and yet leave no excess on the surface. These details may seem unimportant, but many a road has been ruined by not giving it sufficient thought.

The road is then ready for the seal coat. This is applied in the same way as the first coat of bitumen, but the quantity is reduced to a half gallon per square yard. A covering of pinstone or good gravel and more rolling completes the job.

The method of repair outlined above should be employed on all macadam roads where the surfaces have become so rough as to call for general resurfacing. The method will be found cheaper in the long run than patching and surface treatment where the area to be patched amounts to any considerable percentage of the total surface.

If the surface area of the macadam on the whole is in good condition, but with minor holes and breaks, local patching of the holes, succeeded by surface treatment of bituminous materials, has become the accepted method of repair throughout the New England states. Many of the old macadam roads have been kept

along by this method on the main intercity and interstate highways with markedly good results. Neglecting differences in traffic and in bitumen, the results are directly proportional to the condition of the road at the outset.

Timely Surface Treatments Superior.

Surface tar treatments begun on macadam before the surface had become worn and pitted are markedly superior to surface treatments on worn macadam, no matter how well the repair work has been carried out. In no department of human endeavor does the proverbial stitch in time save more than in the application of bituminous coat-

The General Method of Patching Bituminous Concrete Pavement—Filling in the Holes with Properly Sized Stone.

Patching Gang at Work on Street Surface—Pouring the Hot Refined Tar on the Stone in the Holes to Be Repaired.

ings to macadam and and bituminous macadam before the actual holes develop. Any experienced road man would be willing to agree that it saved ninety-nine patches instead of nine.

Methods for Repairing Tar Paving.

The general method of repairing holes is a modification of the reconstruction method outlined above, and is applicable to all classes of hard surfaced roads, macadam, bituminous macadam, concrete and asphalt.

The holes must be cleaned out to a fine edge and must be dry when the patching is done. A thin coating of refined tar is painted over the hole and its edges. Stone is then put in the hole of such a size that a single stone will reach from the top to the bottom of the hole. In practise the repair gang carries in a cart a number of different sizes of stone. The largest sized stone carried is two and a half inch. In case these larger stones are used a few stones of smaller size are sprinkled over the top to key in the large stones.

A light coat of refined tar is then spread on the patch and tamped or rolled until solid. The making of these patches is a fine art in itself. When well done, they are perfectly level with the old road and, if on a bituminous macadam, cannot be distin-

guished from the original road.

In order to make the surface uniform, and as an economy of maintenance, it is now customary to follow the patching by a surface coat of bituminous material. The kind of material and the amount are determined by the character of the road. The main macadam roads of the Metropolitan Park system of Boston have been kept up for many years with a refined tar applied hot. Many cities and towns, however, find for this class of roads and traffic that the cold application of refined tar is cheaper and very effective.

The economy of effective patching and of surface coating for automobile travelled roads is just beginning to be felt. On certain roads leading out of Paris

this replacement was formerly required every two years. With surface tarring and automobiles the rebuilding has been deferred to four or more years.

With other roads it pays better to spend a few cents a yard each year than a large amount per yard every few years. By these surface applications the roads are not only preserved, but are made dustless and attractive to travel.

The economical application of surface coatings of refined tar has led to the development of many types of apparatus for spreading them.

Finishing the Filling of the Hole with Stone Screening Preparatory to Consolidation by Hand Tamping.

Where extensive work is done, as in the vicinity of Boston, and on the Maryland state roads, the efficiency of automobile trucks equipped with apparatuses especially designed to afford uniform distribution of variable quantities over given surfaces has been fully demonstrated. Trucks specially equipped are now built so that they will distribute by spraying any volume of material from a fifth of a gallon up to two gallons per square yard. These automobile equipments will also handle both hot and cold refined tar products up to a radius of 60 miles from a central plant, or can be used to pump material from a locally placed tank car.

For smaller work horse drawn outfits are available for handling cold material, and spreaders drawn by road rollers or traction engines can be utilized for hot materials. To describe these apparatuses in detail would require an article in itself. Suffice it to say that they have been perfected for all classes of work, and that the road authorities need not hesitate to adopt this form of treatment for lack of proper apparatus for applying the bituminous materials.

BOYCOTT ERIE RAILROAD.

President Underwood's Attack Forces Abbott Company to This Action.

The statement made by President Underwood of the Erie Railroad Company, blaming moving pictures and the "automobile craze" for the business depression experienced in some sections of the country of late, has caused the Abbott Motor Car Company of Detroit, to boycott the Erie. In an order issued, M. J. Hammers, vice-president, of the Abbott Company, characterizes President Underwood's statement as being unwarranted and manifestly unfair to the automobile manufacturers in particular, to the city of Detroit in general, and especially to the several hundred thousand skilled working people and their families who find in the automobile industry a worthy and satisfactory means of livelihood.

Mr. Hammers then pointed out that since the organization of the Abbott Company a few years ago the freight and express business it has done has amounted to 9000 carloads of freight and 430,000 parcels. Stating that the company believes this traffic in the future should be sent over railroads that maintain policies constructive in things the company is concerned in, he ordered that until further notice all freight and express shipments be routed other than those of the Erie

Railroad, which order has been observed.

President Underwood now says his statement was misconstrued.

BOARDS REJECT 'BUSES.

As the height of the bodies of omnibuses which promoters hoped to operate in Chicago boulevards was such that the lower branches of the trees shading these ways would need be cut away to permit free passage, and that there was fear that the machines, because of long wheel-base, would cause congestion of traffic, the joint committee of three park boards having jurisdiction of the boulevard system voted unanimously to refuse a petition for franchise to operate several lines of machines. The pleasure of the users of vehicles was regarded as paramount to the convenience of the people who might use the omnibus service.

\$10,000 FOR DESERT RACE WINNER.

At a meeting recently at Bisbee, Ariz., it was decided that the prize of this year's desert race from Phoenix, Ariz., to El Paso, Tex., will be \$10,000. Last year the prize was \$6000. The race will take place Nov. 6 to 9 and the cars will pass through the cities of Chandler, Tempe, Mesa, Florence, Tuscan, Bisbee and Douglas. George T. Peabody of Chandler will print 25,000 copies of a booklet containing photographs, route descriptions and a map which will be circulated for advertising purposes.

NEW ORLEANS RETURNS FEES.

The Louisiana legislature recently enacted the Davey law, which became effective immediately, and as this prohibits licensing of motor vehicles by municipalities, the city of New Orleans was compelled to refund to all owners of motor vehicles the fees exacted for the licensing of the machines by the city. The fees were returned in the form of checks through the secretary of the board of examiners.

MUST SALESMEN BE REGISTERED?

A question now before Attorney-General Garnett of Kentucky is whether a salesman whose firm supplies him with an automobile instead of a mileage book for railroads, is required by law to pass an examination as a chauffeur and be registered as such. The Kentucky law, as it stands, is not explicit on this matter.

SALEM FIRE TESTS MOTOR APPARATUS.

Largest Number of Machines in Departmental Use Ever in Actual Service Demonstrate Efficiency and Endurance Far Beyond Normal Requirements.

THE Salem fire disaster, June 25-26, gave motor fire apparatus the hardest service and efficiency test such equipment has ever been given, and in every work during the conflagration the machines demonstrated remarkable capacities.

Many appeals for assistance were sent out from the stricken city between 1:45 and 6:30 P. M. on June 25, and, in all, 52 different fire apparatuses responded, 29 of which were motor driven, bringing together for actual service the greatest number of motor fire fighting machines ever in use in New England, and possibly in

Packard that pulled a steam pump from Winchester, a distance of 20 miles, in an hour and 40 minutes. In both instances the hauls were impossible for horses, and considering the difficult operation of pulling a huge steam pump behind a truck, through streets and congested traffic, the machines made exceptionally good time.

Analyzing the records made by the motor fire apparatus, during the entire period of action, the results shown are especially noteworthy. A La France combination chemical and hose wagon of the Boston department started over the road at the same time two two-horse steam pumps and two hose wagons were sent over to the Boston & Maine freight yard at Charlestown to be shipped by special train. The motor driven machine made the 14½ miles in 23 minutes, and the crew was at work in Salem before the other equipment was started. In addition to this, it was necessary to unload the horse apparatus by hand on its arrival, which required not only considerable time, but was hazardous for the safety of the apparatus, owing to the lack of facilities and the inexperience of the volunteers.

The Cambridge department was asked for assistance the

The Ahrens-Fox Motor Pump of the Lynn Fire Department, Which Pumped Continuously for 17 Hours and 30 Minutes.

any single instance in America.

Of the motor apparatus at the fire there were eight American-La France make, eight Knox, two Seagrave, two American & British, one Robinson, one Webb, one Ahrens-Fox, one Fore River Ship Building Company, one Federal, one Christie, one Knox-Martin, one Chalmers and one Pope-Hartford. These included four tractors.

In addition to these, three trucks hauled horse-drawn steam pumps to the fire. One of these was a Packard, owned by the Paine Furniture Company, Boston, and it drew a steam pump 11 miles from Manchester. Another was a three-ton

morning following the fire, and a Knox combination wagon was sent over the road, 23 miles, in 46 minutes. This machine carried 19 men and passed through heavy traffic, showing an average of 30 miles per hour. The Lynn department received the first call at 1:55, and an Ahrens-Fox pumping engine was despatched immediately. This machine covered the four and a half miles in 12 minutes, carrying 12 men. A Seagrave combination wagon with a crew of four, made the distance from Lynn in nine minutes when the second call was given. A Knox-Martin tractor, with a ladder truck, made the same run

Removing Orphans and Attendants From a Burning Orphanage to a Place of Safety in a White Omnibus.

in 14 minutes with 14 men, and an American & British gasoline-electric tractor, with a steam fire pump, made this distance and the men were at work in 14 minutes. Despite the fact that the roads were thronged with motorists journeying to Salem to witness the fire, the tractor-drawn machines made an average of 19.1 miles per hour.

The real work of the motor apparatus began after the record breaking trip to the city. A remarkable service was rendered by the giant pump of the Fore River Ship Building Company. This is the largest fire pump ever built and has a capacity of 1,800 gallons a minute. The machine has a six-cylinder motor of 150 horsepower, and a speed of 40 miles per hour. This machine worked at the fire for 17 hours and 30 minutes and had as many as eight lines of hose working at one time. On the morning of June 25, this outfit had been sent to Manchester, N. H., and had worked continuously at a fire from 2 to 11 in the morning. The crew was returning to Quincy, Mass., when the call for assistance was received at Stoneham. This big machine supplied water for the crews of the combination wagons from Medford, Revere, Stoneham and for other apparatus. Being merely a

demonstrating crew and not attached to a department, no special record of the service appears in any report, other than the praise that was given by the commanders who worked their men from it.

The time of service of the machines varied greatly because of the frequent changes necessary. The Marblehead engine was coupled to three different hydrants before water could be obtained, and while the crew worked 15 hours and 15 minutes, not all of the time was the machine pumping. Nine changes in all were made by this squad.

The Peabody men, with steam pumps, were worked for 20 hours and five minutes, and the Lynn crew with the Ahrens-Fox engine, for 19 hours and 36 minutes, this machine pumping continuously for 17 hours and 30 minutes. During that time the engine used 55 gallons of gasoline and three gallons of oil. The Robinson pump of the Chelsea department was in service 10 hours and 30 minutes and compelled to make six changes, losing 500 feet of hose to save the engine from being trapped by fire. Several times the engine could draw only enough water for a single line of hose. The Seagrave combination was changed three times. The Knox combination wagon of the Danvers department was in service 13 hours, and during that time made seven changes of location.

A run of 11 miles in 16 minutes was made by the Knox combination wagon from Manchester.

The Giant Pump of the Fore River Ship Building Company With a Capacity of 1,700 Gallons a Minute. This Pump Rendered Remarkable Service.

A Coal Yard and Surrounding Property Entirely Enveloped by Flames, Showing Destructiveness of Flames.

This machine carried a large crew of men and was on duty for 12 hours, making six changes. The Knox triple combination engine from Reading was nearly an hour finding water, and then located a stagnant pool and drafted through 20 feet of suction hose and forced it 1,000 feet for five and a half hours. Later the company was located at a hydrant and laid two lines of 1,000 feet each, and pumped steadily for five hours. This machine used 40 gallons of gasoline and six quarts of oil.

The La France engine from Swampscott made the run to Salem, 6.1 miles, in nine minutes and 45 seconds. It started with four lines of hose, but after vainly working for a half hour, during which time the compound gauge showed 20 inches of vacuum because of lack of water in the main, changed to another location, where it worked two lines of hose nine hours and 15 min-

utes, having abundance of water. A change was then made and the pump worked four hours and 21 minutes with one line, and the fourth shift was for a single line for one hour and 25 minutes. The total pumpage for this machine was 15 hours and 31 minutes and the engine was run continuously for 17 hours and 21 minutes. Before the start for Salem the motor was run two hours and six minutes at three different fires. The Christie tractor from Somerville broke a thrust bearing and was towed into Salem by a truck, and then the steam pump was worked for eight hours steadily. The long run, 19.5 miles, was an unusual test, and despite an auxiliary water tank the machine heated the water in the radiator to such an extent that renewal of water was necessary twice, and the escaping steam and hot water was blown back over the machine, so that the crew was forced to stop and cool the water to protect themselves.

A summary of the apparatus of the motor driven type responding to Salem's call for aid shows that Boston, Beverly, Cambridge, Chelsea, Danvers, Everett, Lynn, Malden, Manchester, Medford, Revere, Winchester, Somerville and Stoneham sent combination hose and chemical wagons; Chelsea, Marblehead, Reading and Wakefield sent triple combination pumps, hose and chemical machines; Lynn and Swampscott sent motor pumps; Lynn a Federal hose wagon; and

Panoramic View of Devastated Section of Salem, Showing the Large Area of City That Was Flame Swept—The Unusual Combination of Conditions Contributing to the

Lynn, Somerville and Beverly sent tractor-drawn steam pumps, and Lynn a tractor-drawn ladder truck, as well as two chief's cars. Salem had one combination hose and chemical wagon. The steam fire pumps were, aside from the five from Boston, and two from Gloucester, sent over the road, two coming from Peabody, and one each from Malden, Manchester, Marblehead and Winchester. A Medford steamer was sent to Malden to be shipped by train, but was held at the freight yard because of advice that it could not be used from scarcity of water.

The driving distances were far in excess of what fire apparatus is usually required to do in suburban service. The mileages of the relief equipment sent by road were as follows: Boston, 14.8; Cambridge, 23; Chelsea, 15; Danvers, 4; Gloucester, 15; Lynn, 4.5; Everett, 14.2; Malden, 14; Manchester, 11; Marblehead, 4.5; Medford, 18; Peabody, 2; Reading, 13; Revere, 12; Somerville, 19.5; Stoneham, 12; Swampscott, 6; Wakefield, 12, and Winchester, 20.

Commanders of the different attachments reported that some of the work of the motor fire apparatus was quite beyond what any machine might be expected to endure in service, yet without exception the engines demonstrated capacity absolutely convincing of their efficiency and endurance. According to an authority the work of

The Knox Triple Combination Apparatus, Which Was Sent to Salem from Reading and Worked 10 Hours and 30 Minutes.

the different motor apparatus at the Salem fire show conclusively that the machines have been developed to a point where they are not only dependable as steam apparatus, but they have other qualities that are immeasurably superior to any other form of fire equipment that has been produced.

In addition to the fire apparatus motor trucks were worked in invaluable service throughout the period of the fire and for days following. The militia used a White truck to great advantage in distributing supplies to the homeless after the disaster. During the fire a White passenger omnibus was used to remove the orphans and their attendants to a place of safety from a burning orphanage.

As for the fire itself, careful estimate shows

Fire Burnt in a Crescent Shape and Practically Wiped Out the Wooden Dwellings, Shops and Factories—An Conflagration, Which Burned Unchecked for Hours.

that 253 acres of the city, closely built with dwellings, shops, factories, mills and varying types of structures were devastated, the destruction being generally complete. Salem is a city of nearly 50,000 people, situated on the water front, and on a long peninsular between two arms of the sea. The city has developed westward and it is surrounded by Marblehead, Lynn, Peabody, Danvers and, across the inlet at the north side of the city is Beverly. The inlet between Beverly and Salem is spanned by the Boston & Maine railroad bridges and the regular highway bridges, so that there is direct communication between the two either by train or by road.

The conflagration was spectacular and terrifying in the rapidity of its spread, and, fanned by a strong wind, as well as by a draft created by the upward movement of the atmosphere caused by the flames, it developed a forward movement that could not be faced. The fire started in the patent leather factory of Korn & Company, in the heart of the thickly populated wooden dwellings. From this point the flames swept a mile to the railroad tracks in less than an hour and a half.

RUSSIAN AUTOMOBILE PROGRESS.

The figures given below, recently published by Russian authorities, give an idea of the increased use of the automobile in Russia.

During 1901, only 40 automobiles and seven motorcycles were imported; in 1906, the imports aggregated 243 cars and 380 motorcycles, and five years later, the number of cars was 2117 and of motorcycles 1134. The imports of motor cars and cycles during the first seven months of 1911 totaled in value \$3,400,000, during 1912 \$4,000,000, and during the following year \$6,000,000. Of 1844 automobiles and 792 motorcycles imported into Russia during 1910, Germany supplied 1247 cars and 582 cycles, France 385 and 56, respectively, England 86 and 18, United States 49 and one, and Italy 20 and nine. Complete automobiles imported pay \$88 duty, if accommodating four or more passengers; cars for three or less passengers pay \$56. Chassis are taxed at five per cent. of their values.

PRINCESS COMPANY STARTS AUGUST 1.

The Princess Motor Car Company, Detroit, Mich., one of the newly organized concerns of that city, has taken lease of a building at 348

Clay avenue, and plans to start operations August 1. The company has capital stock of \$100,000. The ultimate purpose is to triple the 10,000 square feet of floor space now available for manufacturing.

The company will it is stated, produce 100 cars a month for the balance of the year. The officers are: C. D. Smith, president; W. H. Brennan, vice president; I. N. White, secretary and general sales agent, and O. C. White, purchasing agent and general manager.

MARKET FOR AMERICAN CLOCKS.

According to the American Consul in Breslau, Silesia, Germany, Germany offers excellent opportunities for marketing the products of American automobile clock makers. Not only is there a wide call for these articles as part of the regular equipment, but automobile supply houses frequently carry a large stock and sell a good many automobile clocks. Some eight-day clocks sell for as little as \$3.57.

FORD ADDS TO FACTORY.

The Ford Motor Car Company has started work on an eight story addition to its factory at Jackson avenue and Honeywell street, Long Island City, New York. The cost will be \$650,000.

JAILED FOR BORROWING CAR.

For taking a car from a garage without the permission of either the owner or the garage manager, an employe of the Park Avenue Garage, Bridgeport, Conn., was sentenced four months in jail.

AERO CHART OF WORLD.

The Aero Club of America has appointed a committee to make an aeronautical map of the world, and to establish a chain of landing stations for water and land aeroplanes.

PROHIBIT ELECTRIC HORNS.

Maryland has prohibited the use of electric horns at night, and motorists not equipped with bulb horns are arrested and fined \$1 and costs, a total of \$2.45.

BOSCH PRODUCTS READY.

The Bosch Magneto Company, New York City, announces that the various new Bosch electrical products, including the Bosch lighting and starting systems, which have been in the market for some time, are now ready for quantity deliveries.

JEFFERY CAR POPULAR ABROAD.

That the Jeffery car, made by the Thomas B. Jeffery Company, Kenosha, Wis., is popular abroad is indicated by the accompanying photographs. In the upper left picture the King of Italy is seen riding in a Jeffery car, the center

tion between the state of Wisconsin, and the city of Waupun to secure the use of convict labor on the public highways. Wisconsin's progress in this direction has been hampered heretofore by lack of legislation permitting an indeterminate sentence to be imposed upon convicted criminals.

A strip of road 15 feet wide and two miles and a half long has been mapped out for the first stretch to be improved. This road extends from Waupun, which is the home of the Shaler vulcanizers, to Chester.

SCHROEDER'S PEUGEOT ENTERED.

The Peugeot car which, driven by Jules Goux, finished first in the 1913 500-mile race at Indian-

The Jeffery Cars Are Generally Used and Are Favorably Known Abroad, These Illustrations Being of "Sixes" in England, Spain, France and Russia.

view shows a Jeffery machine at the St. Petersburg show, and the upper right illustration is that of a Jeffery six before J. Reyne's establishment, Barcelona, Spain.

The lower row, reading from left to right, show Jeffery cars before the House of Lords at London, Eng.; before the Statue of Columbus at Barcelona, Spain; in the bull ring at Barcelona, Spain, and at the Paris automobile show.

CONVICT LABOR FOR ROADS.

M. E. Faber, manager of the C. A. Shaler Company, acting as secretary of the Waupun, Wis., Advancement Association, has been instrumental in securing the necessary co-opera-

apolis, was the first entry received for the Elgin races, Aug. 21 to 22. The car was entered by E. J. Schroeder of New York City, who in former years backed Ralph de Palma, but he has named no driver for the car as yet.

TIRE VULCANIZERS IN FAVOR.

C. R. Quine, sales manager of the Williams Foundry & Machine Company, Akron, O., states that 30 tire manufacturers have adopted and now use the Akron-Williams tire repair vulcanizers. The Ford Motor Company recently ordered 14 A-W plants for distribution among its accessory stations.

MARSH TO BUILD CAESAR CAR.

Veteran Designer Leaves Vulcan Company and Organizes New Concern.

A. R. Marsh, designer of the Vulcan car and organizer of the Vulcan Manufacturing Company, Painesville, O., has disposed of his interests in that company and is now located in Anderson, Ind., where he is organizing a company to build a light car. The new car will be named the Caesar and that early deliveries may be made contracts have been made for a large stack of components to be made to Mr. Marsh's designs.

Mr. Marsh is a pioneer in the automobile industry. As a manufacturer of motorcycles he made and marketed the Marsh machine in 1899, which is claimed to have been the first motor bicycle produced in this country. Charles H. Metz of the Metz Company, maker of the Metz car, was then associated with Mr. Marsh as a partner.

In 1907 Mr. Marsh disposed of his interests in the American Motor Company, maker of the M. M. motorcycle, to his brother, W. T. Marsh, and commenced experimental work in light automobiles. Since that time he has designed and built seven distinct machines of the light car type, including the Vulcan.

NEED LAWS FOR AUTO THIEVES.

Job H. Lippincott, State Motor Vehicle Commissioner of New Jersey, says the state laws need changing to deal with the criminal element that is now specializing auto stealing, as, he states, the present statutes are inadequate. Commissioner Lippincott tells of investigations which convince him that numerous bands of thieves not only systematically steal automobiles but will only drive away certain makes. This is, he says, because the fences where the machines are disposed of have bodies for these cars, and consequently the work of changing the equipment, raising or obliterating the engine numbers, etc., is simplified.

WORLD'S RUBBER PRODUCTION.

According to the Goodyear Tire & Rubber Company, a leading London rubber man who recently visited the Goodyear plant estimated that for 1914 the world's rubber production would be: Plantation 65,000 tons; Brazil wild, 32,000 and other wild 10,000 tons. He claims that within a few years plantation rubber will almost

wholly supersede the wild supply. The wild supply, however, has certain qualities that will always make necessary the use of considerable quantities of this staple.

FARMERS OPPOSE ROAD LAW.

Farmers and their organization in Pennsylvania demand that all candidates for the Legislature place themselves on record before election as opposing the present automobile road act. This law bars all traction engines and threshing machines from improved roads, and, according to the farmers, makes useless \$7,000,000 worth of threshing machinery.

COLGATE'S MECHANICS' SOAP PASTE.

Colgate & Company, 199 Fulton street, New York City, manufactures Colgate's Mechanics' Soap Paste, a special preparation for cleaning the hands. This cleanser, which will thoroughly remove grime and grease, will not injure the skin. It is pleasantly perfumed. Department 22 of the company will send a sample to any motorist upon receipt of two cents.

WALPOLE TIRE SALE DEFERRED.

The United States District Court has changed the original order for the sale of the Walpole Tire & Rubber Company, Walpole, Mass., and set the date for the sale for August 12. This was done at the request of the stockholders' organization committee, which is arranging to bid in the property.

OVERLANDS IN ICELAND.

The automobile is now in use in the land of ice. The Willys-Overland Company has sold three cars through its agency at Reykjavik, Iceland. These are the first machines ever operated in the land of the Northern Lights.

HAVERS PLANT SUFFERS FIRE LOSS.

The Havers Motor Car Company's main plant at Port Huron was recently destroyed by fire, the origin of which is unknown. The loss is estimated at \$60,000. Several finished cars, as well as bodies, chassis and parts were destroyed.

FEATURES OF 1915 KING TOURING CAR.

FROM the standpoint of the driver's comfort and convenience, the 1915 Model C King Car, is highly developed, both in design and construction. All the operating devices are so grouped that the driver has every means of control instantly available.

The changes in the new model include an increase of 1-16 inch in the bore of the engine, the substitution of the Atwater Kent igniter for magneto ignition, elimination of the straight dash between the bonnet and the cowl, and the use of a pressed steel rear axle housing.

The cantilever rear spring suspension, which has always been a King feature of construction, is continued. The unit power plant is an L head type, and the block cast cylinders are 3 5-16 inch bore and five inch stroke. The crank case is an aluminum alloy. The three crankshaft bearings are 1 11-16 inches diameter. The main bearing lengths are: Front, 3 1-8 inches; middle, three inches; rear, four inches; the connecting rod big end bearings are 2 5-8 inches length. The valves are 1 13-16 inches diameter, fully enclosed and are operated by roller push rods.

A specially designed carburetor is used. The gasoline is carried in a tank in the cowl, which allows a high carburetor position, affording accessibility and freedom from condensation in the short inlet pipe. The lubricating oil is circulated by the fly wheel to the crankshaft bearings, overflowing to oil pockets from which all other parts of the motor are lubricated by splash. The motor is cooled by water circulated through a honeycomb radiator by thermal action. A six-blade pressed steel fan insures complete circulation of air through the radiator and about the engine.

All operating devices on the Model C are grouped on an instrument board within easy reach and directly under the eye of the driver. The electric light switch, ignition switch and speedometer are lighted by a small electric lamp, which also lights the driver's section of the car. As shown in the accompanying photograph of the instrument board, the gasoline filler cap is located at the extreme right of the group where it

is most accessible. The gasoline gauge is directly beneath the filler cap, and the petcock of the feeder to the carburetor is within easy reach of the driver.

An improved Ward-Leonard starting and lighting system is fitted as extra equipment. It is a motor-generator, the drive being direct to the fly wheel, this arrangement eliminating one set of reduction gears. The improved starter is now operated by a lever instead of the push button as in Model B. The new starter is regarded as being much safer as it is only necessary to push the lever about two inches, and it automatically resumes a neutral position after the motor has been started.

A full floating rear axle is provided in this

Streamline Body of the 1915 King Touring Car, the Cowl Replacing the Straight Dash of the Previous Types.

model, this type being claimed to be superior to any other. The axle itself has a pressed steel housing, and drive shafts can be removed by merely taking off the hub flange nuts. A saving of 50 pounds in weight has been made by providing a pressed instead of a cast steel housing. The bevel gear ratio is optional, either 3 7-10 to 1 or 4 to 1. Both sets of brakes operate on 14-inch drums at the rear wheels, the expending set being operated by a hand lever.

The multiple disc clutch consists of eight bronze driving plates, each containing 40 cork inserts, and nine steel driven discs. It runs in motor oil supplied by an overflow of the reservoir in the motor base. The sliding gear transmission has 6-8 pitch gears with 7-8 inch face, which are carried on shafts mounted on Hyatt roller bearings. The control lever is slightly

shorter than on the Model B.

The drive to the rear axle is through a Spicer universal joint and one enclosed propeller shaft with a sliding joint. The steering gear is of the Gemmer irreversible worm and gear type. Fastened to the steering column is a small control

which cuts off the air from the carburetor and gives a rich mixture to the motor for starting.

The wheels are of the artillery type, second growth hickory, and are fitted with 33 by 4 inch Goodyear No-rim-cut tires on demountable rims. The standard 56-inch tread or 60-inch Southern tread will be furnished. The wheel base is 113 inches. An extra tire is carried in the rear.

The front springs are of the standard semi-elliptic type, but, as stated above, the rear springs are of the cantilever form. This cantilever spring is set at right angles to the direction taken by resisting forces caused by road shocks. The front end of the spring is attached to the frame by a slotted bracket, which permits freedom of movement endwise, but does not allow transverse motion. The rear end is attached to the tube enclosing the rear axle shaft. An extra leaf on the under side of each rear spring prevents excessive rebound.

The choice of either a five-passenger touring or a two-passenger roadster body is offered for the one chassis. New bodies of the stream line form have been designed. A choice of either leather or corded fabric is given, and the backs of the seats are piped instead of tufted.

A rain vision, ventilating windshield is built into the cowl construction, and a one-man top has been added to the up-to-date equipment. Side lights have been eliminated, extra bulbs in the head lights taking their place. In addition to the above, quick attachable curtains, a Stewart-Warner speedometer, an electric horn, tire irons, pump, jack, tire repair outfit, tools and an extra rim are part of the regular King outfit.

The electric lighting equipment of the car is designed to preserve the lines of the body and to obtain an appearance that is especially desirable,

Features of the 1915 King Car: Upper Illustration Shows the Seating Arrangement of the Body, and the Lower a Side View of the Chassis.

but had not been possible with previous constructions. The electric current for lighting the car is supplied from an 80 ampere hour Willard storage battery that is suspended from the chassis, directly under the front seat, where it is

convenient for examination and attention and may be easily installed or removed.

The car is fitted with a pair of 11-inch search lamps that are mounted on brackets. The lamps are of the two-bulb type, with a set of small bulbs so installed that these may be used at will by a switch, so that the power of the lighting may be increased or diminished according to the needs of the traffic or the condition of the streets or highways. The smaller lamps may be used for city driving, this obviating the need of supplementary dash lights, and besides minimizing the current used and better conserving the battery, the lines of the cars are preserved unobstructed from radiator to the rear of the tonneau, which decidedly improves the appearance of the body. Incidentally the equipment is simplified throughout by this manner of installation.

The arrangement of the body is exceedingly satisfactory, for provision is

STANDARDIZED ROADS CAR OUT.

A good roads car representing the Society of Road Standardization of America has begun its first journey, in the interests of standardized roads, leaving Chicago for the Pacific Coast. The initial trip will cover seven states, Illinois, Missouri, Kansas, Colorado, Utah, Nevada and Cali-

Characteristics of the King Car: Upper Illustration is a Three-Quarters View from the Front; Centre Insert Shows the Instrument at Board, with the Gasoline Filler at the Extreme Right, and the Lower is a Top Plan View of the Stripped Chassis.

made for carrying utilities and stores. The compartment beneath the left side of the front seat is sufficient to take all of the tools, spares, supplies, and the like, and the space under the wide rear seat is available for the storage of personal effects. With the running boards clear the car is especially sightly and it can be kept well with a minimum of attention.

fornia, the objective point being San Diego, Calif.

The trip is being made in a Cole car, the gift of J. J. Cole, president of the Cole Motor Car Company of Indianapolis, Ind. G. E. Minor, formerly connected with the Old Trails Association, the National Highways' Association and Indiana Good Roads Association, is at the wheel of the machine. Mr. Minor will lay out, map and log 60,000 miles of the best and most travelled roads in the United States. It is the purpose of the society to so map the ways that a child could understand and be able to fol-

low the information to whatever destination may be desired.

As a part of the instruction in the La Crosse County Agricultural School, La Crosse, Wis., the students are erecting a model fireproof garage and repair shop. The school will also have a gymnasium.

SIXTEEN EVENTS FOR GALVESTON BEACH.

Large Number of Cars Entered Including the Winner at Sioux City---Course Reported Very Fast---Prospects for 1915 Racing---Sioux City Track Sold.

EDDIE RICKENBACHER, winner of the Sioux City sweepstakes, with his Duesenberg car, and Ralph Mulford and Mel Stringer with Peugeots, are the latest entrants to the Galveston Beach races July 29 and 30 and August 1 and 3. This brings the total entry up to 15. It is expected that Barney Oldfield will be entered and will be at the wheel of a 90 horsepower Fiat.

In all 16 events are carded for the four-day meet, including three amateur races. Departing from custom of former seasons, instead of a long distance race competed for in heats, there will be three 50-mile, class D, free-for-all contests, for which the biggest prize of the meet will be offered. There is a total of \$4,650 in cash prizes offered, and many trophies.

Many entrants are either en route for Galveston or have already arrived with their machines. The beach has been tried by several drivers and it is reported to be remarkably hard and fast.

S. F. Duesenberg, Bill Endicott, E. Rickenbacher and one unnamed driver will drive Duesenberg cars. Joe Horan and two unnamed drivers will pilot Metropole. Other entrants and their cars include: Chandler, in a Braender Bull Dog; Joe Le Cain, with a Chevrolet; Charles Keene in a Beaver Bullet, Conde Moseley in a Studebaker, H. L. Kindred in a National, George Clark in a Texas, T. C. Jones in a Mercer, and an unnamed driver for a Delage.

The grandstands, with a seating capacity of over 4,000, are more than half completed. A record crowd is anticipated this year.

PROSPECTS FOR 1914 RACING.

W. A. Smith, advertising manager of the Mercer Automobile Company, Trenton, N. J., says that the revival of automobile competitions, particularly road races, has become general in this country this year. "A review of the contests already held, and a glance at the schedule of the contest board of the American Automobile Association, will quickly show that there is a marked increase in the number of road races, track and kindred contests," said Mr. Smith. "Touring events and the reliability contests such

as predominated on the automobile sports calendar of several years ago, are taking another drop to the discards, the A. A. A. list failing to show one such event scheduled for this season."

Mr. Smith points out that the Grand Prize and Vanderbilt Cup races were run this year after being abandoned last season. Also that the Tacoma, Wash., road races were again held, and the calendar still calls for the running of the Elgin road races, and the Galveston Beach events. He says: "While there is an increase in the interest in road races, the specially constructed speedway events will be the features of automobile racing in the future, with the exception of the Grand Prize and Vanderbilt, which will undoubtedly hold the same position in automobile sports they have in the past."

NEW ENTRIES FOR ELGIN RACES.

Two Mercer cars will be entered in the Elgin road races to be competed over the Illinois course August 21 and 22. Spencer Wishart will return from Europe in time to drive the same Mercer he drove into second place at the recent Sioux City meet at an average of 78.3 miles an hour. Edward Pullen, the driver of the winning Grand Prize Mercer, is now on his way from the Pacific coast to get the second Mercer entry into shape.

Ralph DePalma, with the German Mercedes that won the French Grand Prix, and Bob Burman with a Peugeot, are also entrants. This makes 10 entries to date, exclusive of the Mercer entry which has not been announced officially. There are: two Marmons, two Peugeots, two Sunbeams, two Stutzes, one Mercedes and one Duesenberg.

CADILLAC WINS COLORADO DERBY.

Harry W. Swigert, driving a Cadillac car, won the sweepstakes trophy for the best general average of consistent driving in the first annual all-Colorado motor derby, July 3, 4 and 5. Point cups for the five separate legs of the 280-mile run from Denver to Colorado Springs, Canon City, Pueblo and return, were won re-

spectively by Carl Schaub, Cadillac; Swigert, winner of the grand prize, Cadillac; A. C. Lee, Abbot-Detroit; E. H. Bull, Franklin, and T. Marx, Locomobile.

The winner finished 14:6.15, which was nine minutes under time secretly fixed by the timing committee as the most reasonable for covering the official route.

ADDITIONAL RACE PRIZES.

The Rudge-Whitworth Company, Ltd., Coventry, England, manufacturer of the Rudge-Whitworth detachable wire wheels, announces through its American agency, the Standard Roller Bearing Company, Philadelphia, Penn., that it will give \$200 to the first car in the Elgin races on both days of the meet and \$100 to the second car both days, provided they are equipped with Rudge-Whitworth wire wheels. The Elgin road races will be held this year on August 21 and 22.

NEW DIRT TRACK RECORD.

In the free-for-all at the Rose City track, Portland, Ore., July 12, Percy F. Barnes, in a Romano car, established a world's record for 25 miles on a dirt track, the time being 22 minutes, 7 1-5 seconds. He drove a sensational race against Tetzlaff and Carlson, both driving Maxwells.

Tetzlaff won the first heat of the three-mile event from Brock in two minutes and 37 seconds and won the second heat in two minutes 36 3-5 seconds. In the five-mile race from a standing start Barnes in a Romano won in four minutes and 30 seconds.

OVERLAND FIRST AT VISALIA.

Driving an Oakland car, T. McKelvy, of Fresno, broke the Visalia, Calif., record of 3:4.56 made by Sprague in a National in 1912, and won the 150-mile sanctioned road race in 2:47.53, equal to 53.6 miles per hour. Briscoe in a National pressed him close throughout, and finished in 2:49.46. Campbell in a Packard was third in 3:9.40, and Pillett in a Ford fourth in 3:10.18. The prizes were \$1,000 first, \$500 second, \$250 third and \$100 fourth.

ABANDON WISCONSIN TOUR.

There will be no revival of the Wisconsin State Automobile Association reliability tour for the Milwaukee Sentinel \$1,000 trophy in 1914.

The association claims that the A. A. A. will not grant a sanction for a grade 1 tour, nor permit the association to provide a stock car classification and registry.

SYNDICATE BUYS SIOUX TRACK.

A syndicate headed by E. R. Schultz, secretary of the Sioux City Automobile Club and Speedway Association, which promoted the recent 300-mile race at Sioux City, has purchased the Sioux City track. The new company is capitalized for \$100,000, with \$50,000 paid in.

WANT CREDITORS TO PAY BACK.

Detroit Trust Company, trustees for Herreshoff Motor Company of Detroit, Mich., has asked Lee E. Joslyn, referee in bankruptcy, to demand that the creditors who have received payments within the past four months refund the same. Under the Michigan bankruptcy law no creditor has preference within four months of filing petition, and should any payments be made, as in this case, they must be paid back. The amount involved is not made public.

CROWN COMPANY BUYS PLANT.

The Crown Motor Car Company, Louisville, Ky., has purchased the manufacturing plant owned by the Ohio Falls Motor Car Company at New Albany, Ind. Statement is made that the company will shortly reorganize under the name of the Hercules Motor Car Company, and after additional capital has been secured will operate on a far larger scale than heretofore.

ALTREE JOINS BOSCH.

A. H. D. Altree, former Chicago branch manager of the Bosch Magneto Company, has been appointed vice-president of the concern, with offices in New York. F. D. Norman, previously in charge of the Bosch Toronto office, has succeeded Mr. Altree in Chicago.

WALPOLE CREDITORS WELL OFF.

R. G. Curtis, representing the reorganization committee of the Walpole Tire & Rubber Company, told Judge Dodge in the United States District Court recently that all creditors would receive 100 per cent. of their claims if the plans of reorganization are adopted.

THE 1915 WAVERLEY MODELS.

The Waverley Company, Indianapolis, Ind., has announced that it will build for the 1915 market what is known as model 109, a four-chair brougham type, and that this vehicle will have incorporated in it a series of devices that will appeal particularly to women drivers, as these are intended to afford every possible factor of safety that science and engineering skill can produce. The control car cannot possibly be started unless the controller handle is at first speed; this prevents the quick start of older types of electric cars, which was caused by the lever being pushed too far forward.

The 1915 Waverley is equipped with five-quarter elliptic springs—the installation being intended to prevent excessive rebound. Should the car so strike a rut or stone as to throw the wheels out for an instant, they are automatically adjusted by the semi-irreversible steering

The Silent Waverley Electric, 1915 Model, the Interior View Showing the Four Chair Arrangement.

system controlled by a side lever.

That the Waverley is specially designed for the women is also shown by the equipment, which consists of gray stripe upholstery, gray axminster carpet, silk drapes for the oval windows and scalloped edge shades on the boudoir type for the large ones, cut glass flower vase, leather toilet case with watch, memorandum book, perfume bottles, umbrella holder, etc., etc.

JULY 4 BIG DAY FOR BOSCH.

That the Bosch Magneto Company has reason to feel happy over the result of the Glorious Fourth is shown by a casual glance at the Bosch victories registered that day. At the Tacoma, Wash., 250-mile race Bosch magnetos and Bosch plugs were on the first four cars to finish. In the 200-mile race at the same place Bosch magnetos were on the first four cars to finish and Bosch

plugs were on the second, third and fourth. In the 100-mile event Bosch magnetos were first and third over the line, a Mea magneto equipped machine being second. The Bosch plugs ran 1-2-3.

At Sioux City, Iowa, Bosch magnetos were used by cars finishing from 1 to 10 without a break and after yielding first place on the plugs to a foreign make, ran from second to 10.

To cap the day's events Bosch magneto equipped cars ran from first to seventh without a break in the Grand Prix of France.

GOOD ROADS AS A CROP BOOSTER.

Statistics issued by the Department of Agriculture, show that an improved road will vastly increase the productiveness of the area through which it is built. These studies were made by the department in Spotsylvania, Virginia. In 1909 the county voted \$100,000 to improve 40 miles of roads. Two years after the completion of this work the railroad took away in twelve months from Fredericksburg, the county seat, 71,000 tons of agricultural and forest products hauled over the highways to that town. Before the improvement of the highways, the total was 49,000 annually. In other words the volume of the country's produce increased 45 per cent.

Likewise there was a great increase in dairy products. In 1909 these amounted to 114,815 pounds but two years later had increased to 273,028 pounds, or about 140 per cent. In addition to this, there was a reduction of eight cents a mile in the haulage cost, which saved the farmers a total of about \$41,000 a year.

On July 31 the Associated Automobile Clubs of New Jersey will have an efficiency run from Newark to Sea Girt.

The post office at Louisville, Ky., has ordered six new motor trucks for the collection of mail. The increase of service will be begun September 1.

More than 15,000 miles and not one breakdown is the record of a Kissel Kar truck, owned by L. G. Goodrich, of Fresno, Cal. This truck has carried seven tons at a time and four or five tons over eight miles of dirt roads.

GENERAL NEWS OF THE INDUSTRY.

Bosch Magneto Company Absorbs Rushmore Dynamo Works and Will Market All Its Products---Changes in Personnel, New Concerns and Building Plans.

WHAT is considered the largest merger of the motor vehicle electrical accessory industry was consummated July 11, when the Bosch Magneto Company, New York City, absorbed the Rushmore Dynamo Works, Plainfield, N. J., one of the oldest concerns of the kind in the country. Announcement of the Bosch lighting and starting system was made last autumn, but no extensive advertising and selling campaign was inaugurated. Careful analysis of the market demonstrated very large undeveloped possibilities. The great advantage to both the vehicle builder and the owner having a complete electrical equipment for ignition, lighting and

marketing of all products of the Rushmore Company. The selling organization, method of distribution and supply is exceptionally large, there being beside the four branch houses, a main office and more than 239 distributors and supply stations.

The addition to the Bosch Company production department is more than 100,000 square feet of floor space, with equipment entirely modern and complete. At the Springfield works of the company, all material is received and shipped on a private siding from a main line of a through railroad. The Rushmore Works has its own foundry equipped with power moulding ma-

Rushmore Dynamo Works, Plainfield, N. J., Purchased by the Bosch Magneto Company—The Plant Is Now Known as the Rushmore Works of the Bosch Magneto Company.

engine starting produced by one manufacturer, and all of a quality recognized as standard throughout the world, was such that the company decided to develop its resources for producing lighting and starting systems that would be sufficient to meet any demand made upon it.

With this policy the Rushmore Dynamo Works were taken over in their entirety. The Plainfield plant will be known as the Rushmore Works of the Bosch Magneto Company and operated in conjunction with the Springfield, Mass., factory and will have manufacturing facilities probably second to none for the particular lines to which they are devoted.

The Bosch Magneto Company will continue to manufacture and market its well known ignition apparatus and specialties and the production and

chines; it has its own lens grinding factory in fact, every part of the Rushmore-Bosch products including lamps, searchlights, lighting and starting systems for trains, automobiles, motor boats, etc., can be produced in the new plant. The factory employs more than 700 men, and the Springfield works is even larger.

The Rushmore Dynamo Works has concentrated supplying manufacturers with Rushmore starters and generators, and has exploited them with considerable success abroad, where this equipment is standard for a number of high priced machines. The Rushmore starter has also been exclusively adopted by a number of American car manufacturers.

The first important contract which included the Bosch products was signed by the Nordyke

& Marmon Company, Indianapolis, Ind., for the 1915 Marmon cars, which will be entirely Bosch equipped.

FRENCH SUCCEEDS WILLIS.

George M. Dickson, general manager of the National Motor Vehicle Company, Indianapolis,

Lucius S. French, Advertising Manager, National Motor Vehicle Co.

maker of the well known National cars, announces the appointment of Lucius S. French as advertising manager. Mr. French is well known in the automobile industry, being associated with the Cole Motor Car Company and later with the Henderson Motor Car Company.

He succeeds P. P. Willis, who becomes a member of the Thompson-Carroll-Tripp Company, Cleveland, O., advertising specialists.

DENBY TRUCK COMPANY.

The Denby Motor Truck Company has begun business at Detroit, Mich., with offices at 2036 Dime Bank Building, and a factory at Dubois and Franklin Streets. The factory has 20,000 square feet floor space, and sufficient material has been contracted for to build 500 trucks the first year. The company's officials are: Garvin Denby, president; J. Walter Drake, vice-president; Arthur Webster, secretary; Edwin Denby, treasurer, and R. F. Moore, advertising manager.

ERBES BUYS CUTTING PLANT.

L. S. Erbes has purchased the stock, repair parts, name and good will of the Cutting Automobile Company, Jackson, Mich., and plans to continue motor car manufacturing in the factory building. Mr. Erbes has material for 200 cars, and he proposes to fit Wisconsin motors to Cutting chassis and turn out roadsters and possibly cyclecars.

BUY OLD COLUMBIA FACTORY.

At a price stated to be between \$250,000 and \$350,000, the Billings & Spencer Company of Hartford, Conn., has acquired the factory of the Columbia Motor Car Company, once owned by the United States Motor Company.

OVERLAND HAS LARGEST PLANT.

With completion of extensive buildings now in the course of construction the Willys-Overland Company plant at Toledo, O., will become the largest factory in the world devoted exclusively to the manufacturing of automobiles. More than 1,000,000 feet of working space will be available after the changes are made.

The factory, when completed, will consist of 64 buildings, having an aggregate of more than 60 acres of floor space. These changes were necessary to manufacture the new Overland six-cylinder car, which will be ready for delivery in the early fall, and which will necessitate a further increase in production.

MERKLE JOINS MOTSINGER.

J. F. Merkel, former manufacturer of the Merkel motorcycle, has become identified with the Motsinger Device Manufacturing Company, La Fayette, Ind., in the capacity of general sales manager. This company makes the Motsinger carburettors and electrical apparatus.

Mr. Merkel designed the Merkel motorcycle in 1899 and manufactured this product until about a year ago. He was a pioneer in his field, being the first man to equip a motorcycle with a magneto, and was the first manufacturer to market magneto equipped motorcycles exclusively. Incidentally, Mr. Merkel built the first automobile constructed in Wisconsin.

J. F. Merkel, Sales Manager, Motsinger Device Manufacturing Co.

HOOD JOINS DETROITER.

He Will Relieve C. S. Briggs, President of Company, as Sales Manager.

Wallace C. Hood has been appointed sales Manager of the Briggs-Detroit Company, Detroit, maker of the Detroit.

Wallace C. Hood, Sales Manager of the Briggs-Detroit Company.

Mr. Hood has relieved C. S. Briggs, president of the company of the duties of directing the sales organization, and Mr. Briggs will devote his energies to the production of the 1915 line.

Mr. Hood is well and favorably known to the automobile industry, having been identified with it as early

as 1898. He was travelling sales manager in southern territory for the Thomas B. Jeffery Company, when the single-cylinder Rambler was marketed. In 1905 he joined the forces of the Thomas Company at Buffalo and four years later became identified with the Chalmers Motor Company, having charge of the western territory. Later he was appointed sales manager for that company. In 1911 he was engaged with the Metzger Motor Car Company, remaining with that concern until it was purchased by other interests.

Mr. Hood is extremely well known to dealers throughout the country. He estimates that he has travelled about 150,000 miles in his capacity as sales manager. He is a specialist in field work.

TO CLOSE POPE PLANT.

August 20 is the Date Named for Shut-Down-Property to Be Sold.

The plant of the Pope Manufacturing Company, Hartford, Conn., will close permanently August 20, according to the information given by Receiver George Pope to Judge Holcomb in the

Superior Court. At the same time the court granted the receiver authority he asked for to sell the property of the Pope Manufacturing Company, in Connecticut, as a manufacturing unit. The court also permitted the sale of the company's personal property, at the discretion of the receiver, except the cash and bills receivable.

This action follows the decision rendered by Judge Bennett during the early part of July declining to permit the receiver to sell the Pope properties in Connecticut and Massachusetts at auction as a whole, advising the receiver to apply for an order to sell it separately.

Receiver Pope told the court that in his opinion more money could be secured if the property was sold in small lots to purchasers who desired certain parts of it. The counsel for the receiver announced that a dividend would be paid before September 20.

HOOVER HOLTON JOINS MONARCH.

Hoover Holton, formerly associated with the American Motors Company and the Empire Automobile Company of Indianapolis, Ind., has taken full charge of the sales of the Monarch Motor Car Company of Detroit, Mich., as general sales manager.

Mr. Holton has had wide experience and a host of friends in the trade. He has travelled the entire United States and Canada, and has placed automobiles in many parts of the world. It is said for Mr. Holton that he has a keen conception of the dealer's position and co-operates with the dealer and distributor to placing their business on a scientific basis that will afford maximum results.

Hoover Holton, Sales Manager, Monarch Motor Car Co.

Mr. Holton is a specialist in field work and his connection with the Monarch Company will mean greater activity for the selling organization.

RECEIVER FOR U. S. L. COMPANY.**Company Claimed to Be Solvent But Poor Management is Alleged.**

Judge Hazel, of the Federal District Court, Buffalo, N. Y., has named two receivers for the United States Light & Heating Company, who are to continue the business of the concern.

James O. Moore, of Buffalo, and James A. Roberts, of New York City, were named by the court, a joint bond of \$100,000 being fixed for the two. Mr. Ackerman is vice-president and general manager of the company, and Mr. Walker is a member of the stockholders' investigating committee.

Several petitioners in the United States Court added to their application for the appointment of a receiver, allegations of mismanagement. The petitioners allege that in the past five years, directors of the United States Light & Heating Co., a Maine corporation, with a plant in Buffalo, N. Y., issued in an illegal manner \$9,500,000 worth of stock. Five particular cases were cited by the petitioning stockholders where stock was issued in violation of law.

According to one allegation the committee, through its investigations, found that the company was suffering from lack of working capital, a condition brought about by poor financing. Consequently, the stockholders decided it would be to the best interest of the company if certain officials, who are also directors, resigned from both positions.

Since the first of the present year the affairs of the company have been handled by Frederick R. Humpage, of Buffalo, Guy M. Walker and J. A. Fletcher, both of New York, as a stockholders' committee. The petitioning creditors state they do not desire that the factories of the company be closed. They offered in evidence contracts to show that considerable business is obtainable by the company and that money sufficient to meet all obligations reported existing, can be secured within the next several months. The concern claims assets of \$3,000,000, with reported liabilities of \$900,000.

PARTIN-PALMER IN STAVER PLANT.

The Partin Manufacturing Company of Chicago, maker of the Partin-Palmer car, has secured the old Staver plant in that city, and took possession July 1. The Chicago property has

three times the capacity of the company's Detroit factory. Increase of business with the production of a low-priced car made the change necessary.

NEW EISEMANN BRANCH.

Owing to a large increase in business the Eisemann Magneto Company, Brooklyn, N. Y., has changed the location of the Indianapolis branch from 514 to 415-417 North Capitol avenue. The change affords better facilities for the the offices and the service department of the company. Prompt and efficient service is assured Indiana users of the Eisemann products. The company announces that orders received for the Eisemann magneto attachment for the Ford car can now be filled on the same day the order is received.

WILL INCREASE CAPITAL.

According to reports in financial circles the General Rubber Company, which is owned jointly by the United States Rubber Company and the Rubber Goods Manufacturing Company, will increase its stock from \$5,000,000 to \$8,000,000. The stock of course, will be subscribed by the two companies.

NEW FEDERAL FACTORIES.

An order for new factory buildings costing \$500,000 was the way in which officials of the Federal Rubber Company, Milwaukee, Wis., celebrated the third anniversary of that organization. Work is already under way for the new structures, and when completed they will add about 150,000 square feet of floor space to the works.

WITH FEDERAL TRUCK COMPANY.

Harold P. Sigwalt, formerly in the advertising department of the Geuder, Paeschke & Frey Company, Milwaukee, Wis., is now connected in a similar capacity with the Federal Motor Truck Company of Detroit.

NEW OAKLAND BRANCH MANAGER.

L. S. Shouk, formerly sales manager of the John Deere Plow Company, has been appointed branch manager of the Oakland Motor Company at Indianapolis, Ind.

NEW ACCESSORIES FOR THE MOTORIST.

BELL HOSE CLAMP.

Locks to Valve Member and Prevents Leakage When Pumping.

The Bell Pump Company, 78 First street, East Detroit, is marketing the Bell hose clamp, a connection for tire

pumps, which the maker states is very efficient. It not only has a rubber socket, but in addition a threaded internal eccentric, which operates internally upon the threaded part of the tire valve tube.

The rubber socket is engaged with the valve member in the usual manner, and a pressure of the finger actuates the eccentric lever and threaded eccentric inside the clamp, engaging the threads of the valve much in the same manner as a nut. This construction, shown in the accompanying illustration, prevents the clamp working loose. The device is quickly detached by moving the lever member and displacing it from the valve.

DUNKLEY COMPRESSOR.

Combines Power Pump, Motor Cleaner and Vacuum Cleaner.

The Dunkley Company, Kalamazoo, Mich., is manufacturing an equipment for the private as well as public garage, which combines the functions of a high grade air compressor, a vacuum cleaner and a motor cleaner, all mounted on one base.

The compressor is designed to be driven either by a belt or by an electric motor, provision being made for the installation of the last named unit. The compressor proper is of the double acting, water-cooled type and is a high pressure design. The tank has a capacity of 80 gallons and is provided with a gauge, suitable length of high grade flexible hose and connections.

Mounted on the same base is the motor cleaning attachment. It comprises a fuel tank and a two-way nozzle, which has passages for the air and gasoline, which breaks the liquid up into a very fine spray. Being projected under considerable

pressure, the atomized fuel will reach and clean places not easily accessible by the usual methods. It is stated that heavy deposits of grease and oil may be displaced readily and that the surface is left very clean.

The vacuum cleaner is obtained by utilizing the intake of the compressor, a vacuum tank and dust collector being provided. This permits of utilizing the equipment for removing dust from tufted cushions, tops and places difficult of access with ordinary cleaning members.

NO-SPILL BATTERY.

Electrolyte Is Stated to Be Non-Freezing and Non-Spilling.

The Premier Electric Company, 4031 Ravenswood avenue, Chicago, maker of the Hi-Lo horn for the Ford car, is introducing a storage battery which may be utilized for ignition, lighting, operating a horn, etc.

The electrolyte is stated to be non-freezing, as well as non-spilling, special emphasis being laid upon this feature, which makes for convenience when handling the cell and cleanliness of the battery compartment. The

efficiency of the battery is stated to be equal to conventional types.

The case containing the cells is finished with rubberoid paint and is supplied with antimony binding posts, which are held to be non-corroding. The Non-Spill storage battery comes in six-volt, 60 ampere-hour and 80 ampere-hour capacities and is moderately priced.

DIMMERS.

The number of cities enacting ordinances regulating the use of headlights on motor vehicles is increasing. While the car manufacturers are giving this much attention many thousands of machines are lighted by electricity and acetylene that are not equipped with light regulators. To equip a machine with a device for eliminating the glare of the lamps does not entail any material expense for the owner, for generally these are moderately priced; in fact, there is a large variety offered at a reasonable cost. Light controllers are a distinct advantage when meeting with and passing other vehicles and pedestrians, making for fullest safety for all users of the highways.

HANDY CONTROLLER.

Automatically Admits Air to Intake Manifold as Required.

The Handy carburetion controller is the product of the Cray Company, 652 Woodward avenue, Detroit. It is

a simple, compact device, which is fitted to the intake manifold between the carburetor and the cylinders. The function of the controller is to automatically provide extra air to the mixture, thereby reducing the suction at the spraying jet and preventing undue enriching of the mixture at all motor speeds. The stream of air striking the fuel vapor breaks it up into a fine spray and mingles it with the air, thereby obtaining a rapid burning charge.

The Handy controller is automatic in its action. After the motor has become warmed up a small control lever on the steering column or other convenient place is moved, which opens the Handy valve. A special equipment is made for the model T Ford motor.

HILL AUXILIARY SEATS.

Lock Automatically, Fold in Small Space and Are Detachable.

The Hill Manufacturing Company, 27 Fuller street, Buffalo, N. Y., specialist in seats for motor cars, is marketing the revolving auxiliary seats shown in the accompanying illustration. These designs have folding cushions and the seats are square, with slightly rounded corners. The width is 13 inches; depth, 11.5; height from bottom of seat to top of back, 17.5; back, 16 by five. The spring cushions are trimmed plain or tufted and with dark leathers.

The seats lock automatically in two positions without the use of springs or levers, fold up in a small space and are instantly detachable without the aid of tools. The riding qualities are said to be all that could be desired and the best of material is utilized throughout.

GEM SAFETY TIRE SIGNAL.

Explodes Percussion Cap When Pressure Falls Below Normal.

The Safety Tire Signal Company, 655 Twelfth street, Boulder, Col., is marketing the Gem Safety tire signal.

nal, a device which warns the operator of the car when the pressure in the tire falls 20 pounds below normal. It is approximately the same size as the conventional tube valve and it is stated that it may be installed easily. It is also water and dust proof.

When the pressure in the casing falls from 80 to 60 pounds, for example, the device fires a percussion cap in the head of the construction, and it is stated that the signal is sufficiently loud to attract the attention of the driver. It does not allow the air to escape, however, as there is no connection between the signal and the tube, except that the inner tube lies over the end of the device, keeping it locked until the pressure falls. The Gem Safety Tire Signal comes in sets of four for solid rims and with one extra member for the demountable types.

BROWN MASTER VIBRATOR.

New Design for Model T Ford Motor Held to Be Very Efficient.

The Brown Company, Syracuse, N. Y., is manufacturing a new type of master vibrator for the model T Ford motor, and one of its qualities is the purely mechanical adjustment employed. It is stated that it is so simple that a novice may adjust it without trouble and in a very short time. It is also stated that when once set it will require no attention, as the adjustment is permanent.

Another feature is the use of non-sticking contact points. This is obtained by the method of separation, a sharp blow action being utilized instead of their being drawn apart. They are constructed of a specially hardened material. The vibrator is mounted in a mahogany dash case equipped with a substantial kick switch, and can be attached to the dash between the regular coil and the source of current supply. A Puritan switch is utilized, the design being thief proof, as the lever or han-

dle may be displaced. The advantages of a master vibrator are well known. The new design is constructed of high grade material and the workmanship is first class in every respect.

MAPLE THERMO CUT-OUT.

Replaces Fuses in Lighting System and Breaks Circuit.

The R. H. Maple Company, Indianapolis, Ind., has brought out the Maple Thermo cut-out, which is a device for replacing fuses in the electric lighting system of the motor car. It employs the thermostat principle, being affected by the heat of the current passing through it, and it is adjusted to break the circuit at a temperature of 200 degrees.

The thermostat metal is in the form of a coil, as shown to the right in the illustration, and the connections are two nuts at the lower corners. The electricity passes through the thermostat metal and wire connection to the central metal fitting, thence to a similar member at the left through contact points at the upper corner.

Any excess current causes the thermostat to coil more closely, allowing the lever across the top of the cut-

out to be lowered under the influence of the spring contact points, interrupting the current. With a two-wire system two cut-outs are combined. A post projects through the cover near the middle of the lever, serving as a visual indicator when the current is interrupted by the cut-out, by assuming a position opposite the word "Off". It is stated that the device offers only a fraction of the resistance of fuses. It is placed on the dash and wired between the battery and the switch.

TIRE SIGNALS.

Despite the fact that the tire manufacturer warns the motorist that efficiency can be obtained only when the shoes are inflated and maintained at predetermined pressures, many automobilists are content with observing the instructions only when fitting a new casing. If the pressure falls the fabric is subjected to undesirable stresses.

Several devices are marketed for notifying the driver when this pressure falls, and one that sounds a signal sufficiently loud to be heard when the car is being operated. Another device explodes a cap. Both types serve a useful purpose in that the motion of the car may be checked before the tire is damaged.

TAYLOR POWER PUMP.

New Design Has Many Improvements and Is Lighter.

The Taylor Manufacturing Company, box 485, Chicago, maker of the Taylor engine driven tire pump, has

made a considerable change in the original design, which has been described in these columns. The air valves in the head are now machined out of bar stock and replace the rough casting formerly utilized.

It is pointed out that this tends to keep the pump much cooler. The body has been stripped of all unnecessary corners, ribs, etc., and now presents a very smooth, attractive appearance. The weight has also been reduced by the removal of all surplus material. A larger oil filler has been incorporated for replenishing the supply to its crankcase.

GRESSER SHOCK ABSORBER.

Coil Springs Utilized and Device Acts in Both Directions.

The Buckeye Suspension Company, Cleveland, O., is manufacturing the Gresser shock absorber, which resembles those employing the friction principle, but the shock absorbing action is obtained by two coil springs. One of these is secured to one arm of the device and the second to the other member in such manner that the absorber acts in both directions. The special feature claimed for the device is that a limited amount of spring movement is permitted without the absorber being actuated, but with large oscillations of the springs the movements are controlled.

This is explained by the fact that with seven or eight-inch leverage the outer coils of these springs will offer practically no resistance when wound at an angle of 12.5 degrees. With this leverage approximately 1.5 inches play above and below the normal position is allowed, or three inches in all.

KISKI LICENSE PLATE HOLDER.**Practical Device for Securing License Plate to the Vehicle Springs.**

The Kiski Novelty Company, Leechburg, Penn., is manufacturing a patent license plate holder which,

the company claims, holds the number plate securely and does not mar or detract from the beauty of the car.

Recently the improvements were made on the holder, and the new type is attached by a clip placed over the top of the lower leaves of the front springs, being secured by a set screw and lock nut. The license plate is retained by two small bolts and wing nuts attached to the arms of the holder. As shown in the accompanying illustration these arms are adjustable to any width license plate. It is claimed for the new device that it is at all times secure, does not rattle or obstruct the passage of air to the radiator.

THE AERO PUMP.**Several Types Marketed by Advance Machinery Company.**

The Advance Machinery Company, Toledo, O., is producing the Aero pump, in one, two and three cylinder models, which are motor driven. These are designed for regular and special equipment of new cars, and for installation in motor cars already in service. One feature of Aero pumps is the automatic blow-off valve. This can be set for any pressure desired and automatically exhausts when it is reached. In the illustration the two-cylinder pump without gear shift is shown at the left, and the three cylinder pump with eccentric gear shift is at the right. The cylinder and crankcase parts are gray iron castings, sand-blasted, double-coated with baked black enamel. The trimmings are nickel finished. The crankshaft and connecting rods are drop forged. The bore of the cylinder is 1 3/8 inches and the stroke is 1 1/4 inches.

The intake valves of Aero pumps are carefully screened to keep out foreign matter. A splash system

lubricates the cylinders and bearings of the crankshaft, and the maker claims it practically impossible for oil to work up on the cylinder head. But to insure that no oil goes into the tires, two different forms of oil separators have been provided between the outlet valve and the tire connection.

DAY TIRE VALVE.**Atlas Auto Supply Company Adds Springless Valve to Its Product.**

The Atlas Auto Supply Company, Chicago, Ill., manufacturer of Tire-Doh and Tire-Doh products, is marketing a new tire accessory known as the Day tire valve. This valve consists of three parts only, and no springs are used.

The Day valve is made of brass. It is screwed into the tube valve stem after the old valve has been removed. It is stated that the absence of springs gives longer life to the valve. Another quality is that tires can be pumped with greatly reduced effort, and fewer number of strokes, because there is no back pressure caused by spring resistance. This, of course, is due to the fact that the valve has no springs, and to the

greater size of the passage for air. In the accompanying diagram the figure at the left shows the valve open, and in the other it is in a closed position. Day valves are supplied in sets of five, this number equipping the four tires in use and a spare tube.

TIRE VALVES.

Among the accessories placed on the market are tire valves designed to economize time and labor of the motorist. A great deal of effort is necessary when pumping to overcome the pressure of the ordinary tire valve, and a part of the stroke of the manually operated pump is necessary to compress the air to the pressure that will open the valve. The new tire valves are so constructed that the pressure required to open them is comparatively small, and one of their qualities is that they open at the beginning of the pump stroke. Generally these valves can be used in or on the valve stems of the tubes. They are not expensive, are easily attached and their usefulness will appeal to motorists whose machines are not equipped with power tire pumps.

Always consult the Classified Buyer's Guide published elsewhere in this issue when in need of material, etc.

MOTOR DRIVEN AUTO HORN.**New Construction of Ball and Rotor Said to Eliminate Friction.**

The Duplex Electric Manufacturing Company, Pittsburg, Penn., is marketing the Safeguard motor driven

auto horn, which, is maintained, causes extremely light wear on the motor bearing. The Safeguard horn is a ball and rotor construction, and it is claimed that it is economical of current and that friction is entirely eliminated.

The horn is made in two models, A and B, both identical, save that the latter is three inches longer and sounds a deeper and more powerful tone. A smaller horn to be driven by three dry cells is made for use on motorcycles. The makers state the Safeguard horn was tested for nearly two years before it was placed on the market, and they have types that are efficient and durable.

NEW STEAM VULCANIZER.**Positive Supply Company Now Manufacturing Small Portable Vulcanizers.**

The Positive Supply Company, Davenport, Iowa, manufacturer of portable steam vulcanizers and kerosene garage heaters, is producing a steam tire tube vulcanizer for use in private garages and small repair shops. It is stated that this equipment is the only one made expressly for repairing tire tubes that utilizes steam for vulcanizing.

The maker states that the outfit can be carried in the tool box of an automobile. It consists of a metal body, with one compartment for water and another for fuel. The water section is between the tube and the flame, where it equalizes the heat generated. A tube is vulcanized, says the manufacturer, so that the patch becomes a part of the tube, without danger of burning or scorching. It can be mounted on any bench or post. The weight is three pounds. A surface of 12 square inches can be vulcanized with one setting.

PARTIN-PALMER ANNOUNCES NEW MODEL.

ALATE construction in light cars is a run-about, the Partin Palmer "20," made by the Partin Manufacturing Company, 29 South

tion and lighting. A Gray & Davis electric starter is furnished as extra equipment.

The Atwater Kent ignition system is driven by spiral gears. The motor drive is taken by a cone clutch and thence transmitted by shaft to the rear axle, with which is incorporated the gearset. The gearset affords three forward speeds with a motor to wheel ratio of 4 to 1 on high. The gears are made of chrome nickle steel, and the shafts are mounted on Hyatt high duty roller bearings. Adjustments are provided for the bevel gears and for the gear shifting rods. The rear axle is a built-up structure with full floating

The Partin-Palmer "20," Showing the Streamline Body and the Complete Equipment.

La Salle street, Chicago, Ill. The features of this car include a streamline body, full equipment, including the Gray & Davis electric lighting system; standard tread and 96-inch wheelbase, Atwater Kent ignition, irreversible steering gear, rear axle gearset, full floating rear axle, three-quarter elliptic rear springs, and sliding gear transmission.

An L-head, block cast, four cylinder motor with bore of 2 3/4 inches and stroke of four inches, with a single casting combining the intake and exhaust manifolds, is mounted on a three-point suspension. According to the manufacturer's claim the motor will develop 22 horsepower, and the car can be driven from 30 to 35 miles to one gallon of gasoline. The gear ratio provides a maximum speed of 50 miles an hour on a level road. The machine has a honeycomb radiator, provided with a water tank at the top, because of the thermo-syphon water circulation. The valves are on the left hand side, and their stems are fully enclosed. Lubrication is by splash in connection with a mechanical plunger pump. The crank case is a single aluminum casting. The Gray & Davis electric generator is mounted on the left side of the motor and driven by a gear in the timing gear housing. A storage battery is used in connection with this generator, which provides current for igni-

shafts. The differential is carried on Hyatt high duty bearings, and the rear wheel hubs are mounted on single annular ball bearings. The drive shafts are made of nickle steel, heat treated, and the differential can be removed through an opening in the housing without removing the axle or the wheels. Both sets of brakes are located on drums at the rear wheels, and are operated by pedals. The torque reaction is carried by a short spring supported torque arm attached to the left side of the transmission housing and separate radius rods with ball and socket joints at the ends relieve the springs of the driving thrust.

While the frame is quite wide at the rear and narrow at the front, a tapered bonnet being used, it has no abrupt offset. The sides are parallel over the semi-elliptic front springs, and begin to diverge just in back of them, becoming parallel again at the forward end of the rear

Side View of the Partin-Palmer "20" Stripped Chassis.

springs, which are three-quarter elliptics. The lower spring is underslung, and integral grease cups are provided at the shackle bolts.

Despite the relatively short wheel base, 96 inches, the driver's compartment is sufficiently large to insure comfort. The dash carries indicators included in the equipment and the cowl contains the gasoline. The full size wooden wheels are equipped with Goodrich non-skid tires of 28 by 3 inches. A spare shoe is carried in the rear, as shown in the accompanying illustration, over the luggage compartment.

WOMAN MAKES AUTO CLEANER.

She Engages in Production of a Body Polish of Her Invention.

Merely driving a car does not satisfy the ambition of women, if one judges from the fact that the sex has now turned to the possibilities of business dependent largely upon the use of automobiles. The fact that a woman was advertising manager of a large prominent automobile concern, was an interesting example, but it is a fancy from such work to the work taken up by Mrs. C. C. Janes, who is manager of the Varni-Shine Company, Columbus, O.

Mrs. Janes is manufacturing a polish of her own invention which she says will keep an automobile body in as fine a condition as when it was first turned out by the factory. Mrs. Janes operates her own plant and superintends the sales organization. She began manufacturing last November, and, with her administration, the business has so increased that a modern factory

Partin-Palmer Rear Axle, Assembled, and with the Differential Plate Removed and a Driving Shaft Withdrawn.

building is about to be erected to meet the demand of rapidly multiplying orders.

Knowing something of the automobile industry, and having had actual experience in the owning and driving of cars, Mrs. Janes realized that the owner of a motor car desires to maintain the appearance of the finish so far as possible. Because of use and frequent washings, this result is not always practical. To obviate dulling the varnish by soap and water the finish must be cleaned with oils in order to retain the elasticity of the varnish. Knowing these conditions, Mrs. Janes was convinced that motorists would appreciate and use such a material as would clean, polish and preserve at one application, thus saving time, labor, exposure and money, and engaged in business that has proven very successful.

MILLIONS EXPENDED FOR GOOD ROADS.

AN expenditure of approximately \$206,000,000 was made last year for road building and maintenance in the United States. In nine years the expenditure for road development has increased 250 per cent. The total expenditure in 1904 being \$79,000,000.

In 1913 the individual states appropriated a total of \$38,755,088 to supplement local expenditures. The bulk of the money supplied last year, as in all former years, came from counties and townships. In 1912 the money raised from this source totaled \$137,493,985. Complete figures for 1913 are not yet available, but the Department of Agriculture places the amount at \$151,000,000. To this must be added \$15,000,000 to represent the value of the labor contributed instead of cash.

There are at the present time 20,741 miles of roads improved either wholly or in part by state aid. Of 2,226,842 miles of roads in the United States, 223,774 miles, or 10 per cent. are classed as improved. To improve the remaining 90 per cent. is a mammoth undertaking, but records show that all good roads work really pays for itself. The first evidence of returns on bettered highways is the reduction in the actual cost of hauling. With a market accessible to them, farmers will work land to its maximum production, which in turn gives an increase in farm property values.

This rise in value, says the Department of Agriculture is not a fictitious one, for it does not benefit the man who wishes to sell and not to farm. The land is more valuable because it can profitably be made to produce more. The money that goes into the roads comes back with interest from the land.

CALIFORNIA GOOD ROADS WORK.

The highway Commission of California has gone to great lengths to secure good roads in that state. More than 2,700 miles of trunk-line highways are now being built with a bond issue of \$18,000,000. The thoroughfares are being constructed for an average of \$6,000 a mile.

To build highways at this figure, the commissioners induced the counties to donate all land needed for rights of way, and to build the necessary bridges. Likewise they persuaded the cities and incorporated towns along the routes to

agree to pave and maintain the sections within their corporate limits at their own expense. A reduction of nearly 50 per cent. in freight rates on materials was secured by the commission, as the companies were assured that great quantities would be transported.

To insure the safety of travellers, grade crossings are eliminated as much as possible and long, sweeping curves are substituted for abrupt turns and the roadways widened. Nearly all grades are within six per cent. maximum.

GOOD ROADS FOR INDIANA.

Governor Ralston of Indiana has appointed a commission and a board of advisors to study the good roads problem of that state with a view to getting quick action in the near future. After a thorough investigation, the commission will make recommendation of a draft of a law to the Legislature next January. At the present time the roads of this state are not uniformly built or maintained.

CONDITION OF VERMONT ROADS.

Roads are seldom closed in Vermont. In that state the town is the unit, and the highway construction carried on does not interfere with travel to any material extent. The state highway commissioner reports that rarely is a road closed, especially during the summer months.

SIGNS TO WARN MOTORISTS.

As a result of the many accidents on the Long Island Railroad grade crossings, the Automobile Club of America has offered to place warning signs 100 yards on either side of the tracks. While this would be helpful during the daytime, yet it would be useless at night when the danger is greatest.

NEW RAQUETTE LAKE ROAD.

A new highway is being constructed at Raquette Lake, N. Y., to connect with the famous Uncas road leading to Eagle Bay. Raquette Lake has heretofore been inaccessible to automobiles. It is now planned to extend the road along the western shore of the lake to the Forked

Lake Carry, where connection can be made with Long Lake and Newcomb, and the network of state roads in the eastern section of the Adirondacks.

PORTLAND-BRUNSWICK DETOUR.

One of the most noteworthy works of road building now progressing in New England is the building of a 20 mile stretch of bituminous-macadam way between Portland and Brunswick, Me. Construction is now in progress for almost the entire distance, and there is a hope that the work will be extended to Bath next year.

For the benefit of the motorists contemplating a trip between these two points, the Maine Automobile Association has mapped out a detour covering 38 1-2 miles. This starting from Portland, is by way of Woodfords, West Falmouth, Yarmouth, South Freeport and Freeport into Brunswick.

Rhode Island Roads.

All state highways in Rhode Island will be open for travel through the whole of the season, according to the State Board of Public Roads.

Book for Maine Motorists.

The Maine Automobile Association has issued a road book containing a road map of the entire state, and a sportsman's map for fishermen and hunters who may make use of automobiles during their expeditions.

Highways in Brooklyn, N. Y.

Superintendent of Highways Leavitt of Borough of Queens, New York, says immediate work will be begun on resurfacing Merrick road to the city line with bituminous asphalt. All roads in Queens are reported in perfect condition.

Maine Roads Fine for Tourists.

The Maine Automobile Association reports that while there are hundreds of miles of new roads being built throughout the state, there is no interference to automobile traffic. Splendid detours are being furnished by the association.

Women to Urge Good Roads.

Mrs. Robert Baker, chairman of the recently created Woman's Auxiliary department of the American Highway Association, announces she has completed preliminary plans for organizing the women of the United States for the improvement of the roads of the nation.

Canada's 3000 Mile Highway.

United States Consul-General Mansfield at Vancouver, B. C., reports that the 3000 mile ocean-to-ocean motor highway across Canada is

virtually completed. "Automobiles are running almost the entire length," says the consul, "and only a few more links of the chain are needed to complete it."

Big State Road Fund.

By a decision handed down by the County Court of Dauphin, Penn., \$1,028,665 is made available for good roads work. The Auditor-General and State Treasurer brought action to obtain a judicial interpretation of the law passed in 1913 which required the turning over to the Highway Department of all moneys accruing to the state from the licensing of automobiles and drivers.

New York Road Repairs.

The highway commission of New York state reports that there are now approximately 600 contracts for construction or repair now effective in all sections of the state, the work varying from one-quarter to 12 miles in length. The main routes between New York and Rouse's Point, and between the Massachusetts line and Buffalo, are practically completed and no difficulty traversing them will be experienced by the motorist. Suitable detours are provided where road repairs are making.

New Jersey Speed Traps.

A warning has been sent out by the Automobile Club of Maryland regarding the existence of new speed traps in New Jersey. Two state automobile inspectors, disguised in linen dusters, ride in an automobile and come up behind the motorist driving within the 25-mile limit. They will then attempt to induce him to increase his speed by faking an effort to race. Should the unsuspecting driver accept the invitation, he is placed under arrest immediately after he exceeds the speed limit.

Road Detours in Connecticut.

According to advices received by the American Automobile Association from the State Highway Commissioner of Connecticut, motorists must make many detours in traversing that state. The road from New York to Westerly running along Long Island shore is blocked at the following points: Town of Orange, short detour; East Haven, one-half mile detour; Groton, on Fort Hill, detour to the right through Noank; Stonington, east of town, requires detour to the north. These places will be cleared very shortly with the exception of Orange. There may be further construction, however, in Stonington and Groton to complete the entire road through this section of the state.

NEW PREST-O-LITE VALVE.

The Prest-O-Lite Company, Inc., Indianapolis, Ind., is now producing an automatic reducing valve for use with its motorcycle Prest-O-Lite gas tank. The construction is similar to that of the larger tanks in that there is automatic control of the gas pressure, which is maintained at two ounces even when nearly empty. The flame may be increased or diminished as desired.

The maker states that the control makes for convenience, especially when the gas is ignited by an electric spark, as the rider can light the headlamp without dismounting. The company is marketing an insulating attachment for burners so that the rider may utilize the current from the magneto or a spark plug for igniting the gas. A friction lighter, shown in the accompanying illustration, which may also be fitted to a lamp,

Prest-O-Lite Automatic Reducing Valve for Motorcycle Gas Tanks, Main- taining Correct Pressure, and Friction Lighter.

is being marketed. By pulling a pendant a spark is created at the lamp burner outlet.

ROAD WIDENING ILLEGAL.

City Solicitor Baker, of Providence, R. I., has ruled that the two resolutions passed by the City Council, for the widening of Thayer street, from Waterman to Angell streets, are illegal. This is due to the fact that the City Council added on each resolution that improvement was to be made "if deemed advisable" by the board of aldermen.

WIZARD AUTOMOBILE WASHER.

A device which insures effective cleaning of the surface of the automobile and saves time in the work without requiring hardly any attention from the operator, is in the Wizard washer, made by the Century Foundry Company, Inc., 1624 North Salina street, Syracuse, N. Y. Wizard

washers are simple, but are ruggedly constructed and consist of a nozzle which contains a turbine motor, one conical and one straight-sided brush and a 12-inch extension for reaching beneath the car. The rotating brush which is driven by and flooded with water, serves to thoroughly cleanse the car, without marring the finish. Each outfit is guaranteed to give absolute satisfaction.

WANT ROADS FOR CONNECTICUT.

The Connecticut Good Roads Association has begun an active and energetic campaign to secure the construction of permanent roads. An urgent appeal is made to business men and taxpayers to assist the work, as the association maintains that the state highway appropriation is likely to be reduced unless concerted action is taken.

According to a letter sent out by the association, the trunkline system of Connecticut consists of 1,420 miles of highway. By October 1, 1915, a total of 900 miles will be improved, leaving 520 uncompleted. However, only a small part of the 900 miles of improved road is of the hard surface construction. The association states that the annual expense of maintenance for this water-bound macadam type is from \$1,000 to \$1,200 a mile.

"If another 500 miles of water-bound macadam is built," says the letter in part, "the repair expense alone will be tremendous. Under present day traffic water-bound macadam is the most expensive road that can be built, if original cost and maintenance are both considered."

The state highway commissioner has asked for an annual appropriation of \$500,000 for renewals and reconstruction of trunklines, and \$500,000 for trunkline repairs.

ENFORCING OLD ORDINANCE.

The authority for the police to seize any vehicle left unattended on the streets is given by an ordinance contained in the charter of New York City for 17 years, and this ordinance is now being enforced. This law classes such vehicles as encumbrances. However, the city officials state that the action is directed towards the garages, whose owners, they maintain washed, stored and repaired cars in the streets.

SUGGESTIONS FOR THE NEW CAR OWNER.

Describing the Components of the Valve Mechanism With Special Reference to the Model T Ford Motor—How the Valves Are Timed.

(By C. P. Shattuck)

The fourth article of the serial dealing with the construction, operation, care and repair of the model T Ford automobile, explains how the valves are operated and timed. The position of the pistons during each of the strokes is shown by a diagram and the operation of the cams made clear by illustrations.

IN THE previous article it was stated that the function of the intake valves was to admit the explosive mixture; that of the exhaust mem-

Fig. 6—Showing Piston Components and Members of the Valve Assembly.

bers to permit the burnt products of combustion to escape. As these members must open and close at a predetermined time, and remain closed during certain strokes, it is obvious that the mechanism actuating them must be accurate in its performance.

The term "mechanically operated valves" is derived from the components of the valve mechanism, which is depicted at Fig. 6, and which was shown assembled in Fig. 2. It includes the valve proper, valve spring, valve spring seat, pin, pushrod or tappet, cams and camshaft. The last named member is actuated by the crankshaft through gearing.

L Head Type Motor.

The Ford motor is of the L head type, having both the intake and exhaust valves on the same side. As there are four cylinders there are eight valves, four intake and a like number of exhaust members. Fig. 5 showed their arrangement in the cylinder heads.

The valves are made in two pieces, the head and the stem, then joined to make a solid con-

struction. The head is provided with a bevel seat, which fits a similar bevel in the cylinder head, and extreme care is exercised in cutting these seats and in grinding them with an abrasive to make the fit gas tight. This is known as grinding in the valves, which work is performed when the seats leak or become carbonized.

The valve stem moves freely through a bushing in the cylinder head, as shown at Fig. 8. As it is important that the valve heads seat firmly when the valve is closed, a coil spring is employed, called the valve spring. The upper end of the spring rests against the cylinder head and the valve stem passes through the open space in the spring. By compressing this spring and securing its lower end to the lower part of the valve stem, the tendency is for the spring to pull the valve downward, keeping it on its seat. The tension of the spring, however, is not so great that it cannot be more compressed, and this occurs when the valve stem is lifted by the pushrod. The spring rests in a seat and a pin is employed to retain it.

Function of Pushrod.

The pushrod, so-named because it pushes against the stem of the valve, causing the latter to lift from its seat, is a movable member, occupying a vertical position in the upper half of the crankcase. Normally, when the valve is seated

Fig. 7—How Cams Actuate the Valves: A, Valve Seated; B, Cam Beginning Lift; C, Valve Fully Open; D, Valve and Cam Inactive.

there is a slight space between the pushrod and the end of the valve stem, which is known as the clearance. When this space is greater than originally intended, the valves start to lift late, affecting the efficiency of the motor, as will be explained in logical sequence.

The lifting of the valves from their seats, and holding them open until the desired strokes have been completed, is obtained by the use of cams. There are eight of these members, one for each valve, and they are so arranged on the camshaft that they actuate the valves as required in the operation of the motor.

A working diagram of the cams and valves is shown at Fig. 7, the size of the cams being exaggerated to make clear their operation. When the intake valve, for example, is closed or in a normal position, the cam is as shown at A. Upon the camshaft revolving its extension or lip comes

be remembered that to obtain a power stroke the crankshaft makes two complete revolutions, or it completes one rotation to obtain two strokes. If the camshaft were driven at motor speed, the valve would remain open for half a revolution every turn of the crankshaft, whereas it is only required to open once every two revolutions. If it be borne in mind that both the intake and exhaust members open but once in four strokes and remain closed during the balance, the operation of the cams will be easily understood.

Timing of Valves.

The usual method of timing the valves of a motor is by utilizing the flywheel, the periphery of which is laid off into degrees. With the Ford motor the piston travel is employed, as the flywheel is enclosed and includes the device for generating electricity for ignition.

The timing plan is shown at Fig. 8 and should

Fig. 8—Timing Diagram of Ford Motor, Showing Position of Pistons and Valves During the Four Strokes—The Illustration at E Depicts the Proportions of the Gears Actuating the Camshaft.

in contact with and raises the pushrod, as shown at B. Upon the cam attaining the position indicated at C, the valve has attained its maximum lift or is fully open. The position A to C inclusive represents approximately a stroke of the piston, which in this instance is the intake stroke. Upon the piston starting its upward or compression stroke, the cam revolves to the position shown at D when the valve is seated. The exhaust valves are operated in the same manner.

Camshaft Necessary.

The camshaft is parallel to the crankshaft and the former is actuated by gearing. The camshaft carries a gear twice as large as that fitted to the crankshaft, and having twice as many teeth is called the 2:1 or timing gear. The proportions are depicted at E, Fig. 8.

The reason for the camshaft making one revolution to two of the crankshaft will be understood when the strokes are considered. It will

be understood with a little study. The intake valve opens when the piston is $\frac{1}{8}$ inch past top dead centre, or, in other words, has started on the down or suction stroke. It closes $\frac{1}{4}$ inch past dead centre. Thus it will be seen that the piston completes its full stroke and travels an $\frac{1}{8}$ inch on the upstroke before the intake valve closes.

The timing of the exhaust valve differs from that of the intake. It opens $\frac{1}{4}$ inch before the piston completes the firing stroke, or $\frac{1}{4}$ inch before lower dead centre, and closes on top dead centre.

In assembling the motor at the factory the crankshaft and camshaft gears are meshed in a certain defined position as indicated at E. Any variance of this arrangement will cause the valves to open earlier or later, according to change in the mesh, and it is folly for the novice to attempt to improve the factory timing.

TY COBB BUYS WHITE SIX.

Ty Cobb, the crack outfielder of the Detroit American League baseball team, has purchased a 60 horse-power White "Six," made by the White Company, of Cleveland, O. While this noted player has won several automobiles offered as prizes for playing superiority, yet he decided to buy a White car, as it is, in his opinion, the one that fully measures up to his ideal.

One of the Georgian's hobbies is automobiling, and all his spare moments off the diamond are devoted to this pleasure. Cobb is generally conceded to be one of the most careful students of the game that ever wore a glove. He goes into every detail of play with utmost care and many of his marvelous plays, most of them spectacular, are carefully planned long before they are executed. Having evolved a plan, Cobb patiently awaits opportunity to make the play, with results which invariably surprise the spectator. The White Company maintains that Cobb has used his characteristic careful study in making his recent purchase.

While this order was given by Cobb before he left his Georgia home in the spring to join his club in New Orleans, La., yet the White Company but recently received orders to ship the car to him at Detroit, where he will keep it during the playing season. Like all players who own motor cars, Cobb gets plenty of opportunity to enjoy his machine while his team is playing at home. After the close of the season, Cobb will send his car to his Georgia home.

GERMANY'S 93,072 AUTOMOBILES.

The German Empire has less automobiles than New York, Illinois, California or Ohio, these states having more than 100,000 cars each, while the latest official statistics from Germany show a total registration of 93,072 cars at the beginning of this year. However, it is more than probable that by this time the number of cars in Germany has reached the 100,000. It should be remembered that the total given above for Germany includes passenger cars and cycles as well as commercial cars and cycles. Passenger cars on January 1 numbered 60,876, of which 15,188 were of

eight horsepower or less, 17,735 between eight and 16, horsepower, 25,734 between 16 and 40 horsepower, and 2219 of more than 40 horsepower. Of 9639 motor trucks in service at the beginning of the year, 2019 were of eight horsepower or less, 2259 between eight and 16 horsepower, 4549 between 16 and 40 horsepower and 812 of more than 40 horsepower. In both classes of automobiles, an increase of high-powered vehicles is revealed by a comparison with the statistics of former years. There were 22,457 motor cycles and 100 freight cycles in use the first of 1914.

THE ROAD DRAG APPROVED.

Department of Agriculture experts, who are cooperating with state and county officials in

Ty Cobb, Star Outfielder of the Detroit American League Club, at the Wheel of His New White Six-Cylinder Car.

work for better roads, declare the road drag is the simplest and least expensive means yet devised for maintaining earth roads. That there is plenty of work ahead for the road drag is shown by the fact that of the 2,000,000 miles of public roads in the United States, only about 200,000 have been improved.

AUTO MAKERS TO TOUR EUROPE.

About 150 members of the Society of Automobile Engineers are expected to make the next European tour, beginning October 9. The party will be the special guest during its travels through France, of the Automobile Club of Great Britain. The itinerary will include Paris, Turin, Milan, Lucerne, Neuhausen, Stuttgart, Mayence, Cologne, Essen, Brussels and Antwerp, where the party will embark for London, November 5. After a nine-day stay in London, the tourists will return to New York.

FOREIGN MECHANICAL DEVELOPMENTS.

The Cary Compound Semi-Elliptic and the Houdaille Adjustable Springs to Absorb Road Shocks--The Lamplough Balanced Worm Drive.

IT is well known that the chief shortcoming of present-day spring construction is its lack of adaptability to variations of load and running condition; that is to say, while there exist devices which overcome the difficulty of this problem, they are hardly used by the countless army of motorists, partly because these accessories are relatively little known generally to the motoring world, and partly because of a general lack of interest, which is, moreover, coupled with scepticism. Nevertheless, as has been stated,

Fig. 1—Houdaille (Upper) and Cary (Lower) Spring Suspensions.

a number of such devices exist and are in practical use in Europe. They are founded upon either of two principles: the use of auxiliary springs which become operative as soon as a certain load is placed upon the chassis, and the provision for adjusting the spring itself to the varied requirements determined by the load carried.

One of the simplest compound springs, which includes an auxiliary device, is Cary's semi-elliptic design, Fig. 2. The model here illustrated uses two sets of spring leaves arranged on a common centre bolt and held together on each side by a bracket. By suitably curving the various sets of leaves, they may be brought into action gradually, the action of the spring being therefore, within limits, proportionate to the weight resting upon it.

Fig. 2 shows the scheme utilized on the London General Omnibus Company's 'buses in London. If the load is increased, additional stiffness of the spring is obtained through the use of a volute spring, the outer end of which is secured to a projection of the chassis frame, while the inner end, as soon as the chassis is weighed down to a definite point above the axle, bears upon the

bolt-head plates of the springs with a force increasing approximately in the same ratio as the load. This coil spring has very little internal friction and consequently there is less tendency under full load to dampen oscillations than in the Cary construction.

With both these compound springs, the stiffness increases with the deflection of the spring, caused either by increased load or road inequalities. The latter case is dangerous to the spring, as the rebound is apt to break a leaf, or several of them. Nor does the compound spring give one the benefit of the full range of deflection; under light load it works mainly over the upper portions of the range and under heavy loads over the lower portions. Hence, a vehicle with compound springs will be more comfortable at half load than one ordinarily sprung at full load, because the latter springs are designed for this condition.

An example of adjustable spring design is the patented device of the Societe Houdaille & Sabot, makers of a hydraulic suspension, which device formed part of the equipment of the winner of the recent British Tourist Trophy Race. In this device, the right and left hand screws actuate blocks sliding on the frame to which rollers are attached, which bear on the ends of the master leaf. Two screws, one on each side of the car, are coupled together by a chain which runs over

Fig. 2—Upper View, Cary's Semi-Elliptic Design; Lower, Omnibus Spring.

sprockets; so that if one screw is turned the other is adjusted equally. This spring is the weaker, the more its length is increased, greatest

stiffness being obtained by shortening of the master leaf.

The Cary pneumatic suspension, Fig. 1, supports the car weight by pistons working in cylinders which contain compressed air. The piston is connected to the axle as shown and its up-stroke compresses the air further; the capacity of the piston chamber determines the stiffness of this system. The piston controls a valve admitting compressed air from a tank to compensate for losses of pressure. Any increase of weight causes an automatic admission of additional air to the cylinder, thereby increasing the stiffness of the spring, and vice versa, there being an escape valve for lessening of load.

FOUR-WHEEL DRIVE TESTS.

Latil and Renault Winners in the Trials Held by French Minister of War.

The results of the military four-wheel drive tractor competition held by the French Minister of War last March have just been announced. The trials were the first of the kind, and took place over country and military roads in the east of France. The machines were subjected to very severe tests, which were followed by a technical examination at the artillery headquarters near Vicennes. Merit points were awarded for regularity of operation, hill climbing, economy of fuel and oil, and condition of machines at finish. The Latil No. 9 led the class for light tractors with a total of 810.7 points, with the Panhards second and third with 773.6 and 743.6 points, respectively. Both of the last named machines were equipped with Knight motors. The Renault machines Nos. 11 and 12 led in the class for heavy tractors with 949.3 and 943.8 points, respectively. Two Latils finished third and fourth.

AUSTRIAN ALPINE TOUR.

Out of 75 cars which started from Vienna on the Austrian 1824 mile Alpine Tour, 60 cars finished after eight days of running and two of resting, thus averaging 228 miles of extremely mountainous territory a day. Among the finishing cars, 16 had clean scores, 32 had penalties and 12 were non-contestants. Of five American cars which started, three Cadillacs finished. The list of clean scores includes five Audi cars, three Austro-Daimlers, three Fiats, two Minerva-Knights, one Benz, one Rolls-Royce and one Opel.

LAMPLOUGH WORM DRIVE.

By using a balanced worm drive, F. Lamplough, an English engineer, claims to have overcome that lack of resistance in the differential which causes it to operate not only when the car is turning, but also when one wheel skids on or bounces off the road, so that the other tire is made to creep. At the same time, the above-mentioned device, which was described in The Autocar reduces the friction in the differential gearset, so that an increase in its efficiency results, as the ordinary worm drive always is accompanied by a backward thrust equal to the forward, which causes a considerable amount of power to be lost in the form of friction.

The construction of this new device is here illustrated. The propellor shaft A carries the left-hand worm B, the differential C and the

Sectional Views of Lamplough Worm Drive.

right-hand worm D. B meshes with the worm-wheel E beneath it and D with the wheel F above it. At the right end of the spindle, which carries F, the driving pinion G is in place, which meshes with the driven pinion secured to the inner end of the right axle shaft; the left axle shaft is similarly actuated. Thus, clockwise rotation of the propeller causes the pinion E to rotate rearward, turning the axle forward. In the same manner, F is rotated rearward and its axle section forward.

The National Automobile Chamber of Commerce will hold a convention of commercial vehicles interests next October. The meeting will be for the purpose of further advancing the work already undertaken by the chamber's commercial vehicle department and for promoting the industry as a whole.

Entered as second class matter, April 16th, 1904, at the Postoffice at Pawtucket, R. I., under the Act of Congress of March 3rd, 1879.

GOVERNOR WALSH'S SIDESTEP.

After making an unsolicited pledge to the motor vehicle owners of Massachusetts that he would not approve legislative acts inimical to their interests, Governor Walsh was visited by a committee representing the motor truck owners of that state and asked to veto a bill increasing the registration tax from a flat rate of \$5 to a sliding scale with a minimum of \$5 for one ton and \$3 additional for each additional ton or fraction. He received the remonstrants, assured them of his fullest consideration and signed the bill the same day. While this directly affects the truck owners, the army of about 100,000 motorists of the Bay state keenly resent what they condemn as unwarranted breach of a promise fairly made and which they were justified in expecting would be kept. They do not hesitate to say that Governor Walsh's act has seriously affected his political future.

MOTORIZING MAIL SERVICE.

The House Committee on Post Offices has amended the Moon omnibus post office bill, which will establish the salary of rural mail carriers who use automobiles at \$1800 a year. The

present maximum is \$1200 a year. Carriers for the rural delivery routes must maintain their own equipment, and the increase of pay will justify the purchase and operation of a serviceable motor car. The Postmaster-General has recommended that the length of the routes be increased from the present average of 24 miles to 50, which will necessitate the use of automobiles. The general public will be materially benefitted, inasmuch as what may be regarded as a city service will be extended through rural communities not now served.

SUNDAY AND SAFETY FIRST.

The daily press is commenting freely editorially upon the Sunday motor car accidents, and suggestion is made that the limit of speed be reduced as a remedy. A strict observance of the recommendations prescribed and circulated by the National Council for Industrial Safety would be more effective. The rules are simple. Drive slowly when passing children and vehicles, when approaching crossings and turning corners. Stop at railroad crossings and behind standing street cars, and use chains on slippery thoroughfares. When in doubt, drive slowly or stop. Eternal vigilance is the price of safety, and with it must be combined cautious and considerate operation of the motor vehicle.

RHODE ISLAND ROADS.

Tourists using the shore road between Westerly and Narragansett Pier, Rhode Island, a much travelled thoroughfare at this time of the year, state it is in a very bad condition. That highway between Charlestown and Westerly, a distance of approximately 13 miles, is so rough and full of holes that many motorists make a detour over the old road to Kenyon and Carolina, thence to Westerly over the state system. Some of the more recently constructed tar roads are not in as good condition as those built a year or more previously. It is to be regretted that after expending thousands of dollars to build new roads that these should be allowed to deteriorate.

Machinery has destroyed the old social life of the rural districts, and the husking bee and barn raising are no more, states a daily paper. True, but the gasoline motor has lightened the labors of the farmer, to say nothing of bringing him in touch with the city market. To the farmer the automobile is a great economy.

NEW BODY FEATURE OF 1915 METZ "22."

CONTINUING the construction of the car which has been proven so thoroughly in the past, the 1915 Metz "22," built by the Metz

Front View of New Metz Fore Door Body.

Company, Waltham, Mass., differs from former designs chiefly in the body. The body is a stream-line type, with a sloping bonnet and cowl dash, the gasoline tank being carried under the cowl. The windshield is attached at the rear of the cowl. Both windshield sections swing for rain vision. The driver's compartment is roomy and comfortable, the upholstery is deep tufted, and, to give protection against rain, the top is designed to fit closely over the windshield. The top is fitted with a slip cover and curtain. Included in the equipment are Prest-O-Lite headlights, a tank and side and tail lamps.

The body design of the 1915 Metz is semi-enclosed, and is a modification of the fore-door type. It is claimed for this arrangement that ample protection is afforded passengers and at the same time the trouble of opening and closing the doors is eliminated. The rear seat is covered by a compartment, which may be reversed and replaced by a torpedo tool chest, luggage or one or two rumble seats. The top is constructed with the idea of utilizing it, when not raised, as a dust shield. As to mechanical detail, the Metz motor is a water-cooled, four-cylinder, L-head, block-cast type, rated at 22.5 horse-power, the the cylinders having $3\frac{3}{4}$

inch bore and four inch stroke. The upper section of the crankcase is cast with the cylinder block, and the cylinder heads are detachable. An automatic float-feed carburetor, high-tension magneto ignition and mechanical-feed constant-level lubricating system are included in the power-plant. The friction type of power transmission, which affords any number of speeds and always the power required by road and grade, drives the jackshaft, whence the power is transmitted by side chains to the rear axle.

Hill Climbing Abilities.

It is the claim of the Metz Company that Metz cars can climb Prospect Hill, Waltham, Mass., on high. This grade varies from 5 to 21 per cent. But the company more than proved its claims for hill-climbing when its car won the Richfield Springs, N. Y., hill-climbing contest on July 4, one, two, three. To do this all the little Metz machines defeated a field of 12 cars, including several high-powered and much more costly cars.

All the parts of the 1915 Metz can be removed with ease. The motor is so designed that almost any work necessary can be done without removing it from the chassis. The head is removable, which permits free access to the pistons, cylinders and valves. To detach the valve enclosure, necessitating the removal of but three bolts, is the work of but a few moments. The dust or sod pan under the motor and transmission are not solidly rivited to the frame, as is the usual custom, but is held in position by spiral springs so it is easily removable. Likewise, the chains may be easily inspected.

The 1915 Metz New Fore Door Body, with Built-in Windshield and Fuel Tank in the Cowl.

APEX AND ZENITH TIRE PUMPS.

The Buffalo Auto Accessory Manufacturing Company, 269 Ellicott street, Buffalo, N. Y.,

Apex and Zenith Tire Pumps.

manufacture the Apex tire pump which is of the three-cylinder type and 22 inches long. The cylinders are made of brass tubing, with Bessemer steel plunger rods and "B" leather washers; the base is of heavy grey iron and gold finished. According to the maker's statement this

pump can inflate an average time in 30 seconds, being so constructed that it operates with extraordinary ease. The Zenith is a two-cylinder pump made of the same high grade material as the Apex, and is as efficient in operation.

SAUNDERS FUEL SAVER.

The Powers Sales Company, 122 South Michigan boulevard, Chicago, is marketing the Saunders gasoline saver, made by the Leslie R. Saunders Company. The instrument is fitted to the intake manifold of the motor between the carburetor and the cylinders, and sprays air at high velocity into the carburetted fuel, insuring a homogeneous mixture. It is easily installed.

As may be noted from the accompanying illustration, the air enters the valve through four large holes, the volume being regulated by a taper plunger that is air tight when seated. The total movement of this plunger is but 9-16 inch,

Saunders Fuel Saver: At Left, the Control Lever Locked; at Right, Sectional View Showing the Air Apertures and Valve.

and to obtain the maximum opening the control level, also shown in the illustration, must be moved nearly two inches. The operation of the

car may be prevented by moving this lever to the lowest position and securing it with a miniature padlock.

The maker states that the Saunders fuel saver will require no attention after installation, that it can be utilized as an air brake when descending hills and that it will greatly increase the efficiency of the motor. A desirable quality is that the control is convenient to the driver. The valve is actuated by a bronze wire enclosed in a flexible seamless tube. The fuel saver is made in a brass and nickel finish, and can be fitted to any car. It is stated that the fuel economy of the Saunders device will save its cost in a month.

PRIZES FOR AUTO PAGEANT.

The best decorated cars entered in the motor carnival to be held in New York City the last week in September in connection with the Commercial Tercentenary Celebration, will receive \$5,000 in prizes. In addition to this, a number of automobile accessory makers and others will donate prizes. These awards will be trophies or cups for private owners and cash for professional chauffeurs.

There will be a special section for out-of-town automobile clubs, a number of which will strive to win some of the prizes offered. No entry or registration fee will be charged and the commission will furnish artists to design floats and decorative schemes free of charge, if entrants so desire.

AUTOMOBILE SERVICE BUREAU.

The Manufacturers' & Dealers' Motor Underwriters has changed its plan to serve as general agents for the Fidelity Underwriters and the United States Casualty Company in the writing of automobile insurance. The present organization will be translated into an extensive automobile service bureau for the purpose of affording an inspection and adjustment service to all insurance companies writing motor car insurance.

PITTSBURG GARAGE ORDINANCE.

The city council of Pittsburg, Penn., has adopted an ordinance providing that public garages must be of fireproof type. The ordinance also prohibits automobiles being placed in any building occupied as a hospital, theatre, church, school or as a boarding, lodging or tenement house.

CORRESPONDENCE WITH THE READER.

Magneto Timing—Reader, St. Louis, Mo.

As a new subscriber of your magazine I should like you to explain the timing of a magneto by the piston travel. If you could publish a drawing it would be of great assistance to me.

By the term piston travel as applied to the timing or setting of a magneto is meant the location of the piston when the magneto is connected to the driving member. This is determined by the designer of the motor and the directions should be complied with in replacing the magneto.

As the spark is supposed to occur after the mixture has been compressed by the piston, the location of the latter when timing by it is important. By referring to Fig. 1 A it will be noted that the piston is within $\frac{1}{2}$ inch of completing the compression stroke. In this instance it is assumed that the factory timing plan calls for this amount of advance; that is $\frac{1}{2}$ inch before top dead centre.

Consequently the motor is cranked by hand until the piston of the first cylinder begins its upward movement, stopping when it is within $\frac{1}{2}$ inch of the top of dead centre. If a petcock cannot be used to pass a wire through to locate the position of the piston, the crank throws may be utilized to ascertain the dead centre location as indicated at B. Generally a wire can be introduced through the valve port into the combustion chamber or petcock, and with the wire in contact with the top of the piston, the flywheel is turned backward until the wire has descended $\frac{1}{2}$ inch.

Having made sure of the proper location of the piston, the driving member is connected to the shaft of the magneto. It is important that the armature be revolved until the figure 1 appears in the indicating window as shown at A, this denoting that the distributor brush is in contact with the segment to which is connected the cable leading to the first cylinder. If the magneto is not provided with an indicating window it will be necessary to displace the distributor cover and rotate the armature until the contact points just begin to break with the distributor brush in a position to make contact with either the extreme left or right upper segment of the

distributor. Generally the magneto is coupled to the driving member so that the contact points just begin to separate. It is important that the proper gap of the contact points be observed.

The diagram shown at C illustrates the timing of the commutator and shows the position of the piston with the spark lever fully advanced and retarded, both in inches and degrees of the crank circle.

Master Vibrators—Skeptical, Washington, D. C.

Will the editor of the correspondence department kindly give me his personal opinion as to the practicability of a master vibrator with a multiple-cylinder motor? I hear differing opinions expressed, some of which come from experienced men who do not favor a master vibrator.

Fig. 1—Timing the Magneto by Piston Travel: A, Showing Piston $\frac{1}{2}$ -Inch Before Top Dead Centre and Position of Distributor of Magneto; B, Dead Centre or Completion of Compression Stroke; C, Illustrating Location of Piston with Spark Lever Fully Retarded and Advanced with Battery Ignition.

The writer is in favor of a master vibrator where multiple-unit vibrating coils are employed for ignition, for the reason that after a coil has seen some service the tension of the vibrators so change that it is extremely difficult to adjust them so that they will operate uniformly. The platinum points may differ as to the resistance set up to the passage of the current, and one or two plugs may give a hotter spark than the others, thereby providing a more rapid ignition of the mixture.

The advantage of the master vibrator is that being a single unit, the interruption of the primary current takes place in the same space of time for each cylinder; that is, there is no lag. For example: If 60 sparks are required a minute, the

vibrator will break the circuit every second. This is termed synchronization, and insures that the spark will take place with the piston in the same position for each cylinder.

The writer has fitted several master vibrators to cars and noted the results. He found that not only did the engine run more evenly, but there was less current drawn from the battery, and starting was much easier than formerly. There was a slight increase in power.

Electric Starter—Reader, New York City.

Why is it an electric starter won't start? A friend of mine owns a ——— car and in starting on a long trip the other day the starter made a few gasps and laid down, which led to the use of the hand crank. On the return trip the starter worked all right. Being curious I would like an explanation.

The conditions referred to would indicate that

Fig. 2—Showing Overhead Worm Drive Used in Pierce-Arrow Trucks.

the battery was exhausted and that after continuous running of the engine the dynamo or generator charged it sufficiently to enable it to energize the electric motor starter.

The generator is utilized to maintain the battery in a properly charged condition, but if a large number of starts are made in a day, and the engine is not operated sufficiently, or at a speed necessary to cut in the dynamo, the supply of current will be diminished until practically exhausted. Storage batteries utilized with starting and lighting systems require attention and should be examined periodically and a reading taken of the electrolyte. If the instructions of the maker of the system were followed the trouble above referred to would be eliminated.

Worm Drive—A. L. B., Boston.

If you have a picture showing the construction of the worm drive such as used on the Pierce-Arrow trucks I wish you would please publish one of the same, as I am interested in this type of drive.

The illustration at Fig. 2 is a phantom view of the Pierce-Arrow worm drive which is of the overhead type. The faint, light lines indicate the differential housing.

Carburetion—Reader, Waterbury, Conn.

Am experiencing trouble with my motor. When running along on the high and about 12 miles an hour the motor misses, bucks and skips when I open the throttle. In a little while it will run all right, hitting four cylinders. It has been getting worse of late. What is the trouble? The valves, ignition and timer are in good shape.

The symptoms mentioned indicate mixture trouble. Generally an over-rich mixture will cause the motor to miss. From the description it would appear that the auxiliary air valve of the carburetor is sticking, as the engine runs smoothly after the throttle has been open for a little while.

Displace the air valve and spring and note if it slides freely on its guide. Sometimes the stem of the valve wears unevenly, causing the guide to catch. This may be tested by starting up the motor and noting if the air valve moves when the throttle is opened. The valve should move easily and freely on the guide and the tension of the spring should be light.

Right of Way—Constant Reader, Boston.

As a reader of your publication I wish to ascertain if the traffic rules of Providence, R. I., contain any provision for protecting the driver of a motor vehicle traversing a main thoroughfare. In a visit to the capitol of "Little Rhody" I narrowly escaped being run into by cars crossing a main thoroughfare upon which I was driving. And in every instance the drivers of these machines failed to sound their signal. I would state, however, that there were no traffic officers on this street which is, I am informed, a main thoroughfare.

During the traffic hours the officers regulate the conditions referred to. On other streets, however, there are no rules other than the general city ordinances which do not specify which machine or vehicle has the right of way; that is, no main thoroughfares are designated.

WAVERLEY'S 26 MILES FOR 10 CENTS.

A 1000-pound Waverley electric delivery wagon covered the 26-mile route from Buffalo to Lockport, N. Y., and return, carrying its full load one way and 900 pounds the other way, in 3½ hours. The current consumption was 105 ampere-hours, which cost 10 cents.

Headlights are not allowed to be used in Pittsburg streets on account of their glare, but side and tail lamps are required.

ARMY MOTOR TRUCK WIRELESS STATION.

ANNIHILATION of distance might aptly be chosen as the distinguishing characteristic of the 20th century. Motor vehicles transfer men and merchandise over hundreds of miles in a small fraction of the time formerly required to do this work. As for transmitting telegraphic information, the use of the motor vehicle has greatly increased the range of practical work.

It is only natural that military needs should utilize every progression of civilization, and, modern army equipment includes both automobiles and wireless telegraphy outfits. An efficient combination of these two utilities, however, seems to have been met by adopting a powerful automobile and a high-powered wireless outfit forming a self-contained unit with the car.

The United States army has acquired for its signal corps a truck built by the White Company of Cleveland, O., with the wireless equipment that can be set up for use in 12 minutes so as to send messages to any point within a radius of 800 miles if weather conditions are favorable. In some tests made, this truck has received messages from points 2500 miles away.

It is the speed with which this apparatus may be placed into readiness for operation, and its great power and extreme range of distance which make it unusually serviceable. The truck engine drives a powerful electric generator which delivers a 500-cycle current at 110 volts that raises from 18 to 32 amperes. The key-operated relay interrupts this current and transforms it so that its amperage is reduced to 8 or 12, while its voltage rises to 22,000. By the time the electricity has arrived at the top of the antennae, it has about 90,000 volts pressure, the amperage approximating zero.

The waves sent out under these conditions

have enough force to travel 800 miles under good conditions, that is, when there is little electric disturbances in the atmosphere which are created by various electrical power plants; under the worst conditions, however, the sending capacity of the outfit is 200 miles.

Coming to a detailed description of this equipment, the antennae, which is of the umbrella type, is mounted on the top of a mast 85 feet high, which is constructed of nine sections, eight of which are lifted by a block tackle suspended from struts which are mounted on a platform on the roof of the truck, but the first or top section is raised by hand. The guy wires are attached

United States Army Signal Corps Motor Truck Wireless Station: At Left, the Interior Equipment of a Special Body on a White Chassis; at Right, Crew Erecting an 85-Foot Sectional Mast Carried on the Machine.

to the fifth section of the mast. When not in use, this structure is taken down and the sections are carried in long compartments secured to the sides of the truck. As the wireless system of telegraphy necessitates a counterpoise, so called, or artificial ground, this is provided in the shape of several heavy insulated wires which radiate from a common center to which the ground wire proper is attached. To make grounding easy, a socket is provided on the side of the truck body, and a ground wire plug is designed to fit into this socket.

Ohio will expend \$15,000,000 this year for road construction and improvements. Three-fifths will be spent by the state department.

ANNOUNCE NEW MODEL IMP CYCLECAR.

THE W. H. McIntyre Company, Auburn, Ind., has announced the production of a new model known as "Imp the Second," which is built along similar lines as the original Imp, but includes a number of improvements of the first model.

In this machine, the four-cylinder water-cooled four-cycle motor cylinders are cast enbloc, with bore of $2\frac{3}{4}$ inches and stroke of four inches. The motor is suspended at three points. The motor has an aluminum barrel crankcase and the nickel-steel crankshaft is carried in two bearings; the connecting rods are heat-treated forgings. The inlet and exhaust manifolds are integral castings. A plunger oil pump insures positive lubrication and a thermo-syphon system of water circulation in combination with a large fan affords ample cooling.

To insure the car having great hill-climbing capacity, the battery system of ignition has been used from the reasoning that it has a wide margin of safety; its current being just as powerful at low as at high motor speeds. Another feature of the ignition is perfect synchronism of the circuit breaker with the motor at all speeds.

Power is transmitted from the motor through a universal joint, propellor shaft and transmission, located under the seat, to a central pedal shaft and thence by a single roller chain to the live rear axle carrying the wheels, each of which includes a gearless differential to prevent skidding when the car turns a corner. The transmission system consists of a pressed-iron disc attached to the propellor shaft, against which

bears a paper friction wheel clamped in two metal flanges; the mounting of this wheel is such as to insure alignment in any position and render it proof against sliding when the car is turning a corner. There is also a provision for taking up wear on the compressed paper wheel. Any number of speeds is obtainable with this device, but four forward speeds and one reverse are registered on the notched quadrant to prevent a change in the relative positions of the two rotating friction members.

The rear axle, supported in roller bearings, carries the 28-inch wire wheels, which have solid hubs integral with the gearless differentials and the pedal-operated internal expanding service brake. The front wheels, of the same dimensions, have adjustable self-contained ball bearings. The tires are 28 by $2\frac{1}{2}$ inches all around. The foot lever-operated external contracting emergency brake operates on drums on the jack-shaft.

A rack and pinion steering gear is used, with a 14-inch wheel mounted at the left side of the car. Semi-elliptic springs in front and cantilever rear springs carry the torpedo-type streamline roadster body, upholstered with artificial leather. The seat is 37 inches wide and 16 inches deep with high back, and the compartment has two doors. The top is a Duquesne pattern and folds back so as not to interfere with driver or passenger passing through the door; a dust slip cover is fitted with every top. Under the cowl, the five-gallon gasoline tank is located in an accessible position. The tank is high enough to

The Imp, the Second Cycle Car, Built by the W.H. McIntyre Company. At Right, a Three-Quarters View of the Fully Equipped Machine; at Left, the Rear of the Body, Showing the Ample Storage Space.

assure positive feeding of the carburetor on any grade. This model has running boards.

The equipment of "Imp the Second" includes a six-volt electric lighting system, two headlights and a tail lamp being supplied with current from special dry cells. Starting is by a cable attached to a hand lever in easy reach of the driver. The cable is wound automatically by a clock spring and turns the motor crank when pulled by the driver.

The new Imp has a 90 inches wheelbase and eight inches clearance, weighs 850 pounds

DAVISON'S VIXEN WINS RACE.

Takes 25-Mile Free-for-All International Contest at 51.2 Miles an Hour.

The Vixen cyclecar driven by Harry Davison in the first International Cyclecar and Light

TO PROMOTE CONTESTS.

Manufacturers' Association to Encourage Racing and Touring.

At a meeting of the Cyclecar Manufacturers' National Association, held in Detroit during the international cyclecar and light car race meet, Frank E. Spooner was elected secretary. Mr. Spooner has been instructed to open an office at 903 Free Press Building, Detroit, as the first step of carrying on active organization work.

At the same meeting W. Irving Twombly, of the Twombly Motor Corporation, New York, and W. C. Lumb, of the Flagler Cyclecar Company, Sheboygan, Mich., were elected directors to fill two vacancies.

A contest committee was appointed and the matter of classification and arrangement of pro-

Contestants in the Second Run of the Cyclecar Club of New England at Haverhill, Mass., in the Noon Control.

Car Race at Detroit, Mich., July 4, starred by winning the 25 mile free-for-all, covering the distance in 29:18.1, and taking the prize from a field of eight contenders, including one French and one English car. Charles Coey in a Coey cyclecar was second, finishing in 30:19.4, and Clancy in a Twombly was third in 30:24.3. Another Twombly car was fourth and a Baby Peugeot fifth, although great things had been expected of it.

The Morgan three-wheeler, made in England, led for a time, but was disabled by a broken steering gear in the ninth lap. Before this, however, it had won a one-mile free-for-all for class A cars and a five-mile free-for-all for stock cars. Davison won also a one-mile free-for-all for class B cars in 1:12.1, and a two mile race for the winners of other events in 2:35.4.

grams of racing events was taken up. The manufacturers decided to encourage the promotion of contests of every character, including track races, hill climbs, road races, and every form of touring, in all sections of the country.

The members expressed themselves as highly pleased with the results of the contests at Detroit, believing that the endurance and speed of the cars in many long races had proven a demonstration of inestimable value to the industry.

The first cyclecar reliability run in America is scheduled to take place on Sept. 5, 6 and 7. The route will be from Newark, N. J., by way of Atlantic City to Philadelphia. Each car will carry an official observer, who will note fuel and oil consumption, stops and repairs. Twelve silver cups are the prizes offered for perfect scores.

IN THE COMMERCIAL CAR FIELD.

Truck, Carrying Load of Six Tons, Hauls Trailer Weighing Nine Tons Loaded with 40 Ton Bank Door---Novel Use of Republic Chassis.

MOTOR trucks gave an extraordinary demonstration of their usefulness and efficiency a short time ago in New York, when a Hydraulic five-ton truck and a Sampson vehicle of the same capacity moved a 40-ton safety vault door, made by the Bethlehem Steel Company, from the East river to the National Park Bank, at Broadway and Ann street. The vestibule frame having been brought by way of the water, it was necessary to transfer it from the lighter on to a wagon by a crane. This done, a five-ton Sampson truck and an American-La France gasoline-hydraulic truck were hitched tandem to move the wagon, the wheels of which had settled in the asphalt pavement. Then the train started at seven miles an hour along the river front, turning into Fulton

ing 30 tons over eight miles of road in Long Island City, negotiating a 3.5 per cent. hill on the viaduct. Because the trailer was not equipped with brakes, 10 horses were used, two of which guided the pole and eight walked behind to hold it steady on the grades.

PURCHASE ARMY TRUCKS.

Nine Makers Share a Blanket Contract of War Department for 20 Machines.

Secretary of War Garrison has approved the bids of nine different manufacturers from whom 20 machines will be purchased for the quartermaster-general's department. The majority of the machines, and possibly all of them, will be delivered at Fort Sam Houston, Tex., which has been the mobilization point of the army serving along the Mexican border.

Bids were invited from the industry generally for differing types of cars and these were submitted at several places, including the headquarters

Hydraulic and Sampson Five-Ton Trucks Hauling a 40-Ton Bank Vault Door Frame on a Nine-Ton Wagon in New York City.

street and up a 3.5 per cent. gradient.

In the middle of this hill, the trucks were stopped as one of the men thought the rear wheel journals of the Hydraulic truck could not stand the speed. Starting up again, the trucks continued at three miles an hour, but when they had to stop on account of a team obstructing the way, the wheels of the wagon carrying the door sank so deeply into the asphalt that the wheels had to be jacked and boiler plate put beneath them to make further progress possible. This happened within 100 feet of the bank building.

Several days after, another Hydraulic truck hauled a trailer loaded with steel girders weigh-

ing 30 tons over eight miles of road in Long Island City, negotiating a 3.5 per cent. hill on the viaduct. Because the trailer was not equipped with brakes, 10 horses were used, two of which guided the pole and eight walked behind to hold it steady on the grades.

Velle Motor Vehicle Company, Moline, Ill.	5
White Company, Cleveland, O.	4
Lippard-Stewart Motor Car Company, Buffalo, N. Y.	3
Thomas B. Jeffery Company, Kenosha, Wis.	2
International Motor Company, New York City	2
Kelly-Springfield Motor Truck Company, Springfield, O.	1
Driggs-Seabury Ordnance Corporation, Sharon, Penn.	1
Lord Baltimore Truck Company, Baltimore, Md.	1
Federal Motor Truck Company, Detroit	1

The chassis only have been purchased and these will be fitted with bodies designed by the engineers of the quartermaster-general's department. These will not be uniform as they will be used for varying works.

GENERAL STORE ON A TRUCK.

E. A. Eriksen, Greenville, Mich., has a novel and interesting use for the motor truck, namely, its application as a mobile general store. In other words, he has equipped a 3000-pound Republic chassis with a special body fitted with suitable shelves and completely enclosed. Having filled it early in the morning with fresh products, he starts out making calls on the farmers of the neighboring country to supply them with what they need. He is paid in cash for all sales, and furthermore receives orders for his next call. He averages more than 70 calls a day, so that every week he visits approximately 500 families and sells to them groceries, provisions, fabrics and various other necessities.

This system of business has proven successful. In fact, the success surpasses Mr. Eriksen's expectation, but the simple explanation is that by bringing his store to the door of the customer, the merchant saves the latter's time, a valuable factor in farming work, especially during the summer. Furthermore, the merchant becomes personally acquainted with his trade and is able to look after it better than otherwise.

The truck used in this case is a standard chassis, the body, however, having been designed to meet the merchant's specific requirements and suggestions. The sides of the body are constructed with a number of doors, affording access to the interior.

British Highways Smooth.

Col. W. D. Sohier, chairman of the Massachusetts Highway Commission, who has just

returned from a trip to England, says British roads are perfectly smooth. In the cities he says the engineers have accomplished something that American experts declare is impossible; i. e., they have succeeded in laying wood block pavement flush with the rails of street car tracks, giving a smooth riding road. Col. Sohier says that constant repair and resurfacing is also a big factor in the success of the British roads.

GREAT BRITAIN SUBSIDIZES TRUCKS.

In its report on the recent trials of trucks, the British War office stated that most of the engines had between 350 and 400 cubic inches displacement as an average, the smallest having 317 and the largest 450 cubic inches. The specifica-

Republic Chassis with a Special Body, Which Is Stocked and Used for a General Store by E. A. Eriksen, Greenville, Mich.

tion of the war office for motor trucks to be subsidized call for a water cooling system including a pump, and all except 10 systems which were belt-driven, were operated by gears.

One interesting fact brought out by the report is that propeller shaft brakes were found to be superior, on the whole, to brakes carried in the wheel drums.

The average fuel consumption was one gallon for 54-gross ton miles, the best result being when one truck covered 200 miles at the rate of 63.3 miles a gallon. The previous best results were 59 gross ton miles a gallon for a whole trial and 68 gallons for a run of 200 miles, although considerably better results than these have been obtained on acceptance tests of new vehicles of the War Department pattern.

GARGOYLE BOOK ON LUBRICATION.**Construction, Operation and Requirements of Engine Lubricating Systems Are Defined.**

After explaining the principles of automobile motor operation, the Vacuum Oil Company, Rochester, N. Y., in a new booklet, "Lubrication of the Automobile; No. 1—The Engine," goes into the subject of oiling the motor with great detail, by first classifying oiling systems as follows:

Full Force Feed—Oil is forced by pump pressure to the main bearings and, by means of drilled holes in the crank webs, to crank pins and through hollow connecting rods, or oil pipes attached thereto, to the wrist pins. Oil returns to sump, or reservoir, and is circulated again.

Force Feed—Oil is forced by pump pressure, or the centrifugal force of the revolving fly-wheel, to main bearings and, through drilled holes in crank webs, to crank pins. The wrist pins and cylinders are supplied by oil thrown from the connecting rods. The connecting rods do not dip. Oil returns to sump, or reservoir, and is circulated again.

Force Feed and Splash—Oil is forced by pump pressure, or the centrifugal force of the revolving fly-wheel, to the main bearings and, through drilled holes in crank webs, to crank pins. The oil from the main bearings falls to wells in the bottom of the crank case, to adjustable troughs, into which the connecting rods dip and splash oil to all other parts of the engine. A constant level is maintained in the crank case by an overflow to the sump, or reservoir, below, whence the oil is circulated again.

Semi-Force Feed and Splash—Oil is forced by pump pressure to a sight feed on the dash and from this point flows by gravity to the main bearings. The oil from the main bearings falls to wells in the bottom of the crank case, or to adjustable troughs, into which the connecting rods dip and splash oil to all other parts of the engine. A constant level is maintained in the crank case by an overflow to the sump, or reservoir, below, whence the oil is circulated again.

Splash—Oil is supplied to the crank case. The connecting rods dip into and splash the oil to all parts of the engine.

In addition, the booklet takes up the question of carbon deposits and their removal, correct and incorrect engine lubrication, proper adjustment of the several parts of the power plant, and diagnosing and remedying engine troubles.

This booklet will be sent free to any motorist upon application to the manufacturer of Gar-

goyle Mobiloils, either at the Rochester headquarters or one of the many branches.

LAW GETS THE BIG FISH.

The amendment to the Massachusetts law which gives visiting motorists 30 days grace instead of 10 seems to some a boomerang. Under the provisions of the old law the visiting motorist could take out a three months' registration at one-half the regular fee, but now if he should desire to stay after the 30-day period the full yearly rate is charged. Over 900 motorists were licensed for three months last year.

NEW YORK'S BIG INCREASE.

During the first five months of 1914, 135,053 automobiles were registered in New York State, as compared with 107,299 for the same time last year. Of this year's registration, 62,134 cars include machines operated in Greater New York. The number of trucks registered before June, 1914, exceeds by far the total 1913 registration of commercial vehicles, according to Mitchel May, New York secretary of state.

TO CIRCLE GLOBE IN CYCLECAR.

Carl Stearns Clancy, of San Francisco, Calif., is preparing to make the tour around the world in a Twombly cyclecar. He has already once traveled around the earth on a motorcycle. After a transcontinental trip, Mr. Clancy will sail from New York about August 20 and on arrival in Europe will travel eastwards through Russia and Siberia.

SAVAGE 20 LIGHT CAR ANNOUNCED.

On Aug. 15 the first Savage 20 light car, selling for \$650, is to be placed on the market. It will be made by the Savage Motor Car Company, Detroit, of which Delbert H. Cummings is president, E. E. Taylor vice president and R. W. Fishback secretary, treasurer and general manager. The car will have four cylinders of 3.357x4.25 inches.

TOLEDO DEALER ENLARGES STORE.

The Toledo Rubber Company, Toledo, O., agent for G & J tires, National Telescope spark plug pumps, Ely-Ford shock absorbers and Wizard vulcanizers, has added 750 square feet to the floor space of its city salesroom.

MACHINERY, TOOLS AND SHOP EQUIPMENT.

HAND operated chain hoists, because of the ease of operation and general utility, are standard equipment in large repair shops and service stations.

Harrington Improved Screw Hoist.

Edwin Harrington, Son & Co., Inc., 17th and Callowhill streets, Philadelphia, manufactures a wide variety of chain hoists one of which, the improved screw hoist, is shown in an accompanying illustration.

It is designed to withstand severe service, and each component is subjected to rigid inspection before assembly. Each link of the chain is carefully tested. The maker states that it has been adopted by the United States government and is in use in a large number of industrial plants.

The worm gear, formerly of iron, is now made of bronze with square hubs, and is driven by a steel worm. The load wheels have square holes fitting squared hubs on the worm gear instead of clutches, increasing the strength and avoiding the liability of breaking. They are also reversible. It is pointed out that when one side of the pockets becomes worn, the wheels can be taken off and turned around, bringing the good side of the pockets into action.

The load is carried on two distinct chains, either of which is capable of lifting a load up to the full rated capacity of the hoist, thereby reducing opportunity of accident to the minimum. The load chain hook has a swivel connection, so that any twist of the chain may be straightened out without removal. A thrust screw and bronze washer at the end of the worm is instantly adjustable for obtaining fast or slow speed in lowering.

The worm and gear are enclosed in an oil tight housing containing a special hard grease. A new hand chain guard is so placed that the

operator can stand clear of the load without wasting time in dragging the chain in the guard. The hoists are made in capacities ranging from 500 to 30,000 pounds, and having lifts of from eight to 12 feet, respectively. The company issues a most complete illustrated catalogue on its product, which will be mailed free upon request.

HERCULES PORTABLE CRANE.

William Shelton Nicholls, Hoosick Falls, N. Y., is manufacturing the Hercules portable crane hoist shown in the accompanying illustration and it is designed for service in the factory, garage and repair shop. It may be utilized in repairing and for a number of other purposes, saving time and labor. A feature of the Hercules is that it is constructed of steel throughout and has solid frame pieces, top to bottom. The base or bed is low, permitting of its use from all sides of the automobile. As will be noted by the illustration, an extra length overhang brings the centre of lift or hoist directly over the motor. The wheels have a wide face and are mounted on roller bearings of ample size. An extension piece for the crank handles, extending these out beyond the mud guards, is standard equipment. The Hercules is made in 1000, 2000 and 3000 pounds capacity and is moved easily about the building. The height overall is

eight feet and the hoist has a capacity of six feet, 10 inches, sufficient to meet varied requirements. The maker will supply complete

Hercules Portable Crane, Having Extra Length Over-hang and Extension for Handles.

FORD HOUSING PULLER.

The Universal Manufacturing Company, Racine, Wis., is marketing a practical tool for

Universal Ford Housing Puller and Pliers.

garages and repair shops handling Ford cars. As may be noted in the accompanying illustration, the tool is designed to remove the propeller shaft housing from the differential. One of the qualities of the tool is that the housing can be removed without injuring its flanges. It is also stated that the device saves considerable time over the usual method of driving with a hammer. The Universal Ford housing puller is sold in sets of two and for a moderate price.

The company also markets extension pliers for reaching and removing nuts, bolts, etc., from places not easily accessible by the hands or with ordinary tools. With the Universal pliers the workman can reach into the pan, transmission, etc. The pliers can be extended 21 inches, and when folded as shown in the illustration is seven inches long and about three inches wide. The maker states that this tool will save its cost in a brief period of service. It is also practical for the motorist who maintains his own car.

ARMSTRONG RATCHET DRILL.

The Armstrong Bros. Tool Company, 357 North Francisco avenue, Chicago, Ill., is marketing a line of ratchet drills, one of which, the Standard combination, is shown in an accompanying illustration. The tool is designed for

Armstrong Standard Combination Ratchet Drill.

general service and for drilling or countersinking holes in material not easily accessible with ordinary tools.

The combination includes a sleeve ratchet for Morse taper shank drills, a square taper socket to fit the same and a short spindle with feed screw by which the ratchet can be converted to use square taper shank drills.

A quality of the Armstrong ratchets is that all parts are hardened. The Standard ratchet combination is made in five styles. The lengths are from nine to 22 inches. The company issues a complete catalogue, giving details and prices of its product, which will be supplied free upon request.

LATHE DOGS AND CLAMPS.

The Armstrong Bros. Tool Company, Chicago, Ill., has issued a new catalogue of drop forged lathe dogs and machinists' clamps, three types

Illustrating Armstrong Machinist's Clamp, Lathe Dogs and C Clamp.

of which are shown in the accompanying illustration. One quality of the clamp lathe dogs is that the under face of the screw heads is convex, fitting into a concave seat, and as the holes in the upper bar are larger than the screw, this allows considerable tilting without bending the screw. The dogs are produced in four sizes, ranging from $1\frac{3}{4}$ to $3\frac{1}{2}$ inches between the screws.

The machinists' clamps are produced in four sizes with openings from $1\frac{1}{4}$ to $4\frac{1}{4}$ inches. All parts are hardened and the faces are ground true. The under face of the centre screw is convex, fitting into a concave seat to allow tilting. The jaws are extra heavy and the maker states they will not bend or spring on a short bite. The C clamp is adapted to a large variety of work. It is produced with capacities of from two to 18 inches adapted for heavy work.

BOSCH BUILDS FULL CAR EQUIPMENT.

THE absorption of the Rushmore Dynamo Works, details of which are given elsewhere in this issue, together with the completion of a line of motor starters, will greatly increase the business scope of the Bosch Magneto Company, New York City, and its products for 1915 will be very much more general. The company now produces magnetos in a great variety of types, electric motor starters and generators, lighting accessories, starting switches, oilers, searchlights, a battery ignition system, control devices, spark plugs, etc. The Bosch Magneto Company occupies a unique position in the automobile industry in that, with the exception of electric horns, it can supply all electrical equipment needed or desired for the average modern car.

Diversity of Design.

The Bosch lighting systems include five different generators, with a diversity of design that the company may meet the many requirements as to mounting, drive and speed. The two Bosch motor starters are over-running clutch types and are 12-volt machines, the standard voltage of the company, such as is generally used abroad. The Bosch company states that it has overcome the obstacles to manufacturing lamps of this voltage, and that there is now an advantage in the use of a 12-volt system, as the current required for any particular lamp load is considerably less than with a six-volt system. As the commutator of the first-named system is smaller, the loss due to brush friction and electrical resistance is less.

The Bosch lighting generators were fully described in the Feb. 25 issue of the Automobile Journal. They are of the shunt wound type, and

the excitation of the field magnets is governed by an automatic controller of the electro-magnetic type carried in the switchboard. This controller reduces the strength of the field as the speed increases and conversely increases the field strength as the speed decreases, thus maintaining the output of the dynamo constant.

Bosch-Rushmore Starting Motor, a Type Especially Adaptable to the Used Motor Car.

The switchboard is a novel construction and is made for standard and cowl dashes. The switch is a kick type and affords use of the battery or dynamo, or both, for carrying the lamp load. A combination voltammeter is included, and the double reading scale shows both charge and discharge currents. A quality of the switch board is a removable key.

The Bosch Magneto Company will market two types of motor starters, the Bosch, which includes an over-running clutch, and the Bosch-Rushmore, which is a direct drive to the flywheel construction. Both will be wound for 12 volts, permitting of their use in conjunction with Bosch dynamos.

Bosch Starting Motor with Over-Running Clutch.—The Main Starting Switch Is Shown at the Left; the Small Lower Illustration Is the Pilot Switch Above Which Is the Automatic Ignition Switch.

The Bosch Dynamo with Magneto Shaft Height Drive and Base, and the Accessories Utilized with the System.

automatically pushes aside an arm which is connected to the ignition lever, retarding the spark.

The motors, generators and accessories of the Rushmore system are well known and will be continued under the name of Bosch-Rushmore. The line includes three dynamos of different size, all wound for six volts; four starting motors wound for six volts, and three starting motors wound for 12 volts.

An interesting type of starter switch is utilized with the Bosch design, one eliminating long leads, devices in the circuit, etc. In the Bosch system the switch proper and its operating device are separated. The switch is actuated magnetically and is attached directly to the starting motor. The energizing of the switch magnet is by a pilot switch, composed chiefly of a plunger through the dashboard, which is pressed by the driver. Closing the pilot switch energizes the switch magnet, admitting current to the motor starter. This eliminates the necessity of resistance in the circuit.

The Bosch Magneto Company is marketing a safety device which automatically retards the spark in case the driver cranks the motor by hand. This device, which is shown in the group of motor starters, is attached to the forward part of the engine and is so arranged that when the starting crank is introduced by the driver, he

The Bosch-Rushmore starting motors are simple four-pole machines of comparatively low speed, with forged steel electrically welded frames. The armature shaft carries a small pinion which meshes directly with a gear secured to the flywheel of the engine, obtaining a single reduction, one resulting in a high efficiency of transmission as well as a high starting speed. The driving pinion is meshed and unmeshed automatically by a patented end throw of the armature and spring. The device is particularly adapted for equipping used motor cars and it is easily installed.

A feature of the Bosch-Rushmore dynamo is the manner of controlling the charging current. Its principle involves the use of the high positive temperature and resistance coefficient of iron. Between the armature brushes of the dynamo and the battery is connected an iron wire resistor, the resistance of which increases very

Bosch Lighting Dynamos.—The Upper Left View Is the Control Box with Cover Removed; the Centre Is the Bosch Combination Switch and Control Box for Standard Dashboard; in the Centre Is the Lighting Switch and Control Unit for Cowl Dashboards.

rapidly when the current exceeds a certain value. The increase in voltage across the iron wire resistor is also used to produce a proportional decrease in the field excitation, so that the voltage of the generator remains nearly constant, independent of the speed at which it is driven by the engine.

In shunt with the iron wire resistor is a field coil, the electromotive force of which is in a direction to oppose that of the main field coil, which is connected directly across the terminals of the battery. The resistance of the field or "bucking" coil is considerably greater than that of the ballast resistor when the latter is cold, or slightly heated. When the ballast resistor becomes heated with current its increased resist-

ance forces the bulk of the current of the generator through the "bucking" coil, thus augmenting the counter excitation produced by the latter. As the strength of the magnetic field is due to the difference between the exciting effect of the main shunt field winding and the "bucking" coil, by suitably proportioning the latter and the ballast coil to the other elements, the variation in current may be as small as desired.

The Bosch Magneto Company is also marketing a battery ignition system, comprising a combined circuit breaker and high-tension distributor. The circuit breaker is practically the same as used in the magnetos constructed by this company, except that it is operated by an external, instead of an internal, cam.

ADVOCATES UNIFORM HIGHWAY LAWS.

WORKING in conjunction with the American Bar Association, the American Highway Association seeks to have old road laws repealed and uniform highway laws substituted. Some laws now in effect have been on statute books for more than 100 years and are obsolete as far as the motor car is concerned.

A committee, appointed by and serving the two associations, has prepared a complete literal compilation of the road laws relating to all forms of indebtedness, the use of convict labor, and various other subjects which have a bearing upon the administration of public roads. An index chart for these laws is now being prepared and as soon as completed the committees will determine upon the lines along which revision will be sought. The governors of the various states will then be asked to recommend to the legislators the appointment of special committees to confer with the committees of the American Highway Association and the American Bar Association, with a view to adequate revision of the existing road laws.

The first step in the revision of the state road laws will be a recommendation by the committees that all obsolete, useless or unnecessary road laws be repealed. Then the work will consist merely of simplifying and arranging in logical order the existing necessary road laws. The committee has discovered a most hopeless confusion existing in states where accumulations of laws in some instances more than 100 years old are still in force to a certain extent.

Wherever practicable, uniform road laws for the various states will be urged by the committees, as it is realized that traffic is now controlled

by economic conditions rather than by state lines, and should not be hampered by conflicting laws of the various communities.

Certain basic principles of good administration will be urged by the joint committees, such as the payment of road taxes in cash, the elimination of a multitude of unnecessary road officials now characteristic of many states, the requirement of skilled supervision in the actual construction and maintenance of roads and providing qualification tests, the constant employment of highway engineers or superintendents, the adoption of the appointive rather than the elective method of creating such officials, the substitution of continuous maintenance for the present intermittent method, the proper utilization of convict labor where climatic and other conditions warrant its use on public roads for the preparation of road materials, the general adoption of the principle of state aid and supervision and the proper safeguarding and accounting of road funds.

The joint committees are expected to make their report at the fourth American road congress, which will be held at Atlanta, Ga., November 9-14, 1914.

RECOMMENDS UNIFORM LAWS.

Representing eight states, an interstate automobile vehicle law commission recently adopted a report recommending uniform laws for the States of New York, New Jersey, Pennsylvania, Maine, Maryland, Massachusetts, Connecticut and Delaware. The speed limit approved by the draft adopted is 24 miles per hour.

MECHANICAL NOTES FOR OWNERS.

THE owner who cares for his machine is frequently called upon to exercise considerable ingenuity in repairing or replacing a damaged

Fig. 1—Repair Made to Broken Exhaust Pipe.

component, especially if the car be an old model, one for which new parts cannot be obtained. An instance of a simple repair

to a broken exhaust pipe was noted recently by the writer.

The machine was used over rough roads and the pipe snapped because the muffler support broke, allowing the tubing to come into contact with a cross member of the frame. As a new part could not be obtained, and the motorist did not care to go to the expense of purchasing and fitting a new pipe, a repair was completed in the following manner:

A piece of tubing, about five inches long and slightly larger in diameter than that of the exhaust member, was secured, and a slot cut as shown at Fig. 1. This reduced the diameter sufficiently to make a tight fit. It was an easy matter to slip the new piece over the broken ends of the old tubing, and to secure it with clamps as shown. Leakage of the burned gases is so slight as not to be noticeable, and although the car has been in service for some time since the repair was made, the part appears to be as strong as it was originally.

UNUSUAL PUNCTURE.

When changing a punctured tube for a new one it is a good plan to make sure that the article causing the trouble is not in the casing. An instance is recorded of where a motorist made several changes of tubes in the same shoe before the trouble was located. A graphophone needle had been driven through the side of the tread in such manner that it was not discernible upon examination of the inside or exterior of the casing. The owner noted that each puncture was similar, occurring about a foot from the valve.

The leak was a slow one, as the puncture was very small. Upon arriving home the tire was subjected to a rigid inspection. By pressing hard with the finger in the neighborhood of the sus-

pected place, a sharp prick was experienced and the tip of the needle located. It required some ingenuity to dislodge it, the work being accomplished finally by a pair of round nosed, pointed, jewellers' pliers.

WEAK VALVE SPRINGS.

The missing of the motor at low speeds is generally caused by leakage of air in the intake pipe connections, valve guides, poor mixture, etc., but if, after making the usual tests, the trouble continues, it is suggested by the Willys-Overland Company, maker of the Overland cars, that the exhaust valve spring be examined to note if it has lost its tension.

If the spring be weak it will not seat the valve at low motor speeds, causing irregular operation, which is often ascribed to the troubles above mentioned. To test the action of the valve spring, insert the blade of a screw driver or similar shaped tool between the coils as shown at Fig. 2. This should be done with the motor running. If the missing stops it will indicate that the spring has lost its tension, and that either a new one is required or the old member needs stretching.

The reason for the missing of the cylinder, which has a weak exhaust spring, is that when the throttle is closed, the suction of the piston has a tendency to raise the valve from its seat, drawing in some of the exhaust gases. An imperfectly seated valve will present similar symptoms.

CARE OF GREASE CUPS.

Fig. 2—Testing Exhaust Valve Spring.

Occasionally remove the old lubricant from the grease cup and insert a wire in the passage leading to the part to be lubricated, as these parts may be clogged. To remove hard lubricant, heat a wire and insert in the passage, then clean well with kerosene or gasoline. In renewing the supply of grease fill the cup about half full, then screw it down. Next refill the cup and replace it, and remove all surplus grease.

NEWS OF THE MANUFACTURER AND DEALER.

The following concerns have been incorporated recently to manufacture or deal in automobiles, accessories, etc.:

Greenleaf Manufacturing Company, Hartford, Conn.; \$35,000; W. H. Greenleaf, George J. Long, John R. Hayes. **W. R. Lantz Carriage & Automobile Company**, Muskogee, Okla.; \$25,000; W. R. Lantz, A. E. Lantz, J. O. Humphries.

Cyclops Cyclecar Company, Indianapolis, Ind.; \$10,000; to manufacture cyclecars; James W. Smith, C. A. Hargraves and others.

Excelsior Tire & Rubber Company, Wilmington, Del.; \$500,000; to manufacture automobiles and supplies.

Cook & MacConnell, New York City; \$1500; to deal in automobiles; John MacConnell, Eugene T. Scudder, Benjamin N. Scudder.

Comet Cyclecar Company, Indianapolis, Ind.; \$20,000; to manufacture cyclecars; F. P. Metz, L. F. Metz, W. H. Ogborn.

Crown Tire & Supply Company, Philadelphia, Penn.; to manufacture automobiles and accessories; J. M. Frere and others.

Savage Motor Car Company, Detroit, Mich.; \$10,000; to manufacture automobiles; Robert W. Fishback, Delbert H. Cummings, Alexander H. Fuss.

The Shurgas Manufacturing Company, Detroit, Mich.; \$15,000; to manufacture automobiles, carburetors and accessories.

Acme Automobile Company, New Orleans, La.; \$10,000; to engage in a general automobile business.

Simpson Garage, Esopus, N. Y.; \$1500; to conduct a garage; Herbert Cohen, Emil Adler, J. J. Curtin.

St. Mark's Garage, Brooklyn, N. Y.; \$10,000; to conduct a general garage and repair shop; D. Saladino, A. Quick, A. E. M. Quick.

Ponca City Garage, Ponca City, Okla.; \$10,000; to conduct a garage and repair shop.

Washington Garage, Chicago, Ill.; \$2500; to conduct a garage; Daniel Lynch, Della Lynch, John Divine.

The Auto Kraft & Garage Company, Detroit, Mich.; \$2000; to conduct a garage; A. C. Born, V. Oldberg, J. Palmer, Jr.

Archibale-Brouse-Parker Company, Cincinnati, O.; \$5000; to conduct a repair shop; Henry M. Brouse, W. H. Parker, R. J. H. Archibale, William B. Parker, Garritt J. Fredericks.

National Auto Repair Company, New York City; \$3000; to conduct a repair shop; Edward Grossman, Albert F. Tins, Walter Peppin.

Spencer Garage Company, Brooklyn, N. Y.; \$5000; to conduct a garage; J. O. Spencer, Jr., Anne E. Spencer, P. M. Weidmann.

The M. & M. Delivery & Garage Company, Buffalo, N. Y.; \$20,000; to conduct a general garage and delivery business; G. Roughhead, R. Macdonald, Maud Macdonald.

Float Jet Carburetor Company, Newark, N. J.; \$200,000; to manufacture carburetors for internal combustion engines; E. S. Smith, M. B. Smith, E. G. Gifford.

Bar-Bar Company, Grand Rapids, Mich.; \$15,000; to manufacture machinery and automobile novelties and specialties; Irving W. Barnhart, E. M. Barnes, R. R. Barnhart.

Canfield Gas Engine Company, Binghamton, N. Y.; \$50,000; A. Louis, W. J. Newing, E. L. Whitlock.

Swan Carburetor Company, San Francisco, Cal.; \$200,000; to manufacture carburetors; H. S. Hutchings, Ella M. Boynton, B. W. Dobbins.

Chicago Auto Radiator Manufacturing Company, Chicago, Ill.; \$1500; K. H. Emmerman, Louis Shaffer, Jacob Siegel.

Sloane-Daniel Motor Company, Bound Brook, N. J.; \$25,000; to manufacture engines, machinery, etc.; J. E. Sloane, C. Hogue, W. Phipps.

Stokes Carburetor Company, New York City; \$100,000; J. F. Smith, W. O. Stokes, T. M. Stokes.

Meder-Staudt Company, New York City; \$10,000; to manufacture and deal in storage batteries, motors, etc.; Philip F. Meder, Charles Meder, Charles Staudt, Katherine Staudt.

Harris Oil Engine Company, Bangor, Me.; \$200,000; to manufacture engines, etc.; H. L. Brown, DuPont Ammen, L. A. Hammersley.

J. & P. Sales Company, New York City; \$5000; to deal

in motors, etc.; Joseph J. Miller, Walter L. Perley, Grace Feeney.

NEW AGENCIES AND BRANCHES.

The Gross Hardware Company, Milwaukee, has been appointed sole agent for the Braender tire for the State of Wisconsin.

The Consumers' Tire Company, Milwaukee, has been appointed exclusive distributor for Acme tires and accessories. The company is located at Seventh and Wells streets.

The Down Town Garage Company, Detroit, is the name of a new concern which has opened for business at 30 Congress street, West.

The Republic Tire Company, Grand Rapids, Mich., has established a salesroom at 124 Division street. George E. Moran is in charge.

The Chalmers & Saxon Sales Company, Macon, Ga., is a new company which has started business in that city. The company has opened salesrooms in the Grand building. A service station has been established and all parts are carried.

The Lee Tire & Supply Company, Grand Rapids, Mich., is now handling the products of the Lee Tire & Rubber Company, Conshohocken, Penn. The company is located at 206 Ionia avenue.

E. Isenham, Indianapolis, has entered the trade as proprietor of the Indianapolis Auto Tire & Accessories Company. He is located at 1702 West North street. Until recently he was manager of the Marmon branch in that city.

The Bartles-Maguire Oil Company, Milwaukee, Wis., has been appointed distributor for the Knight tire.

GARAGE AND REPAIR SHOPS.

Martin Bros., Akron, N. Y., has opened a new garage.

The Wright Garage Company, Merrimac, Mass., has opened a first-class garage on Mill street.

J. B. Price, Quincy, Fla., has opened a new garage. It is modern throughout.

Andrew Stried, Brisswold, Ia., will open a garage and repair shop in the old Motor Inn building on Third street.

George E. Mickel, Walnut, Ia., has opened a new garage and repair shop. It is modern throughout.

Carver & Twyman Garage Company, Trenton, N. J., has opened an up-to-date garage.

Earl Winters, Hutchinson, Kan., has opened an up-to-date garage at 106 Sherman street.

G. E. Mosser, Batavia, Ia., has opened a new garage and repair shop which is modernly equipped.

The Stewart Garage Company, Muskegon, Mich., has opened a new garage which is modern throughout.

W. L. Forney, Chambersburg, Penn., who is owner of the Franklin Auto & Supply Company, has converted his large sale and exchange stable into a garage.

J. Heidelmayr & Son, College Point, N. Y., has opened a modern garage at 90 Jackson avenue. The garage is of fireproof construction.

Cedar & Russell, Santa Cruz, Cal., is the name of a new firm who will operate a first-class garage and repair shop. The company is located on Pacific avenue.

John W. Werts & Son, Shillington, Penn., has opened an automobile repair shop. The new company is located at Lancaster avenue.

The Ahwaga Garage Company, Owego, N. Y., has opened for business. The company has an up-to-date machine shop and repair department. The building is a new one.

Bennett & Fife, Oakland, Cal., has opened a machine shop on 12th street. The company is the local agent for Ford cars.

Rich & Sprague, Scranton, Penn., has opened a new garage at 638 Quincy street. It is modern throughout and the latest machinery has been installed.

The Marksheffel Automobile Company, Colorado Springs, Col., has opened a large garage at 22 North Cascade avenue. It was erected at a cost of \$50,000.

The Mohegan Garage, Lake Mohegan, N. Y., is the name of a garage which was recently opened. Dudley

F. Benton is the proprietor. He is agent for the Ford cars.

J. R. Borthwick, Pittsfield, Mass., formerly with the City Garage Company, has opened a garage and repair shop at 159 Union street.

The Central Garage, Detroit, has been opened in the former Pingree building at Jefferson avenue and Shelby street.

WITH THE MANUFACTURERS.

The Buick Motor Company, Flint, Mich., is erecting a three-story fireproof building for its enamel plant. The structure will be 108 by 265 feet and according to Buick officials it will be one of the most complete factory buildings in the world. In addition to the standard equipment of the modern enameling plant, in the Buick building will be installed the mono-rail system for moving the raw material and the finished product to the various parts of the factory. There will be 15 ovens and two high-speed electric elevators of 4000 pounds capacity each. There will be washed-air ventilation, dustless floors, ice-cooled drinking fountains of running water, well-lighted and sanitary lunch and locker rooms and shower baths for employees.

The Splittdorf Electrical Company, Newark, N. J., maker of the Splittdorf and Apple electrical equipment lines for motor vehicles, has established branches at Minneapolis and Dallas.

The Paige-Detroit Motor Car Company, Detroit, has opened a branch at Birmingham, Ala., in charge of John H. Campbell.

The Cole Motor Car Company, Indianapolis, has added a little six-model which resembles the larger six very closely and sells for \$1865.

The Peerless Motor Car Company, Cleveland, announces a line of four-wheel tractors, to be used for hauling trailers. One type hauls the trailers behind as with the standard truck. Another type carries one end of the trailer upon the tractor chassis.

The Schiedel-Thompson Manufacturing Company, Indianapolis, has changed its name to the Metal Auto Parts Company. The company intends to enlarge its plant. The management and stockholders remain the same as in the past.

The Four Wheel Drive Auto Company, Clintonville, Wis., held its annual meeting recently. The articles of incorporation were amended, increasing the Board of Directors from seven to nine members, and A. W. Priest and A. Kuckuk were elected as directors. The company expended about \$500,000 in the past year for improvements to its factory and also machinery. A dividend of four per cent. on all stock outstanding on June 30, 1914, was declared and paid in cash. The sales for the past year for Four Wheel Drive trucks showed an increase of 165 per cent. over the preceding year.

The Kearns Motor Truck Company, Beavertown, Penn., has acquired 25,000 square feet of additional floor space which will be used for the building of a small car known as the Lulu.

The Buckeye Machine Company, South Lima, O., is erecting a new factory between Atlantic avenue and Broadway. The main building will be of brick. The company manufactures gas engines.

The Pullman Motor Car Company, York, Penn., has

Federal Rubber Manfg. Company's Present Plant at the Left; at Right, a Sketch of the Projected New Plant.

The Dallas Body & Wheel Works Company, Fort Worth, Tex., is establishing a large plant at 23 Commerce street for the manufacture of automobile bodies, wheels, etc. Another plant will be operated at Dallas.

The Federal Rubber Manufacturing Company, Milwaukee, Wis., celebrated its third anniversary on July 1 by the issuance of orders for the erection of new factory buildings costing more than \$500,000. These will consist of a separate building 60 by 497 feet with six stories and basement and additions to four of the present buildings, all 50 by 500 feet and five stories high. Brick mill construction will be used throughout. When completed the new buildings will mean an increase of 150,000 square feet, making 450,000 square feet in the entire factory. At the present time the number of men employed on night work equals the number on the day shift. Three years ago the Federal Rubber Company employed about 30 men, and today the company employs over 1500 men.

The Pacific Rubber & Tire Manufacturing Company, Seattle, Wash., has established a large plant in that city.

E. L. Carmody, Pittsburg, Penn., of the Motormeter Company, has announced that headquarters have been located at Baum boulevard. The company manufactures a device for automobiles to warn the drivers of any derangement in the cooling system.

The Hendee Manufacturing Company, Springfield, Mass., maker of the Indian motorcycle, has opened a branch and service station at 501 South Sixth street, Minneapolis.

The Nurdyke & Marmon Company, Indianapolis, Ind., has removed its Chicago branch to 2430 Michigan avenue.

under consideration plans for a big expansion of operations at its factory. The company is to build for the LaVigne Motor Company of Detroit. Representatives of the latter company and a committee of creditors of the Pullman company who were appointed recently to supervise the work at the York factory, will shortly decide on a definite contract and the work for building the cars will begin.

The Reo Motor Car Company, Lansing, Mich., will erect a large addition to its plant. The new buildings will represent an increase of about 30 per cent. of the present capacity and will be located on South Washington avenue. The company plans to build 12,000 for the 1915 season.

The Maxwell Motor Company, Detroit, entertained about 100 of its dealers from Indiana recently. They were taken to the Tuller hotel where arrangements had been made for them. After a visit to the Maxwell plants a tour of the city was made and the Hoosiers were afterwards entertained at luncheon at the Detroit Motor Boat Club. In the evening the visiting Maxwell dealers were the guests of the company at a theatre party. The dealers returned home in new Maxwell 25's.

The Willys-Overland Company, Toledo, O., has for several months past been making extensive additions to its plant. A number of large buildings is being added. One of them will be 410 by 500 feet and will have four stories and basement. Another will be an immense body plant which will be 200 by 410 feet, including two stories and basement. The power building is 162 by 134 feet and built of brick containing four 500-horsepower McNaul water tube boilers.

EXPORTS AND IMPORTS.

Foreign Trade Increases \$1,326,000, But Buying Abroad Shrinks 1,000,000.

Exports of American automobiles and parts for the eleven months ended May 31, 1914, totaled \$35,070,272, an increase of \$1,326,000 over the corresponding period of 1913, and an increase of \$8,829,000 over 1912.

Bosch Magneto Cup for National Amateur Motorcycle Championship of 1914.

During the same period of the fiscal year the automobile imports were \$1,504,091, a decrease of \$1,000,000 compared with 1912-13. The number of complete cars and chassis imported has fallen from 921 in 1911-12 to 278 in 1913-14, but imports of parts has nearly trebled, the figure increasing from \$283,736 to \$715,344.

For the same eleven months the exports of automobiles amounted to \$24,583,435; of en-

gines, \$1,284,484; of tires, \$3,052,089, and of other parts, \$6,150,864, giving a total of \$35,070,272. For the previous year the figures were: Automobiles, \$23,821,782; engines, \$1,719,493; tires, \$3,512,095, and other parts, \$4,690,983, making a total of \$33,744,353.

SUBSTITUTE FOR GASOLENE.

Officials connected with the automobile industry are watching with keen interest the outcome of a series of tests of a substitute for gasoline now being made at the Indianapolis Speedway. The new product is the invention of a Portuguese named John Andrews, who is securing patents on his mixture. Under the observance of speedway and national factory officials he produced by distillation from water with the addition of a small amount of chemicals, a mixture that exploded fully as well as gasoline. It is claimed that the mixture can be made to sell for five or six cents a gallon.

TO ATTACH WARRANTY'S TO CARS.

As many dealers neglect to notify the makers of cars of the names and addresses of new owners, a copy of the N. A. C. C. standard pleasure car warranty is posted on every new car by one member of the National Automobile Chamber of Commerce to insure purchasers of their warranty. This method advises owners of their rights to demand the replacement of defective parts and the making good of defective workmanship without cost any time within 90 days.

LINCOLN HIGHWAY BOOKLET.

F. H. Trego, chief engineer of the Lincoln Highway Association, Detroit, Mich., has compiled a booklet which has been published by the Goodyear Tire & Rubber Company, containing maps and information for those who may travel by the Lincoln Highway. This book discusses routes, costs, time, equipment, provisions, and gives a set of valuable "Don'ts."

LOUISVILLE AUTOMOBILE SHOW.

The first annual midsummer automobile show held at Louisville, Ky., was attended by 15,000 persons. The show was under the auspices of the Louisville Automobile Club. All dealers present were optimistic, saying that business is much better this year than it was in 1913.

WANTS GENERAL LICENSING.**Suggestion How \$130,000,000 a Year Could Be Raised for Highway Work.**

If the continually growing sentiment in favor of a fair and general taxation by licensing all highway users in America could be practically realized, funds totalling \$130,000,000 could be raised for the construction and maintenance of highways, according to the National Automobile Chamber of Commerce. The licensing, this body maintains, could best be done by the several states on the basis of the use of the roads by the different classes of vehicles. Thus, licensing automobiles from \$10 to \$25, the 1,385,000 cars now in operation would pay a total of about \$19,000,000; 14,600,000 horse-drawn vehicles would, if licensed from \$5 to \$20, produce about \$108,000,000, while motorcycles and bicycles would pay \$3 and \$1, respectively, and aggregate \$3,400,000. The grand total of \$130,000,000 is almost equal to the total available highway funds provided by United States counties, districts and townships.

THE ART OF TESTING CARS.

One must be extra particular in selecting a motor car when the selecting means merely that and no more. To be more explicit, a clean-cut brisk young man, according to San Francisco despatches, was recently observed in that city to stop before a \$5,000 car standing on the street, and after looking it over critically for a few moments, climbed in and started the motor. He then got out of the machine and listened intently to the hum of the engine for a little while, and seeming perfectly satisfied, shut off

the power and passed on to another car.

After repeating this performance several times more he was quizzed by a watchman, but the young man, handing the watchman a cigar, explained that he was merely "testing" the motors. Having thoroughly "tested" an Oakland and apparently finding it to his liking he drove off, still "testing." The car was recovered several days later, but the young man is still at large, and will undoubtedly continue his testing abilities on a larger scale in the future.

FORD BUYS BROOKLYN LAND.

The Ford Motor Car Company of Detroit has purchased a plot at the northwest corner of Sterling place and Bedford avenue, Brooklyn, N. Y., 44 by 100 feet, but use to be made of this land has not been announced.

R. W. MACY CEASES ACTIVE WORK.

R. Ward Macey, Jr., has resigned his position of sales manager of the Premier Motor Manufacturing Company, Indianapolis, but remains a stockholder of the corporation. Before becoming connected with this company he was affiliated first with the Ford and later with the Franklin interests.

NEW STUDEBAKER PLANT.

Studebaker Corporation has added to its string of Detroit, Mich., plants the large structure formerly occupied by the American Harrow Company. This will now be known as Plant 2, and will be used as a parts repository and receiving station.

PRINTING POINT DOES NOT BOB UP AND DOWN

Center at which the type is directed is at rest when impression is made

Ball Bearing; Long Wearing

In an **L. C. Smith & Bros. Typewriter** the spot on the paper which is to receive the type impression is stationary at the instant the type hits. The carriage does not bob up and down when the shift is made to write capitals. Why? Because the type is shifted—not the carriage.

The only movement of the carriage is back and forth on its closely adjusted ball bearing runways—and this does not take place while the print is being made. There is no lifting of the carriage.

This is one reason why **L. C. Smith & Bros.** typewriting is free from blurs and every letter in the right place.

TRADE MARK REGISTERED IN
NON-FLUID OIL
 UNITED STATES PATENT OFFICE

The Invariable Choice
 of Thousands of
 Motorists
WHY?

Because—regardless of the heat, the speed, or the hard service of your car—this effective lubricant maintains a protective film between ALL bearing surfaces. It does not wear out or waste away like ordinary oils or greases. Furthermore, wear and tear is greatly reduced and power losses minimized.

Send for FREE Sample Cans

"K—No. 000 Grade" NON-FLUID OIL is of proper consistency for use in compression cups on all bearings, for packing differential gears, steering gear knuckles, ball and roller bearings etc. It lasts longer than any liquid-oils or greases and is unaffected by temperature changes.

"K—No. 00 SPECIAL" Grade is softer than "K—No. 000" and is designed for lubricating sliding gear transmissions. It cushions gear teeth, prevents abrasion and heating and insures smooth, quiet running.

Ask your dealer for the orange-colored can bearing sprocket-wheel trade-mark shown above.

LEADERS

In the automobile industry as in other lines of trade there is one device or article which, in its chosen field, leads all others in point of quality and widespread distribution. Such a leader is the Zenith carburetor—for six years the unchanging standard of the best known makes abroad.

**Why It Is a Leader.**

When Baverey invented the compound nozzle he solved the problem of efficient carburetion under all conditions with the simplest device for that purpose ever produced. The Zenith has no springs or valves or cams—no moving parts to trouble long suffering motorists. Just a rigid device, finely made, which far outlasts the life-span of a car.

The Motorist Should Know

The Zenith is used on more than 150 cars of Europe's famous list. Already nine American makes of prominence have adopted it. The motorist should know the story of the Zenith and what it means for his pleasure and profit. Send for it.

WHY USE INFERIOR PLUGS WHEN CENTERFIRE

can be bought at the same price? They overcome all Engine troubles, fire where others fail and Add Power to engine. Any length point desired made to order. Try them and you will use them—always. Make a trial and save money. \$1.00 each, 6 for \$5.00.

Pierce-Arrow

*An investment that pays
continuous dividends*

APPLY to the purchase of a motor car the same judgment that directs your purchase of securities. In each case you have a right to an unfailing supply of dividends and a ready market whenever you want to sell.

The dividend that comes from a motor car is the pleasure that it gives you. It is not enough that this should be as great as possible; it must also be as frequent as possible. Pierce-Arrow owners never get over the novelty of possessing a Pierce-Arrow.

Every time one of them sees his Pierce-Arrow approaching, every time he steps into it, every time he is carried smoothly and pleasantly wherever he wants to go—and back again—he experiences a new sense of ownership, a new dividend of pleasure.

And if that investment, which is great enough originally to supply this unique quality of service over many years, is ever to be liquidated, there is always a recognized current value for Pierce-Arrows. Motorists everywhere are anxious to get the added service and luxuries scarcely diminished by one owner in a Pierce-Arrow, for a price that indicates a loss of nothing except the sense of being the first owner.

Pierce-Arrow cars are built in three chassis sizes, 38, 48 and 66 horsepower. These chassis are equipped with many types of open and enclosed bodies, including a runabout with interchangeable Victoria and coupe top.

IGNITION SYSTEMS SPARK PLUGS

Bosch Products are better Products. Bosch Ignition and Bosch Spark Plugs are the almost universal choice of the men who drive the races. Bosch is the Standard here and everywhere.

The natural demand for Bosch Products, coupled with selling effort on your part, means largely increased sales for you and permanent satisfied customers. Recommend Bosch.

Any of our associated firms will gladly assist you. They will install Bosch ignition upon your customers' cars. Ask them about Bosch Ford ignition, gear and chain driven, Zenith Carburetors, Leak-Proof Piston Rings and Kemco Fan Type Generators.
